New technologies have caused changes in almost all spheres of social life, including the field of religion. The use of digital media resulted in new religious practices and produced new types of networked communities (Campbell 2016) which nevertheless cannot be disembedded from their off-line contexts (Campbell 2012). In my presentation I use lived religion approach (Ammerman 2020; McGuire 2008) to discuss the role of digital media in Roman Catholic women's religious practices. I refer to the results of the research which encompassed 48 in-depth interviews with educated, RC women living in big cities in Poland as well as 15 months of research among RC women's community Urzekające (Captivating), including digital ethnography, offline participant observation, IDIs with group leaders, etc. In the presentation I focus on two dimensions of mediatized religious practices: individual and collective. Within the first one I discuss digital media as a part of new or modified women's religious practices. I claim that the use of digital media enables women to combine religious practices with other practices of everyday life and to live religion despite the temporal discontinuity or fragmentation of practices. It also helps them to fulfil the spiritual needs in the context of contradictory expectations resulting from social roles they play and temporal, spatial and social constraints they face. Regarding collective aspect of digital media usage I discuss the social media as a tool for building women's networked communities which legitimize women's experiences and serve as "third spaces" between individual religious lives and the institution of the local Church.

"Building spiritual immunity": 7th Day Adventist Church responding to the Covid-19 crisis

Marta Kołodziejska

Institute of Philosophy and Sociology of the Polish Academy of Sciences, Poland

The paper draws on the results of a study of the Seventh-Day Adventist Church (SDAC) in Poland and the UK, and focuses on the Church's response to the Covid-19 pandemic. Based in the concept of deep mediatization, the study summarizes the results of discourse analysis (Sociology of Knowledge Approach to Discourse framework) of Adventist print media, YT channel content, and interviews with Adventist media producers and creators from Poland and the UK. The paper argues that one of the key reactions to the Covid-19 pandemic was the intensification of production of health-related content in the media, as well as intense focus on immunity and mental health. This connection with scientific/medical sources of knowledge indicates also the blurring of boundaries between these domains. At the same time, increased media awareness was observed among media producers, who strategise and prioritise certain types of content as a response to the health crisis, for the purpose of reaching the non-Adventist majority. The paper will conclude that the pandemic has prompted the SDA Church to make strategic use of their health ministry, and build stronger connections with non-religious sources of knowledge, which was facilitated by the processes of mediatization. As such, it may indicate how some Churches utilise secular discourses to connect with the wider society and legitimize their teachings in a secular context.

The Portuguese and Islam in the Internet Age: Online Reactions to News of the Construction of a New Mosque in Lisbon

Francisco Santos Silva

CIES, ISCTE- IUL, Portugal

This paper seeks to explore how the Portuguese people react online to news about Islam and Islamic themes by looking at a specific case of the plans made by the Lisbon Municipality to build a new mosque in an area with a large Muslim population in the centre of the city. Looking specifically at two newspapers aimed at different socioeconomic segments and the comments left by users on the newspaper's websites and Facebook pages, we can get an informed idea of what feelings and reactions talk about Islam elicits in the Portuguese speaking public. We can also see how these reactions and feelings both differ and are at other times similar across socioeconomic divisions and newspaper readerships.

Portugal, being on the periphery of Europe and a very religiously homogeneous country, has often been left out of the limelight when studying the relations between Islam and Europe. This paper seeks to fill that gap by exploring a collection of Portuguese reactions to the construction of a Mosque in downtown Lisbon, gauging public interest through internet comments which are often very revealing about preconceptions and prejudices on the part of the overwhelmingly Catholic Portuguese internet users.

RN34_T02_02 | Religion, Nature and Environmentalism

Spiritual Valuation of Urban Nature and Its Discontents

Irene Becci, Alexandre Grandjean

University Lausanne, Switzerland

In various Western European cities, have dwellers in recent years invested, through discourses and practices, "ordinary" nature – trees on squares, lawns between houses etc. – with a strong symbolical value. Numerous natural sites that used to be seen as markers "of spatial disorder" (Gandy, 2012: 733) are now re-classified as valuable (Graeber 2001) forms of nature in the city, creating new natural "urban atmospheres" (Löw, 2008) often through spiritual semantics. If for some this urban nature has become valuable as a reminder of "wild urban nature" (Gandy, 2014: 17) or of artistic verticality, it is simultaneously also the object of neoliberal modes of governance, as it is increasingly considered as a commodity (Erwein 2019). This contribution elaborates on the tension the notion of value contains in this context to reflect upon fieldwork observations collected when following urban eco-spiritual practices between 2017 and 2021 in two cities situated in the French-speaking part of Switzerland. Urban natural sites are becoming the new temples of ecospiritual practictioners. A large empirical variety of observations calls, however, for a theoretical framing this contribution tries to address via a discussion of the notion of holism.

The Analysis of an Islamic Religious Institution's Narratives on Ecology: The Case of Turkey

Betül Sarı, Sezai Doruk Soyata

Koç University, Turkey

As the effects of climate change increase, the studies on the relationship between religion and ecology have proliferated worldwide. Existing studies reflect that the scriptural and theological understanding of Islam reinforces the ecological tendencies based on the assumption that Islam is an environmentally responsible religion, focusing on the Quran and hadith. Although there are certain studies on the environmentalist tendencies in Turkey, it is not possible to see how religious institutions of Muslim majority countries react/recommend on the issue of environmental crisis and the local implications of the subject. This study aims to examine how the narrative of The Diyanet (The Presidency of Religious Affairs) in Turkey which is an official state institution under the control of the Turkish Presidency, touches upon the issue of the ecological crisis and offers recommendations on the issue based on Islamic teachings. This study examines Diyanet's Friday khutbahs and monthly magazines published in the last 20 years, the official Twitter accounts of the institution and its leaders, Diyanet TV programs and The Diyanet News website to see any reflection of the ecological issues. Certain important events such as climate change protests around the world and Turkey, signing of global climate change treaties and local political policies and the convergences between the current AKP government's political agenda and the discourse produced by Diyanet are given special focus. The results indicate that Diyanet's narratives on the issue of ecology have been affected by the global and local political agendas rather than solely the Islamic teachings themselves.

1106

The Slow Transition of the Established Churches to Ecology

Christophe Monnot

University of Strasbourg, France

Based on a research carried out in Switzerland from 2015 to 2020, this paper will show how the ecological transition is hindered by different institutional levels. We propose to use Geels' (2002) multi-level perspective on technological transitions as a model to identify how some pioneering initiatives remain at the local level, while others progress and others spread widely to become the norm. The process initiated in 1984 by the World Council of Churches "Justice, Peace and the Integrity of Creation" has not produced the expected outcomes. Pope Francis Laudato Si's ecological encyclical letter (2015), despite its popular success, has also failed to initiate a wave of parishes becoming aware of their ecological responsibility. Yet Geel's model will allow us to identify several initiatives and groups that influence the greening of the churches. In any case, local political/social pressure seems to be much more influential than theological debate in shaping the churches'ecological course.

RN34_T03_01 | Religion and the COVID-19 Pandemic

The COVID-19 Pandemic and its Impact on the Religiosity of Poles

Rafał Boguszewski, Monika Podkowińska, Marta Makowska

Warsaw University of Life Sciences, Poland

For over 20 years, around 90% of Poles have identified themselves as believers. Religiousness is one of the more permanent features of Polish society, although changes have occurred over the years. The COVID-19 pandemic has undoubtedly changed how people function in many dimensions of life, including religiosity. Limitations to the possibilities of participating in religious rites have been imposed. For some, this has meant giving up religious worship, and, for others, seeking alternative forms of participation in religious practices. The sense of danger and uncertainty accompanying the pandemic, particularly in its early stages, has caused some people, especially the most religious, to search for God's support. Based on the results of three online surveys of adult Poles, conducted using quota sampling during different phases of the COVID-19 pandemic, in our talk we will try to answer the following questions: "Has the nature of Poles' religious involvement changed because of the pandemic?"; "Has the number of people engaging in religious practice changed?"; "What demographic features are associated with increased religiosity and the abandonment of religious practices?" We will also consider various scenarios regarding the pandemic's long-term impact on Poles' religiosity.

The Social Capital of Islamic Organizations During Pandemic Crisis in Italy

Luca Bossi[1], Roberta Ricucci[2]

[1]University of Turin, Italy | Department of Cultures, Politics and Society; [2]University of Turin, Italy | Department of Cultures, Politics and Society

1107

Religious organizations can represent an important reservoir of social capital. With their ability to bring people together, weaving dense bonds, they may be able to generate community activism that allows individuals and families to organize and implement actions of solidarity. Often, religious activism constitutes an isolated field: ideas, actions and results are known only within the narrow circle of belonging, without influencing the actions of other religious, secular or public organizations. In the case of Islam, religious activism can be evaluated negatively, becoming a source of conflict in the neighborhoods, bringing back fears of "invasion" and "conquest through generosity". In Italy, several initiatives have emerged within religious organizations and, in particular, within Islamic organizations at the local level, to face religious and material needs that arose or changed during the pandemic and especially during the months of lockdown. The paper proposes to analyze the dynamics and processes of development of social initiatives in which Islamic associations have been involved, as emerged from documentary research, net-ethnography and semi-structured interviews with religious representatives, cultural mediators and volunteers. The case study is that of Turin, an emblematic city in the Italian context, for the processes of inclusion and recognition of the contribution of Islamic

associations in promoting social integration and empowerment, inside and outside the communities of believers.

Masks, Coronavirus, and Religion: A Study into the Relationship Between Compulsory Mask Ordinances and Religious Tradition in the USA during the First Wave of the Coronavirus Pandemic

Bartholomew Alexander Konechni

Sciences Po Paris, France

During the coronavirus pandemic one of the hardest questions to answer has been; why did some authorities decide to adopt stringent measures to prevent the spread of coronavirus whilst others seemingly did nothing? Focusing on the question of compulsory mask ordinances in the United States (during the first wave of the pandemic), this paper will propose that part of the answer (at least within the United States) lies in the religious tradition of communities.

Drawing on data from the U.S. Religion Census: Religious Congregations and Membership Study, 2010 (Grammich et al 2018), American Community Survey 2019, the US Census Bureau and the Federal Election Commission this paper will draw three conclusions about the relationship between the decision, on the part of state and county governments, to adopt compulsory mask ordinances and religious tradition. Firstly, there's a clear association between a state or county having a larger Catholic population and adopting a compulsory mask ordinance, whilst the reverse is true for having a larger Protestant population. Secondly, this Protest-Catholic divide around the adoption of compulsory mask ordinances can be explained through a historic Christian Nationalist-Civic Republican dichotomy (Bellah 1975, Gorski 2017, Perry et al 2020, Baker et al 2020) which intertwines the religious and political traditions of the United States. Thirdly, that alternative explanations, premised on notions of functional differences between Protestantism and Catholicism (Durkheim 2002 [1897], Putnam 2000), or demographic differences between Protestant-dominated and Catholic-dominated communities (Byun et al 2012, Florida & King 2019, Hertz & Silva 2020), fail to explain this association when examined against empirical evidence.

Symbolic Struggles over Communion in Serbia During the Pandemic

Miloš Jovanović[1], Jelena Dinić[2]

[1]University of Niš, Faculty of Philosophy; [2]University of Niš, Faculty of Mechanical Engineering

In contemporary Serbian society, Orthodox Christian culture is imposed as the most legitimate one. Merging with certain political aspects, it presents as an evident resource of symbolic conflicts, usually leading to the reproduction of existent power relations.

Receiving Holy Communion (implying the use of the same spoon for consummation and disregard of physical distance) during lockdown enacted due to COVID-19 pandemic, spawned intensive and highly polarised reactions. Emerged debates vividly portray the aforementioned symbolic struggles. Particularly interesting are state institutions reactions tolerating religious gatherings despite ongoing Government epidemic prevention measures, confirming the hegemonic status of the dominant religious denomination.

In this paper we will analyse data collected through web scraping techniques. However, knowing that statistical analyses of textual data, although having the potential to ascertain valued insights, often struggle with linguistic concepts and context (Müller et al. 2016) traditional data analysis will also be used. Focusing on the news web portals, including on-line comments, as well as Facebook and Twitter posts and quarrels, we attempt to identify and typologize narratives and arguments that are used for legitimising one's own cultural, i.e. (anti-)religious position regarding the participation in the Eucharist and thus violating the enforced health protection regulations. Two opposed and highly polarised blocks were observed, filled with mutual accusations – of ignorance, disrespect, primitivism, blasphemy, backwardness, servile submission – and ensuing ridicule, permeated by moral resentment. These disputes were permeated with the questions of "good" or "righteous" life, especially of what and whose (non-)religious culture should be the dominant one.

Key Words: Symbolic struggles, Serbia, Holy communion, Dominant culture, COVID-19

1108

RN34_T03_02 | Individual Religious Trajectories

Miracle, Mission And The Role Of Church In The Narratives About Individual Religious Path By Former Non-Believers In Post-Soviet Space

Kristina Šliavaitė

Lithuanian Centre for Social Sciences, Lithuania

The paper focuses on the ways research participants who were born and grew up during Soviet period in the Soviet Union narrate about their experience of religious awakening. During Soviet period in the Soviet Union the ideology of atheism was propagated and many people were not able to practice their religion openly or considered themselves as atheists. The paper focuses on the narratives of those who described themselves as non-believers or atheists during Soviet period and refer to certain event or experience which transformed them as human beings and made them part of some religious (Catholic or Russian Orthodox) community. The paper is interested in the ways their stories are constructed and how former (non-believer's or atheist's) and new (church member's) identities and worldviews are seen as interrelated. The paper discusses how we should approach these narratives from sociological or anthropological perspective and what these narratives on personal religious experience in early post-Socialism reveal of broader societal transformations and stability as well as the role of religion during the period of structural changes. The empirical data is interpreted by applying concepts and theoretical perspectives from the theories on collective identities, rituals and post-Socialist transformations. The empirical data is collected in 2019-2020 in the main urban cities of Lithuania among Polish Catholic and Russian Orthodox communities in the framework of collective research project funded by the Research Council of Lithuania (LMTLT), agreement No. S-LIP-19-60.

Muslim Women Entrepreneurs in the Russian Context

Guzel Sabirova

Sorbonne University, France

This paper examines the current entrepreneurial practices of Muslim women in Russia in the sphere of the production of Islamic goods and services (often labeled as halal). Women's Islamic entrepreneurship has been developing since the early 2000s and by today a certain business niche has already formed. The sphere of women's Islamic entrepreneurship covers various business areas. Women open their own business , become economically successful, which forms the new image of Muslim women. One way or another, similar issues are touched upon by researchers of women's Islamic entrepreneurship in different regions of the world. This paper focuses on specifics of the Russian context and on discursive strategies to justify the opportunity / need for business activity, presented in social media (Muslim women blogs, psychological and business trainings and women's communities). Special emphasis will be placed on the following issues: (1) religious (counter) arguments for understanding the "destiny" (prednaznachenie) of women in Islam; (2) the concept of a "modern Muslim woman" as a framework for business promotion and self-development; (3) visual representations of a successful "modern Muslim woman" in social media. The empirical basis of the paper includes materials from the Russian Muslim business blogs, Muslim women bloggers. Analysis of the data shows how a clash, discussion, promotion of different ideas about a Muslim woman (including her business activity) occurs in the Russian Muslim blogosphere. This is becoming the field of knowledge exchange and production.

Spiritual Seekings in Turkey

Kurtulus Cengiz

Ankara University, Turkey

Based on the findings of a wide-scale research project called "Spiritual Seekings in Turkey" which has financially supported by The Turkish Technological and Research Council (TUBITAK); the aim of this presentation is to shed light on the increasing spiritual search and associated new religious movements in Turkey. The research, conducted between 2018 and 2020, tries to understand and explain the dynamics of these new spiritual forms and practices in the light of the Turkish religious context.

1109

The presentation will discuss the findings of 72 in-depth interviews made in six different cities of Turkey: Ankara, İstanbul, İzmir, Konya, Muğla and Çanakkale with individuals who are personally involved in such forms of seeking for at least three years. The project team interviewed six men and six women in each city via snowball technique and reached to different individuals who experience spiritual seeking with its various ways such as meditation, yoga, reiki, numerology, healing, astrology, regression therapy etc. With additional 12 unexpected interviews with some outstanding figures, the number of informants increased to 84.

The main question addressed by this research deals with the ways in which such increasingly visible forms of spiritual seeking relate to and interact with official or heterodox Islamic beliefs, practices, and attitudes. Therefore, the research also tries to assess the extent to which such spiritual experiences within a Muslim majority society differ from those found in the West.

"Religion Helped Me Get Through All This; I Had Only God to Support Me": Religious Reflexivity among Syrians in Germany

Irene Tuzi[1,2]

[1]Humboldt University, Germany; [2]Sapienza University, Italy

This study investigates how Syrian families displaced in Germany used religion as a reflexive element to come to terms with displacement. Findings show that in forced migration, religion can be used to deal with different aspects of the new social environment, to maintain continuity with the past, or to respond to frustrating new settings. As faith is part of the complexity of identity, it can compensate for the loss of other dimensions of identity that can occur in displacement. Religion can become a mechanism to cope with stressful events and help people restore a sense of wellbeing. Participants in this study used religion to renegotiate individual identities when collective structures were unsettled. They engaged in new religious practices or consolidated their religious beliefs to maintain continuity with the past and to cope with life in displacement. Some people used religion to reconstruct their social after self the separation from their beloved ones, some others to cope with the life-changing experiences of displacement. In this sense, "religious reflexivity" is a contemplative and deliberative problem-solving practice and a form of self-formation, self-promotion, and legitimisation for new forms of self-construction. However, in other circumstances, religious reflexivity can be imposed as a form of "power over". This study, based on doctoral fieldwork conducted in Germany between 2018 and 2019, was carried out through participant observation and over 50 semi-structured interviews with Syrian families displaced in Germany.

RN34_T04_01 | Religious Organisations, Social Work and Community

Providing For The Needy: The Role of Immigrant Religious Communities as Welfare Providers in Italy

Samuele Davide Molli[1], Maurizio Ambrosini[2]

[1]Catholic University of Milan, Italy; [2]University of Milan

1110

The Italian religious panorama has significantly changed in recent decades, principally because of migration flows. In the course of time, religious communities have become key landmarks for immigrants, where new forms of activism are emerging, mostly in terms of solidarity. The proposal advances indeed the concept of "welfare from below" as analytical tool to capture and elaborate on the self-produced set of services, practices and acts of help.

Methodologically the proposal builds upon a mix methods study on Lombardy. Firstly, it aimed at providing an original dataset on the new pluralism. Secondly, the research moved to collect semi-structured interviews within communities surveyed, where the forms of supports were a central empirical topic.

We initially provide a theoretical overview on the intersections between religion, welfare and immigration. We then present and discuss a typology elaborated by considering four key markers correlated to the ways in which religious communities we examined operate as welfare providers, namely: a formal or informal provision, the complexity of services offered, the inclusiveness compared to users and the partnerships through which helps can be provided. We thus detail the three main emerging ways of doing welfare: mutualism, mission and coalition.

We conclude by showing implications. Firstly, these forms of civic engagement represent key inclusion processes. Through their religions, immigrants have created spaces and practices of "social citizenship" in times of political exclusion. Secondly, this welfare role has increasingly become pivotal against the critical disadvantages deriving from the current epidemic, contributing significantly to immigrants' capacity of resilience

Inclusive and Included? Practices of Civic Inclusivity of American Muslims in Los Angeles

Valentina Cantori

University Of Southern California, United States of America

How do American Muslims practice inclusivity and bridge religious differences in U.S. civic life? Sociological research on bridging focuses mostly on bridging efforts on the part of majority groups, leaving unanswered the timely question of if and how inclusivity is practiced by minority groups, particularly religious minorities, in U.S. civic spaces. Drawing on participant observation among two Muslim groups in Los Angeles, this paper identifies two practices of inclusivity that participants adopt to bridge religious difference: the Interreligious heritage practice and the Shared ethics practice. Both practices simultaneously draw and diffuse group boundaries, emphasize sameness, albeit using different sets of religious meanings, and are grounded in an understanding of civic spaces as implicitly exclusionary of minorities. I find that these practices can create tension points in the pursuit of mutual understanding and create textures of meanings that operate differently depending on the situation and the participants in the interaction.

Religious Social Work In Contemporary Russia: Independent Development And Adaptation Of International Experience

Irina Petrova, Zaretkhan Saralieva

Lobachevsky University, Russian Federation

The decentralisation of social work in Russia is developing following similar processes in Europe and US. Religious social services are becoming a significant force in the social services market (Becker T., 2005; Cnaan R.A., 2002).

Religious associations in the offer of social services inherit the features of religious social service and non-state social work - flexibility, targeting, weak bureaucracy. At the same time, systematically organized, it adopts traditional gender mode, and reinforces the dual subordination of both social service worker and client - professional and spiritual.

Professionalization according to the 'top-down' scenario (the Russian Orthodox Church) demonstrates the systemic capacity of the all-Russian religious association to force the development of a new profession. Initiative projects by smaller faith-based organizations have led to the emergence of a professionalization scenario "from below.

Modern religious social work in Russia aims a dual system of education - theological and social - as it is in many colleges and universities in Europe and the US.

The authors conducted sociological researchs between 2008 and 2020 including the content analysis of the author's in-depth interviews and web-based interviews with leaders and staff of religiously-oriented social services in Russia, Germany, the UK and the former Soviet Union (N=100) (in Russian, English and German).

Based on the results of the authors' researchs, the category "social work of religious organizations" was introduced into Russian sociology for the first time and a periodization of its development in contemporary Russia was presented. The concept of religiously sensitive social work as the provision to religiously oriented beneficiaries in secular social institutions was adapted (Canda E.R., Furman L.D., 2010).

1111

RN34_T04_02 | The Legal and Political Struggles of Religious Groups

Religion, Social Conflicts And Human Rights

Sinisa Zrinscak

University of Zagreb, Croatia

February 2020 Croatian Constitutional Court ruling that denying the right to adopt children to same-sex officially registered partners is unconstitutional triggered the vast criticism by various conservative groups. One of the main arguments against is that the Court underplayed the right of a child to healthy life. Religion was, however, behind the argument as the right of a child to healthy life has been interpreted as the right to have a "normal" family, based on Christian values. The reference to various human rights and specifically to religious rights is one of the main strategies increasingly used by conservative groups in public debates.

The main aim of this paper is to frame this and similar cases in the context of sociology of human rights. The theoretical context is the development of sociology of human rights and sociology of religious freedom which complement tradition of studying Church-state relations, the position of religious minorities, the role of judiciary, and studies of religious discrimination. However, while embracing both normatively and empirically the human rights approach, sociology of religious freedom enters the slippery terrain of conflicting right claims and of very different usage of various rights by different social groups. In addition, it enters the slippery terrain of politicization of religion, not only epitomized by recent populist use of religion. The question is how to solve this puzzle having in mind the importance of the reference to human rights, in particular for minority religions.

"From the Theology of Prosperity to National-Evangelicalism: Courts Conquest as politics for Evangelical Churches in Guatemala

Thierry Maire

Centre Maurice Halbwachs (ENS-EHESS-CNRS, UMR 8097) Paris, France

In the 90's, the dominant heuristic for the rise of evangelical churches in Latin America, Guatemala being no exception, was that the Theology of Prosperity attracted more believers, partly due to its ideological alignment with both neoliberalism and liberal democracy. During that time some Politicians made use of a religion discourse to attract voters. From the 2000's onward, a triple change has been undergoing. First, some Evangelical Churches have decided to pay back the interest and to enter the political field. Second, the topics moved from anticomunism to culture wars, as anti-LGBT and anti-abortion stances picked up in the speech frame. By doing so, they embraced the same value pattern as their United States counterparts, creating a kind of 'national-evangelicalism'. Third, the political arena being negatively perceived, because of wide-spread corruption and past poor electoral results for 'religious' parties or candidates, a new strategy emerged : to conquer the judiciary. The reform that took place in 2009, regarding the postulation commissions to high offices in Courts, including the Supreme Court of Justice, allowed many powerful evangelical congregations to seize the opportunity to present, support, or negotiate their support to, candidates who would pay close attention to how laws should reflect their core -biblical- values. This was possible thanks to prior opening of law departments in evangelical-owned universities. This presentation is based on my PhD research, field studies and interviews for the past 5 years, as well as using prime and secondary sources. My main theoretical frame lies with legal consciouness studies and the sociology of religion, social psychology and media analysis.

1112

The role of the Catholic and Evangelical churches in the Nicaraguan crisis between 2018-2020

Álvaro Augusto Espinoza Rizo

Bielefeld University, University of Groningen

In 2007 the Sandinist Front took back the power in Nicaragua after 16 years of neo-liberal governments. This new period of Daniel Ortega´s government is characterized by a very close relationship with the evangelical churches. This relationship gave legitimacy from the evangelical churches to government projects. In the same period, the Catholic Church has positioned itself as a critical towards the government.

Since April 2018, a series of protests against Ortega´s government, unleashed intense repression by the government on opposition groups. In this situation, religious groups did not escape from the conflict and were forced to take a position. The Catholic Church openly protected the protesters against the government and has served as a mediator and witness in the dialogues to end the political and social crisis in Nicaragua. On the other hand, evangelical churches are divided. They have distanced themselves from political power, losing legitimacy and credibility among the population.

This presentation is based on the results of fieldwork conducted in Nicaragua in 2020. It is the primary goal of this presentation to show my analysis of how religious groups, mainly the Catholic Church and some Evangelical Churches, have been crucial to the defense of human rights and how they will be key actors in the process of reconciliation and "return to peace" between the State and the population.

Turning Spirituality into Public Event: Collective Meditations, Social Movements and Holistic Spirituality

Victor Albert Blanco[1], Maria del Mar Griera Llonch[1], Anna Clot[2]

[1]Universitat Autònoma de Barcelona, Spain; [2]University of Barcelona

Dynamic and vibrant forms of urban religion have gained resonance all around Europe in recent times (Knibbe 2009). Although most academic literature has emphasised the increasing visibility of religious minorities and historical churches in the public sphere, it is relevant to outline the emergence, spread and popularisation of "urban spiritual events". Drawing on an empirical research in Barcelona, we aim to sociologically address the singularity of these events and unravel their significance for broader understandings of contemporary forms of urban religion along three different lines: the public and collective character of these events, the importance of the spatial and embodied dimensions and the affinities of these urban spiritual events with new social movements aimed to decelerate society (Rosa, 2013). The main argument is that the singularity of these holistic spiritual events emerge from their hybrid nature that combines repertoires from three different sub-cultures (social movements, urban popular culture and holistic spirituality). They are creative assemblages that blend together languages coming from these different milieus and, thus, generate new spatial practices that contribute to transform contemporary cities.

RN34_T05 | Religion and Gender

Gender, Women and Sexuality in the Discourse of Islamist Women Intellectuals in 2000s Turkey: A Contestation to Secularism

Aysun Güneş Durmuş

Middle East Technical University, Turkey

Drawing on the discourse of Islamist women intellectuals at their column writings on gender, women and sexuality in 2000s Turkey, this conceptual paper will try to deal with a dilemma, which I believe, is inherent to the ongoing historical contestation between the secular character of Turkish Republic and, correspondingly, formation of the Islamist political parties' discursive ground. By saying dilemma, I refer to one of the establishing pillars of Turkey's Islamist oppositional tradition.

This pillar can be interpreted as one of the parts of the formation process of Islamist discourse composing its constitutive elements based on secular institutions, besides having its distinctive arguments. Islamists' enrollment into secular educational, political and legal institutions enable them to have the capacity to produce their own discursive positioning against secularism.

One of the domains on which we can touch on this inquiry is embodied in the discourse of Islamist women intellectuals on gender, women and sexuality in 2000s Turkey. Why Islamist women intellectuals maintain a stance against secularism while their participation into political and intellectual space of Turkey is the result of this secular institutions is an inquiry that's worth studying. This inquiry will be a contribution to the literature on the question of hypocrisy emerging within the scope of the problems defined in studying women in Muslim countries and will open a new room to discuss ways of reproducing patriarchal knowledge.

Religion and Gender in Contemporary Greece: A Sexuality Discourse

Niki Papageorgiou[1], Chara Karagiannopoulou[2]

[1]Aristotle University of Thessaloniki, Greece; [2]Panteion University, Greece

In 2015, amid a financial crisis and flourishing populism, Greece came to discuss the recognition of same-sex marriage and the right of LGBTQ2 to enter into a cohabitation agreement. The heated political debate about same-sex civil partnership raised multiple questions regarding the intersection of gender and religion. This paper moves beyond biological determination, understands sexuality as involving power dynamics, and being political and thinks on the realm of sexual politics. Its aim is to trace the interplay among gender and religion in the Greek context by deconstructing and analysing, with the use of documentary analysis, the sexuality discourse within the civil partnership debate that took place at that time. To this end, the official discourse of the Greek Orthodox Church will be analysed with the aim to answer the following research questions:

a) Who qualifies as a subject of recognition and who remains unrecognizable regarding civil rights?

b) How does Greek Orthodox Church construct its sexuality discourse as legitimate?

c) What is the ideal family model proposed and the normatively accepted gendered roles according to the Greek Orthodox Church?

d) To what extend does Greek Orthodox Church succeed in instrumentalizing religion in its discourse regarding gender issues?

The field research will be Greek Orthodox Church's documents, such as Encyclical Letters, Messages to the people, Decisions of the Holy Synod of Greek Orthodox Church, etc.

.

Religious communities standing against Second-Order Sexual Harassment

Lena De Botton[1], Roger Campdepadrós[2], Ana Burgués[3]

[1]Universitat de Barcelona, Spain; [2]Universitat de Girona, Spain; [3]Universidad de Granada, Spain

As the scientific literature review shows us, last years have witnessed how different religious communities and individuals have broken the silence against sexual abuses and sexual harassment committed by some elements within their community, usually from representative or responsible positions. Against the odds and conservative and reluctant authorities, current religious communities are increasingly rejecting these misconducts, asking their representatives to elucidate these incidents, conducting support actions towards the victims, and turning themselves in safe spaces that evict violence. As scientific evidence highlights, building safe religious spaces is a clue to overcome and prevent sexual abuse. Thus, there is also a need to protect those individuals that support the victims or research this field because they usually suffer the so-called Second-Order Sexual Harassment (SOSH), which definition is the physical or psychological violence, retaliation, humiliation or persecution against those individuals that support the victims of violence. For the first time in legislation on gender-based violence, the concept appears in the modification of the Catalan law 05/2008. It is a pioneering law that will protect those who receive attacks because of standing against sexual harassment and abuses and favouring the victims. We will expose the incipient research on the field we have reviewed.

key words: second-order sexual harassment, violence against women, upstander, religious communities, equality policy

Feminized but Not Feminist. The Case of Priestesses of the Catholic Mariavite Church in Poland.

Aleksandra Herman

University of Warsaw, Poland

There is a Church in Poland that calls itself catholic, and in which women have been serving as priests and bishops for almost 100 years. The spiritual beginning of the Catholic Mariavite Church is marked by revelations to a nun Franciszka Kozłowska (1893), whereas her excommunication by the Pope (1906) resulted in institutionalization of disobedience in the form of alternative church. The mariavite church is a legal consequence of excommunication, and Kozłowska, the first woman cursed by name by Vatican, became the antagonist of Pope's patriarchal rule. However, it was only her successor who introduced the possibility of ordaining women as priests in 1929.

In my paper I will refer to contemporary state of the Church on the basis of field research carried out in 2020. In a few recent years the clergy has been limited to priestesses because of the aging, and the Church itself is in decline due to local range and lack of replacement of generations in the rural environment. Although the fact that women priests serve in their parishes seems to be obvious to the faithful, the knowledge of about the history of the formation of their Church is not very deep today. Simultaneously the feminization of the Church had never been a trigger to the priestesses' emancipation because they were under constant domination of the male-centered Church's structure.

RN34_T06 | Religion and "Othering" Processes

Pedagogy of Beit Midrash for Promoting Perceptions of 'Others'

Doly Levi-Eliyahu, Galia Semo

Levinsky college of education, Israel

The term 'other' means the ability to be distinguished from the familiar, the accepted and the known in terms of: age, ethnicity, gender, race, sexual orientation etc. The educational institutions in Israel, as in other places around the world, are becoming more diverse, and the challenges of inclusion and integration are becoming more significant. Teachers are required to find ways to design environments based on solidarity, democracy and equality between groups in society. One way to cope is to study in pairs, 'chavruta' in a beit midrash (house of study) at school.

The study is qualitative-interpretive, based on interviews with 13 Bible teachers. Its purpose is to examine perceptions and actions of Bible teachers who have established and operated a beit midrash based on humanistic education and promoted a positive attitude toward the 'other'. The Beit Midrash is a non-classroom learning environment, which encourages critical thinking and awareness to social diversity. The discourse in the beit midrash revolves around questions of identity, belonging and emotions that are typical of adolescence.

The beit midrash is not only a place but also a method. Students are given the opportunity to look at all the participants in the discussion from an equal point of view, which reduces the possibility of underestimating the value of opinions that arise in the discussion. In this way, the participants of the Beit Midrash reveal the similarities between them and the 'other' in various aspects, and a positive attitude develops towards the 'other'.

Deckel, A. (2017). Crossroads: Beit midrash study as a mechanism for development of personal identity in work group. Mikbatz: The Israel Journal of Group Psychotherapy, 35-48.

University Students' Judgements about Ingroup and Outgroup Children's Rights in Spain, Italy, and the UK

Silvia Miele[1], Patrice Rusconi[1], Harriet Tenenbaum[1], Cherie Cheung[1], Francesca Trevisan[1], Isabel Maria Ortega Flores[2]

[1]University of Surrey; [2]University of Almeria

This study investigated university students' endorsement of rights of child minorities. A total of 353 participants (M = 26.52, SD = 9.87) enrolled in Spanish, Italian and UK universities completed a survey containing six vignettes involving either Christian, Muslim or vegan children's self-determination and nurturance religious rights. Frequency and quality of contact with the target group the respondents had been asked about were also measured. We conducted a 2 (Type of Right: Nurturance, Self-determination) x 3 (Country: UK, Italy, Spain) x 3 Condition (Muslim, Christian, vegan) mixed-design ANCOVA model. Type of Right served as a within-subjects variable and country and condition were between-subjects variables, after controlling for quality of contact as a covariate. Self-determination rights were more likely to be endorsed than nurturance rights. A significant interaction was found between the Type of Right (nurturance vs. self-determination) endorsed, condition (Muslim, Christian, vegan) and country (Italy, Spain, UK). The covariate quality of contact was significantly related to Type of Right. The implications for future research about religious rights are discussed.

1116

Categorization of (Im)purity by State Islam in Turkey: Gender Discrimination in Orthodox Islamic Discourse

Figen Uzar Özdemir, Atilla Barutçu

Zonguldak Bülent Ecevit University, Turkey

This study aims to explore how the Islamic catechism (ilmihal) prepared by the Directorate of Religious Affairs (DRA), Turkish state's religious apparatus representing orthodox Islam, categorizes purity/impurity of bodily substances such as blood, urine, excrement etc. This categorization acts as a source of information on pious people's suitability for religious and social participation. In a paper presentation in 2015, we demonstrated that Muslim women are religiously and socially excluded based on a categorization of women's blood as dirt made by the ilmihal of the DRA. With this actual study, we aim to include categorizations of purity/impurity regarding both sexes' bodily conditions: the constant flow of urine and excrement due to certain diseases like ostomy. By this way, we try to explore whether women's biological conditions are treated and categorized differently than other biological conditions during which bodily substances, usually regarded as dirt, flow out of the body. After analyzing the ilmihal on the categorizations of pure/impure bodily substances and other booklets of fatwa regarding the conditions of people with ostomy, we found out that the constant flow of urine and excrement from the bodies of people with ostomy is categorized as özür- meaning both defect and excuse-hence no hindrance to the performance of Islamic rituals. On the other hand, the menstrual and post-natal bleeding of women is categorized as impure and as an obstacle to the performance of religious rituals. This finding shows that production of religious knowledge and discourse involves discriminatory approach towards women's social and religious status.

Principles and Conditions that Make the Dialogue to Allow Interreligious Dialogue Groups to Produce Human Agency

Ana Burgués[1], Roger Campdepadrós[2]

[1]Universidad de Granada, Spain; [2]Universitat de Girona, Spain

Evidence shows that interreligious dialogue can be one of the pathways to building bridges among diverse cultural and religious communities that otherwise would confront conflict. Some literature reflects from a normative standpoint on how the features of interreligious dialogue should be to be authentic and meaningful. However, there is scarce literature on what conditions make this dialogue fruitful, producing mutual understanding, reducing prejudices, gaining human agency, and the like. This communication contributes to the existing literature with theoretical and empirical evidence of how dialogic interreligious dialogue gives birth to both human agency and personal and social transformations. Thus, our goal was to delve into these conditions and provide evidence on how those interreligious dialogue groups, by placing great importance on a particular type of dialogue give birth human agency. To achieve this endeavour, we have analysed the activity of several interreligious dialogue groups, and we have documented the human agency they generate and gathered evidence about the features of these conditions. We have studied four interreligious dialogue groups affiliated to the UNESCO Association for Interreligious Dialogue (AUDIR), employing in-depth interviews and discussion groups. These groups operate in diverse and multicultural neighbourhoods where local actors and neighbours hold dialogues about each own religion. In so doing, social coexistence, friendship ties, and advocacy initiatives arise. After analysing the data collected, we conclude that for the interreligious dialogue to give positive and promising fruits, it must meet some principles of dialogic learning, namely, equality of differences, egalitarian dialogue, cultural intelligence, solidarity, and transformation.

RN34_T07 | Negotiating Religion in Policy Making

A Comparative Analysis of the Discussions on Muslim Women's Headscarf in Turkey and Europe

H. Şule Albayrak

Marmara University, Turkey

Muslim women's headscarf is commonly interpreted in two ways: as a symbol of Islamic faith and expression of personal piety or as a symbol of patriarchal oppression, enmity against modernism and secular state. Recent public debates on Islam and headscarf in Western countries give remarkable examples of those diverse arguments and the discussions recall Turkish experience in the last three decades.

Public debates on headscarf constitute a symbolic issue in Turkey since 1980s. It has been perceived as an expression of Islamic faith and personal piety for common people whereas wearing headscarf has been evaluated by secularist elites (politicians, intellectuals and army members) as a symbol of being reactionary and a sign of objection to modernist principals of Turkish republic. Therefore, headscarf ban implemented at schools, universities, even in hospitals for decades and this issue became one of the most contentious problems until 2010s, when the ban was lifted. However, perceptions are still alive.

This paper aims to analyze public debates on Muslim women's headscarf and questions the commonalities and differences of headscarf discussions in Turkey and Western Europe. For this purpose, I will refer to the theoretical discussions on modernity, secularism and laicism. Moreover, I will specifically discuss and apply discourse analysis on various perspectives on headscarf debate in Turkey and Western Europe.

Religious diversity and public participation. Local forums in Spain

Gorka Urrutia Asua

University of Deusto, Spain

Spain has been exposed during the last decades to a qualitative change in its socio-religious composition, evolving from a mainly catholic country to a more diverse one, equating to other European societies. Several elements have contributed in this direction, starting with the political change occurred in the late 70's with the opening to a democracy and the recognition of human rights as the freedom of thought, conscience and religion. Since then, first with the implantation of other religions (different to Catholicism) and secondly with the increase of religions and their members, the landscape has been slightly modified. This new landscape has influenced social debate on how religious diversity should be tackled by public institutions, specially at subnational level. Some public entities have implemented mechanisms of participation for religious representative through the creation of local forums and other type of activities. Taking into consideration the newness of such initiatives, this paper aims to reflect on the potentiality and limitations of this kind of participation, comparing experiences in other European countries with some initiatives of this kind in Spain.

1118

Responding to Brexit: A Study of Churches on the Island of Ireland

Gladys Ganiel

Queen's University Belfast, United Kingdom

This paper analyses how national-level church organisations in Ireland are responding to Brexit, an issue that has far-reaching consequences for relationships on the island of Ireland; and between the Republic of Ireland and the UK. It outlines changes in religious and political identification on the island (both the Republic and Northern Ireland) since 1998, the year of the Good Friday peace agreement. It explores how both religious and political identifications, such as Catholic nationalist and Protestant unionist in Northern Ireland, have loosened. In particular, church attendance has declined and there has been an increase in those identifying as 'neither' rather than nationalist or unionist. But Brexit has been a

shock to relationships and identities, increasing the risk for re-polarisation, especially in Northern Ireland. In that light, the paper analyses how the churches have responded to Brexit, profiling the work of the island's main national-level ecumenical organisations, the Irish Council of Churches and the Irish Inter Church Meeting. Drawing on publicly available documents and interviews with staff and clergy involved in these organisations, it analyses how the churches have presented a united front on Brexit, shifting focus to the risks of polarisation and the potential damage to the common good. The responses to Brexit are set in a wider context in which there has been unprecedented levels of inter-church cooperation on issues related to the Covid-19 pandemic. It argues that national level, inter-church cooperation has been more frequent and united during the pandemic than at any other time in Irish church history. At the same time, the churches' responses may have less impact due to increasing secularisation and declining social and political influence.

Shamans, Bureaucrats and Their Cosmologies: Grid Group Model for Local Religious Organisations in Buryatia and the Irkutsk Region

Maria Volkova

The Russian Presidential Academy of National Economy and Public Administration, The Moscow School of Social and Economic Sciences, Russian Federation

This paper addresses interaction between bureaucratic optics and cosmology of shamanistic organizations. Over the past 17 years, shamans have been uniting into local religious organizations and registering them formally with the state in Buryatia and in the Irkutsk region of Russia. This process transformed the role and the very meaning of shamanism, which became an official religion. Differences between shamanistic organizations create controversies both within the shamans as a group and between the shamans and the state. The first one is related to local differences in cosmologies. When shamanistic organizations tried to unite and create a common organizing system similar to the Russian Orthodox Church, they failed due to the wide differences in beliefs and ritual practices. The second controversy is a result of the Russian Ministry of Justice's attempt to fit shamanism into a framework of bureaucratic distinction between religion and non-religion. Some of the organizations transformed themselves to better fit the

bureaucratic definition of religion, while others, on the contrary, resisted this definition. I build on Mary Douglas's grid-group model. I argue that reaction of organization to bureaucratic definition depends on which type an organization belongs to on the group-grid axis. Where high grid-high group organizations try to fit into bureaucratic definition, high group-low grid organizations try to modify bureaucratic definition. This creates an interactive loop between bureaucratic classification and inner classifications assumed by organizations. Drawing on 40 interviews with representatives of 10 shaman organizations and participant observation carried out in Buryatia and the Irkutsk region of Russia in December 2019-January 2020, I explore the issue of how this interactive loop is occurring and functioning.

RN34_T08 | Studying Religion: Concepts and Methodologies

Uncertain Faith. A quanti-qualitative research in Italy

Roberto Cipriani

Roma tre University, Italy

After twenty-five years from the research on La religiosità in Italia (Religiosity in Italy) by Vincenzo Cesareo, Roberto Cipriani, Franco Garelli, Clemente Lanzetti and Gianfranco Rovati (Mondadori, Milan, 1995), this new survey presents a relevant novelty: the approach was not only quantitative (through the administration of a questionnaire to a statistically representative sample of the entire Italian population, made up of 3238 interviewees, as Franco Garelli reports in his Gente di poca fede. Il sentimento religioso nell'Italia incerta di Dio (The religious sentiment in an Italy uncertain of God, il Mulino, Bologna, 2020), but it also had a qualitative character, through completely free or semi-guided interviews with a set of 164 subjects, appropriately chosen on the national territory (following criteria not far from the overall demographic picture). The result is a very varied and intriguing scenario that attests to the persistence of forms of belief and ritual, but also opens up problematic perspectives on the future of faith. The themes of daily and festive life, happiness and sorrow, life and death, the representation of God, prayer, the

1119

religious institution and Pope Francis are examined in particular.

Facing the Ultimate Questions in a Secular Society: a Discourse Analysis of Public Communication of Science

Benedetta Nicoli

Università Cattolica del Sacro Cuore

According to current religious studies, secularization does not produce a disappearance of religion; rather it entails a differentiation and multiplication of religious forms. Within this new religious pluralism, the concern for ultimate questions still arises also outside the religious traditional institutions. The present research investigates these religious changes by focusing on the emerging of ultimate questions in public communication of science (PCS), a context of great social relevance presumed to be among the most secularized. The research employs a discourse analysis of PCS monographs regarding the gene and the brain to reconstruct if and how scientists who are authors of PCS discuss ultimate questions. The analysis pays particular attention to the interaction between the scientific language and the religious language that occurs when authors debate these specific topics. Results show that a significant part of PCS promotes an "expanded view" on ultimate questions, trying to reconcile scientific and religious contents. These findings also provide new insight into religious and spiritual beliefs among scientists, which prove to be in line with the general trends of contemporary society, and suggest new methodological and theoretical paths of investigation as regards the relationship between science and religion.

Religion in "Cosmopolitan Communities of Risk": On Power, Moral Cosmopolitanism and the Responsibility to Protect

Chrysa K. Almpani

Social Research Centre for Religion and Culture, Aristotle University of Thessaloniki, Greece

Ulrich Beck's sociological theory outlined that in a world where the social experience is inextricably linked to the concepts of manufactured uncertainty and ontological insecurity, the awareness of the global risk cultivates to some extent the realization that all people commonly share the worldwide risks and opportunities, without time-bound constraints. This ever-growing awareness, along with the constant interchange between the local and the global perspective, is leading to the development of "imagined cosmopolitan risk communities".

As the old certainties of modern society are falling away and our connection with the grand collective narratives of the past is weakening, all human institutions (religions included) are in the midst of a great social transformation that Beck named as the 'metamorphosis of the world' (Beck 2016; Tsironis & Almpani 2020). This on-going transformation has introduced new spaces and frameworks for acting and reflecting on the global risks, and politics is no longer subject to the same boundaries as before. At the same time, religious reference is still shaping borders within Europe and between Europe and 'the others'; it continues to influence political identities and policy-making, symbolism and international developments.

This paper discusses Ul. Beck's thesis on the political impact of religion in our contemporary world and the way this impact is re-negotiated in the context of world risk society. Reassessing the discourse on the global religion–politics dynamics, through the eyes of both political and religious representatives at the EU level, the doctoral study reflects on the concepts of power, moral cosmopolitanism and the responsibility to protect.

1120

The Social Meaning of Religious Experience on the Example of the Religiosity of Poles in the 21st Century

Stella Grotowska

AGH university of Science and Technology, Poland

The aim of the presentation is to analyse selected aspects of religious experience present in the media discourse in Poland. This issue seems interesting for at least two reasons. Firstly, the importance of religious experience grows with the sensation-seeking approach, common in contemporary culture. Secondly, although religious life in Polish society is subject to deinstitutionalisation, Poles see religion as an important element of their everyday lives.

The concept of experience in religious research seems promising as it puts together the dimensions of social reality, often separate, and goes beyond dualism of subjectivity and objectivity. The semantic field of experience includes contact with the actual world. Sensory experience precedes conceptual development, but does not necessarily induce it or determine its forms and results. Experience understood in this way is close to pragmatism and philosophy of life of Dilthey who sees experience as an individual and subjective event, albeit subject to expression, communication, and objectivity. Experience can also be reflected in testimony, i.e. in forms of transfer of possessed knowledge using linguistic or other means, e.g. by a particular way of behaviour or way of being. Religious experience includes religious beliefs and reference frameworks, commitment, and emotions. This perspective makes it possible to explore religious meanings in everyday life.

This raport is intended to identify distinctive patterns of the religious experience. It is based on the discourse analysis of selected Polish-language websites and desk research relevant for the issue. The discussion is limited to the dominant religion in Poland, i.e. Roman Catholicism.

RN34_T09 | Religion, Empowerment and Crisis

Identity and Transnational Space: The Case of Old Believers Youth in Latvia

Anita Stasulane

Daugavpils University, Latvia

This paper explores the transnational space and identity-constructing issues of the Old Believers young people in Latvia. Since the first of arrival of the Russian Old Believers in 1659, this ethnic and religious community has a significant role in Latvian society. This case is of particular interest in providing an in-depth insight into the intersection of ethnicity, nationality and religion, as the Old Believers are an ethnic and religious minority. Applying the concept of transnational space, this paper considers the role of religion played in the integration of identity among young people belonging to the Old Believer religious community: their self-understanding as a composition of intersecting identities that influence each other; the manifestations of the intersection of various identities; the relationship of identity integration to religion. The paper focuses on the research questions of how the Old Believers young people describe their ethnicity, nationality and belonging to Europe, how specifically these identities overlap with each other, how the multiplicity of identities impacts self-categorization of themselves as "European". The analysis is based on the findings of ethnographic research conducted in the Old Believer youth group in Daugavpils (Latvia) within a framework of the international project "Cultural Heritage and Identities of Europe's Future" (CHIEF), funded from the European Union's Horizon 2020 Research and Innovation Program under Grant Agreement No 770464.

1121

Religious Practices in Poland During the Covid-19 Pandemic. Between the Law and Social Reality

Łukasz Mateusz Skoczylas

Adam Mickiewicz University in Poznań, Poland

The purpose of the speech is to: 1) diagnose the methods of interpreting the legal rules related to religious practices during the Covid-19 pandemic in Poland. Opinions on the legitimacy and purposefulness of restrictions allow to check the degree of their acceptance and the methods of their social justification; 2) diagnose the changes in religious practices of Poles during the pandemic. An essential element of the study is implementing, breaking, or reinterpreting (circumventing) the restrictions. The innovative methods of adapting to new legal norms in the least burdensome way are particularly interesting here.

The speech will present results of the research, which consist of 1) 20 IDI with four categories of respondents (priests, monks/friars, journalists of religious media, and laypeople co-organizing religious practices); 2) analysis of the content of internet forums and articles in religious media; 3) internet survey. The respondents represent various religions (Christianity, Islam, and Hinduism) and denominations.

The research results show that the degree of acceptance of the restrictions is high. The narratives explaining this are particularly interesting. On the one hand, they talk about the close cooperation of Roman Catholic bishops with state authorities. On the other, they demonstrate the conviction that it is necessary to submit to restrictions to not give the impression to the public that believers are a privileged category. Fewer voices critical of regulations were constructed around the belief that religious practices are more important than e.g. cultural or sports events.

The Role of Religiosity and Spirituality in Attitudes Towards COVID-19 Pandemic Management

Márton Tamás Csanády[1,2], Fruzsina Mikó[2,3]

[1]Károli Gáspár University of the Reformed Church in Hungary, Hungary; [2]Budapest Metropolitan University; [3]Corvinus University of Budapest

With the spread of the COVID-19 pandemic and the appearance of the vaccine, denial and negative views of vaccination have also surfaced. In Central Europe, these negative views became especially popular (Ipsos, 2020): anti-vaccines have also become a significant group in Hungary (Bauer, 2021), although general vaccination in the country is prominently high. Clearly, rejection of the COVID-19 vaccine can identify a wider range of people than rejection of mandatory vaccinations. Doubts and mistrust, of course, not only against vaccinations but also against epidemic management can be identified in everyday discourse. Research data from other countries suggest an association between anti-vaccination and religious attitudes (Whitehead & Perry, 2020, Włodarska A., 2021). In August 2020 we conducted a nationwide online survey (N=1,000). The focus of the survey was on religion and the COVID-19 pandemic, but the questions included issues of institutional trust and satisfaction with the health care system, among others. The aim of the research was to explore whether there is a relationship between attitudes toward the COVID-19 pandemic and religiosity and spirituality. In our presentation we would like to highlight the role of religiosity, spirituality, and trust factors in pandemic-related behavior.

1122

Empowerment Through Religion: Catholic Religion As A Political Tool Of The Polish Party In Lithuania

Anna Ewa Pilarczyk-Palaitis

Vytautas Magnus University, Lithuania

Polish minority is the largest ethnic minority in contemporary Lithuania. It is also the best organized Polish community in the World, with numerous cultural organizations, but most of all with a political party, whose representatives are in local structures as well as in central government bodies, and even in the European Parliament. Polish ethnic party - Electoral Action of Poles in Lithuania - Christian Families Alliance (EAPL-CFA) is a significant political force in contemporary Lithuania. In the last years instead of typically Polish postulates (such as right to write surnames or place names in Polish), the postulates related to the Catholic worldview, e.g. postulate to introduce a complete ban on abortion in Lithuania, are put in the first place. In 2009, Polish municipalities approved a resolution to intronate Christ as the king of Vilnius and Šalčininkai districts. Also one of the most important museums in the Polish-dominated Vilnius district is the Priests' Museum. Catholic religion has become the main tool of empowerment of this political force. Catholicism is a fundamental component of politics of memory and identity politics in the regions ruled by this party, and religious references are an integral part of almost all of the party's political rituals.

Based on the results of a public discourse research and some empirical qualitative research, the article attempts to answer the question of how the Catholic religion is used to strengthen the political power of EAPL-CFA party in Lithuania and what tensions this generates, both within the Polish community in Lithuania, and between the Polish minority and the Lithuanian majority, but also between the Polish minority and the Lithuanian Catholic Church.

RN35_T01_01 | Anti-Migrant Politics and the Role of Migration Studies

New Imaginaries for Countering Welfare Bordering: A Case Study of Enforced Destitution and Debt in the UK's Family Migration Rules

Eve Dickson, Rachel Rosen

University College London, United Kingdom

In 2012, the 'no recourse to public funds' (NRPF) condition was extended to long-standing migrant families in the UK who had previously achieved rights to residence and welfare through human rights mechanisms. Through close examination of policy, political statements, and media coverage, we make the case that the NRPF extension was – and continues to be – intentionally subjugating and punitive, most aptly understood as a policy of enforced destitution and debt imposed on negatively-racialised post-colonial subjects. In drawing out the implications of our argument, we point to time, destitution, and debt as core technologies of the UK's migration regime, alongside everyday bordering, detention, and deportability. Denying support through NRPF serves to exclude putatively included migrants while normalising conditional approaches to social support. Our paper reveals why moral arguments against NRPF based on destitution fail. In response, we argue that challenging welfare bordering requires a more systemic appraisal of policy frames, intentions and effects, and the development of alternate imaginaries of solidarity and belonging.

Perceptions of Foreigners' Preferential Treatment and Their Relation with Anti-immigrant Attitudes: Evidence from Spain

Álvaro Mariscal de Gante, Sebastian Rinken

Institute for Advanced Social Studies (IESA-CSIC)

According to the theory of group-threat, economic downturns in the host society trigger negative attitudes towards immigration and immigrants due to perceived competition for scarce resources. While access to public services such as health care or education contributes to immigrants' successful integration into host societies, this may cause critical viewpoints to arise. The risk exists that natives perceive governments to unfairly favor immigrants – a remarkably common situation across Europe, as data from the ESS suggest – and extreme-right populist parties may take advantage of it.

This paper aims to explore the dilemma and contradictions of immigrants' access to social rights by focusing on the Spanish case, a traditionally welcoming society which was hit by an extraordinarily severe economic crisis. Subsequent austerity programs left the social protection system underfunded, and a populist right-wing party has recently emerged (Vox). However, in defiance of group-threat theory, no manifest wave of anti-immigrant sentiment has arisen in this unpromising context.

The paper draws on survey data and focus group results, both of which were generated in the framework of an ongoing research project on immigration attitudes (proj. ref. CSO2017-87364-R, financed by the European Fund for Regional Cohesion and the Spanish Ministry of Science). Firstly, the extent and nature of natives' perceptions of unfair treatment is illustrated. Then, we explore the role of such perceptions as predictor of unwelcoming immigration attitudes, or indeed anti-immigrant sentiment. Thirdly, we analyze the discourse emerging from such perceptions in focus groups deliberations. Finally, we formulate some evidence-based suggestions for policy-makers.

1124

Living Together in Times of 'Hospitality Crisis' and Pandemic: Local Perspectives on Migrant Inclusion in Two Polish Urban Localities

Agnieszka Trąbka, Dominika Blachnicka-Ciacek, Dominika Winogrodzka

SWPS University in Warsaw

The anti-refugee and xenophobic rhetoric of the right-wing government has not only incited anti-migration sentiments among large segments of the Polish society, but also severely slowed down the development of formal support and integration mechanisms available for migrants in Poland. Yet, despite the creation of 'hostile environment' a la polonaise, in recent years, Poland has become one of the biggest importers of migrant workers from outside of the EU (mainly Ukraine) using the quick path of the so called 'permit system' to promote the immigration.

In this paper, we adopt a local perspective to explore barriers and possibilities of settling in and 'establishing footholds' for these new migrants in local communities in Poland in the context of the top-down imposed 'hostile environment' and pandemic reality which increases the precarity of lives and livelihoods and a sense of social alienation. We purposefully leave the framework of 'integration' to look at the possibilities of recognition, encounter and inclusion as less rigid and ambitious, but perhaps more relevant and inclusive in theorizing the relationship between the migrants and their community neighbors in times of crisis. In doing so we draw from the ongoing fieldwork undertaken as part of Horizon 2020 MIMY project in which we conduct interviews with young migrants, stakeholders from migrant and refugee support groups (both formal and non-formal), as well as community members in two locations – Warsaw's working-class neighborhood of Praga and Pruszcz Gdański, a satellite-city of Gdańsk in Pomorze region.

Local Hostility Effect on Immigrants' Wellbeing: Does Population Composition in Neighbourhood and Neighbourhood Contact Matter?

Michaela Sedovic

London School of Economics and Political Science, United Kingdom

Current research suggests that contact of migrants with the native population can affects their wellbeing both positively and negatively. Similarly, studies show that individuals perceiving discrimination score lower on life satisfaction scales. One potential but under-researched driver of this effect is the native population's attitudes towards immigrants (ATI).

My paper explores the effect of neighbourhood hostility towards immigrants on migrants' life satisfaction in England and Wales. Using individual data from wave 3 of the UK Household Longitudinal Study including measures of neighbourhood interactions, matched to aggregate data on attitudes to immigrants derived from the Citizenship Survey (2010/2011) I focus on attitudes at the small area level of LSOAs (areas containing around 1500 households). Controlling for neighbourhood level characteristics, which may be associated with ATI, such as unemployment rates, and for individual level characteristics related to life satisfaction, I estimate the relationship between neighbourhood ATI and individual life satisfaction. Additionally, I explore the moderating effect of neighbourhood ethnic composition, close ties in neighbourhood, and neighbourhood interethnic mixing on this association.

By exploiting measures of both contact with and exposure to other ethnic groups (i.e. neighbourhood ethnic composition, neighbourhood mixing, interethnic friendships), I am better able to identify the mechanisms linking environmental attitudes to wellbeing. Specifically, I test the claims from cultural threat theory, neighbourhood effect theory, and intergroup contact theory. I thereby shed further light on heterogeneity in the life satisfaction of immigrants. My preliminary results suggest negative effect especially on second generation of immigrants of certain ethnic backgrounds.

RN35_T01_02 | Migration and the Pandemic 1

Polish Multiple Migrants Worldwide and Their Experiences During the COVID-19 Pandemic

Justyna Salamońska[1], Aleksandra Winiarska[1], Marta Kluszczyńska[2], Aneta Krzyworzeka-Jelinowska[1]

[1]University of Warsaw, Poland; [2]Adam Mickiewicz University, Poznań, Poland

When the COVID-19 pandemic hit last year, the Multimig project researching Polish multiple migrants worldwide was midway through a qualitative panel study (QPS). The QPS, originally designed to follow mobile life trajectories, enabled us to catch a dramatically changing context, including not only the health crisis but also social, economic and political shifts and how these influenced the individual biographies. In this paper we draw on rich material, presenting the experiences of Polish multiple migrants as they were affected by the COVID-19 pandemic. The particular strength of this empirical study is a comparative angle, as we are able to put together the experiences of people in various migrant destinations, at various points in their life courses and with various sets of resources. We focus our analysis on forced immobility, as many migrants were affected by the lockdown and social distancing restrictions, albeit at different time points. Some Poles decided to move from their destination country to Poland, others decided to stay. In each case these experiences provide insights into the negotiations that migrants made around settlement and mobility. As the QPS sample covered a wide range of occupational positions, we were able to track how migrants were affected economically and how various welfare states provided (or not) a buffer when need was. Last but not least the QPS interviews shed light onto the social lives of migrants. Information and communication technologies, extensively used by migrants already, took on even more importance as they became a substitute for physical mobility.

Displacement, Vulnerability, and Resilience: Student Migration in the Face of Dual Crises of Immigration Control and the Global Pandemic

Qiong {Miranda} Wu, Shuang Yin Cheryl Ng

Central European University, Austria

International higher education has been confronting with dual crises of border restrictions and the COVID-19 pandemic that impeded international students in completing administrative procedures to ensure enrollment and migration (Schleicher 2020; OECD 2020). Many EU nations have adjusted their student migration policies to accommodate international students (European Migration Network 2020). However, Austria has maintained strict migration regulations on international students from third-country nations. Our study thus focuses on the experience of the third-country nationals enrolled in an international university in Austria in the face of the global pandemic and immigration control. Through 20 semi-structured and in-depth online interviews, we find that institutional racism embedded in poor communication, inadequate and incongruent information, and discriminatory behaviors from immigration authorities fostered distrust and feelings of exclusion and unwelcome. COVID-19 regulations have further slowed down the processing time of residence permits and further exacerbated students' sense of displacement from the academic and wider community. Moreover, the global pandemic has led to restrictive conditions and serious financial struggles that hindered the immigration process. Despite the multidimensional challenges of migration amid the global pandemic, international students have built a cooperative community to stay resilient in a rising uncertain landscape. To conclude, our study draws implications for the impact of the global pandemic and immigration control on international higher education and student migration.

International Migration and COVID-19 Pandemic: Challenges and Social Support in Russia

Maria Ivanova, Olga Borodkina

Saint-Petersburg University, Russian Federation

Migration is a fundamental, demographic, social, and economic factor that influence on economic and social situation in the country. The economic crisis caused by the coronavirus epidemic in Russia is evaluated as the strongest in the last ten years. As in many other crises, migrants are particularly vulnerable to the direct and indirect impacts of the COVID-19 pandemic. Their ability to avoid infection, to receive adequate medical care, and to cope with the economic, social, and psychological consequences of the pandemic is determined by their living and working conditions, legal status, language skills, social networks, and level of integration in host communities.

Migrants are one of the most vulnerable groups since the existing state social support programs are aimed mostly at Russian citizens. Besides, a large number of migrants have been working under an unformal agreements without legally contractual relations, which led to mass lay-offs and job cuts. The international migrants during the epidemic need for humanitarian assistance, prevention of domestic violence, information supports, regulation at the legislative level, prevention measures and medical care in the context of a pandemic, and the possibilities to return to the country of origin.

The government has adopted several measures to extend the stay of foreign citizens during the crisis to prevent an increase in the number of migrants with illegal status, however, there is an urgent need to take measures to provide social support to migrants.

The research was conducted at Saint Petersburg University and supported by Russian Science Foundation, Project No 19-18-00246.

The International Mobility and Return to the Country of Origin during the COVID-19 Pandemic – The Case of Serbia

Dunja Poleti Cosic, Anđelka Mirkov

University of Belgrade – Faculty of Philosophy

The paper analyzes the impact of the COVID-19 pandemic on the international mobility of Serbian citizens. Exploring the countries such as Serbia can shed new light on the experiences of the cross-border movements of the people coming from the countries with the specific geopolitical position. Namely, Serbia as the EU candidate country with the Schengen visa-free regime still belongs to the European semi-periphery, which affects the characteristics of its transit, emigration, and circular migration flows. The paper aims to examine the medicalization of international mobility and especially the impact of health-related political decisions restricting the citizens' freedom to return to the country of origin. Data were obtained through an online survey conducted during April and May 2020, involving 305 adult Serbian citizens who participated in the international mobility flows during the health crisis at the beginning of the COVID-19 pandemic. The research distinguished between four categories of the internationally mobile citizens who returned from abroad in the critical period: inhabitants of border settlements who entered the territory of the neighbouring country almost every day, travellers who found themselves abroad on a short trip, temporary or circular migrants who stayed abroad up to three months, as well as the mobile Serbian emigrants. The research findings indicate that the political and medical decisions during the state of emergency in Serbia have ignored the facts on the extent and variety of cross-border movements, neglecting the needs of the citizens who took part in the international mobility flows.

RN35_T01_03 | Migration and Care Work: reproductive labour and the role of 'family'

The Double Penalty: Female Migrants and Family's Responsibilities in Europe.

María Sánchez-Domínguez[1], Luis Guirola Abenza[2]

[1]Complutense University of Madrid, Spain; [2]Bank of Spain, Spain; Duke University, USA

In this paper we evaluate the career and family opportunities of female migrants compared to their native counterparts, and examine whether their outcomes converge with the length of stay in Europe. We focus on the interplay between two key dimensions of gender equality: labor market outcomes, and the incidence of family responsibilities. We assess the impact of two country-specific features: the role played by families and in the provision of care and the impact of the segmentation of European labor markets. These features have been shown to account for a substantial part of cross-country variation both in gender equality and in the integration of migrants.

Empirically, we will rely on the EU-LFS to compare the labor market outcomes of female immigrants as a function of their years of residence in the country to native workers with similar characteristics. We use a matching algorithm to pair each female migrant with its closest female native counterpart based on her age, education, household composition and geographical location. We then estimate, as a function of the length of stay in the country, in a) the employment gap of female immigrants with respect to female natives; b) the gap in quality of that employment, and c) the effect of care responsibilities accounting for these gaps. To identify the impact of care responsibilities, we construct a measure that combines current labor market status, with the information provided by respondents that justify that status. Finally, we examine how our results vary between southern and northern Europe.

Reimagining Alternative Borders: The limitations and possibilities of everyday practice interactions.

Julie Claire Walsh, Asma Khan

The University of Sheffield, United Kingdom

In the UK, hostile immigration policy and normative conceptualisations of 'family' are shaped by processes of racialisation that 'other' migrant families, and position some as 'more British'. Here, we will draw on the findings of an ongoing collaborative study - that set out to explore the presence of 'everyday bordering' in social care practice with migrant families living in England - to show how these patterns of power are enacted but also 'reimagined' in the everyday. We will do so by focusing on how practice interactions – before and during the pandemic - are described by migrant families themselves, and by social care practitioners.

Whilst the primary site of immigration control is traditionally perceived to be at national borders, the ways in which immigration is controlled and surveilled are multiple. 'Everyday bordering' is therefore a concept developed by scholars to describe how, in a hostile policy and media environment, bordering practices extend increasingly into everyday life and influence ideas of who 'belongs'. In this paper, we contribute by showing that although interactions between social care practitioners and migrant families are affected by the hostile environment, and can reify borders, they also have transgressive potential; practitioners and migrant families frequently engage in strategies to navigate and 're-make' their futures and the everyday borders encountered. We conclude, however, by highlighting the limitations of these strategies in achieving structural change and offer practical suggestions for alternative futures in social care practice when working with all families that have migrated to the UK.

1128

Motherhood in Post-Migrant Context: An Intersectional Discussion on Gender, Integration Policies and Cultural Practices

Pinar Gümüs[1], Ipek Göcmen[2]

[1]Justus Liebig University Giessen; [2]Max Planck Institute for the Study of Societies

Integration discourses have long been problematizing Turkish/Muslim women's integration to the German (and the European) society due to women's low levels of participation in education and labor market, and relatedly in the public sphere. These discourses generally describe women as stuck in the domestic sphere constrained within 'traditional and cultural' roles, and imagine motherhood as the only/main focus of life for them by also judging their (insufficient) care practices in a stigmatizing way. These practices are also usually pointed out as a ground for integration problems of the future generations. On the other hand, Turkish-originating migrant women negotiate their motherhood in this context referring to dualities such as 'us vs. them'. In this paper we demonstrate how motherhood in post-migrant context emerges as a dynamic field of negotiations that is articulated through integration policies as well as cultural practices at the intersection of gender and migration discourses. Based on ethnographic data collected via in-depth interviews with Turkey-originating migrant women in Germany, expert interviews with social workers and discourse analysis of integration policy papers, this paper aims to offer an interpretation of how Turkish-migrant motherhood has been (re)constituted in post-migrant Germany. Exploring the social construction of motherhood as embedded within everyday life experiences and the institutions of the host society, the paper will make an interdisciplinary contribution to the area of sociology of migration and gender, and in particular to a better understanding of the dynamics of post-migrant society.

RN35_T02_01 | Migration and Social Inequalities

Tyrannies Of The Home. Exclusionary Sociability And Women's Citizenship In Finnish Integration Policies

Linda Haapajärvi

Centre Maurice Halbwachs, France

This article provides a critical examination of the idea of the "Finnish home" as a principle of participatory immigrant integration policies. Based on ethnographic fieldwork at the Kamppila neighbourhood house, in Helsinki, I show how local welfare professionals attempt to bestow a "homely" mode of sociability upon the native and immigrant women participating in the institution's activities, and how immigrant women contest these initiatives. Analyzing the practices of boundary-work that underlie these institutional encounters, I show that the supposedly neutral and natural mode of sociability is structured by rigid symbolic boundaries and justified by deeply culturalized, gendered, and classed repertoires utilized to define the contours of the "Finnish home". Despite its inclusive agenda, this concrete form of local-level participation creates conditions for condemning immigrant women to the status of outsiders on the basis of their perceived incompetence in the "Finnish way of life".

1129

Outside The Gateways Cities. Changing Minorities' Mobility And Settlement Patterns In Italian Local Contexts.

Marta Scocco, Maria Letizia Zanier

University of Macerata, Italy

For a long time, both migration and urban studies have been strongly focused on metropolises (i.e., the top level of urban hierarchies), considering this particular context as paradigmatic of the urban condition, including migration processes. However, this type of cities does not necessarily represent the current experience of many urban contexts, including in relation to migrants' settlements [Glick Schiller and Çağlar 2009].

In recent decades, scholars observe a change in minorities' mobility and settlement patterns that appear to be selectively spread in strongly economically developed countries [Pavolini and Barberis 2015]. Such rescaling migration processes are taking place both in countries where migration has been mostly metropolitan for decades (like the US) [Michaels 2014; Farrell 2016; Zuniga and Hernandez-Leon 2017], and in more recent immigration countries (like Mediterranean ones) [Osti and Ventura 2012]. These processes are particularly evident in the Italian context, where the immigrants' presence in small and medium-municipalities shows migratory balances in several cases higher than the national ones [Balbo 2015].

Our study aims to deepen the migration settlement outside the gateway cities where the salience of migration issues is even more further increased by its interaction with other burning issues, such as social inequalities.

Case studies [Sinatti 2008; Cancellieri, Marzadro and Ostanel 2015; Cancellieri and Barberis 2015] belonging to different Italian local contexts will be discussed, representing examples of residential concentration/enclavement, where the strong presence of immigrants is the result of a complex intertwining between job chances and better housing opportunities, often in the absence of institutional housing policies [Fravega 2018; Agustoni and Alietti 2018].

Disadvantages in Welfare Benefit Receipt Among Immigrants in Europe

Márton Medgyesi[1], Maria Montanari[2]

[1]TK Centre for Social Sciences, Hungary; [2]Politecnico di Milano

This research aims to study how disadvantage in welfare benefit receipt among migrants in EU member states is shaped by welfare state characteristics and migrant integration policies. We study disadvantage in welfare benefit receipt among migrants differentiating between newly arrived migrants and those who have spent more time in the host country. Using pooled waves of EU-SILC database from 2011 and 2016 covering 21 European countries, we first establish that that newly arrived migrants are disadvantaged in terms of receipt of non-contributory benefits (family benefits, housing and minimum income benefits) compared to locals. However, this disadvantage in benefit receipt tends to be smaller among more established migrants and in some countries it practically disappears among those who have arrived to the host country at least 15 years ago. There are however important differences between the EU member states in the magnitude of the disadvantage in benefit receipt among immigrants. Following the literature our hypotheses is that both welfare state characteristics and immigrant integration policies have an impact on the magnitude of this disadvantage. Our multilevel models show that disadvantage in benefit receipt among the newly arrived migrants is smaller in countries with more extensive welfare rights for migrants, while the disadvantage tends to be higher in countries with more generous welfare benefits. Among the more established migrants however the disadvantage tends to be smaller in countries where they can more easily obtain a long-term residence permit, which effectively gives rights to similar welfare rights as the locals.

Linguistic Diversity as a Challenge for a Monolingually-Oriented Organisation: A Study of Street-level Bureaucrats in a Public Employment Service

Elisabeth Scheibelhofer, Clara Holzinger, Anna-Katharina Draxl

Universität WIen, Austria

Migration-induced superdiversity requires a reassessment of the articulation between language, migration, and institutions. Public institutions, such as national employment services, must fulfil a special role in a society where new forms of mobility and transnationalism lead to the emergence of multilingual life worlds. Taking into consideration scholarly criticism of superficial celebrations of neoliberal multiculturalism and multilingualism (Canagarajah 2017), we deem it necessary to concentrate our research on the specific processes through which (linguistic) difference is transformed into inequality.

In a Grounded Theory based qualitative research project, we interviewed employees at the Austrian Employment Service at multiple organisational levels. The results demonstrate the absence of a coherent institutional strategy regarding linguistic diversity. Instead, street-level bureaucrats (Lipsky 1980) have considerable leeway in decision-making regarding language use and a disorganised mix of strategies can be identified. This apparent incongruity can be understood by the co-presence of diverging ideas and ideologies surrounding multilingualism as well as a neoliberal working context characterised by new public management and activation policy (Soysal, 2012). Our research aims to move beyond unchallenged traditional ideas about language usage that reflect social inequalities within society in general and to contribute thus to the surmounting of language-based discrimination and unequal life chances in multilingual societies.

RN35_T02_02 | Displacement, refuge and relocation

Environmental Displacement and Planned Relocation on a Forced-Voluntary Continuum – Epistemological Findings from Uruguay

Jana Donat

PhD Candidate at the Department of International Development (University of Vienna), Project Assistant at Research Platform "Mobile Cultures and Societies" (University of Vienna)

Conceptual questions arise when investigating social inequalities within the wider frame of environmental displacement and planned relocation. What extent of environmental and socio-economic risk is declared to be within acceptable limits until one is proclaimed displaced? Who is allowed to participate in relocation programs, and who isn't? Do people affected by displacement that participate in a voluntary relocation program still belong to the classification of forced mobility? While the element of coercion is omni-present due to environmental and climate impacts, studies show that it is still debatable whether participants of planned relocation are also displaced. Likewise, clear-cut theoretical differentiations between voluntary and forced im/mobilites are misleading as all forms of human im/mobilities are socially negotiated in the interplay of agency and structural constraints.

To exemplify the paradoxes of forced im/mobilities and confinement within the realm of environmental displacement and planned relocation, the National Relocation Plan (NRP, 2010-) from the Uruguayan Government will be introduced. Several inundation and relocation sites in urban Uruguayan settings illustrate the reciprocal entanglements of (1) immobility and mobility, (2) force and voluntariness, as well as, (3) environmental and climatic slow-onset and sudden events. At first glance, the NRP's categorization as reactive, voluntary, permanent and administered seems obvious, but actors' localized knowledges from risk assessment, social administration and relocation management in Uruguay open up an epistemologically differentiated dialogue

1131

about displacement and relocation in urban spaces on a forced-voluntary continuum.

"Governmental Mobility": the Relocation of Refugees in the EU

Léa Lemaire

University of Luxembourg, Luxembourg

This article deals with the relocation of refugees in the European Union (EU). Relocation is a policy instrument which aims to transfer refugees within the European Union (EU). In 2015, it was adopted as a plan by the European Council, in order to solve the so-called refugee crisis. Its goal was to remove 98,255 migrants from Greece and Italy to other member states. While relocation has been at the centre of EU debates on refugee policies, especially since 2015, it has been overlooked in the scholarship. This paper intends to fill this gap by focusing on the case of Malta. Indeed, prior 2015, relocation has already been implemented in Malta. The island state was the first EU member state to experiment relocation as a sending country, between 2009 and 2011. To a certain extent, Malta has served as a laboratory where the relocation of refugees has been tested and then extended to the whole of the EU territory. This research explores how refugees are governed through relocation, understood as a form of governmental mobility (Gill 2009; Michalon 2012). This concept highlights the extent to which asylum seekers are increasingly moved between detention centres at a national scale. Scholars have argued that mobility is put at the service of confinement (Michalon 2012). This governmental mobility prevents refugees from controlling their own migratory trajectory and contributes to their self-deprivation. This argument is complemented in the context of relocation in the EU. The empirical side of this research is based on qualitative methods and inspired by anthropological approaches. I conducted multi-sited fieldwork in Malta and Brussels, which combines ethnographic observations with interviews.

The Impact of the 2015 "Refugee Crisis" on Perceptions of Migration: Evidence from Greece, Germany and Turkey

Dimitris Parsanoglou[1], Aggeliki Yfanti[2]

[1]University of the Aegean, Greece; [2]Panteion University of Social and Political Sciences, Greece

The so-called "refugee crisis" of 2015 triggered in different places in Europe a series of repercussions: among others an unprecedented wave of humanitarian action performed by international and local organisations, along with individual and collective solidarity and volunteer actions have marked a temporary shift in perceptions of Europeans towards migrant and refugee mobility.

In this presentation we examine the societal impact of the developments that occurred in European border zone in 2015-16. We combine two sets of data: on the one hand, primary qualitative data collected in 2016 and 2017 in the framework of two research projects conducted in the Greek islands, in Athens and Idomeni (on the Greek-North Macedonian border), focusing on the de- and re-stabilisation of the European border regime, and on volunteering for refugees in Europe; on the other hand, we analyse data from the 7th wave of the World Values Survey which started in 2017, concerning Greece, but also Germany and Turkey that played a central role in the refugee drama. The analysis focuses on the demographic profile and the 10 items used in the theme of migration in order to capture the impact of the "refugee crisis" on the perceptions around migration regarding social, economic and cultural issues linked to mobility.

By combining qualitative and quantitative analysis, we intend to provide a comprehensive outline of a significant moment in the contemporary history of the European border regime, which seems to have a strong impact on how societies deal with migrants and refugees both at high level policy and at grassroots level.

1132

People-Making via Refugee Representations: Recep Tayyip Erdogan's Discourse on Syrian Refugees

Kerem Morgul

University of Wisconsin-Madison, United States of America

A growing body of research investigates the anti-migrant discourse of Europe's populist right-wing parties, showing how they define "the people" as a downtrodden ethnocultural majority whose way of life and interests are imperiled by dangerous "outsiders" and their "elite" allies. Not all populist nationalisms, however, center their rhetoric on migrant bashing. In this paper I focus on the case of Turkey's Recep Tayyip Erdogan, who has used Muslim nationalist narratives with populist themes over the past 10 years to promote acceptance of Syrian refugees in the country. Through a critical discourse analysis of 60 speeches down-sampled from a corpus of 508 public addresses, I ask how Erdoğan has represented Syrian refugees, what lines of action he has proposed to tackle the refugee crisis, and how these representations and proposed lines of action relate to his Muslim nationalist project. I also explore the shifts and continuities in Erdogan's discourse on Syrian refugees. Shedding light on the intersecting logics of inclusion and othering in Erdoğan's discourse, the paper problematizes the dichotomy between civic-inclusionary and ethnocultural-exclusionary forms of people-making. On the one hand, it shows that, under certain circumstances, ethnic and cultural criteria for national belonging may serve inclusionary ends, encouraging positive attitudes toward ethnoculturally similar migrants. On the other, it highlights the fact that inclusion and exclusion are matters of degree, with a broad range of possibilities lying in between full inclusion as equal members and outright exclusion. The paper ends by calling for a dynamic and relational approach to analyzing populist nationalisms and their stance vis-à-vis international migrants.

RN35_T02_03 | Migration and the conditions of informal labour markets

Refugees and Asylum Seekers in the Informal Economy: Motivations, Dilemmas and the Role of Professionals Supporting Integration

Iraklis Dimitriadis

University of Milan, Italy

Numerous refugees and asylum seekers (RAS) reached Italy since 2014 and entered the secondary labour market which is characterised by the prevalence of informal economy. However, while a burgeoning literature focuses on RAS' labour market integration, little is known about their engagement in the informal economy. This article aims to fill this gap by exploring perceptions of the involvement of RAS in informal work arrangements, and the motivations leading them to get informal jobs. Based on the ongoing fieldwork research within the H2020 MAGYC project, the article draws on semi-structured interviews with RAS (20), TSO professionals and municipality staff (30) working on projects in support of Refugee labour market insertion (coaching, mentoring, vocational training) in Northern Italy. Moving beyond discourses portraying RAS as informal workers facing precarious and exploitative conditions, the analyses sheds light on RAS' perceptions, choices and decisions when participating in the informal economy. Informal work can be considered as a survival activity while RAS do not access formal jobs or as a way to increase their employability or income. However, informal work can lead to neglect or abandon of internships and other training-job insertion projects. Such a choice is often criticized or disapproved by professionals supporting RAS' insertion in the formal labour market. This can create tensions between professionals and beneficiaries, and may imply that RAS lack future support from the former. The paper also discusses how COVID-19 pandemic shapes RAS' involvement in informal jobs.

1133

Collective Networks, Space and the Syrian Labour Force in Turkey

Emin Yigit, Gulhan Demiriz

Aydin Adnan Menderes University, Turkey

As a result of the developments in the Middle East, now there are more than three and a half million Syrians live in Turkey. Some of them, who are willing to move towards European countries when they have the opportunity, seem to plan their future rationally in the face of ongoing uncertainty in Syria. Hence, most Syrians who did not remain only as the "object of the process", but rather developed a number of strategies as "rational subjects" did not stay at their first destination after migrating to Turkey, and eventually migrated later on to different cities within the country. It seems that they take different factors into account in their decisions related to the final destination point. It should be noted here that their inclusion into the labour force in Turkey is extremely dynamic and has a rational relational integrity.

Based on all these factors, in this study, the functioning of collective networks in the inclusion of Syrian labour force in sectors in Turkey is questioned in relation to space. Accordingly, the questioning also includes the way immigrants are adapted to urban sectors in this highly fluid, dynamic and multi-actor movement. The findings of this study, which aims to discuss the rational mechanisms by which Syrian workers place collectivity in front of the macro-economic dynamics of the market, are based on the analysis of data collected from in-depth interviews of sixteen participants in Konak and Bornova (urban) districts and twenty participants in Bergama and Torbali (rural) districts of Izmir.

The Migration Indsutry in the Turkey: A case of Afghan Migrants

Yasin Özbey

Istanbul University, Turkey

In the research, based on transnational theory I try to understand how Afghan migrants, who crossing borders irregular and working unregister in Turkey, are affected in the migration industry and how they affect it. Few researchers have addressed the question of Afghan migrants context of the migration industry itself. Hence, the paper aims at conceptualizing and empirical analysis of how Afghan migrants experience informal sector in Turkey related to migration industry, how migrants and migrant industry actors constitute their agency, how it contributes to policy making. While this study focuses on micro level (migrants) and meso level (intermediaries, employers, migrant smugglers, etc.) as units of analysis, the macro level (border policies, informal labor market) are also included. Preliminary finding is that migration industry provides trans-local links for Afghans, ethnic hierarchy is emerging in the informal sector. Qualitative methods were used in the research. The city of Istanbul is selected as the main venue of research since it inhabits the vast majority of irregular Afghans working in the labor market. Additionally, it represents large informal sector and a hub for transit networks. I conducted 8 in-depth, semi-structured interviews with Afghans and It has been planned to meet with at least 22 Afghans more and 15 other actors (intermediaries, employers) in migration industry. The fieldwork of the research is not completed yet due to Covid-19 measures.

The Authoritarian Turn, Humanitarian Migration and Super-exploitation in Brazil

Francis Portes Virginio[1], Paul Stewart[2], Brian Garvey[1], Daniela Stefano[3]

[1]University of Strathclyde, United Kingdom; [2]Ecole de Management, France; [3]Federal University of ABC, Brazil

This paper examines the super-exploitation of immigrants who are seeking humanitarian protection in the Brazilian Amazonian region. There is a distinct authoritarian turn in neoliberalism coupled with the deterioration of working conditions and restrictive responses to immigration, shaping the experiences of forced migration within the Global South. In this sense, the relationship between the subsequent incorporation of these immigrants into these labour markets and their re-productive struggles in repressive labour regimes must be refined. In the last two decades, the literature has shown a renewed interest in the definition of super-exploitation, bolstered by the rapidly economic growth of Latin American countries alongside their prevailing dependency on the exports of commodities and on appalling working conditions. However, this paper argues that the understanding of contemporary form of super-exploitation experienced by migrant workers remains underdeveloped in the literature. Drawing on extensive qualitative data collected through semi-structured interviews, focus groups and workshops with over 300 immigrants in need of humanitarian protection, this

1134

paper makes an innovative contribution to the conceptualisation of super-exploitation in the 21th century, particularly in relation to the field of social reproduction. More than an economic relation, the pattern of super-exploitation conceptualised here across community, workplace and citizenship relations take into account the non-economic forces shaping the dependence of workers on wages below the value necessary for their social reproduction. Therefore, the paper shows that super-exploitation can be defined more accurately as a combination of economic and non-economic variables that entangle productive-reproductive-exploitative relationships.

RN35_T03_01 | Building new solidarities: host societies mobilizing for migrant inclusion

Towards A Typology of Solidarity Cities Across Europe In The Omnipresent Of So-called Refugee Crisis Since 2015

Gulce Safak Ozdemir

Pompeu Fabra University, Spain

The main contribution of this paper is to develop a solidarity city typology through a comparative analysis of 14 global cities in Europe within the context of so-called refugee crisis. While sanctuary cities have taken place in migration studies over the past two decades, "solidarity cities" is a relatively a new concept. Migration scholars has primarily focused on multi-level governance of migration by considering the relationship between cities and their national governments. Yet, little is known about internal dynamics of these cities. To this end, this paper aims to explore solidarity city concept zooming into cities to distinguish the role of local governments and local civil society actors across diverse size and positions of cities in Europe. Accordingly, the solidarity typology is developed as bottom-up-(civil society oriented), top-down-(local government oriented), decoupling-(non-harmonious top-down and bottom-up solidarity), full-(harmonious collaboration of local government and civil society actors) and limited-(no established solidarity) solidarity cities. This research mainly based on official policy documents

and relevant programs of local governments and registered local civil society organisations in the cities. Inspired by MIPEX index, I build a local level governance migration index for the local governments and civil society organisations. Based on this "local level solidarity index", I mapped out 14 European Cities in terms of mentioned typology. Initial results propose that Berlin, Barcelona, London, Vienna, and Milan are considered as full solidarity cities; Madrid and Stockholm reflected as top-down solidarity cities; Brussels, Budapest and Munich emerged as bottom-up solidarity cities; Amsterdam, Rome and Paris are deemed as decoupling solidarity cities; and Prag is a limited solidarity city.

Disentangling the Role of Social Innovation for Migration: a Civil Society Perspective

Melissa Moralli

University of Bologna, Italy

Social innovation (SI) can be intended as a process or a practice that is created by an individual or, more likely, by a group of individuals with the aim to answer an emerging or existing social problem thanks to the creative capacity of the subjects participating in it. Hence, SI can represent a process of collective action and mobilisation, achieved through civil society's direct participation, negotiation and collective learning, often remedying social inequalities and conditions of marginality. Although migration cannot be considered a social problem - since it has always characterized human history - the consequences of distorted representations of this phenomenon and an unjust access to mobility are real. On a local level, this means considering how social dynamics can influence and are influenced by migration, and how the public sphere is composed both by institutional solutions and civil society's individual and collective agencies. Among these dynamics, social innovation can be considered as a transformative agent that can positively impact the social inequalities and marginality that pervade the phenomenon of migration. Drawing upon these premises, I will propose a specific conceptualisation of SI consisting of processes and practices of empowerment and the direct participation of marginal groups, by analysing some initiatives of social innovation in the field of migration encountered in different research projects. Secondly, I will suggest an analytical proposal which shows how SI can play a role at four levels when engaging with migration: the field of narratives, the relational and the spatial dimensions and the participatory dynamics.

1135

Affective Proximity to Asylum Struggles. Home Accommodation of Asylum Seekers in Finland.

Paula Merikoski

University of Helsinki, Finland

This empirical paper discusses home accommodation of asylum seekers in Finland, which is one of the solidarity mobilisations that emerged as a response to the so-called asylum 'crisis' in 2015. Recent studies have discussed volunteers' and activists' motivations and emotions underpinning these efforts, often emphasising compassion (Armbruster 2019; Kleres, 2018; Maestri and Monforte, 2020). Drawing from feminist understanding of home and citizenship, this paper understands private and political spheres of agency as intertwined (Blunt & Dowling 29096; Lister 2007; Yuval-Davis 1999). This paper is based on thematic in-depth interviews with local hosts who have shared their homes with asylum seekers, and it examines how living together through the in-between time of seeking asylum transforms the hosts' domestic life. It explores how the domestic life of the host gets entangled with the asylum process of the asylum seeker, and how mediatised sensorial connection to war and conflict becomes part of the shared everyday life. Asylum seekers may live years in a liminal in-between time/space, often physically separated from the rest of the society, and local non-migrant people are rarely close to that liminality. In home accommodation, the asylum seekers' past and present struggles are inseparably intertwined with the affective home experience of the host, and the struggle for asylum becomes a shared mission. Thus, this paper argues that compassion does not adequately describe the emotional basis of home accommodation. Where compassion implies inequality and distance between the compassionate and the unfortunate one (Berlant 2004), affective proximity - to the new person and to their asylum struggles - is transformative and politicising.

Seeing Ourselves in Others: Empathy, Solidarity, and Migrant Reception in Poland and France

Kaja Skowronska

University of Tours, France

While recent years have seen a notable increase in anti-immigrant rhetoric and sentiments in Europe, they have also been a time of increased activity by a variety of grassroots and non-governmental organizations assisting migrants. In addition to providing aid on the ground, those organizations have also frequently attempted to counter negative attitudes towards migrants and to foster solidarity towards them.

In this paper we compare strategies, discourses, and images used by such organizations in Poland and in France. In particular, we look at the appeals to the public's emotions and at the underlying understandings of solidarity and empathy. The more general question guiding this research is that of the conditions under which solidarity towards those branded as "others" becomes conceivable.

In order to address this question, this paper offers a comparison of two countries with diverging profiles in terms of the nature and history of migration flows, migration policies, and approaches to migrant inclusion. Such a comparison can produce insights into the links between strategies chosen by pro-immigration actors to foster welcoming attitudes and their local context. It allows to situate those actors' activities in relation to the prevalent conceptions of otherness, sameness, and cohesion of the political community. It can also throw light on the ways those conceptions are being challenged, modified, or mobilized.

The paper is based on a comparative analysis of materials (texts, websites, images, and videos) produced by a sample of NGOs in Poland and France since 2015. The sample includes both organizations with a longstanding history and newer associations, on both the local and national level, allowing for an analysis of potential differences between those types of mobilization.

RN35_T03_02 | Rethinking identities, attitudes, and prejudice towards and among migrants

Where Nationalism Meets Class Formation: Hiring Discrimination Against Applicants With A Migration Background By Dutch Municipalities.

Hans Siebers

Tilburg University, Netherlands, The

Hiring discrimination (Pager and Shepherd 2008) against migrant people has been documented and demonstrated extensively (Baert, 2018; Riach and Rich, 2002; Zschirnt and Ruedin, 2016). The literature focuses particularly on forms of discrimination, including taste-based and statistical discrimination (Birkelund et al., 2020; Midtbøen, 2014). However, much less is known about the factors and mechanisms that actually produce this discrimination (Gaddis, 2019; Midtbøen, 2014; Reskin, 2003).

In 2018 and 2019, we studied hiring processes of four Dutch municipal organisations by way of a questionnaire among selectors (N = 551), a questionnaire among migrant and non-migrant applicants (N = 751) as well as 48 interviews with selectors, migrant and non-migrant applicants. Findings showed that these municipalities discriminate against applicants with a migration background. One factor and one mechanism are responsible for this discrimination.

Factor: This discrimination is driven by Dutch nationalism. Both in its previous multicultural form and in its current ethno-nationalist form, it classifies people with a migration background as outsides based on origin and assumed cultural differences. This othering reduces the chances for applicants with a migration background to be hired.

Mechanism: Processes of class formation allow nationalism to become operational in hiring. As gatekeepers of class, selectors assess applicants' disposal of cultural capital (Bourdieu, 1984, 1986), i.e. being 'enthusiastic', 'energetic' and 'motivated'. Due to insecurity stemming from nationalism, migrant applicants are less successful to profile themselves on those job-unrelated and non-functional requirements and thus tend to be rejected as applicants. These findings provide an original contribution to the literature.

Intergroup Contact and Population Innumeracy: Misperceptions, Attitudes, and the Varied Encounters between European Citizens and Non-EU Foreigners

Daniel Herda

Merrimack College, United States of America

Interpersonal contact is often an important independent variable for understanding citizens' attitudes about immigrants. The intergroup contact theory famously contends that certain types of exposure will increase intergroup understanding and reduce negative prejudice and xenophobic attitudes. However, recent research on misperceptions about immigrants finds that contact also promotes faulty information. Specifically, studies of immigrant population innumeracy – the tendency to incorrectly estimate their population size – find that certain types of contact are associated with larger over-estimates, which in turn are associated with negative attitudes. These disparate results of contact warrant detailed consideration. Thus, using data from over 20,000 respondents in the 2017 Eurobarometer, the current study simultaneously examines how negative attitudes toward immigrants and misperceptions about immigrants are related to interpersonal contact experiences. Further, given findings indicating that certain types of contact are more likely to promote either prejudice-reduction or over-estimation, the current study takes a unique approach by considering 8 different contexts of contact: 1) workplace, 2) childcare or educational context, 3) public services, 4) neighborhood, 5) sport, volunteer, or cultural activities, 6) household services, 7) friends, and 8) family members. Preliminary results indicate that contact through friendships and activities have the strongest prejudice-reducing effects, while having little influence on population innumeracy. At the same time, workplace and neighborhood contact have the strongest influence on population

1137

misperceptions, while having comparatively little effect on negative attitudes. Overall, the findings demonstrate the importance of considering respondents' totality of intergroup contacts when examining how intergroup exposure connects with attitudes and perceptions. This study concludes with recommendations for future research.

The Attitudes Of European-born Immigrants Towards Non-European Immigrants: The Role Of Value Contexts In the Home And Destination Country

Ognjen Obućina

Institut national d'études démographiques (Ined), France

Although not entirely unnoticed by social scientists, the research on mutual attitudes among migrant groups is less extensive than the sizeable body of research on attitudes towards migrants in the native population. This study uses data from 25 European countries and seeks to explore the attitudes of European-born immigrants towards immigrants from other continents (henceforth simply referred to as non-Europeans). The principal goal of the study is to compare the importance of the value contexts in the sending and receiving countries in shaping cross-group attitudes among migrant communities. The empirical analysis is based on repeated cross-sectional data from nine waves of the European Social Survey. The nine surveys were conducted between 2002 and 2018. The analysis includes European-born men and women who live in Europe and outside their country of birth. The dependent variable is based on European immigrants' attitudes towards arrival of non-European immigrants from poor countries. Descriptive analysis shows that European-origin immigrants' views of non-Europeans are more favorable than among natives, and less favorable than among non-European immigrants themselves. Multivariate analysis indicates that the role of the receiving context is more important than that of the sending context. In particular, a more negative attitude towards non-Europeans among natives in the country of residence increases negative attitudes towards non-Europeans among European immigrants. In contrast, the attitude towards non-Europeans among natives in the country of origin is not associated with European immigrants' attitudes towards non-Europeans.

Immigration Flows to Lithuania: The Influence of Collective Identity In Making a Decision to Migrate

Indre Kireliene

Lithuanian Centre for Social Sciences, Lithuania

The globalization and international migration of people is causing demographic changes. The example of Lithuania illustrates the negative trend of migration from Lithuania, but the increase in immigration flows caused by non-European nationals. This paper refers to be one of the first works on the correlation of immigrant collectivism as a factor influencing migration and integration of immigrants. This problem is relevant and interesting for a large audience, not only in the Lithuanian scientific field but also around the world. To respond to the problem, the following tasks are implemented: to discuss the integration of immigrants through the access of collective identity and to examine how the collective identity of immigrants is linked to integration in Lithuania.

The theoretical background of the research is based on the approaches of Migration Networks theory (Massey, 1988; Amaral, 2018) in order to substantiate immigration motives through the aspects of collective identity as simplifying factors for adaptation. The paper data set will be focused on the following research questions, which are not answered in the academic literature and previous research. The empirical part of the research is based on semi-structured interviews with immigrants (non-European citizens) discover how collective identity affects migration in Lithuania in order to enrich the research and expand the field of knowledge of migrant's experience, the research involved 21 participants who were immigrants and have lived in Lithuania for at least 2 years. The entire research covers immigrants, who came to Lithuania for various purposes, without dividing them into separate integration segments.

RN35_T03_03 | Return migration in the European context

Black Jeans, White Sneakers: Consumer Acculturation In The Context Of Central And Eastern European Women Studying in Denmark

Flora Szabo, Anuja Pradhan

University of Southern Denmark, Denmark

The thesis explores adaptation and stigma management (Crockett, 2017) strategies of Central and Eastern European women, who migrate to Denmark for higher education, using acculturation theory (Berry, 1980).

The research asks how consumers navigate the influence of fashion and language - key acculturation agents - in order to resist cultural stigma faced owing to their country of origin.

We draw upon postassimilationist consumer acculturation theory (Penaloza, 1994, Üstüner and Holt, 2007, Luedicke, 2015) and key sociological studies examining the perception of Central and Eastern European migrants (Fox et al., 2012, Andreouli and Howarth, 2019) and analyse fifteen in-depth interviews through a Bourdieusian lens (Bourdieu, 1979, 1986, 1991).

The findings show how these women are affected by the territorial stigma (Wacquant et al, 2014) of "Eastern Europe", which leads them to mask their identity visually by dressing in Danish styles and working towards acquiring linguistic capital by learning Danish.

However, some informants experience tensions of maintaining femininity and self-expression in the process since their feminine signifiers are discarded by dressing in Danish fashion. Additionally, many find the Danish language difficult to master, and often feel locals prefer communicating with them in English.

A new model of acculturation was developed, highlighting differences between the women's "despised origins" and "fetishized residence" (Denmark) and three fluid adaptation strategies: Unchanging Habitus, Masked Assimilation and "Shattered" Cosmopolitanism.

The paper contributes with a new model of acculturation in the context of European student mobility and reveals existing inequalities between Western and Eastern Europe.

The Homecomer, the Stranger and the Others. Strategies of Return Migration in European Context

Mariusz Dzięglewski

Pedagogical University of Cracow, Poland

The paper – based on the extensive empirical research - focuses on the process of return migration, from a holistic and policy-oriented perspective. Studies in return migration, have provided a large body of knowledge on particular issues, but generally fall along two lines: they are either broad macro analyses and models or narrow ethnographic views. The paper attempts to chart a course between these two approaches, combining returning migrants' life trajectories, as seen by themselves, with analysis of the structural processes that have taken place in the last three decades in Europe and in Poland, as a new EU country. In analyzing the social and cultural changes reflected in the biographies of returning migrants, the author uses a framework based on an original synthesis of Alfred Schütz's phenomenological approach, focusing on the returnees' "life words," with the social realism of Margaret Archer, focusing on the concerns and projects of individuals interacting with social and cultural structures.

The paper makes a strong argument for return migrants' agency and capacity for reflexivity. It also underlines the significance of life-stage in return migration planning, and of attachment to specific return locations. The centrepiece of the paper is a typology of different migrant strategies towards return migration, illustrated with portraits of six of the author's interviewees. The types are conceptualised along a spectrum, from the Conservative's return to a 'known country,' to the Stranger's return to an 'unknown country'.

Emotions on the Move – Returning 'home' (?) in the Life Course Perspective of Return Migrants and Their Family Members in Poland and Lithuania

Violetta Anna Parutis[1], Marta Buler[2]

[1]University of Essex, United Kingdom; Vytautas Magnus University, Lithuania; [2]SWPS University of Social Sciences and Humanities, Poland

In migration studies emotions seem to be mainly explored from a psychological perspective (mental issues, adaptation problems etc.), although it has already been shown that emotions can be a powerful factor in social sciences, where they can act as a bridge over the liminal space between the individual and the social (Zembylas, 2012), or as a crucial link between micro and macro levels of social reality (Turner and Stets, 2005). Developing the above mentioned perspectives further and, complementing them with the life course approach (Elder 1998) to the study of emotions in migration, this paper aims to contribute to a deeper understanding of the social role of emotions in mobility decision making, with a special focus on the context of family and perception of emotions in migration by migrant and non-migrants family members.

The empirical material for our paper comes from a comparative qualitative study on return migrants in three European countries: Lithuania, Poland and Croatia (REMIT project, 2020-21, Vytautas Magnus University). For this paper we use a subsample of 20 in-depth interviews with return Polish and Lithuanian migrants (N=10) and with their family members (N=10) in Poland and in Lithuania.

We argue that emotions are, on the one hand, an intervening factor for mobility and, on the other hand, are shaped by the distance from family and the country of origin. We propose comparative case studies between Polish and Lithuanian 'mobile' families focused on the dominant emotions in the life course perspective.

"Then" and "Now": Romanian Returnees Contemplating Re-migration

Laura Morosin [1], Alin Croitoru[2], Monica Serban[3]

[1]University of Sussex, United Kingdom; [2]University of Sibiu; [3]ICCV

This paper examines re-migration considerations amongst Romanian returnees from various European countries, drawing on 120 interviews with participants aged 20-40. Whilst returnees' motivations and reintegration experiences are increasingly well documented, much less is known about the re-migration intentions of those who have moved back to the country of origin for some time. Yet, ongoing mobility and re-migration are common phenomena (White 2014), and offer unique insight into returnees' adaptation, life trajectories, and aspirations. Our paper contributes to this under-researched area by exploring how young Romanian returnees think and talk about re-migration. We pay specific attention to how economic and family circumstances shape re-migration considerations in the case of students, higher- and lower-skilled workers. We find that re-migration considerations are often informed by a comparison between "then" and "now", whereby returnees compare where in life they are now, in terms of age, work, and family circumstances, to then, when they initially migrated. In contrast to the more experimental and spontaneous moves undertaken in the past, reflections on re-migration indicate much more careful assessment and clearly defined parameters, dictated by returnees' different and increasingly complex life circumstances. In many cases, re-migration thus depends heavily on the promise of employment security, financial and professional rewards, and/or opportunities for family members abroad. Our findings extend life-course perspectives on migration, showing how transitions to adulthood in the sphere of work and family crucially shape returnees' re-migration intentions, and im/mobility more generally, in conjunction with previous experiences abroad, transnational connections, and life on return.

Queer Refugees in German Shelter. Transformational Potential by Voluntary Queer Refugee Support

Olaf Tietje

University of Munich, Germany

The architecture of refugee shelters in Germany increases the isolation of refugees, forces them to remain inactive, and concentrates people with different backgrounds and future perspectives in a very small space. Under these circumstances, vulnerable groups such as queer refugees are particularly affected by experiences of direct and indirect violence. Against the background of a lack of state sensitivity for the complexity of the contexts in which queer people flee, the support of queer supporters is important not only to be able to successfully contest the asylum hearing. Without voluntary supporters, queer refugees have little chance of a safe home. For historical reasons, the queer community has a wide range of experience in dealing with homophobic and transphobic violence. Self-help and self-organization are part of the history of the queer movement - not only in Germany.

The tradition of queer self-organization is actualized in the tenacity with which voluntary supporters support queer refugees in cooperation with (queer) full-time structures. My talk aims the transformative potential of civil society support in situations of vulnerability and victimization. I will explore the question to what extent these interventions in heteronormative conditions also scratch the almost self-evident juxtaposition of queer people and Muslims in public debates. To this, my conclusions are based on my research within the BMBF (German Ministry of Education and Science) financed project 'Welcome Culture and Democracy in Germany'. Analyzing guided interviews with both volunteer supporters and queer refugees, I will illustrate my conclusions with some empirical snippets of my research.

An Attempt to Understand the Crisis in Masculinities of Poor Syrian Refugee Men in Ankara, Turkey

Saeid Mozafari, Halime Ünal Reşitoğlu

Ankara Yildirim Beyazit University, Turkey

In recent years, migration studies have started to focus on the transformation or crisis effects of forced migration on masculinity. Particularly, there is still a need for deep understanding of the transformations or crises that refugee men experience in their masculinity. Therefore, this research aims to understand the impact of such conditions as the war, the migration and being urban poor on masculinities of Syrian refugee men living in lower class districts in Ankara, Turkey, one of the biggest host countries for diverse migrant groups, particularly Syrians. The method of the study consists of qualitative research techniques such conducting in-depth semi-structured interviews with 17 Syrian men as well as doing observations in their homes where interviews took place. The findings indicated that devastating life conditions such as poverty, unemployment, social exclusion, ethnic discrimination have caused Syrian refugee men to question their masculinity. Many of them concern about whether they can fill the breadwinning father image in this new country. Accordingly, the crisis of masculinity differs with regard to the factors such as generation, religiousness, city of origin in Syria. For instance, older men are able to fill the gap coming from masculinity crisis by means of interiorized patriarchal culture and discriminative religion values. Based on our observation, it can be said that masculinity crisis manifests itself in different ways, such as the spatial design of homes, bodily performance, discourses and attitudes toward women and children. The crying of a participant who has been laid off due to pandemic is a sign of fractured masculinity.

Key Words: Syrian Men, Forced Migration, Urban Poor, Crisis in Masculinities

Migration, Honour, Violence and Inequality: Developing Isolation and Mobility as Mechanisms of Honour Related Violence

Rúna í Baianstovu[1], Sofia Strid[2]

[1]Örebro University, Sweden; [2]Örebro University, Sweden

The aim of the paper is to contribute to the expanding knowledge-base for reducing honour related violence (HRV), that has become increasingly complicated, not to say corrupt, by ongoing neoliberalism and right-wing agendas.

HRV is a serious problem with complex roots, causes and sometimes deadly consequences. It is a contested academic and political field constructed through various borders, boundaries, and intersections such as nation, ethnicity, gender, age, sexuality, religion, and migration. The paper examines some of these borders, boundaries, and intersections by analysing the expressions, prevalence, and patterns of HRV in Sweden, a historically social democratic and femocratic welfare state, challenged by increasing social, economic, and political inequalities, and a mainstream discourse describing HRV as a distinctively dangerous form of violence linked to culture, religion, and migrants' failure to 'assimilate' to Nordic ideals of gender equality. As such, positionings on HRV have played and continue to play straight into the hands of nationalist politics, racist agendas, and right-wing assimilationism.

In contrast, the paper draws on feminist and intersectional sociological theory, at the interface of honour, integration, migration, to develop the concepts of isolation and mobility. It is based on a substantial qualitative and quantitative empirical material: focus groups and individual in-depth interviews with people with direct, personal experiences and indirect, professional experiences of HRV (n=259) and three surveys answered by fifteen-year-olds in Swedish metropolitan areas (n=6002). The paper shows first, how isolation and mobility reinforce or weaken honour norms and violence, respectively.

RN35_T04_02 | Migrants agency, imagination, and identity

Nostalgic, Converted, or Cosmopolitan: Processes Of Identity Construction In Spanish University Students Migrated Abroad

Rubén Rodríguez-Puertas, Alexandra Ainz-Galende, Antonia Lozano-Díaz

University of Almería, Spain

The high unemployment rate that is affecting Spain in recent years, along with the consolidation of labour market insecurity, have generated great changes in social behaviour, with a prominent tendency for young people to leave the country. With the aim of understanding, from the point of view of these new migrants, how their migration processes and sociocultural integration in their host countries are, This communication examines how these new Spanish emigrants rebuild their identities during their migration processes and the factors that influence them. For this purpose, in-depth interviews were carried out with the aim of knowing the life stories of 41 young people with migration experiences during the period from 2010 to 2015. The information obtained is analyzed following the Grounded Theory method, which enables the differentiation of three discursive categories in the evolution of the identities of the young university emigrants. So, these identities are named here as converted adaptation (Rejection of Spanish society), nostalgic adaptation (longing for the Spanish society), and the mutation to a new hybrid identity, in which cultural patterns of origin are intermingled with those of the new society where the migrants live (cosmopolitan adaptation). These categories allow us to explain how the perception of young people about their home and host societies changes, as well as how their sociocultural adaptation to the new context is affected by the conducts and behaviours inherent to said perception.

Immigrant Agency: The Case of Russian-Speaking Immigrants and Citizens in Germany

Tetiana Havlin

University of Siegen, Germany

The central question of this talk asks: Which transformations does human agency undergo in the process of migration and settlement from the individual and collective standpoints? In order to answer this question, grounded theory (Corbin, Strauss) and transnational methodology (Glick Schiller, Faist, Amelina) served as a guidance to empirically generate elements composing an analytical concept of "immigrant agency". This concept is operationalized in terms of identity frameworks, language applications and actions (esp. entrepreneurial and leisure activities) based on original empirical research. The theory of immigrant agency (TIA) was generated out of, and grounded in, the mixed method research (incl. interviews, ethnography of leisure, a dataset of immigrant businesses) conducted in the period between 2012-2020 in the two ordinary mid-sized cities of Western Germany. In the focus is agency of immigrants from the former Soviet Union who arrived to Germany between 1990-2005. Three elements of TIA – identity, language use and actions – are approached from the dual perspective of the individual and the collective as a continuum. Additionally, the immigrant agency is understood as a phenomenon imbedded in the complex web of structural and network relations, of transnational social and urban spaces; it is approached from the processual (Abbott) and flexible ethnic boundary-making (Wimmer) perspectives. That led to the creation of a multidifferential and nonhierarchical understanding towards immigrant agency of Russian-speaking immigrants and citizens in Germany.

Imagined Mobilities And The Materiality of Migration: The Search For 'Anchored Lives' In Post-recession Europe

Michela Franceschelli

UCL, United Kingdom

The dichotomy between mobility and migration became a disputed conceptual distinction during the expansion of European Free Movement between the 1990s and early 2000s. Then, mobility literature sought to open a new chapter in the study of contemporary human lives by theorising them as 'liquid' and suggesting movement as their universalising feature. Intra- European migrants have been increasingly characterised by their 'mobility spirit' and therefore as legally unconstrained, driven by individualised behaviours and engaged in temporary cross-border movements. Set in the backdrop of post-recession intra-European migration, this paper explores how migrants' mobility spirit is being negotiated with the need to anchor their lives to stable relationships and to the attainment of financial security. It draws on interviews conducted with Italian young adults in London and shows how imagined projects of temporary mobility materialize into longer-term migration experiences where the search for anchored rather than liquid lives becomes more prominent. Henceforth, the analysis challenges the typified profile of EU movers by pointing at their quest for social and financial stability and by exposing their personal vulnerabilities while making the theoretical distinction between migration and mobility less relevant.

1143

From Dictatorship to a (Non)Comfortable Life: New Migration from Russia to Israel in 2010th

Varvara Preter, Julia Lerner

Ben-Gurion University of Negev, Israel

In this paper we sketch a portrait of new migration wave from Putin's Russia coming to Israel which increased in 2010th (CBS 2020) and present this group as a particular type of migration not only in the Israeli scene but also globally. We suggest that the particular combination of political and life-style dispositions of this new wave of migration as well as their practices of self-relocation make them an intriguing case for study transnational forms of movement and belonging.

Typical representatives of this migration are described as new Russian "middle class", high-educated and "westernized", anxious about Putin's regime and therefore seeking to emigrate from Russia (Gudkov, Zorkaya, 2013, Florinskaya, Karachurina, 2018, Levada-Center 2019). These new immigrants usually continue working on Russian employees practicing remote jobs in their first years of immigration. They take an active part in protest actions devoted to the issues of Russian internal politics. They also intensively reflect on their immigrant experience in a quasi-private quasi-public digital space of blogs and social networks maintain link with Russian speaking transnational immigrant identity. Therefore, the life-style migration combined with the motivation of political civic refuge shapes the encounter of the new Russian migration with their host society and different groups that inhabit it.

The paper is based on the ethnographic and netnographic interviews and observations collected in our pilot study within and about this group while examining their everyday and digital life, and is enriched by the comparative analysis with the earlier studies on Russian speaking migration to Israel.

RN35_T04_03 | Reflexivity in Migration Research 1

Integrationism and Boundary Liberalism in Switzerland

Stefan Manser-Egli

University of Neuchâtel, Switzerland

Recently, there has been a growing interest in 'aggressive integrationism' and the 'civic integration paradigm', referring to 'integration' as to be achieved by coercing, testing, penalizing and, ultimately, excluding. This paper studies integration as a category of practice in Switzerland, where naturalization and residency permits are increasingly predicated on integration requirements. One of them is the 'respect for the values of the Federal Constitution', concretely referring to (attitudes on) forced marriage, circumcision, sexual orientation, gender equality and expressions of respect. Against the theoretical backdrop of what has been conceptualized as boundary liberalism or illiberal liberalism, this article enquires into the social imaginaries that are (re)produced by integration policies and discourses. These concepts refer to the fact that the extent to which immigrants are believed to have acceptably liberal values has become a site of boundary making in Western Europe with integration increasingly being predicated on the adoption of liberal-democratic norms and practices and assumptions underpinning liberal personhood. Methodologically, the paper builds on an empirical analysis of the legislative process leading to the value criterion of integration and fieldwork among public authorities implementing and enforcing it. In terms of alternative futures, the paper shows how the value dimension of integration reproduces a presumed incompatibility of Islam and liberal values, drawing a bright, gendered, and nativist boundary against an imagined Swiss or European community of value. This social imaginary of the 'liberal self' against the 'illiberal other' and its reproduction and enforcement by state authorities undermines fundamental premises of liberal democracy.

1144

Making Muslims: Migration and the Governance of Religious Plurality in Europe

Bilgin Ayata[1], Vivien Nürnberg[2], Serdar Kandil[2]

[1]University of Graz, Austria; [2]University of Basel, Switzerland

Despite growing scholarship on the official recognition of Islam in Europe, one shortcoming in this literature remains the undifferentiated treatment of "Muslims" as the main and sole counterpart to the state, either as a group particularly resistant to institutionalisation or as subjects of state governance. The latter strand of writing constitutes an important counterpoint to the former. What both approaches unites is the reification of "Muslim" subjects and practices, which calls for more complex analysis. In this paper, we are analysing the so far neglected aspect of the official recognition of Alevism alongside that of Islam in an effort to counter essentializing and linear views in the literature on Muslim migrants. Alevis form a persecuted religious community from Turkey who were subsumed under Islam until recently, when they mobilized in Europe for official recognition as an independent religious group distinct from Islam. To do so, they delineate themselves from Sunni Muslims as being compatible with European values, highlighting their secular, progressive, gender-sensitive identites. In this paper, we critically examine the various processes of Alevi recognition in Europe in conjunction with the incorporation of Islam to show how what kind of affective citizenship regimes (Ayata 2019) are in place during religious incorporation in Europe. We do so by employing insights from postcolonial studies on the indirect rule of native populations (Mamdani 2020) to the case of the official categorization and defining of migrant communities as religious groups. The paper draws on empirical fieldwork conducted in Germany, Switzerland and Austria as part of a research project on migration, religion and belonging.

The Stayers and their Part in the Migration Project

Małgorzata Dziekońska

Univeristy of Bialystok, Poland

In migration research attention has been placed mainly on the migrants and rarely has it been directed at those who stay - the stayers. The latter have been identified with many names (the left-behind, non-migrants, homeland kin etc) which as a matter of course, do not exhibit the agency of those who decide to stay. As „the left-behind" they are rather presented as in a way underprivileged and weakened whereas the results of the qualitative research conducted among family members of international migrants in Poland demonstrate this might be just the opposite.

The aim of the presentation is to show the migration project from the stayers' point of view, their everyday lives and staying experiences, and to reveal their role and responsibilities at home during the migrants' absence. The researched stayers refer their memories of migration which took place four decades ago and from this time perspective they reflect on the decision to separate for some time as well as on its' consequences. They weight all their losses and gains which resulted from the migration for all involved in the migration project.

The major conclusion is that migration and staying are not the opposites of each other but they are interconnected, filled with mutual obligations and support circulating from the migrants to the stayers, usually in the form of remittances, as well as from the stayers to the migrants mainly as emotional support. None of the parties is passive or powerless.

1145

Reflecting On Forms Of Knowledge Production Within Migration Studies. From A 'Mobility Lens' Towards The Concept Of Entangled Mobilities

Janine Dahinden[1], Anna Wyss[2]

[1]University of Neuchâtel and nccr on the move, Switzerland; [2]University of Neuchâtel and nccr on the move, Switzerland

Migration studies have been confronted with many critics regarding their epistemological and theoretical underpinnings, namely with regard to their sedentarist bais and methodological nationalism. The mobility turn revealed to be a promising avenue to address (at least some of) these critics. In this paper we argue that scholars have not yet fully exploited the potential of applying a 'mobility lens' to create alternative forms of knowledge. We propose a relational perspective introducing the concept of 'entangled mobilities'. We suggest that with such a focus we are better equipped to carve out the embeddedness and entanglement of individual mobilities within asymmetrical power relations. Such an approach allows to unveil inequalities and inter-dependencies caused by and shaped within global inequalities and different regimes of mobility. We offer a methodological framework that allows studying entangled mobilities via three different entry points.

RN35_T05_01 | Reflexivity in Migration Research 2

Recentering the South and the Geopolitics of Knowledge Production

Eleonore Kofman[1], Ezgi Tuncer[2], Zeynep Benlisoy[2]

[1]Middlesex University, United Kingdom; [2]Kadir Has University, Turkey

1146

Migration Studies have tended to focus on movements from the South to the North leading to discussions about the need to recenter the South (Fiddian-Qasmiyeh 2020), recognise its significance and the new directions of migration within the Global South (Nawyn 2016), and reorient the geopolitics of knowledge production. In this endeavour, the binary between North and South can be overly simplified and fail to recognise the increasingly heterogeneous and complex dimensions of an increasingly stratified South. Upper middle income countries have generated their own migratory systems which draws in both those from other countries of the South and from the North. They range across the less and more highly skilled occupations and not just of domestic and care workers for women and construction for men. For some, these locations have become attractive due to the barriers entering the wealthy countries of the North; for others, it has been younger females and males with high cultural capital but precarious livelihoods in the North who have partaken in such North-South flows. Indeed the latter may benefit from their status as migrants from the North to secure higher social status and economic returns.

The complexity of the migratory field been demonstrated in our research as part of the project Gendered Dynamics of Labour Migration (Middle East, South Asia), in particular in the research conducted in Turkey which draws in migrants from the Former Soviet Union, the Middle East and Europe. We use our interviews undertaken in Istanbul to question the geopolitics of knowledge production of and in an upper middle income country.

A Proposal for an Ideal-type of Second Generation Youth

Marilena Macaluso[1], Giuseppina Tumminelli[2], Marianna Siino[3]

[1]Cultures and Society Department, University of Palermo, Italy; [2]Department of Political Sciences and International Relations, University of Palermo, Italy; [3]Cultures and Society Department, University of Palermo, Italy

The term "second generation" is used in reference to a part of the population whose origins are different from those of the native residents. The expression highlights differences in both educational and cultural classifications between first generations who arrived in a new country, and the children of these who were born in the new country or came there as a result of family reunification in pre-school, childhood or adolescent years. Our paper deals with the theoretical and empirical aspects about second generation youth and their pathways to identity construction and political participation, which are strongly marked by the lack of recognition as citizens, the discrimination they suffer and the feelings of exclusion they experience. We present the results of a quali-quantitative analysis carried out with the support of the T-Lab software of a corpus extracted from forty-two in-depth interviews with second-generation young people aged between 18 and 30 and living in seven Italian cities (Palermo, Cagliari, Rome, Bologna, Milan, Turin and Padua), carried out within the framework of the European project OLTRE "Beyond. Counter-narratives from the margins to the centre". Furthermore, starting from our research we use Weber's ideal-type in order to create a second generation youth' typology.

Should I Stay, Go or Wait? Context and Meaning in Migration Decision-Making Amongst Highly Skilled Movers and Non-Movers from Israel and Turkey

Nora Meissner

Tel Aviv University, Israel

In light of contemporary global socio-political and socio-economic changes that unsettle taken-for-granted principles of liberal democracy, meritocracy, and social cohesion, it is important to rethink how we categorize and explain high-skilled migration. Based upon structural notions of brain drain/gain, most research regards high-skilled migration as a category of analysis that can only be understood in relation to external factors. Thus, highly skilled migrants are often considered as the paradigmatic example of voluntary economic movers. Yet, scant research has been done on how highly skilled individuals actually think, feel, and talk about migration, or what their strategies for and struggles around migration are. In other words, little is known about when and how migration works for highly skilled individuals, and why it prompts some of them to leave while others choose to stay. Seeing migration as an agency-centred category of practice, my presentation aims to further our understanding of high-skilled migration as a meaningful social action that involves both staying and leaving. Based on 80 in-depth interviews conducted in 2019 and 2020 with young, highly skilled women and men from Turkey and Israel living in Istanbul, Tel Aviv, and Berlin, I comparatively investigate the conjunctures in time and space at which they make the decision to leave or to stay as well as the meanings they attach to migration. Using the conceptual tool of a generational class my research links the local with the national and the global; illustrates how social changes manifest in individual lives; and emphasizes how choices shape and are shaped by social position.

German Poles' Experiences of Ethnoracial Exclusion

Eunike Piwoni

University of Passau, Germany

Since Lamont et al.'s (2016) ground-breaking 'Getting Respect' (PUP) the question of how ethnoracial exclusion is experienced by minorities has started to receive more and more attention. Yet, there is still a lack of studies exploring the experiences of what we might call 'invisible minorities'. Based on qualitative, semi-structured interviews with 23 second-generation immigrants of Polish origin (all of them German citizens) in Hamburg I shall contribute to filling in this gap. There are 2.2 million people of Polish migrant background in Germany, and approximately 1.4 million of them hold German citizenship. It is the second largest immigrant group in Germany. However, as Polish immigrants appear to integrate easily and do not seem to differ from German majority society in terms of phenotype, religion, or culture, they have been described as an 'invisible' minority.

In my talk, I shall present findings with regard to, firstly, incidents of experienced exclusion, and, secondly, responses to those incidents and general strategies of action to gain recognition in German society. In specific, I shall show that German Poles (in contrast to, e.g., African Americans) (1) refuse to frame specific incidents as 'discriminatory' or 'racist', (2) tend to locate incidents of exclusion in the past, and (3) frequently differentiate between their personal and either other groups' or other Polish people's experiences. As for their strategies to gain recognition in German society, I shall show that, in contrast to the group's image as an 'invisible minority', some interviewees aimed at making their ethnicity more salient in their everyday lives. The talk will also highlight within-group differences, and discuss the findings against the background of studies in different contexts.

RN35_T05_02 | The Reordering of Borders and Mobilities - 1

Border Control Between Civil Society and the State

Margit Fauser

Hochschule Darmstadt University of Applied Sciences, Germany

Much research on migration management and border control focuses on policies and dynamics on the national and European scale, while the role of local border processes has gained prominence that only more recently is attracting the attention from scholarship in the field. In these specific urban bordering processes, local non-state actors, welfare agencies and NGOs play an important role as they contribute to migration management processes and the production of borders. Like local authorities, different types of civil society actors operate and make decisions within spaces where they frequently have to interpret laws, regulations and ordinances in order to give advice or directly support migrants. In so doing they act within a dynamic legal context, often with vague guidelines, particular organizational cultures and professional commitments. Against this backdrop, we ask how local non-state actors contribute to disciplining migration and how they support migrants in challenging borders. How do street-level workers interpret their room for manoeuvre and frame their position in this setting?

The paper is based on empirical qualitative reconstructive research and draws from interview data that are currently being collected in the city of Frankfurt with representatives of civil society, welfare organizations and local authorities.

1148

Do I deserve to belong? Young Polish and Lithuanian migrants' perspectives on Brexit-implied reordering of borders

Dominika Blachnicka-Ciacek, Irma Budginaite

SWPS University of Social Sciences and Humanities, Poland

The notion of belonging, prominent in social sciences, has been recently used extensively in relation to Central Eastern European migrants in the UK. While the Brexit debates on migration have focused on the macro- politics of belonging and the topic of who deserve to stay and under which conditions, they have often bypassed the question of how these discourses of 'deservingness' surrounding Brexit, impact the everyday and intimate aspects of belonging among migrant communities. Drawing on the interviews with 77 Polish and Lithuanian migrants (in their 20s-30s) in the UK conducted from 2019 to 2021, this paper explores how migrants position themselves in relation to these discourses of deservingness and hierarchies of desirability, and how they negotiate their strategies of (non)belonging to the British society in Brexit Britain. We argue that the prominence of the deservingness discourse which has gained new momentum by the Brexit-implied reordering of borders entraps migrants in the constant process of boundary making and may in fact prevent them from ever feeling part of the 'community of value'.

The International Protection' New Borders. The Case of Climate Migrants

Marta Vignola, Michela Trinchese

UNIVERSITA DEL SALENTO, Italy

The impacts of climate change are creating serious environmental harms, forcing millions of people to migrate. The dissertation examines the climate migrations effects on the traditional forms of national and international protection in Europe and their possibility of emancipatory side effects (Beck, 2015). The economic and social inequalities which characterize this type of human mobility, when crossing international borders, define the inability of obtaining forms of protection. However, the phenomena that create these conditions are not natural, but depend to a large extent on the environmental and social unsustainability of the dominant economic system. This aspect shows the need to discuss the current architecture of human rights' protection, recalling the reflections on system crimes proposed by Ferrajoli (2019). The border studies (Mezzadra, Neilson, 2014; Rigo, 2017), are useful to understand in which way the borders, including the borders of law are widened, narrowed, and crossed by the climate migrants demand of protection, creating new democratic iterations (Benhabib, 2000). These processes of crossing are accompanied by an innovative use of certain concepts, such as dignity, vulnerability, and self-determination, reinterpreted through an approach based on human rights protection. The theoretical and descriptive framework is tested in an empirical section. The dynamics of implementation of the norm towards the climate migrants recognition, have been analysed through the analysis of three jurisprudential cases and nine in-depth interviews with nine interviews with heads of international protection recognition paths in Italy.

On the Production of (temporal) Difference: Examining Experiences Asylum Through Frames of Temporal

Sarah Philipson Isaac

Gothenburg university, Sweden

In this article, I analyse the experience of waiting as an administrative exclusion among individuals who have sought asylum during the temporary asylum law in Sweden. The law is here seen as manifesting a temporal governance, in which time and timing of the asylum application has detrimental effects for those applying for protection. The asylum process is analysed as a case of 'the production of difference' inherent to racial capitalism, which also functions as the overarching theoretical framework of the paper together with theories from the field of critical border studies. The empirical material comes from ethnographic fieldwork between 2018-2021, as part of a larger project on border temporalities and its manifestations within the temporary asylum law.

Focusing on the participants different experiences with state bureaucracies in relation to their asylum process, the analysis suggests that time and waiting is utilised as tools of exclusion and exhaustion, which here is understood as crucial to the enforcement of temporal governance. In line with Shahram Khosravi (2021), the participants' experiences of ennui function as an

1149

engendering of a political consciousness focusing on the resistance inherent in waiting practices: "a waiting-towards the not-yet is attentive and oriented". The analysis reveals the negotiations, strategies and struggles that take place within the realm of temporal governance. Through the theoretical lens of racial capitalism, the experiences of asylum politics are further understood as part of a larger matrix of power that includes groups and populations deemed as either 'unwanted' or 'troublesome' by the state (Rajaram 2018).

RN35_T06_01 | Claiming rights, changing politics, redefining citizenship

Long-Term Residents Or Delayers? A Call For Substantive Citizenship In Italy

Stefania Yapo

University of Trento, Italy

Is the delay of naturalization a form of claims making against a restrictive citizenship regime? The paper addresses this question by exploring life and citizenship trajectories of long-term residents from a third-country in the case of Italy. The Italian citizenship regime is among the most restrictive systems in Europe due to the specific requirements for third-country nationals upon naturalization such as a 10-year long residence track, a complete job record from the last 3-year period, and a discrete language knowledge. Based on ethnographic investigation, the analysis reveals the recurrent interlinkages between life-course transitions and the systematic delay of the naturalization process among long-term residents. Through the conceptual framework of denizenship, the analysis reconstructs on what basis the purposive delay of naturalization might be used to contest the functioning of a system that does not consider concrete forms of social involvement as objective measures of integration. Therefore, the diffused strategy of delay can be viewed as an informal but yet explicit grassroot instrument to reform the criteria for citizenship acquisition. The main argument is that denizens' lived experiences represents a wake-up call for a less arbitrary naturalization process that recognizes substantive citizenship, contesting the efficacy of the Italian "crown model" of citizenship. The paper aims to contribute to the ongoing debate on how

migration may trigger the emergence of individual based performative and substantive forms of citizenship, going beyond the legally based nation state monopoly.

Maghrebi Workers against France's National Railway Company: A Biographical Policy Analysis of Successful Mobilization Against Discrimination

Christoph H. Schwarz[1], Elise Pape[2]

[1]Institute for Social Research, Frankfurt/Main, Germany; [2]University of Strasbourg, France

In France, in the early 2000s, a group of several hundred Maghrebi-born workers engaged in a legal case against their (former) employer, the SNCF, France's national railway company. For decades, they had been denied equal wages, promotions, retirement pay and further benefits that their French colleagues had benefitted from. In 2018, the workers finally won this spectacular case at the Paris Court of Appeal, marking a milestone in the struggle against institutional discrimination in France. Based on life story interviews and informal talks with some of the railway workers, this paper analyzes the way French migration and labour policies as well as Moroccan diaspora policies have impacted the workers' life courses and inversely how the biographical experiences of the latter have shaped their individual and collective engagement. Based on the method of biographical policy analysis (Apitzsch, Inowlocki, Kontos 2008), the paper identifies structural and biographical conditions for engaging in this political struggle and sheds light, amongst others, on the importance of transnational dynamics in collective resistance in a postcolonial context. The article thus aims to contribute to the discussion on migrants' political agency in the struggle against discrimination, and how it is hindered or fostered by different policies by state institutions, enterprises, and trade unions but also by the regimes of the receiving countries of residence as well as the countries of origin (Iskander 2010).

Political Contribution of (Re)migrants in Lithuania, Poland and Croatia

Ingrida Geciene-Janulione

Vilnius University, Lithuania

After the Collapse of Communism many Central East European countries experienced large migration of their citizens to West European countries with deep-rooted democracies. A possible assumption is that emigrants adopt civic norms, values and practices prevailing in those countries and transfer them to those that stayed in their countries of origin. Such transfer can be both remote and direct after returning home. This presentation aims to reveal civic and political remittances made by return migrants in three Central East European countries – Lithuania, Poland and Croatia. Presentation is based on in-depth interviews with 43 returnees of these countries made in May –November 2020. By following theoretical insights on migrants' political influence on their country of origin (Keck and Sikking 1998, Piper 2009, Tabar 2014, Kessler and Rother 2016, Ahmadov and Sasse 2016, etc.) presentation explores political remittances forms, factors that influence the motivation to remit and process of transfer. Also it discusses acceptivity of these remittances by people in countries of origin.

Experience of Citizenship and Acculturation among Slavic Migrants in Poland

Jan Bazyli Klakla

Jagiellonian University in Cracow, Poland

This presentation is based on a research project that aims to deepen the understanding of the impact of institutional and legal factors on the process of migrants' acculturation. As part of the project, 20 narrative and biographical interviews were conducted with long-term migrants from Slavic countries currently living in Poland.
A thematic analysis of the collected data was carried out guided by Template Analysis method. The subject of citizenship was one of the most important topics that I identified. In my presentation I would like to present the lived experience of citizenship among my interlocutors and the impact of this experience on their acculturation orientations.
The results indicate, on the one hand, the irrelevance of this status due to the europeanization processes and the widening spectrum of rights enjoyed by denizens, and on the other hand, its role in achieving fair and equal treatment in the host society. In the presentation, I also consider the impact of the current political situation and the dominant public discourse on both the feeling of being welcomed in the country and the community, and feeling of responsibility for the state and democracy.

RN35_T06_02 | Migration and the Pandemic -2

Impact of the COVID-19 Pandemic on International Student Mobility: Challenges and Vulnerabilities

Carola Bauschke-Urban, Dorina Dedgjoni, Stephanie Michalczyk

Fulda University of Applied Sciences, Germany

The COVID-19 pandemic has severely affected the internationalization of higher education by posing unprecedented challenges for international students. It forced a dramatic reordering of the conditions of higher education mobility and increased already exciting multi-layered inequalities for international students in higher education institutions. This is particularly true for students from the Global South (Bilecen, 2020; Marinoni et al., 2020; Adnan & Anwar, 2020) and their vulnerable position in the higher education system. Previous research has especially drawn on the negative impact of the Covid-19 crisis on students' mental health (Husky, 2020; McCarthy, 2020; Peters et al., 2020), whereas our paper focuses a.) higher educational inequalities, b.) organisational inequality structures, c.) the radical change of mobility conditions for international students. Drawing on theories of transnational migration and on Bourdieu's educational inequality theory, we also included intersectional perspectives on social inequalities. Our sample (problem-focused interviews with 30 international students in the STEM field) was interviewed twice and in two waves – firstly before, and secondly, during the pandemic crisis and our data shows a dramatic change of international students' mobility experiences. The dynamics of our research setting, developed and analyzed on the background of Grounded Theory Methodology, gave the opportunity to focus the direct effects of the pandemic. Low income due to the loss of part-time jobs, increased learning diffculties, delay and endangerment of graduation, negative effects to student's future entrance and integration into the labor markets indicate a strong increase of vulnerabilities and challenges for international students. They suffer from dramatically changed experiences of mobility and living abroad under the conditions of lockdown and social distancing. Conclusively, the damage of previous mobility concepts is the consequence.

Struggling With And Responding To Migrant Poverty In The Times Of Covid-19. A Comparative Case Study Of Local Welfare Systems Responses To The Needs Of Low-income Migrants During The Pandemic.

Ewa Cichocka[1], Karolina Łukasiewicz[1,2], Kamil Matuszczyk[1]

[1]Centre of Migration Research, University of Warsaw, Poland; [2]New York University

The aim of the presentation is to discuss the research results of a comparative study of local welfare systems response to migrant poverty in the context of the COVID-19 pandemic. The presentation uses comparative case study design based on Berlin, Stockholm, London and NYC and the situation of Polish immigrants. The current crisis created unique challenges for the local welfare systems and left immigrants in a particularly vulnerable position. Scholars of international migration pay increasing attention to local policies focusing on cities' innovative integration policies. However, less is known about cities' response to the needs of their marginalized immigrant populations struggling with poverty. This presentation is based on comparative qualitative study results including interviews with immigrant service providers, local experts and Polish migrants and native-born who experienced poverty. The data was uploaded to Dedoose software and analysed using a grounded theory approach. In the presentation, we will discuss how the four various local welfare systems responded to the needs of low-income immigrants during the pandemic including implementing new, national-level policies, as well as developing new, local and community-based policies and programs. We will discuss similarities and differences across cities in their response, and reflect on Polish immigrants' various perceptions of these responses. Our results indicate that the crisis has been highlighting and exacerbating challenges that existed in the local welfare systems prior to the pandemic, such as "coordination challenge" and inequalities in services provided to immigrants.

1152

The Life Of Migrant Workers During Covid-19 Crisis: Decree Relaunch Italy And Its Contradictions

Alagie Jinkang, Valentina Cappi, Pierluigi Musarò

Alma Mater Studiorum, University of Bologna, Italy

Is well acknowledged that individuals' material conditions of existence count among the determinants of biopsychosocial health (WHO, 2010). Evidence demonstrates the pandemic deepened pre-existing socio-economic inequalities, impacted human mobility and worsened the conditions for migrants in marginalised and vulnerable situations (Zapata and Rosas, 2020; FLAI/CGIL, 2020; ILO, 2020). Within the Italian policies and public debate, multiple threats irregular migrants experienced during the pandemic got overshadowed by the need for essential workers caused by COVID-19 crisis (Giacomelli, Musarò, Parmiggiani, 2020). Due to this shortage, the Italian government, on May 19, 2020, issued a temporary regularisation to migrant workers, framing it as an act of legality and dignity.

This paper presents the results of two surveys conducted during and after the Italian lockdown, the first one aimed at exploring the living and working conditions of 85 migrant workers residing in Italy, the second one, linked to H2020 PERCEPTIONS project, aimed at collecting perceptions of 120 first-line practitioners on the impact of COVID-19 on their work and lives of migrants. Through the discussion of the surveys' outcomes, the paper provides an analysis of some of the paradoxes of the Decree Relaunch Italy, namely: the impossibility of social distancing for migrant workers amassed in 'ghettos', its high legal threshold and the subsequent subordination of workers to their employers. Highlighting the Decree's political narrowness and misused opportunity towards the socio-economic complexity of essential workers, our paper concludes by proposing a paradigm shift towards a systemic thinking on migrant workers' rights in the COVID-19 crisis.

Changing Representations Of Lithuanian Migrants In The Public Discourse In the Context of Covid-19 Pandemic

Irma Budginaite-Mackine

Vilnius University, Lithuania

With the intensification of the mobility of the Lithuanian population since 2004, the attention to this topic in both public and academic discourses has gradually increased. According to research carried out abroad, the portrayal of migrants and the conceptualization of migration experiences may change over time in response to significant 'unsettling events' (Kilkey and Ryan, 2020) such as the previous economic crisis or Brexit, which in turn may affect both migratory attitudes and other personal life decisions. Covid-19 pandemic as the most recent unsettling event may foster the 'discourse of fear' and induce negative attitudes towards mobile people due to the risk of spread of virus (Rafi, 2020). The paper aims to reveal the changes in the representations of Lithuanian migrants in the public discourse (2004-2020) and how the new unsettling situation connected to Covid-19 pandemic affects the meanings attributed to migration in everyday contexts.

Empirical data is gathered from internet media portals and analysed following the 'migrant discourse analysis' approach suggested van Dijk (2018). The changes in migration discourse in Lithuania connected to the newest 'unsettling events' (Brexit, Covid-19 pandemic) are compared with the representations which dominated in the migration discourse in the context of earlier 'unsettling events' (like global economic crisis that hit Lithuania in 2008-2009).

RN35_T06_03 | Debating positive effects on labour migration

How Institutional Interplay Shapes The Labour Market Success Of Immigrants: Perspectives From A Two Sided-Matching Process

Kevin Alan Franz Ruf, Florian Zimmermann, Anja Wunder

Institute of Employment Research, Germany

We investigate how economic and institutional interplay between the country of origin and the receiving country shapes the labor market success of foreign-trained immigrants (FTI) on the German labor market. We investigate the research from a two-sided-matching approach, considering employer and employee perspective. First, we assume that human capital quality acts as a proxy for the transferability of skills as well as for the quality of the educational system in the country of origin. We expect a similar economic development of home and host country positively to positively affect the labor market success of FTIs. Second, we test whether the institutional similarity of the educational system in the country of origin affects the labor market opportunities of FTIs in Germany, arguing that institutional similarities improve the overall job matching process. Consequently, we expect both – human capital quality and institutional similarity – to have a positive effect on the labor market opportunities of FTIs. In order to evaluate our hypotheses, we use pooled data from the German Microcensus. The sample units are foreign-trained immigrants from seven European countries. We use the gross domestic product per capita as proxy for the human capital quality. The share of upper secondary vocational educational enrolled in a dual system serves as proxy for the institutional structure of the home country. To measure the labor market opportunities, we use the employment status and wages as dependent variables. Results from a linear probability model and an interval regression show that the interplay between home and host country affect the employment chances of FTIs in Germany. While the institutional similarity increases the employment probability, the human capital quality positively affects wages.

Does Working Together Foster Positive Or Negative Attitudes Towards Migrants In Denmark?

Lancine Eric Diop[1], Anna Diop-Christensen[2], Christian Albrekt Larsen[1]

[1]Department of Politics and Society, Aalborg University, Denmark; [2]Department of Sociology and Social Work, Aalborg University, Denmark

Most previous studies examine exposure to diversity in a residential context. However, we spend most of our day at work. Therefore, workplaces are an interesting micro context for inter-ethnic contact. In this paper, we investigate the effect of ethnic exposure at work on natives' support for immigration. Here we contrast two hypotheses: 1) Based on the contact theory of Allport (1954), we may expect positive effects of contact on native attitudes, while 2) and based on the conflict theory (e.g. Blalock 1967; Olzak 1992; Quillian 1995) will expect that working with many migrants will foster resentment towards new migrants. We use a logistic regression model and combine Danish administrative data with the European Social Survey. The Danish administrative data represents a unique opportunity as it allows us to identity the degree of diversity at work place level and merge this information with individual attitudes towards migration.

1154

The Higher, The Better? Testing The Relative Impact of Social Capital on High- and Low-skilled Immigrants' Labour Market Integration.

Julia Rüdel

University of Heidelberg, Germany

With respect to immigrants' labour market integration, the advantages and disadvantages of having certain kinds of social contacts have mainly been discussed by differentiating between native and co-ethnic contacts. However, I argue that by linking general social capital theory with integration approaches the dynamics of social capital differ for low- and high-skilled immigrants and are actually more likely to be determined by the contacts' social position instead of by their ethnicity. I assume that the impact of social capital on labour market outcomes is not linear but takes on a converted u-shape function for low-skilled immigrants indicating that not the highest social contacts provide the most useful resources. As to high-skilled immigrants, I suggest that the relationship is exponential meaning that the highest social contacts particularly benefit their labour market integration. Using data of the National Educational Panel Study (NEPS), I rely on a position generator to operationalize social capital and test the impact on employment and occupational status. Estimating fixed effects models with lagged independent variables, the results support my hypotheses regarding the occupational status for the different dynamics among high- and low-skilled immigrants. However, they also indicate that the likelihood of getting employed increases for both groups with greater co-ethnic occupational diversity in their networks. This article advances the understanding and measurement of social capital in migration research and further contributes to the discussion of what kinds of social contact are beneficial for whom considering immigrants' labour market integration.

RN35_T07_01 | Networks, brokers, and diasporas

Small Network - Great Importance. Muslim Networks in Poland.

Maria Stojkow

AGH University of Science and Technology, Poland

In my speech, I will analyse the network of Muslims living in Poland who reached Poland during three waves of migration. Each of the waves of migration had its own specificity, related both to the country of origin of the migrants and to demographic issues. The Muslim community in Poland is not very numerous, dispersed, mainly visible in large cities. This makes interpersonal contacts between the Muslims quite difficult. A migrant's ability to move to a particular destination, find a job, open up an own business, can be directly impacted by the migrant's social network. Muslim networks have been recreated on the basis of depth interviews with representatives of the Muslim community in various places important for polish ummah. My main analysis focuses on hubs, which often also become 'network weavers', who take responsibility for building a network of relationships, do not wait for the connections to appear, they also prevent the groups from becoming too distant to each other, but actively create relationships and enable interactions between entire groups and individual people, who know and have contacts with an above-average number of other people, therefore they have a much greater influence on them than formal leaders. This kind of analysis help restore the dynamics of integration processes of this category with the Polish society, at the same time allowing to define attributes which, when changed, will have a significant impact on relations they participate in. This will allow to define barriers for the processes to include this category in the society and diagnose factors that are conducive to their isolation.

Welfare Brokerage and EU Free Movers' Access to Social Citizenship

Alexandra Voivozeanu

University of Liège, Belgium

While European citizens are granted free mobility of labour across Member States, poor language skills and the lack of knowledge of their entitlements often hinder their access to formal social protection in the country of destination. In this context, welfare brokers - actors that help migrants access social benefits in host countries - often step in.

Based on interviews with Romanian migrants in Germany, as well as with representatives of companies, civil society organizations or other types of intermediaries, this research will briefly explore the barriers encountered by migrants and show how they integrate the recourse to brokers among their social protection strategies. At the same time, it will analyse the ways in which various categories of welfare brokers (formal/informal, altruistic/profit-oriented, independent/part of complex networks) operate and strategize at a national and transnational level. To this end, the present contribution draws upon the literature on intra-EU mobility and welfare (Amelina et al 2020) and on the literature on migration brokers (Lindquist, Xiang, Yeon 2012).

Bridging Cultures, Bonding Lives – Social Networks of Refugee Women in Germany

Susanne Schuehrer[1], Giuseppe Pietrantuono[2]

[1]German Federal Office for Migration and Refugees, Germany; [2]University of Goettingen

This paper addresses social network formation and social isolation in the integration process among refugee women in Germany. Faced with a dramatic increase in its refugee population, their successful and rapid integration poses a pressing issue to German society. In this context, the pivotal role of social networks to support the integration process is unquestioned. So far, quantitative research widely neglected to focus on social networks' role in the integration process for refugee women in European countries. We aim to close this gap by analyzing a novel dataset from the representative study 'Forced Migration and Transnational Family Arrangements –

Eritrean and Syrian Refugees in Germany (TransFAR)'. Other than existing data, the TransFAR data contains detailed information on 1400 refugees from Syria and Eritrea, half of them women, who arrived in Germany between 2013 and 2018. Additionally, it includes comprehensive information on the participants' family and social networks. Based on this data, we examine women's social capital formation, focusing on their opportunities to meet people outside their families, their life situations, and social networks. As an additional subjective measure of social integration, we consider their reported feelings of social isolation. First results indicate strong influences of country of origin and long-term staying perspectives on women's network formation, while those effects are not observed in men. Furthermore, family orientation of networks differs strongly between countries.

Diaspora Policies And Path-dependence: A Case Study On Romania

Alexandra Deliu, Malina Voicu

Romanian Academy, Romania

1156

The fast-growing number of Romanians living abroad requires the adaptation of the policies employed by the Romanian state towards its diaspora. This paper analyses diaspora policies promoted by the Romanian state since 1990, combining interviews with key informants involved in the development of the new policy framework and the analysis of relevant documents issued by the institutions playing a role in shaping it. The study takes a longitudinal stance and focuses on two dimensions: who belongs to diaspora and what are the entitlements in terms of political, civic and social rights granted to diaspora. The results provide support to tapping and embracing perspectives, as proposed by Gamlen et al (2019), the motivation shaping Romanian diaspora policies residing in building and preserving a transnational Romanian citizenship, as well as in the state's interest in exploiting diaspora's resources. Due to historical reasons the first perspective prevailed over the second one, the diaspora policies being tailored for the needs of so called "historical diaspora" (Romanian ethnics living in the neighbor countries) and overlooking the needs of "diaspora of mobility" (citizens who left the countries for economic reasons since 1990). As outcome of path-dependence in designing policies, the needs of the new diaspora remained unaddressed leading to higher potential of social exclusion among their members, both at the destination, due to the emphasis on Romanian

identity, that might sometimes clash with the new social environment of migrants, and upon an eventual return at the origin.

RN35_T07_02 | Migration and Care Work: key challenges in current research

Claims-Making and Recognition through Care Work: Narratives of Belonging and Exclusion of Filipinos in New York and London

Rizza Kaye Cases

University of the Philippines Diliman, Philippines

Based on a larger study on mobility projects and networks of 134 Filipino nurses, domestics, and care workers in New York and London, this paper examines how Filipino migrant workers 'claim' their 'rightful' place in the place of destination within the context of underappreciation for the kind of (care) work that they do. Research participants tend to position themselves as valuable by differentiating themselves from the stereotypical image of migrants who are just after the benefits they can get from the 'host' country. Their feelings of belongingness and 'deservingness to be there' are also validated by the recognition that participants get from their work and perceived greater purpose of their role as care providers.

At the same time, the financial security that they were able to attain allow them not only to become a part of the 'host' society but, more importantly, of their 'home' country. However, while care work allows participants to see themselves as deserving to be in the place of destination given their contribution, being employed in what is deemed as low-status job can also make migrants feel that they are living on the margins of the 'host' society and that they do not really belong.

Thus, these ambivalences concerning migrants' claims-making and struggles for recognition through care work could be conceptualized as Irene Bloemraad's notion of 'structured agency.' On the one hand, claiming recognition conforms to certain normative ideals and constrained by immigration regimes and practices of 'controlled inclusion.' On the other hand, claims-making is also agentic as migrants try to fulfil their migration projects and assert their right to have better futures for themselves and their families.

Migration and elderly care work in Italy. Three stories about Romanian `badanti`

Sebastian Țoc[1,2], Dinu Guțu[1]

[1]National University of Political Science and Public Administration; [2]Research Institute for Quality of Life, Romanian Academy, Romania

In the context of the increase of women's employment rate in Italy and the fall of former socialist regimes in Eastern Europe, care work in Italy has been gradually redirected toward migrant care workers from this part of Europe.

The neoliberal economic model in Eastern Europe has created chronic unemployment, low paid jobs, and decreased living standards. Migration became one of the few options for the population to make ends meet. The migration began during the transition period and accelerated after the EU expansion of 2007. A United Nations report (2017) mentions that between 2007 and 2017, approximately 3.4 million Romanians left the country, representing 17% of the population, the second largest global migration rate after Syria.

According to the Italian Institute of Statistics, in 2020, approximately 1.2 million Romanians were officially living in Italy, being the largest group of foreigners in the Peninsula. Approximately 57% of Romanian migrants are women, most of whom work in the reproductive and care sectors.

Based on previous work (Vianello 2016), which describes two types of migrant care workers from Ukraine in Italy, we expand the categories, describing three specific types of care work migration from Romania to Italy. We provide an in-depth description of exploitation and power relations, informality in the relationship between employer and employee, and the consequences of the thin line between work and private life. The qualitative methodology is based on twenty semi-structured online interviews with Romanian care workers (informally "Badanti") and two interviews with stakeholders.

1157

"They Have Come to Die Here": Care for Elderly Migrants in Slovak Private Care Homes

Zuzana Sekeráková Búriková

Institute for Sociology, Slovak Academy of Sciences

Research on intersection of elderly care and migration focused especially on the migration of carers and studied care provided by migrant domestic workers either in the institutions or in the homes of elderly.

This paper focuses on different intersection of elderly care and migration, namely on institutional care provided in Central European countries to elderly migrants coming from Western Europe. Migrants here are elderly and they migrate specifically in order to be cared for by the institutions abroad. Drawing upon semi-structured interviews with executives, directors and employees of Slovak private care-homes for elderly, this paper examines infrastructure of transnational care provided for elderly migrants.

Foreign elderly migrants coming to Slovakia suffer from serious diagnoses and need intensive care. Their transnational migration is usually initiated by their relatives who seek cheaper alternatives to institutions in their home countries. Private care homes belong to entrepreneurs and are often part of wider entrepreneurial portfolios unrelated to care. While clients do not favour being placed in the institutions abroad, executives and carers in Slovak institutions acknowledge that foreign clients as burdensome. In this paper I will examine this difficult relationship of commoditized care.

RN35_T07_03 | Refugees, Asylum and Forced Migration

Reconfiguring Syrian Migration To Morocco And Belgium Before 2011And The Relationship Between Conflict And Displacement.

Virginia Fanny Faccenda

Université Saint Louis- Bruxelles, Belgium

My contribution focuses on the study of Syrian migration to Belgium and Morocco before the civil war of 2011.

From the outbreak of the civil war in 2011, Syrian forced migration has become a central theme in the contemporary research agenda. The work on Syrian mobility generally focus on the debate on humanitarian intervention and the influence of public policies by portraying Syrians as refugees living in camps or receiving humanitarian aid, in most cases in Middle East or Europe. Although forced migration is now at the heart of public debate, Syrian migration to Morocco and to Belgium appeared before the outbreak of the war. Since the 1970s, in Morocco, Syrian migration began with the coup d'état of the Baathist general, Hafez El Assad, where the middle class of entrepreneurs escaped from Syrian policy of nationalization and preferred the liberal context of Morocco to invest. In Belgium, many Syrian students chose to continue their university career as a strategy to benefit from scholarships and emigrate to Europe.

By these migration experiences, this contribution aims at reflecting on the relationship between conflict and displacement beyond the only humanitarian support for actors fleeing from an objective threat or living in a refugee camp.

The contribution will be based on the ongoing ethnographic research and it will retrace the mobility of Syrian privileged actors. With the help of biographical interviews and the reconstruction of private archives (travel documents, letters, residence permits, etc.) and of public archives (registration at the chamber of commerce, lists of companies, study stays and national registers, etc) it will reflect on the multiple ways of studying Syrian displacement from its authoritarian conflictual context.

Organized Violence and Forced Migration in Mexico and Turkey as Transit Countries

Ludger Pries

Ruhr-Universität Bochum, Germany

Ludger Pries and Berna Zülfikar
Between countries of the Global North and the Global South, two crucial transit countries are hosting a huge and increasing number of forced, temporary, and transit migrants: Turkey and Mexico. While the externalization policies of the countries of the Global North keep these countries as political barriers, organized violence and other factors constantly push forced migration towards these transit countries. The paper is based on an extended research of an international team focusing on the relation between organized violence and forced migration in Mexico and Turkey. Besides empirical field work and biographical interviews, empirical data gathering also includes surveys of more than 350 (forced) migrants in each of the countries. In the paper we will present first findings of the surveys related to the interrelations between (1) the forms and extend of organized violence experienced in the country of origin and in transit countries, (2) the role and impact of this experienced organized violence on migration decisions and migration as everyday social practice and (3) social factors of sociodemographic individual variables and family conditions.

From So Far To SO-CLOSE: Promoting The Inclusion of Refugees through Cultural Heritage

Ainhoa Flecha, María Fernanda Barrera, Sonia Parella, Massoud Sharifi Dryaz, João Pedro Silveira Martins, Teresa Sordé Martí

Universitat Autònoma de Barcelona, Spain

This paper presents the first results of SO-CLOSE (Enhancing Social Cohesion through Sharing the Cultural Heritage of Forced Migrations) , an H2020 project funded by the EC aimed at better understanding the use of cultural heritage and memory in the construction of collective identity.

RN35 | Sociology of Migration

Heritage constitutes a breeding ground for social actions and interactions that occur in the shared frameworks of meaning and experience. Heritage in this sense can take an active role in establishing communication between host society and refugees, stimulating activities aimed at enhancing the participation of local and refugee communities. Renewing memories and sharing experiences can also be a way for refugees to build links among each other and with places. SO-CLOSE gathers research centres, cultural institutions and technology companies to work on the co-creation of digital tools and the Memory Centre, a multilanguage multimodal platform to share cultural heritage.

This communication presents the results of the fieldwork conducted in 2020 in four EU countries with a history of exile and forced migrations: Italy, Spain, Poland, and Greece. A total of 197 semi-structured individual interviews were carried out with academics, policymakers, cultural institutions, NGOs, refugees and asylum seekers. The paper first discusses the inclusion processes by focusing on the experiences of refugees and asylum seekers in the destination country. The second part analyses access to cultural heritage and its connection to refugees' inclusion. The third part of the paper addresses the role of digital tools in the sharing of the experience of forced displacement between refugees and the local communities in Europe.

RN35_T08_01 | Migration and Education

Why We Should Take Care More About Interaction Effects For Exploring The Mechanims Of Inequlity In Education. Ethnic Effects At The Transition To Higher Education In Germany.

Swetlana Sudheimer[1], Hanna Mentges[1], Sandra Buchholz[1,2]

[1]German Centre For Higher Education Research And Science Studies; [2]Leibniz University Hanover

The theoretical model of Boudon (1974), originally developed to explain social origin effects, has been widely applied also for studying ethnic inequalities in

education (Kristen/Dollmann 2010). It allows us to understand if migrants' disadvantages in education can be explained by the fact that a migration background is often associated with weaker social backgrounds and poorer school performance. Various studies have since shown that, when additionally controlling social origin and performance, ethnic effects do not only disappear, but often even reverse.

However, taking a closer look at the rich body of research it becomes clear that studies usually limit themselves by only modelling gross and net effects of ethnic origin. Yet, this does not allow us to understand if ethnicity operates equally at all levels of social origin and school performance. This important question can only be answered if models additionally include interaction effects between migration background and social origin and performance, respectively.

Using data from the German DZHW Panel Study of School Leavers with a Higher Education Entrace Qualification, our analysis show that even at this late educational transition significant ethnic disparities exist. After controlling for social origin and school performance, migrants display a higher likelihood to enter higher education than non-migrants. Modeling interaction effects, it additionally becomes clear that social origin and school performance operate differently for migrant and non-migrant children. While non-migrants' educational decision depends on social origin and school performance, migrants' transition to higher education is not at all influenced by these factors.

Transnational Migration and Multigenerational Educational Mobility

Olav Nygård

Linköping University, Sweden

In this study, I explore how migration affects educational mobility over three generations. Quantitative studies on the relation between migration and education often suffer from destination-country bias in data, resulting in the conflation of ethnicity and migration, or in an inability to account for the pre-migration lives of migrants. This limits our understanding of social mobility and reproduction, and the role of migration in them.

In this study, I address this gap by using data on 2,000 migrants to Sweden and their children, collected through retrospective interviews. The data set contains detailed information about the respondents' lives before and after migration, including on their home conditions when growing up. By combining this information with Barro-Lee data on educational expansion, I study to what extent different migration-related factors – such as timing and reason for settlement in Sweden – are associated with different patterns in educational mobility. Preliminary results show how migration to Sweden is often associated with upward educational mobility in absolute terms (years of schooling) but downward mobility in relative terms (education rank). Downward mobility was particularly pronounced for refugees and their children. Labour migration and family reunification was in turn associated with slight upward mobility between the migrating generation and their children, but downward mobility in relation to the grandparent generation. The findings consequently question the standard narrative of integration as upward mobility, and highlight the importance of a transnational framework for understanding social processes.

African 'Incomplete Frontier Migrants with Convivial Disposition' in the Age of Digital Mobilities -The Case of African Students in China

Lin Chen1, Chinglin Pang[1], Sylvie Gadeyne[2]

[1]KU Leuven; [2]Vrije Universiteit Brussel

As China's development has led to the advance in higher education institutions, students from the South, especially those from African countries with strong relationships with China since Bandung Conference are increasingly finding their way to Chinese universities. Yet at the everyday life they are facing a manifold of obstacles turning their study period in China into a challenging endeavor. These constraints concern immigration regulations, educational program, access to health care, banking and financial services and the internship-labor market. This paper focuses on unveiling the history, development and current limitation of China-Africa higher education student mobility under the framework of Forum on China-Africa Cooperation in both Systematic and Non-systematic way, respectively in education, labor market, health care and social media sector. This paper seeks to gain insights in their life world through the theoretical lens of incomplete frontier mobility, conviviality and coping strategies. Adopting both conventional and online ethnography the findings demonstrate how African students reject taken-for-granted categorizations and in facing adversary and friction they find various ways to overcome them. Based on data from in-depth interview and ethnography online

1160

and offline, this paper investigates the coping strategies of African students when confronted with these systemic and non-systematic restrictions as incomplete frontier migrants with convivial disposition in the age of digital social connections, along with physical encounters online platforms are set up to discuss shared problems.

RN35_T08_02 | Migrant Vulnerability and Victimization

Vulnerability of Unaccompanied Foreign Minors in Italy

Giuseppina Tumminelli

University of Palermo, Italy

In recent years, the vulnerability of unaccompanied foreign minors who cross the Mediterranean sea and continue to arrive on Italian coasts has been emphasized with greater weight. The condition of unaccompanied foreign minors presents elements of fragility due to the difficulties both in being able to take care of themselves and in being in a fragile phase of development.

These are minors who have faced a journey without adults, who have experienced situations of violence and trauma during the phases of migration (before, during and after the journey) and re-traumas (during the journey and after arrival).

Unaccompanied foreign minors manifest post-traumatic stress situations, anxiety states, adaptation disorders. Another element is the presence of high numbers of minors who have suffered abuse, exploitation, violence and discrimination along the way. This entails in the country of arrival ensuring protection and special care. The analysis addresses the health repercussions of trauma, violence and hardship experienced in the country of origin, during the journey and in the context of destination of unaccompanied foreign minors.

The paper will be organized in two parts. In the first one, referring to data on the presence of unaccompanied foreign minors, the phenomenon will be presented. The second part will present the results of a research aimed at starting a reflection on the vulnerability of unaccompanied foreign minors in terms of the relationship between pathologies and diseases that unaccompanied foreign minors are carriers.

The Vulnerability And Resilience Of Transnational Families During Global Crises

Christian Schramm

Ruhr- University Bochum, Germany

Global crises, such as the current Covid-19 pandemic or the last financial and economic crises of 2008, generate shocks around the world. But their effects differ on local, regional and national levels of social spaces depending on their embedment in the flow of goods, funds and people. Migrants and their families who create transnational social spaces, i.e. transnational families, are crucial in shaping the specific outcome of global processes on these different levels. They are especially vulnerable because of their often disadvantaged positioning in societies of arrival or due to the economic dependence of family members in societies of origin. At the same time, as families, they show particular resilience to abrupt societal changes.

This paper discusses the ambiguous character of resilience in transnational families, which implies protection and opportunities as well as dependencies and risks for individual family members in societies of origin and arrival. To tackle vulnerabilities, individuals' social practices aimed at building resilience are referring to the local, regional, national levels of daily life as well as to the transnational space of the family. The study identifies factors and mechanisms that weaken or increase resilience and raises questions about the political equality of migrant families.

Resilience is conceptualized as the counterpart of vulnerability and implies the ability to withstand, adapt, innovate and recover from shocks and stresses. Families are conceptualized as figurations with fragile power balances implying unequal and shifting resource distributions among family members. The principles of biographical research are central to the methodology. The analysis is based on more than 20 (biographic) interviews and long term multi-sited empirical fieldwork related to Ecuadorian transnational families living between Spain and Ecuador (1990s–2014).

1161

Do Transnational Activities Abate Emotional Marginalization Of Migrants?

Coline Kuche

Georg-August-University Göttingen, Germany

In the last years, emotions have received increasing attention in migration studies. Nevertheless, empirical evidence based on population-representative samples is still scarce. Particularly the relationship between transnationalism and emotions is limited. This study aims to tackle this gap by examining the emotional experience of 1st/2nd Generation migrants in Germany. First, the role of transnational activities for emotions is outlined. Hypotheses are based on Randall Collins' Interaction Ritual Theory which states that interactions between individuals with similar symbolic systems and in equal power positions will create emotional energy. Thus, it is argued that interaction rituals via transnational activities abate the emotional marginalization of migrants. Second, empirical indicators of transnational activities e.g. transnational contact, visiting the country of origin or consumption of foreign media are discussed. The hypotheses are examined using data from the German Socioeconomic Panel (Waves 2007-2018). Panel data regressions are applied to predict migrants' relative frequency of emotional marginalization, anger, sadness, fear and joy in the last four weeks. The descriptive results show that migrants experience comparably more fear and sadness, but less joy and anger compared to natives. Furthermore, the multivariate analysis shows that e.g. contact to close family abroad abates the relative frequency of emotional marginalization. In general, emotional marginalization is strongly related to the self-reported experience of ethnic discrimination. In sum, migrants' lower emotional marginalization due to transnational activities asks for further investigation which might answer when and why migrants do or cannot pursue these emotionally decisive activities.

The Institutionalisation of Vulnerability Discourses in the German Resettlement and Community Sponsorship Programs

Tatjana Baraulina, Maria Bitterwolf, Florian Tissot

Federal Office for Migration and Refugees, Research Centre Migration, Integration and Asylum, Germany

As a reaction to the "summer of migration", many European governments have adopted "active refugee admission programs" (ARAPs), such as resettlement or community sponsorship programs. ARAPs aim at giving an opportunity to vulnerable refugees to come safely and legally to Europe for durable protection. However, ARAPs are also criticized for restricting the humanitarian movements to the EU to a small number of "most vulnerable refugees". Thus, the discourses on vulnerability established itself in the debate on European refuge politics. In the present paper, we show the "institutionalisation of vulnerability discourses" in the German Resettlement program and the German community sponsorship program NeST. We conducted 39 interviews with state and non-state actors, sponsors and refugees participating in both programs and reviewed administrative data on the admission process. The paper stresses the ambiguities and contradictions arising around the discourses on vulnerability in the German ARAPs. The UNHCR uses vulnerability as an operative tool to select the refugees to be resettled and as a lobbying tool to encourage member states to increase their resettlement quota. Actors promoting NesT develop a communication strategy to motivate potential sponsors, as NesT relies heavily on the financial and social support of sponsors. In contrast to the UNHCR, which stresses the inability to access full protection as a central feature of vulnerability, state and civil society actors deploy a narrative emphasising "the helpless among refugees". Both interpretations, however, contradict the agency and resilience of the refugees themselves. Although the refugees participating these programs know that their experience of flight, violence and loss is one reason why they have been selected for resettlement, they nevertheless refuse being treated as passive victims.

The Fertility Regime Of Immigrants And Their Descendants In Spain, Intergenerational Convergence?

Jesús García-Gómez, Chiara Dello Iacono, Guillermo Orfao, Mikolaj Stanek

University of Salamanca, Spain

Due to imprecedent increase of the immigrant population in the first decade of this century Spain is now the European country with the highest number of Latin American immigrants and the second highest number of Maghrebi immigrants. Although many studies have been carried out on the immigrants' fertility regimes in Spain, immigrant descendants' reproductive patterns have not yet been systematically explored, mainly due to lack of data. This study leverages the alluring oportunity to investigate the fertility regime of the 1st, 1.5 and 2nd generation of Maghrebi and Latin American immigrants in Spain between 2011-2015 using a new database which links Natural Movement of the Population Records to the 2011 Spanish Census. By means of Negative Binomial Regression Models and the construction of a set of interaction terms the quantum, the tempo and the role that labour market participation and educational level play on fertility is analized. Our results show a sharp constrast between Latin Americans and Maghrebians in Spain and their descendents in patterns of reproductive behaviour which supports main assumptions of Segmented Assimilation Theory. Latin American 1st generation immigrants have two differences with native-born women: an earlier transition to motherhood and no positive association between labour market participation and fertility. However, 2nd generation Latin American immigrants converge to the fertility regime of Spanish women. Maghrebi 1st generation immigrants have four differences with native-born women: a much higher fertility, an earlier transition to motherhood, a no positive association between educational level and fertility and a negative association between labour market participation and fertility. 2nd generation Maghrebi immigrants converge to the fertility regime of Spanish women, but still show clear differences.

Spatial Distribution, Residential Patterns and Mobility Strategies of Chinese Population in Barcelona Metropolitan Area

Yuelu He, Cristina López, Jenniffer Thiers

University of Barcelona, Spain

Chinese population in Spain has been constantly increasing since the end of 20th century even in the economic crisis of 2008. Till 2020 Chinese ethnic group has become the sixth largest migrant population in Spain and the third largest in Barcelona Metropolitan Area. Despite a growing scholarly interest on Chinese migration in Spain, there is still a lack of study on demographic changes of influx of Chinese migration to the host society over the recent decades. Likewise, what is not yet clear is their residential mobilities and localization patterns, although this approach plays a central role to understand the heterogeneity of socioeconomic and cultural characteristics of Chinese ethnic group in Spain, as well as their different migration trajectories.

This work analyzes characteristic of residential patterns of Chinese population in Barcelona Metropolitan Area and their intra-municipal mobilities in the area. Building on both quantitative and qualitative data, this research uses data from Residence Variance Statistics (EVR) collected by the National Institute of Statistics (INE) and qualitative material of 25 structured in-depth interviews with Chinese residents in Barcelona. Our preliminary findings indicate that Chinese residents are highly concentrated in a handful of municipalities and scarcely move once they settle down. Yet limited as their mobilities are, these intra-municipal mobilities have been found to be surprisingly intensive and deeply rooted in social networks within the ethnic group.

From the Global North to the Global South. European migrants in Latin-America: The case of Chile.

Sylvia Soto-Alvarado[1], Fernando Gil-Alonso[2]

[1]Universidad Austral de Chile, Chile; [2]Universitat de Barcelona, España

Though Global South to Global North migration flows predominate, some take the opposite direction. More specifically, this contribution focuses on European flows to Latin America, initially analysing the phenomenon from a quantitative perspective and then, from the qualitative one. Chile is selected as a case study. In the first part, the sociodemographic characteristics of European migrants –such as nationality, age, sex, educational level, and occupation– are analysed using Census and register data from 2002 to 2017. In the second part, qualitative analysis, through semi-structured interviews with Europeans living in Chile, is used to know, among other issues, the main reasons for choosing this country as a migratory destination. Using the sociological discourse analysis technique, a series of discursive positions are obtained from the interviews. Indeed, these positions were elaborated from four identified dimensions: motivation, personal or family strategy, choice of destination and migratory networks. Quantitative results show that Chile is now at a new stage of international immigration. Not only does it receive immigrants from neighbouring countries, as was traditionally the case, but also from other Latin American countries and from the Global North, including European countries. Qualitative results show, for instance, the discursive position of Spanish migrants. In a context of labour exclusion due to the global and national economic crisis beginning in 2008, these mostly highly qualified migrants sustain personal and professional fulfilment reasons for migrating.

RN35_T09_01 | Recent developments in researching labour migration

The New Migration and Labour Market: Italian Experiences in China

Grazia Moffa[1], Marianna Chirivì[2]

[1]University of Salerno, Italy; [2]Ce.Do.M

The new complexity of the geography of migration and the overlapping routes of flows requires a new point of observation (Calvanese 1992; Castles & Miller 1993) and an assessment of the different components of new migration. The choice to emigrate depends on many aspects and new interpretative approaches are needed (Moffa 2014; San Filippo 2017).

Statistics show a steady increase in the number of consular registrations based in the People's Republic of China: 10,779 Italians in 2019, an increase of 1,417 registrations compared to 2017 (MAECI 2019).

What dimensions act in the choice to emigrate and what aspects characterise the profile of Italians who decide to emigrate to China? In 2018, the Documentation Centre on New Migrations Ce.Do.M.-UNISA of the University of Salerno launched a research with qualitative analysis techniques. The reflections are based on fifty-three in-depth interviews with Italians in Shanghai.

The work follows two specific directions of analysis: the first traces the socio-cultural profile of the subjects interviewed, through the reconstruction of their life, training and work trajectories, family networks and friendships. The second one focuses on the new context of life, on the opportunities it offers or on the criticalities experienced. The paper contains part of the results of the research, highlighting some aspects of the new migrations from Italy: the push and pull factors, the presence or absence of a community, the process of work and social integration. Finally, we report some reflections on the impact of the Covid-19 pandemic on the life projects of the interviewees.

Keywords: International migration, China, Qualitative research, New italian emigration, Italy

Temporary Labour Migration From Ukraine: The Case Of Orchestra Musicians

Olena Gulenok

Graduate School for Social Research (Polish Academy of Sciences)

Over the past decades, a lot of research has been done on the migration of Ukrainian citizens to more economically developed regions. However, in studies of Ukrainian migrant workers, the focus is usually on either "uneducated" people doing low-paid work or "educated professionals" forced to look for "unskilled" jobs overseas due to being underpaid in Ukraine. In the case of orchestra musicians, to the contrary, highly educated professionals doing "skilled" work in their home country emigrate to work in the same field abroad.

Orchestra musicians from various Ukrainian cities regularly travel to Germany, Poland, Switzerland, the United Kingdom and other countries to work at theatres and circuses or play on the street for several weeks or months. This enables them to stay in a Ukrainian orchestra where they are paid too little to make a living. Some musicians may play on the streets overseas during winter holidays while officially being on leave at work in Ukraine; others may work on a cruise liner or in a circus for 2-3 months, for instance, to repay a loan. What many of them have in common is informal employment, "agents" taking up to 30% of their salary (also informally), low wages compared to the standards of an emigration country, feelings of instability and uncertainty about their futures.

In my research, I attempt to analyse mechanisms that allow for this type of migration (social capital, informal arrangements, regulations, etc.), reveal gender and race dynamics, and address labour conditions. The main method is in-depth interviewing.

The Impact of Sectoral Changes on Occupational Mobility of Immigrants

Julie Fournier[1], Sorana Toma[2]

[1]European University Institute; [2]Ghent University

The literature on immigrants' occupational mobility unanimously agrees that immigrants tend to experience downward mobility when entering the labour market of a new country. One of the main explanation put forward by the classical theory of assimilation is the less-than-perfect international transferability of human capital. Many studies have sought to empirically assess this theory, with the implicit assumption that the value of human capital is homogeneous within a domestic labour market. They have thus ignored that the transferability of human capital from one activity sector to another is imperfect as well. When immigrants also change sector upon entering the host country's labour market, the devaluation of their human capital may be partly due to the loss of value of the human capital which is specific to their pre-migration sector, rather than only the result of the devaluation of the capital acquired abroad.

We examine to what extent and in which ways sectoral mobility is related to occupational mobility using the French Longitudinal Survey of First-Time Arrivals. The descriptive and multivariate analyses show that immigrants who change sectors are much more likely to experience mobility, both downward and upward. This is coherent with an explanation in terms of human capital specific to the premigration sector as far as downward mobility is concerned, less in the case of upward mobility.

1165

Moral Economy And Deservingness In Immigration Policies: The 2020 Regularization In Italy

Maurizio Ambrosini

Universita degli Studi di Milano Dipartimento di Scienze Sociali e Politiche, Italy

This paper has two purposes. The first is of theoretical nature: to review the use of the moral economy concept in migration studies, and the related concept of deservingness. I will identify different versions and meanings, showing their significant contribution to the understanding of migration issues, but discussing their lack of consideration of a particular aspect: the conflict between competing moral economies.

The second and related purpose will be to apply the concept of moral economy to an analysis of the public debate on the recent measure, related to the COVID-19 pandemic, enacted to regularise unauthorised immigrants in Italy (May-August 2020). The measure, almost unique in Europe and in the Global North (only Portugal enacted a similar provision) has only involved workers, and specifically those who were employed in two sectors: agriculture and domestic/care services. This decision can be seen as a choice in terms of moral economy: some sectors and some immigrant workers have deserved more consideration than others.

The empirical material is constituted by declarations and statements of social and political actors who took part in the debate, using moral-economic arguments to support their position.

I will review it through the lens of competing moral economies and different notions of deservingness. In the conclusion, I argue that the concept of moral economy is intriguing and has great potential, but it needs to be refined, with more conceptual accuracy and clarity, and with more attention to its competing versions.

RN35_T09_02 | Migration, local solidarities and everyday interactions

A Transformative Education Program for Migrant Integration: What Happens in the South of Italy

Fiammetta Fanizza

Univesity of Foggia, Italy

This proposal discusses the strength of a transformative education program focusing the attention on the importance of the taking care about each other. It takes cue from the rebuilding of the Ninth Ward of New Orleans after the hurricane Katrina in 2005 to argue the possibility af a new model of welfare.

In the view to consider welfare according with a generative approach, this proposal argues of a different system of integration for migrants and refugees and for this reason tells about what is happeing in the South of Italy, and expecially in the Apulian Region where the local government develops trasformative education programs for social inclusion. No different rules for migrants but, together with native people, a particular system of public engagement (Piano Triennale per le Politiche Migratorie 2016 - 2018, a sort of local government masterplan for migration poicy) faces marginality for the achievment of common wellbeing.

This proposal assumes that combining both different categories of people and problems in the view of the achievement of generative and interconnected forms of welfare deals with the idea of a real integration. Because the Covid pandemia, the improvement of this latter becomes particularly urgent, either by the safety point of view and, generally speaking, for the the achievement of higther social justice levels.

Explaining Changes Over Time in the Native-Immigrant Gap in Active Civic Participation: The Role of Socioeconomic and Cultural Factors

Anders Bastrup Jørgensen, Hans-Peter Y. Qvist

Aalborg University, Denmark

The social integration of immigrants – referring to the extent that they engage in social interaction with natives – is considered a crucial issue in Europe. One key indicator of social integration is active civic participation in voluntary organizations. However, while cross-sectional evidence from various European countries has shown gaps in active civic participation between immigrants and natives, little is known about how these gaps have developed over time and why. One theory that we label "the primacy of socioeconomic integration theory" is that immigrants' social integration is largely an epiphenomenon of their socio-economic integration. Another theory that we call "the primacy of cultural background theory" is that immigrants' social integration depends on their cultural background. In this paper, we draw on a combination of repeated cross-sectional survey data and administrative register data to examine how the gap in active civic participation between immigrants and natives has developed over time in Denmark. Next, we examine to what extent the trend in the native-immigrant gap in civic participation is explained by socioeconomic and cultural indicators depending on the immigrants' countries of origin.

Reconfiguring Spatialities of Survival: The Case of Sub-Saharan Street Vendors in Madrid during COVID-19

Paola Leenhouts González-Espejo

Universidad Complutense de Madrid, Spain

"Top manta" is a widely used expression in Spain to label a type of street vending carried out public spaces through the use of a blanket (manta) to transport and showcase what are majorly forged products. It is often performed by males from West African countries, mainly Senegal (Espinosa, 2017), who in light of not having a regular administrative status, constantly face copious difficulties to access the labour market (Cachón, 2011) and vice versa, earning in the meantime their living with this informal activity. Since 2015, selling forgeries has been punished by Spanish Criminal Law (Martínez Escamilla & ASPM, 2014) while informal street vending is deemed illegal by most municipal and regional ordinances in Spain. However, and especially so prior to the COVID-19 pandemic, it was a commonplace scene in urban centres and coastal regions in Spain and other Southern European countries, such as Italy or Greece (Fyssa, 2016). The COVID-19 pandemic has had a magnifying effect of those social inequalities inherent to our societies, creating along the way new forms of exclusion. Mobility restrictions have precluded the existing (and risky) possibilities of earning a living by selling goods in public spaces (squares, streets, metro stations or beaches). Moreover, street vendors who did not have a regular administrative status could never opt to any kind of government aid during this sanitary crisis. Many others feared going outside and being stopped by police during the total lockdown. Amidst these changes and normative impositions towards the so-called "new normality" in cities, this contribution explores how top manta street vendors find ways to reconfigure their spatialities, through the use of technology and the articulation of local solidarity networks.

1167

Life in Limbo: The In-Between as a Window of Opportunity (A Case Study)

Joshua Guiness[1], Daniel Kuhnert[2]

[1]ETH Zurich, Switzerland; [2]TU Berlin, Germany

Hegemonial concepts of belonging continue to form the ideological basis for the European Union's migration policies of exclusion: through restricting freedom of movement and imposing wearisome bureaucratic procedures, asylum seekers and immigrants are condemned to powerlessness and sub-citizenship. The EU's externalization of 'the stranger' creates a state of perpetuated limbo that leaves people in between the solid states of conventional social norms and kinship relations. This leads to a state of 'fixed temporality' for migrants in Athens.

Borrowing from the concept of liminality by Victor Turner, our interest lies in discovering how this in-between state affects the everyday life of migrants in Athens. During rites of passage, the rules and conventions of society do not apply. In the case of Athens as an arrival hub for refugees and migrants, liminality occurs both on the larger scale of refugees' legal status, their geographic location, and on the micro-scale of their everyday life. A condition in which refugees cease to be seen as legitimate members of their societies of origin as well as the society they live in produces an undefined, often excruciating state of paralysis – but it potentially also enables a form of life different from before and after. Could this liminal state of transition be used to propose a radical re-thinking of kinship, communal life, and spatial justice?

This qualitative research explores the shifts in societal norms and everyday experience for migrants during the limbo state and illustrate how these inform their way of life and socio-political consciousness. Covert participant observation in two accommodation projects for refugees in Athens, Greece, over a period of six months provide the empirical grounds of this work.

RN35_T10_01 | The Reordering of Borders and Mobilities – 2
Reconfiguring mobilities and identities: Effects of Brexit on British citizens abroad

Christine Barwick

Humboldt University Berlin, Germany

Without a doubt, Brexit led to a reordering of European borders with serious consequences for intra-European migrants and their possibilities to be mobile. In fact, intra-European mobility is the major ingredient of European citizenship and the one with direct impact on European citizens. While European migrants in the UK faced difficulties regarding their right to remain, the situation for British citizens abroad was even more severe in that they faced the withdrawal of their European citizenship and hence their right to free movement. With this background, the presentation examines the consequences of Brexit for British citizens in Berlin, with a focus on their (changing) mobility/settlement plans as well as the strategies they develop to pursue these plans. Adopting a spatio-temporal lens, I examine the changes that are Brexit, particularly the 'return' of legal integration, and the reconfiguration of spatial identities. To secure the right to stay put and to remain mobile within the EU, the respondents had to resort to legal mechanisms, applying for citizenship or a residence permit. Moreover, Brexit also leads to a reconfiguration of spatial identities, whereby belonging to the nation decreased, and European belonging increased. Thereby, free movement is key as it can be considered as an expression of one's identity as an open and curious European who supports diversity. Thus, Brexit and its reordering of borders leads to a reconfiguration of mobility/settlement plans, but also has symbolic effects on the affected people's spatial identities.

1168

Sticky Borders: Senegalese Migrant Navigation Of Every Day's Bordering Practices In Oujda, Morocco

Imane Bendra

University of Antwerp, Belgium

Beyond the borders spectacles at the frontiers of Spain and Morocco, the externalisation of European migration policy in Morocco led to the proliferation of borders within the territory. On a micro-level, migration externalisation policies are visible through bordering practices that produce inequalities, exclusion policies and stereotypical perceptions of migrants (Faist, 2009). These practices are embedded in discourses, institutions and attitudes and differentiate between migrants based on social, cultural and spatial borders (Balibar, 2002, Yuval-Davis, 2013, Anderson, 2014). This article is based on fieldwork in Oujda, Morocco and on life-history interviews with Senegalese migrants. Senegalese migrants who work as street traders in Morocco perpetually interact with border externalisation processes imposed from above yet shaped locally by different actors and practices.

By focusing on everyday experiences and encounters, I argue that the bordering within the city is not only a process enacted onto migrants but becomes an embodied condition generated by restrictions placed on their mobility and their activities by state and non-state actors. I argue that the border is continuously relocated, following the migrants' mobility, sticking to their bodies (Brems et al., 2019) and visible with their movement through the public space. I analyse how Senegalese migrants are stopped, controlled and displaced by bordering processes and how they navigate these policies to continue their activities. Stepping away from the border zones, this article contributes to the literature on the proliferation of borders in non-European urban settings, on how externalisation policies are performed and challenged on a micro-level.

Civil Society Organisations, Civic Stratification, and Migration: A Comparison between Four European Countries.

Dana Brablec

Bangor University, United Kingdom

European societies face a series of economic, political, and cultural challenges that are restructuring social cohesion and stratification patterns as well as dynamics of inclusion and exclusion in communities, labour markets, and citizenship. Building on the notion of civic stratification as an analytical framework, broadly understood as a system of differential granting or denial of rights, this paper explores the factors shaping civil society organisations' engagement with migration, boundary mechanisms, and forms of bordering. Civil society organisations have played a leading role in social cohesion as well as in the promotion of social capital production, social participation, and democratic engagement, among many other areas. However, civil society organisations are not homogeneous, nor do they constitute a cure for all the uncertainties that affect contemporary societies. Through a comparative cross-national analysis that adopts a plural causation approach and based on online in-depth interviews with civil society organisations' professional workers, this paper examines how eight civil society organisations working in the area of migrants socio-economic integration in four European countries (Czech Republic, Ireland, Sweden, and the UK), navigate and contest contemporary challenges such as public funding limitations, socio-political polarisation and, more recently, the consequences of the COVID-19 pandemic.

The New Borders Of International Protection: A Case of Climate Migrants

Michela Trinchese

University of Salento, Italy

The dissertation examines the European jurisprudence's evolution proposed by transnational climate migration. The research question is what way the link between climate change and migration calls into question the traditional forms of international protection in response to new social demand of protection.

The borders, territorial and regulatory, produce and reproduce specific subjectivity, in this case the gap between the legal and illegal migrants, who find themselves involved in border struggles (Mezzadra, Neilson, 2014), in an attempt to cross them.

In these border struggles, the climate change' social impacts define what Beck calls "emancipatory catastrophism" (Beck, 2015), that is a discussion within the present international protection normative, that produce democratic iterations (Benhabib, 2000).

The empirical section is developed through the qualitative approach. The case law products about climate migrants' protection are analysed through semantic analysis of the texts, to identify the main principles or concepts used to include the climate migrants within the international protection system. In-depth interviews with privileged subjects may offer further insights.

The judges do not live their role in a passive way, but involve in the border struggles in an attempt to reproduce or call in question the borders of the law. The work of different Courts are extending the lateral datum of the immigration law to include the climate migrants.

The concept of system crimes Ferrajoli (2019) remembers that the violations of human rights as economic system's consequences, like climate change, are without protection. Therefore, it is important to further the discussion about climate migrants' protection.

RN35_T10_02 | Discourses and Politics of Asylum and Forced Migration

Integration as a Discursive Construction, or: The Imperative of Integration

Stefan Röhrer

IAB - Institute for Employment Reasearch, Germany; University of Luxembourg, Social Research and Interventions

The contribution proposed analyses the (German) discourse on integration and describes its effects on the level of subjects. While showing that the discourse of integration appears as an imperative to refugees, I draw on biographical narrative interviews to analyse how refugees from Syria are interpellated by this discourse and how they (can) react to it. It is shown that the case-specific understanding of integration has an enormous influence on the assessment and implementation of arrival processes. These reconstructed understandings of integration among the refugees who arrived here range from integration as reciprocity, integration as orientation towards fundamental rights or administrative act to an understanding of integration as overcoming one's own perceived cultural foreignness.

In doing so, I understand the discourse as Interpellation (Althusser) and the interview situation as articulation (Hall). This makes it possible, as suggested by Spies (2017), to use a concept of subject oriented towards Butler and Foucault in the sense of empirical subjectification research to ask about possible subject positions in discourse and their influence on subjects positioning as well as their power to act. The interviews were conducted as part of the IAB-study "Networks of Integration".

Cultural Varieties of Framing Refugees: How the Admission or Exclusion of Refugees is Justified in Political Discourses in Six Countries around the Globe

Daniel Drewski, Jürgen Gerhards

Freie Universität Berlin, Germany

In the past years, the number of refugees and asylum seekers has increased substantially across the world. In principle, under international law, all countries are equally obliged not to "refouler" (push back) refugees and asylum seekers and not to discriminate between them on the grounds of ethnicity, religion, origin etc. In practice, however, countries vary widely in terms of their public discourses on refugees, and the number and kinds of refugees they admit. For example, Turkey has adopted an "open border policy" for refugees fleeing the Syrian civil war. In contrast, Poland has completely sealed its borders towards refugees from Syria. How can these differences be explained?

We argue that the variety of national discourses on the admission of refugees is primarily shaped by a country's national self-understanding and how actors construct a nation's collective identity. Accordingly, differences in the definition of one's own identity are related to differences in the definition of "otherness". Our analysis is based on a qualitative discourse analysis of parliamentary debates on refugees in six countries: Chile, Germany, Poland, Singapore, Turkey, and Kenya. All these countries face pressures to admit refugees, but some of them react with more restrictive and some with more permissive policies. With this selection of countries, we cover different displacement situations and explicitly include countries from different regions across the world, given that many studies on refugee-related discourses tend to focus on the Global North.

Closing Buildings, Shifting Borders: Contentious Politics over Urban Relocations for Refugees and Asylum Seekers

James {Jay} G. Johnson

University of Toronto, Canada

The majority of the world's refugees and asylum seekers live in cities, despite various policies to limit their access to urban areas. While territorial borders and legal rights are often discussed at the national scale, the governance of refugees and asylum seekers in urban spaces draws attention to contested borders and rights within specific cities, neighborhoods, and buildings. Various studies have importantly highlighted the exclusionary effects of urban confinement and bordering for refugees and asylum seekers, while there remains further opportunity to analyze the underlying political and legal contention over the relocations and closures of specific buildings and urban spaces designated for refugees and asylum seekers. Therefore, in this paper, I argue that resistance to designated spaces and buildings for refugees and asylum seekers are embedded within longstanding and contested social, racial, and spatial urban boundaries that stand in ambivalent relationship to nationally-defined territorial borders and legal rights. To support this argument, I build on fieldwork and legal research concerning contentious politics among various state institutions and civil society actors, including local businesses and non-profit organizations, over the relocations and closures of Refugee Reception Offices (RROs) in South African cities, in direct comparison with contentious politics over accommodation centers and camps for migrants in French cities. By looking at contentious politics over particular urban spaces and buildings, I highlight the limitations of nationally-defined borders and rights, with certain cities and urban spaces perceived as more relevant and contested for the broader realization of legal rights and reconfiguration of state borders.

The Role of Personal Social Network in the Labour Market Integration of Refugees

Kamal Kassam

Federal Institute for Population Research, Germany

The role of family members and the personal social network (PSN) of migrants is crucial for their integration into the labour market of the destination country. However, the literature on this topic in the context of forced migration is still scarce. Therefore, this paper aims to fill this research gap by exploring the importance of PSNs for refugees' labour market participation. I use a novel dataset from the project "Forced Migration and Transnational Family Arrangements - Eritrean and Syrian Refugees in Germany" (TransFAR). TransFAR provides a wide range of information about socio-economic characteristics of 1458 Eritrean and Syrian refugees living in Germany since 2013. It also offers a wide range of details about the family arrangements and the structure, as well as spatial distribution of their personal social networks. By estimating different logistic regression models, I am analysing the extent to which PSN structure (family, ethnicity, gender) can explain refugees' employment status (unemployed / employed, i.e. entered the job market through a payed job or vocational-training). To account for classical explanations of labour market integration, I also control for the variables of family composition as well as age, gender, education, country of origin and further demographical and economic variables. Preliminary descriptive results show that about 68% of men and 16% of women are employed and have on average 4 to 5 people in their PSN. Furthermore, the finding indicates that the more diverse the refugees' social resources are, the more likely they are to enter the labour market.

RN35_T11_01 | Cultural diversity, minorities and arts in the city

Life in London on the eve of Brexit - Polish migrants' reports

Katarzyna Anna Winiecka

University in Bialystok, Poland

In 2016 there was a referendum on the United Kingdom's membership in the European Union. It was a moment when many migrants (re)considered their presence and their position in the society of the United Kingdom. One of the largest affected groups of migrants were the Poles. The purpose of this presentation is to present the situation of Polish migrants on the eve of Brexit, from the perspective of life in a multicultural and superdiverse city - London. The spectre of Brexit has brought out social tensions, detectible to varying degrees depending on the social character of the place of residence in question. In this presentation I have tried to answer the question: How has the multiculturalism and the superdiversity of London influenced the social mood and the social status of migrants facing Brexit? The article was based on 25 in-depth interviews with Polish immigrants living in London. Interviews were carried out at the end of April and the beginning of May, and in October 2019.The theoretical basis for this research was concept of social anchoring (Grzymała-Kazłowska 2013).The research was realised within the framework of the scientific program: "The process of the social (re)adaptation of Polish migrants in London when facing Brexit – change and redefinition of social status from an intragroup perspective"

The Discreet Appeal of Cosmopolitan Cities: the Migrantour Project

Ilenya Camozzi[1], Felicitas Hillmann[2]

[1]University of Milano-Bicocca, Italy; [2]Humboldt-Universität Berlin, Germany

In post-industrial cities, with high shares of migrant populations, over the past two decades regeneration policies were directed towards tourism, leisure and culture. These urban strategies prioritise the needs of short-term visitors over those of the resident population, and have led to the commodification of migrant neighbourhoods, promoted in travel guides as 'must-see' districts, and multicultural festivals. Alongside these municipal policies, smaller-scale, more bottom-linked initiatives connected to migration and ethno-cultural diversity have emerged, producing a sort of counter-model within the urban fabric. Our paper focuses on a project entitled 'Migrantour', co-funded by the European Commission, which offers intercultural urban walks in 20 European cities: a form of responsible tourism which aims to combat securitarian narrations of the city. The project focuses on visitors and the resident population at the same time. The guides themselves are first and second-generation migrants. We explore this form of migration-led regeneration and its ambiguities through the lens of cosmopolitanism. While post-industrial cities may prove capable of reframing their migrant neighbourhoods as cosmopolitan, rather than spatial 'ethnic' concentrations, smaller cities need to come up with a completely different approach. Our exploration of the dynamics and contradictions of this project sets out to identify the conceptual boundaries among different types of mobility within urban settings.

Roles of Immigrant Art within Communities and in Relation to Host Societies

Özlem Alioğlu Türker, Hayriye Erbaş

Ankara University, Turkey

The artists as a category within immigrant groups have so far gained scant attention despite their seminal potential regarding debates on cultural diversity, cultural incorporation, integration, interculturalism etc. in the field of immigration research. This paper aims at analyzing roles of immigrant art and artists within immigrant communities and in relation to host societies. The artists may follow personal artistic aspirations and ascribe one's artistic production with further purposes within a social milieu as well.

The qualitative research is based on fifteen in-depth interviews conducted with Iranian immigrant artists in each country, Turkey and the USA. Host countries are subject to comparison in the contexts of nation state formation, citizenship regimes and immigration policies to distinguish post-migration processes. The Iranian immigrant communities in two countries have diverse group embodiments due to diverse host country conditions. Thus, the Iranian immigrant artists within these communities and in relation to host societies, attribute various roles to their artistic productions and practices. The roles of immigrant art may be delineated in two putative groups of artistic aspirations. First group of roles which may be associated with group closure and self-segregation tend to strengthen in-group solidarity, reinforce cultural memory, preserve and reinvent tradition, empower next generations against assimilation and so on. The second group of roles i.e. cultural incorporation, group identity-cultural heritage representation, protests for group rights and intercultural dialogue may be considered as mediums of acculturation and integration. This paper comparatively investigates the immigrant community and host-society dynamics that lead the immigrant art/artists to assume either group of roles.

1173

Living Arrangements among Older Migrants in Europe

Francesca Zanasi, Maria Carella

University of Bari, Italy

In Western societies, the share of older foreign-born population is increasing: individuals who migrated early in life are "ageing in place", and late-life migrants relocate for amenity or to reunite with family. However, studies on European older migrants´ living arrangements are lacking. The topic deserves consideration to shed light on older individuals´ support network, and eventual situations of social isolation in a frail stage of life. With SHARE data (2004-2017) we investigate the older population´s living arrangements, namely living alone, living only with the partner, living with children, and three-generational households (co-residence with children and grandchildren) in selected European countries. We compare native- and foreign-born individuals aged 50+, considering the age at migration and country of birth. Preliminary results show that the destination country matters more than the migratory background: foreign-born older individuals adopt the living arrangements typical of the destination country. Co-residence with children is more common in Southern Europe, while in Northern Europe more individuals live alone or only with the partner. Nevertheless, differences emerge when looking at three-generational households. They are more prominent in Southern European countries among foreign-born individuals, and especially among those who migrated after the age of 40. The differences are not very pronounced according to the geographical area of origin; overall, it seems that migrants from within Europe are more likely to live only with the partner, while migrants from other continents (Africa, Asia) more often reside in three-generational households.

RN35_T11_02 | Seasonal Work and Temporary Migrant Worker Programmes

Work Migrants Between Borders – Precarious Work And Lifeworlds In A Europeanized Labour Market

Ingrid Jungwirth[1], Tesseltje de Lange[2], Anita Böcker[2], Lisa Berntsen[3], Sandra Mantu[2], Natalia Skowronek[2]

[1]Rhine-Waal University of Applied Sciences, Germany; [2]Radboud University, The Netherlands; [3]De Burcht, The Netherlands

1174

With the Covid pandemic the highly precarious working and living conditions of work migrants in 'essential' sectors have come once more into the focus of public interest. This was promoted through outbreaks of infections in the meat processing industry, for example in Germany, which had an impact on the municipalities where they are located and led to a shut down of entire districts. Although these precarious working and living conditions have long existed, they have not been researched in an encompassing manner so far. Taking the pandemic as a starting point, our joint research has the aim to get in-depth insights into work migrants' working and living conditions in the Euregio region Rhine-Waal, located in Germany and in the Netherlands, which is characterized by a dynamic history and presence of migration and mobility. Another more recent distinctive feature is the intra-European mobility of work migrants from East-European states, some of them commuting across the border and dividing employment and lifeworld between the two countries. In this context our collaborative, interdisciplinary and mixed-methods research project has the aim to find out to which extent transnational social fields have evolved with this practice, spanning the societies in the Rhine-Waal region and, additionally, the work migrants' societies of origin. Taking up the approach of precarization in the world of work, we research to which extent work migrants are being expropriated from their social rights and work rights in

this Europeanized labour market with its divided responsibilities and liabilities.

Transnational Migration and Social Change. An Exploration of the Mechanisms Through Which Labour Migration Can Reduce Poverty and Inequality

Guri Tyldum

Fafo, Norway

Migration is often associated with increased incomes for migrants and their families, and although migration and remittances is claimed to have a poverty reducing impact in many policy initiatives, there are still significant gaps in our knowledge of how and when migration can reduce poverty in a population. In this paper I investigate current theories of poverty and migration to identify the key mechanisms through which migration can reduce poverty for individuals, communities and for nations at large. The paper focusses on transnational practises of short term (circular) labour migration, and draw on research from Eastern Europe and Asia. I show that migration can have a poverty alleviating effect for individuals and communities in some context, in particular in softening negative impacts of economic restructuring and economic crisis. However, the relationship between migration and social change is more complex. Although migration can empower marginalized groups by giving access to resources, ideas and networks, short term (circular) labour migration is not likely to change structural inequalities, discrimination and marginalization, and in some cases, the alleviation of acute poverty provided through labour migration can be argued to delay required economic transformations and social change.

Temporary Labour Migration, The Pandemic And Precariousness Beyond The Metropole

Martina Boese

La Trobe University, Australia

In the face of the growing popularity of temporary labour migration programs with governments across the globe, critics of such programs have highlighted the precarity such policies entail for temporary migrant workers. This paper will critically review and add to this body of scholarship by applying the concepts of precarious migrant status (Goldring and Landolt 2011) and precarious employment (Vosko 2010) to the analysis of qualitative interview data with migrants on different temporary visas in Australia. This data highlights different dimensions of precariousness that extend beyond work and legal status and beyond the temporary visa holders themselves to their family members as well as other vulnerable labour market participants with forced migration backgrounds. Many of these impacts are directly or indirectly produced or enabled by regulations and are exacerbated in regional and rural locations where many temporary migrants are channeled to address labour and skills shortages. Adjustments to temporary labour migration regulations during the pandemic in combination with recent government responses to temporary migrant labour shortages have further revealed the limitations of temporary migration policies that are solely guided by short term labour market goals. The paper will discuss these limitations and the tensions between economically oriented temporary labour migration policies at the federal government level and policy initiatives in the areas of multiculturalism, interculturalism and social cohesion at local government and State level in Australia.

1175

The Agricultural Work in Times of Covid: the Case of Huelva from a Gender Perspective

Berta Güell, Blanca Garcés-Mascareñas

CIDOB, Spain

The health crisis has made more visible than ever the multiple vulnerabilities to which agricultural workers in Spain are exposed in terms of labour rights and living conditions. These vulnerabilities are sustained in a highly segmented labour market based on criteria of ethnicity and gender (Hernández and López 2015), and in policies of sexual labour division in search of 'migratory utilitarianism' (Morice 2007). In this context, women of migrant origin are especially exposed to a series of discriminations that respond to the intersection of different axes of inequality (gender, ethnic / racial origin, age, etc.). Starting from the pre-Covid scenario, this communication delves into the impact of the pandemic on the situation of seasonal workers in the agricultural enclave of Huelva. In particular, it focuses on three key aspects of agricultural work: recruitment, working conditions and living conditions in a context of closed borders, difficulties in geographical mobility and protocols to comply with sanitary measures. This communication is based on the analysis of 30 in-depth interviews conducted during the pandemic, in the framework of a recent European research project around migration governance (ADMIGOV).

RN36 | Sociology of Transformations: East and West

RN36_T01 | Changes in political dimension

Development of Class Based Voting in Slovakia After the Velvet Revolution in 1989

Paula Ivanková

Institute for Sociology of SAS, Slovak Republic

After the breakdown of traditional class-based voting theories, new approaches explaining voting behaviour are coming to the fore at the beginning of the 70s of the 20thcentury when many western countries have been experiencing a decline of the - until then - stable associations between class and voting preference. However, in post-communist countries, the overall trend may differ due to changes in the social stratification, political and economic systems that these societies go through. These are very different from the situation in countries where most class voting research was conducted. This paper examines the development of class voting in Slovakia during the period 1991– 2020 – just after the communist regime fall to the present days. The paper also asks if particular features in the voting behaviour in Slovakia can be identified. Can we identify traditional class-based voting patterns during (and after) the regime transformation in Slovakia? Is there even a relationship between the class position and a voting preference? If so, how has it been changing over time? Overall, our analysis does not show a clear class voting trend in Slovakia in the studied period. However, besides class – other socio-economic characteristics, like education and income – seem to be clearly related to the political party choice.

National Factor in the Last Polish Transformation since 1989 - From Deficit to Overabundance

Joanna Kurczewska

Polish Academy of Sciences,IFiS Poland

Paper attempts to answer the question posed in the title referring to (1) interpretative analysis of concepts of the Polishness, national community, national sovereignty, patriotism, nationalism and cosmopolitism and concepts of historical policy and its derivates in the cultural texts; (2) analysis limited to the priviledged active participants in the „ideological disputes" in two disctinct phases of the transformation - initial romantic (M. Ziólkowski) phase 1989-2004 ending with accession to the EU and statist construction of the 'New Nation' (M. Migalski) since 2015; (3) analysis of the interpretative operations on festive (national holidays, electoral campaigning and governmental exposes) and everyday (working parliamentary documents, daily regular and social media political discourse) occasions. These scope of the analysis shall be limited to one chosen category of priviledged participants as politicians at national and regional level. The choice is theoretically based on particular theories of political culture in context of national culture and communication networks. The empirical base is mostly provided by the Author's own qualitative research made in the 1990s and in the recent decade. As the result (a) the repertoire of the interpretations of the role of national factor as seen by politicians in two differrent phases of transformation under comparison and (b) location of these interpretations in the wider axiological context.

1177

The Rise of Independents in the Local Politics in Czechia - the Collapse of Party Politics or Just Democratic Innovation?

Tomáš Kostelecký

Institute of Sociology, Czech Academy of Scinces, Czech Republic

After the re-introduction of a competitive party politics in the Czech local government in the local elections 1990, political parties, beside the Communist Party itself, were week in most municipalities. The dominating idea of the early post-transformation years was that poliitcal parties need some time to build or re-build their organisations at the local level. However, over three decades after the regime change political parties struggled with this task. In the last years it look like political parites are almost dead at the local level, namely in the small municipalities, and are effectivelly replaced by independent candidates a slocal political actors. The paper analyses the importance of independents candidates in local politics using electoral data and examines factors that either contribute to or hinder the diffusion of non-partisan politics in the Czech municipalities.

Attachment To Land Or Sense Of Social Place: What Does Explain Social Transformations In Post-socialist Rural Areas?

Pierre Deffontaines

Université Bourgogne Franche-Comté, Agrosup Dijon, France

In post-socialist studies, social sciences criticize "transition" analyses and underline the "small tranfrormations" of economic practicises. Concerning rural areas, they have showed the discrepancies between the content of the reforms, which promote the development of private agricultural enterprises and land distribution, and their implementation. Why agricultural land ownership has not led to land appropriation by rural workers and a development of small private agricultural enterprises? Further, what were the factors of social changes or social reproduction in post-socialist rural areas? In order to overcome the opposition between economic explanationsof new rural stratification and

cultural explanations that insist on the embeddedness of the "attachment to land", the paper proposes the notion of "sense of social place" exploring the social structure of rural communities, and its effects on the use of law, ways of counting or view of future of rural dwellers. Based on an ethnographic case study in central Ukraine, carried out between 2014 and 2018, it considers rural areas as socially differentiated in a multidimensional perspective inspired by Bourdieu. Then it analyses the social process of transformation and reproduction for the past 30 years: from the socio-professional hierarchy of the soviet agricultural system to the new economic and social inequalities. The survey is based on interviews with company managers, farm workers and independent small farmers. It focuses on land appropriation, local conflicts and their resolution. In such a context, the sense of social place refers to professional and economic dispositions and skills and the representation of the social order, that affects the capacities to advocate a right to land and the possibility and desire to farm it.

RN36_T02 | Political reality and transformation narratives

Being an Eastern European Intellectual today. Ideological challenges and competition with the "Spoiled Western Leftists"

Anemona Constantin

University of Bucharest, Institute of Research of University of Bucharest, Romania

This paper aims to understand how Romanian intellectuals respond to contemporary ideological challenges such as global warming, the issue of refugees, political correctness, gay marriage or neo-liberalism. By combining historical archives (Romanian Communist Party), press, interviews and autobiographies, this paper reconstructs several biographical trajectories and public controversies in order to understand how, since the fall of the Berlin Wall, the local intellectuals seek to understand the political transformations of Eastern

Europe by comparing this region to Western Europe. One of the main questions the analysis asks is how evolved the social role of intellectuals since 1989 in a country located, both symbolically and geographically, on the borders of Europe.

Cynicism in the Place of Ideology: Party Nomenclature System in the Times of Real Socialism and after 1989 Transformation. The Case of Poland

Kaja G. Gadowska

Jagiellonian University, Poland

In the times of real socialism in the countries of the Eastern Bloc, the system for filling key public positions in administration, economy and other realms of social life was based on the recommendation of the communist party. One of the foundations of the new democratic states was to become the principle of filling public positions on the basis of meritocratic criteria. In Poland, however, despite formal regulations guaranteeing the citizens the right to access to public service on equal terms, staffing the key positions in state administration and economy depends on political decisions by the consecutive governing parties. Based on empirical research, this paper argues that after 30 years of democracy there has been restoration of the patterns of staffing public positions used in the period of real socialism. Replacing legal norms by informal rules serving current party interests results in erosion of public institutions and undermines the very foundation of liberal democracy.

Structures Of Power and Domination, Citizens, And Institutions In Russia.

Sergey Patrushev, Irina Nedyak

Federal Center of Theoretical and Applied Sociology of the Russian Academy of Sciences, Russian Federation

The paper examines the collision between political power and domination in the democratic societies. It explores the way of studying power relations and politics used in modern (post-Weberian) theories of domination. Their analytical potential is demanded by the fact of the continuing expansion of social relations of domination in the sphere of various regimes of democracy.

We present an analysis of the activity of citizens and the transformation of institutional design in Russia using (1) theoretical and analytical views of political (i.e., emancipative and communicative) power and the power of domination or oppression and (2) data from all-Russian representative polls (2018, 2019, 2020) carried out by the Department of Comparative Political Studies of the Institute of Sociology of the FCTAS of the Russian Academy of Sciences.

Having identified the general and specific for Russia structures and variants of expanding domination, we tested their influence in several dimensions: the processes of depoliticization and loss of civic qualities, alienation and social disintegration, the internalization of the political culture of submission as well as the deformation of moral order and work ethics. We argue that the social pathology of domination blocks the development of socially oriented and state-controlled modernization projects from the federal to the regional and local levels.

The main task is to identify promising areas, resources, and methods for eliminating social relations and policies of domination since the structures of domination inherently carry the danger of violence, arbitrariness, and the death of public policy.

1179

Transforming Namescapes: Street Renaming during Romania's Postsocialist Period

Mihai Stelian Rusu, Alin Croitoru

Lucian Blaga University of Sibiu, Sibiu, Romania

Postsocialist transformation brought about a massive reconfiguration of urban landscape in Central and Eastern European countries. Within the public space, much of these changes concerned the removal of monuments, commemorative plaques, and street names that celebrated the ideological ethos of the socialist regimes (historical dates, political values, leaders and heroes, etc.). Given the violent nature of the regime change, in Romania these transformations have gained a greater momentum. Based on an original quantitative dataset compiled after conducting a sociological survey online, in this paper we set out to examine the factors shaping people's attitude towards the purging of socialist symbols inscribed into the street nomenclature in Romania. The main aspects taken into consideration are individuals' value-system and political orientation, local identity and place attachment, civic participation and social capital, as well as standard socio-demographic indicators such as age, gender, education, and ethnicity. Descriptive analyses and logistic regression modelling of these data were carried out to identify the main determinants that structure individuals' attitudes towards the revision of the socialist past. Such an approach based on quantitative analyses contributes to a better understanding of postsocialist transformations of the public space and opens up previously unexplored avenues of inquiry into how citizens relate to the coming to terms with a controversial past.

RN36_T03 | Revising Discourses and Narratives of transformation

Doubly Out Of Place? How West Germans Explain Civil Society And Democracy To East Germans.

Patrick Kahle[1], Michael Corsten[2]

[1]University of Hildesheim (Germany), Bielefeld Graduate School in History and Sociology (Germany); [2]University of Hildesheim (Germany)

Surprisingly, transformation research on post-socialist societies often, even in comparative approaches omits the case of East Germany. It is classified as 'special case', which due to its division and re-unification was considered as a ready-made-state (Pickel 1997). In research, East Germany was neither seen as part of East Central Europe nor assigned to Western Europe (Böick/Brückweh 2019). In the last few years East German intellectuals form to question the events after 1989 (Milev 2020), an East German identity (Schönian 2020), and analogies between East Germans and migrants (Foroutan et al. 2019).

Based on an ongoing research project in which we interview studied, professional actors who usually have a mentor role for arriving refugees and a mediator role for stakeholders, we detected a double displacement and alienation. In rural areas of East Germany we often met employees in refugee social work who only moved to the region on the occasion of their work – from the center to the periphery. We observed that such 'delegated' actors consider themselves as 'migrants' in their field of engagement, especially West Germans who were active in East German regions. One of our respondents identified himself, in conflict with the role of mediator, as a polarizing factor in his efforts to explain civil society and democracy. Following comparative research on civil society in East & West (Beetz et al. 2014; Pavlova/Silbereisen 2015) we trace a genealogy of figures already been illustrated as arrogance as a delict (Schneider 1998) or as ‚losers and winners' (Danilova 2014).

Lessons From Polish Transformation: Is There a Place for Considering Alternatives?

Agnieszka Kolasa-Nowak

Marie Curie-Sklodowska Univeristy, Poland

Postcommunist societies are examples of accelerated social transformations and almost equally rapidly changing interpretations about their basic characteristics, global position and future challenges. The notion of alternative paths is inherent to the understandings of social transformations in last 30 years. After an initial belief in a rapid process of transition to the Western pattern of development, discussion turned to consideration of local paths. For a long time, attention was paid mainly to the specific local aspects of economic, political and social modernization. Yet recently, there are many indications of the deepening uniformity and similarity of problems such as rise of political populism, deep political polarization and nationalistic and authoritarian turn.

The paper will consist of a reconstruction of present debates, both in public discourse and in the social sciences, especially in sociology, about the changing context in which main issues of Polish society and its future challenges are now being considered.

Search for appropriate framework go into three different impact levels: global, in which technological and anthropocentric threats are been considered; regional, in which the postcommunist or Eastern European problem of durable backwardness seems to be crucial; and national, concentrating on local historical dependency paths. Finally I will try to deliver conclusion whether these interpretations reveal potential for explaining open-ended and alternative changes and to what extend that knowledge can be useful for solving recently emerging social problems in a global scale. There is also the possibility that the belief in alternative paths of development is being replaced by the recognition of convergence and final unification of social processes in postcommunist countries.

Recognition Gap in East-Central European Societies. Distribution of Respect in the consciousness of Polish adult citizens.

Piotr Michał Kulas

University of Warsaw, Poland

The respect returned to the moral grammar of social conflict in the post-status twentieth-first-century Central European societies. In the last decades, people of the region experienced the change of stratification from that based on rank order to class stratification, i.e. from traditional 'status society" to modern 'class society'. Along with this, new forms of social and cultural identity have emerged. These raise questions concerning also the change within the logic of the distribution of respect. The presentation proposes to look at the current moment in the recent history of co-called Central-European countries, with Poland as a critical case study in the framework of recognition theory. In the first part of my presentation, I recall the theory of recognition and discuss the concept recognition gap. More critical reflection embedding respect is needed to understand social and political conflicts. My presentation tries to develop the main societal and cultural dimensions of "recognition gap" in Central-European societies, particularly Poland. Inequalities in recognition or "recognition gaps" embrace both disparities in redistribution and cultural esteem. In the second part, I talk about the methodology of my research and show my data. The presentation is based mainly on data collected in the survey on the representative sample of Polish society (n = 1000 adult respondents), yet it also draws on other sources. In the concluding remarks, I put my findings in the perspective of recognition and recognition gap to analyse the main dimensions of respect as perceived and understood by people experiencing cultural and societal change.

1181

Transformation as a Political Tool. An Empirical Analysis of the Concept of Transformation Based on Polish Sejm Transcripts Between 1989 and 2015

Andrzej Pawel Pabisiak

Jagiellonian University, Poland

From the perspective of three decades since the fall of communism in Central and Eastern Europe, the process of transformation into democracy and capitalism turned out to be a more complex, lengthy, and multidimensional phenomenon than scholars and political actors tended to think. Democratic backsliding and growing nationalism in Hungary and Poland, both considered to be examples of successful change after 1989, and their ongoing dispute over dealing with their communist past, continue to provoke fundamental questions concerning the transformation and its outcomes. Based on quantitative and qualitative empirical studies of the full corpus of Polish Sejm transcripts from 1989 to 2015, including over 3500 statements of members of parliament as well as interviews with members of political civil society actors, trajectories of a notion of the transformation and its changes are constructed depending on times, power, political terms, and actors. The analysis centres on two main questions being: what is the notion of transformation and how has it been changing over the last thirty years, and what role has it played in creating the political culture in Poland. It is apparent that the concept of transformation was strictly correlated with a power position and from the very beginning was highly ideologized by pro-democratic parties. Therefore, the transformation and its contested collective memory, presenting the changes after 1989 as a 'stolen revolution', has been an important tool in the struggle for power, successfully used by nationalist parties. As a result, the notion of transformation becomes corrupted and thereby plays a key role in dividing the narratives of contemporary Poland.

RN36_T04 | Institutional and relational dimensions of transformations

A Rough Road From Transformation To Innovation. How Has The Experience Of Transformation Influenced The Development Of Innovation Performance In Eastern Europe Countries.

Agnieszka Karpińska

University of Bialystok, Poland

Since the influence of technological innovations on countries' economic development is lower than expected, researchers are displaying more interest into the noneconomic, determinants of innovation. Representatives of the humanities claim that there is the knowledge about institutional components of the innovation system, and elements are attributed certain functions, but there are a few teleological studies to explain the construction of each segment which is said to have started functioning as a system.The aim of the contribution is to analyse Europe's region innovativeness from a different point than adopted in the literature. First, it adopts a more comprehensive, teleological framework of national innovation systems, which cross-cut economic sociology, the sociology of knowledge, organizational institutionalism and science, technology and innovation sciencel. Secondly, the purpose of the analysis is to present a comprehension of the empirical data and theoretical background of the non-economic determinants of innovation potential in Eastern Europe countries (EECs), in particular post-Soviet states (PSTC). Since the early 1990s these countries have experienced a difficult transformation from a closed centralised economy to a free market one. Diversity and reintegration in the European structures with the unique effects of the transformation process provide interesting questions for research innovation. However, the case of social determinants of low innovation capacity in PSTC is

rather unexplored research area. This study addresses the research questions: Which specific features of post-Soviet transition societies determine their low innovation capacity? The analyses will draw the three bundles of paradigms: national innovation system, social capital paradigm and new institutionalism approach.The paper aims to provide some relevant policy conclusions for developing innovation in EECs.

Relations Between Business Associations and Government: Institutional Model and Practice in Russia and Italy

Daria Evgenyevna Pritvorova

The Institute of Sociology of the Russian Academy of Sciences (ISRAS), Russian Federation

Business associations, representing the entrepreneur interests in the dialogue with the governments, play a crucial role in the decision making as well as policy creation and initiative execution that are defining the business climate of respective countries. Increasing collaboration along with the continuing movement from informal towards formal norms and practices as well as the frequent instances of the structured interaction indicate the ongoing institutionalization of the relations between business associations and government.

The main hypothesis is that the business associations' activity, aimed at supporting the represented businesses' demands relies primarily on the pillars of the institutional framework: the evolving rules and norms and their practical implementation. The robustness of such a framework is, therefore, key to the efficiency of the collaboration between the political actors.

To analyze the main factors of the institutionalization we separate interest groups in Eastern and Western Europe, that were formed within different legal and historical frameworks. The associations are separated into two distinct types: 1) 'national' chambers of commerce and 2) 'international' non-profit entrepreneur associations, representing global financial, social, and other types of capital.

Focusing on Russia and Italy, the work compares the peculiarities of the mechanisms, rules, and norms, in accordance with the concept of: 'national' and 'international' associations. The analysis of the empirical data from the case studies outlining the activities of the Russian Union of Industrialists and Entrepreneurs (Russia), Confindustria (Italy), and the Association of European Businesses (Russia) assesses the

institutionalization process and reveals the differences stemming from specific political contexts.

Social Innovations: Prerequisites For Institutional Traps From Ethnographic Studies. Russian Case

Elena Danilova

Federal center of theoretical and applied sociology of the Russian Academy of Sciences, Russian Federation

The paper aims at the sociological analysis of the processes of introducing institutional innovations in the social sphere. Some cases of recent social innovations in Russia are analyzed through ethnographic studies of the grassroots level and routine interactions between the population and official bodies. Habermas's ideas about the collision of the "system" and the "life world", as well as the Weberian idea of conventional actions, make it possible to single out the so-called "conventional zones", which may contain prerequisites for the institutional traps for introduced innovation. The inherent meanings, differently understood by the participants of innovations and mastered in the processes of interaction, can further reproduce undesirable effects for the institutes that are becoming.

1183

Relational Reflexivity as a Path to Socio-environmental Responsibility

Matej Makarovic[1,2,3], Tea Golob[1,2]

[1]School of Advanced Social Studies, Slovenia; [2]Faculty of Information Studies, Slovenia; [3]Institute IRSA, Slovenia

The paper addresses the issue of relational reflexivity in the context of responsible behaviour in Slovenia. It draws on the perspectives adopted from the theory of Archer and Donati. In a dynamic morphogenetic society, responsibility cannot rely only on internalised norms but requires one's own personal reflexivity as a (self)critical internal dialogue. To contribute to positive macro level social change, however, a collective or relational reflexivity is needed as well. The analysis on the Slovenian national representative sample demonstrates the existence of socio-environmental responsible behaviour as a single dimension that combines social and environmental responsible behaviour. We demonstrate

how it leads to relational reflexivty, for which we provide a proxy quantitative indicator.

RN36_T05 | Social policies and outcomes in transforming societies

Current Transformation And COVID-19 Pandemic

Uroš V. Šuvaković

University of Belgrade, Teacher Education Faculty, Serbia

Today's change units do not occur solely European East vs. European West, extended to America. The COVID-19-induced transformation leads to broad change in the world, not only in the above direction, but also north vs. south. The planet is the space with ongoing accelerated changes, with the most important ones in the field of geopolitical power, but also in people's everyday life. COVID-19 vaccine and medications have become a powerful weapon in realizing geopolitical influence. Vaccine (non)availability to poor countries (including some European countries such as Bosnia and Herzegovina, or North Macedonia) causes an increasing social gap globally.

It transpires that, particularly in EU, main concerns were military and economic power, energy and cyber security, while public health as a major legacy of the welfare state became neglected due to neoliberalism. Currently the main concern is health safety affecting not only countries, but also individuals. The absence of timely anti-epidemic solidarity with Italy and Spain – just as previously with the Greek financial crisis – led to huge disappointment regarding the EU ability to respond collectively in the times of crisis. Poor management of the COVID-19 vaccine acquisition process forced some EU countries (first of all Hungary) to begin acquiring vaccines independently from Russia and China at the very beginning of 2021.

Non-EU Serbia managed to obtain Pfizer, Sputnik-V and Sinofarm vaccines mid-January 2021 and organize mass voluntary vaccination, which ranked it as the second European country (after the UK) by the number of vaccinated people per population in February, confirming its proper strategic decision to cooperate both with the East and the West.

Keywords: COVID-19 pandemic, health safety, global geopolitical power redistribution.

Life Expectancy in Lithuania 20th Century: New Research Findings

Zenonas Norkus

Institute of Sociology and Social Work, Vilnius University, Lithuania

Life expectancy is one of most (if not the most) informative measures of human wellbeing. Its important advantage is cross-time and cross-country comparability. Such measures are necessary for measurement and comparison of the social transformations period over lung run and to quantitatively explore changing depths of East and West divide. Life expectancy is estimated by constructing life tables from population distribution by age and mortality by age data. Largest collections of historical life tables are accumulated in the Human Mortality Database and Human Life Table Database. However, they contain large gaps on the interwar Baltic countries, where only interwar Estonian and Latvian national offices did construct life tables for census years. In addition, Estonian demographer Kalev Katus (1955-2008) did construct life tables for Estonia (1923-1938) and Latvia (1925-1938). Largest gaps persist for Lithuania, where for period before 1959 life tables are available only for 1897 (by Mikhail Ptukha) and 1925-26 (by Antanas Merčaitis). Main reason for this situation is lack census data. Between 1897-1959, there were only two censuses in Lithuania: in 1923 and 1942. However, only data of first census were processed and published, providing basis for estimates of A.Merčaitis. The life tables for 1925-34 period are presented, which were constructed by the author using formerly unknown sources. New findings are used to compare interwar Baltic mortality trends in the framework of the theory of demographic transition.

The Institutional and Individual Causes for Marriage Delay in China: Evidence from CGSS 2003-2017

Shuangshuang Liu

Gent University, Belgium

Background China is experiencing a rapid educational expansion and a second demographic transition, bringing more and more women and men to postpone their marriage. Hence, these broad societal factors have a strong influence in the Chinese marriage market.

Aim This study scrutinizes these trends by investigating marriage delay in China from both an individual and institutional perspective.

Methods We study data from people aged 18-80 (N = 88,829) from the Chinese General Social Survey (2003-2017), applying a repeated cross-sectional design. We model the impact of education expansion in each subsequent cohort, using Kaplan-Meier survival estimates and lognormal models.

Results We find that: (1) Higher education and city hukou delay people's marriage age. Education's effect is more obvious for cohorts born after the reform and opening-up. Interestingly, the educational expansion more strongly affects both higher-educated women and lower-educated men with rural hukou. (2) Parents' higher education (especially mothers' high education) delays people's marriage age, and shows a U-shape change across cohorts. (3) Also, CCP members get married earlier than non-CCP members, but this effect is becoming weaker across cohorts.

Conclusion Our findings suggest that institutional factors have a strong effect on marriage delay in China, and that it's not solely depending on individual factors and personal choice. Furthermore, our findings across cohorts reflect the institutional changes that took place over time in China.

The Influence of Area-based Policies on Preventable Mortality Risk in Urban Settings

María Jesús Martín Díaz[1,3], Ángel Ramón Zapata Moya[1,2], Clemente Jesús Navarro Yáñez[1,3]

1The Urban Gobernamce Lab (CSPL), Universid Pablo de Olavide, Spain; 2Department of Social Anthropology, Basic Psychology and Public Health (UPO); 3Department of Sociology (UPO)

Socioeconomic Status have been proposed as a "fundamental cause" of the (re)production of health inequality. According to FCT, people with a higher socioeconomic status can use a range of flexible resources to improve their health, avoiding the risks of preventable mortality at each historical time (Phelan, Link and Tehranifar, 2010). However, the health benefits of resource may vary between social groups and contexts according to institutional interventions. Area-based policies implemented in socioeconomically deprived urban areas can be conceived as institutional interventions aiming at improving the 'flexible resources' of communities where social problems are more highly concentrated (Zapata Moya & Navarro Yáñez, 2017). In this paper we analyse the impact of area policies, implemented in Andalusian cities in recent decades, on the risk of avoidable and non-avoidable mortality. Using data from the Longitudinal Survival and Longevity Statistics of Andalusia (Spain), we conducted a quasi-experimental study based on a cohort of individuals living in urban areas targeted by the URBANI, URBAN II and URBANA initiatives defined in the project URBAN-IMPACTS . Counterfactually, we used another cohort of individuals matched by socioeconomic characteristics and living in areas where these policies have not been in force. Cox survival models segregated by sex and urban vulnerability were estimated. Consistent with the FCT, the results indicate that area-based policies seem to moderate the risk of preventable mortality, especially in the most vulnerable settings. We discuss the implication of this finding from an urban sociology and health in all policies approach.

RN36_T06 | Values, perceptions and choices in transforming societies

Meritocratic Perceptions in Former Communist Countries: Comparative Analysis Between Poland And Georgia And Azerbaijan

Könül Jafarova

University of Wroclaw, Poland

Meritocratic perceptions of society are based on the idea that one's efforts lead to success through hard work and talent regardless of the socioeconomic background of an individual. Such perceptions tend to emphasize the high possibility of the return of the hard work in rewards. The evidence based on the national polls suggests that these perceptions have been lower in the former communist countries in Central and Eastern Europe (CEE) while comparing to Western (European) countries. This is primarily justified, along with other reasons, with egalitarian approach of people in this region as a communist legacy, the role of non-merit factors as well as different interpretations of inequalities in those societies. In this article, I analyze data from the 6th wave of the World Values Survey on the meritocratic perception of hard work leading to success conducted in 2012, 2014 and 2011 in three former communist countries: Poland, Georgia and Azerbaijan respectively. While the majority of the literature focused more on the comparison of the merit-based perceptions within and/or between former communist countries in CEE and non-former communist Western countries in intraregional perspectives, I explore these relations by drawing comparisons between former communist country of Poland and former Soviet states of Georgia and Azerbaijan based on the data from the 2010s to also observe how those perceptions evolved across time, if any. I suggest that Poland, as a Member State of the European Union, which tends to be viewed as merit-based space, might be perceived more meritocratic compared to Azerbaijan and Georgia, despite being a former communist country.

Relevance of the "Geopolitical Choice" Rhetoric for the Socio-political Situation in the Post-Soviet Countries (the Case of Moldova)

Lyudmila Saburova[1], Nikolai Tsveatcov[2]

[1]Institute of Philosophy and Law, Ural Branch of RAS, Russian Federation; [2]quot;Intellect group" Company

Since the collapse of the USSR, almost all post-Soviet countries have found themselves in a circumstance of geopolitical choice. In the past decade, the geopolitical rhetoric in the political discourse has even increased. However, the relevance of such rhetoric is increasingly being questioned. In particular, the geopolitical agenda found its limitations in political mobilization during the Presidential elections in the Republic of Moldova in 2020. Despite the fact that the main candidates did not directly demonstrated their sympathies to one of the geopolitical vectors, their reputations were clearly identified through the categories of "pro-Western" and "pro-Russian". This positioning of candidates, formed long before these elections, dominating political discussions, political analytics, pre-election polls. The paradigm of presidential elections implied that there are no independent leaders with their own political programs and national agenda; instead, there is external geopolitical competition. However, a series of focus group studies conducted during the pre-election campaign showed that voters themselves do not consider the candidates' geopolitical "anchors" as basic and decisive. Moreover, the topic of "geopolitical choice" often provoked a negative reaction from respondents as a topic that "splits people" and "distracts from internal problems". Respondents mostly spoke about the candidates' ability to solve the acute social and economic problems of the country, such as unemployment, low salaries and pensions, forced labor migration that separates families. Many respondents expressed the idea that the artificial choice "either with the West or with Russia" harms the national sovereignty and the unity of the nation.

1186

Transformation of Geopolitical Orientation in Ukrainian Society (2018-2020): Emergence of a New Pattern

Serhii Dembitskyi

Institute of Sociology National Academy of Sciences of Ukraine, Ukraine

I define geopolitical orientation as a set of attitudes of a political community towards external sources of power relations in the global perspective.

Geopolitical orientation includes: 1) assessment of the priority of cooperation with a geopolitical actor (general geopolitical openness); 2) assessment of a geopolitical actor's policy towards the respondent country (the degree of productivity of the current geopolitical interaction); 3) attitude to military cooperation with a geopolitical actor (geopolitical cooperation in the field of security); 4) attitude to the intervention of a geopolitical actor in the policy of the respondent country (acceptance of a geopolitical actor as a senior partner).

To measure the proposed concept, I developed the scales that measure geopolitical orientation of the population of Ukraine towards the European Union (EU-geopol) and the Russian Federation (RF-geopol). These scales were used in a series of representative surveys in Ukraine in 2018-2020. The obtained results allow me to draw conclusions about the stable and dynamic aspects of geopolitical orientation of the Ukrainian population.

The dynamic aspect shows the gradual improvement of respondents' geopolitical orientation towards the European Union. Between 2018 and 2020, the additive index of the EU-geopol scale increased from -0.1 to 0.7 (the range of possible values of both scales is from -4 to 4). The stable aspect shows the permanently negative geopolitical orientation towards the Russian Federation. The values of the additive index of the RF-geopol scale varied in the range from -2.0 to -1.7.

Value Consensus and Discrepancy Among the Major Ethnolinguistic Communities in Latvia: The ESS Survey Data Analysis

Inese Supule

University of Latvia, Latvia

In this paper social transformations are explored through the lens of values and attitudes of the two major ethnolinguistic communities in Latvia. The paper examines the existence of a set of core values that is shared by (or at least equally widespread among) the Latvian and Russian-speaking communities in Latvia, as well as other values and attitudes that are still rooted primarily in people's ethnic and/or linguistic self-identification. Comparing values of ethnic Russians in Latvia and other countries such as Russia and Ukraine allows examining to what extent Russians in Latvia have assimilated into their ethnic segment instead of mainstream society. Thus, this study scrutinises the degree of value homogeneity or heterogeneity in Latvia, and asks a question about the potential challenge of polarisation in the future. The value model used in the study is based on the model of Shalom Schwartz's value theory (Schwartz, 2012). The analysis is based on the data from the European Social Survey, which includes 21-item version of the Portrait Values Questionnaire. Target group: Latvian residents aged 15 and over. Sample size: 918 respondents. Survey method: random sample representing the population of Latvia, using the address register. Survey time: 10.10.2019 to 21.01.2020. The data analysis has been performed within the project "Value (trans)formation in uncertain times: social cohesion and neoliberal ethos in Latvia".

RN36_T07 | Changes in social structures and mobility factors in transforming societies

"Success and Well-being as Indicators of Intergenerational Subjective Mobility"

Yulia Epikhina

Federal Center of Theoretical and Applied Sociology of the Russian Academy of Sciences, Russian Federation

Intergenerational social mobility is traditionally measured on the basis of statuses comparison implemented in different dimensions of social life that characterize two generations, dubbed as the generation of "parents" and the generation of "children". This method is regarded as an objective procedure that allows to explore the differences that occurred in living standards and life styles over time. However, in addition to the objective dimension, social mobility can also have a subjective dimension, which is understood as an assessment of personal progress. This assessment can be effected as a comparison between respondent's own life and the life of the previous generation, or in some cases a comparison between different points in respondent's life indicating his or her perception of losses or achievements. The latter type of comparison is exemplified by the frequently used question on the change in the financial situation of the respondent over a certain period of time. One of the first studies of subjective social mobility was carried out by J. Goldthorpe in the project "Class mobility in the UK". After completing the main part of the mobility study, the question came up as to whether mobility, measured and recorded on the basis of structural indicators, was perceived as significant change by respondents themselves. It actually posed in a significant way the problem of a relationship between objective and subjective dimensions of mobility. The necessity to record subjective mobility raises the question of measurement indicators. The current paper explores subjective evaluation of well-being and assessment of personal success as indicators of subjective mobility.

Do Non-cognitive Abilities Compensate For Educational And Occupational Outcomes In Economic Transition and Economic Growth?

Alicja Zawistowska[1], Marek Muszyński[2]

[1]University of Bialystok, Poland; [2]Polish Academy of Sciences, Poland

Recent studies show that non-cognitive abilities, e.g. grit or locus of control, have a positive effect on career outcomes. However, less is known how non-cognitive abilities intertwine with occupational and educational achievements under different social and economic conditions, namely in periods of abrupt economic transition compared with times of stable economic growth. In the current study we address this gap by examining two Polish cohorts, both aged 30 at the time of measurement, but born at dissimilar times. The first cohort, measured in 2000, was born in 1970 and tailored school decisions to socialistic economy, but entered labour market in the onset of capitalism. This discrepancy caused difficulties in occupational careers. The second cohort, measured in 2019, represents people born in 1988-89. who took key educational decisions in the realm of market economy and entered workforce in times of stable economic growth. We investigate whether non-cognitive abilities, proxied by locus of control, neutralise adverse effects of socialistic education on labour outcomes in the older cohort. We compare these effects to the cohort raised in the developed capitalism. Our preliminary findings show that locus of control mediates educational and occupational achievements in the cohort born in late '80s. Moreover, we present differences in key non-cognitive abilities between the two analysed cohorts and comment on them in terms of socio-political changes and their effects on personality.

Keywords: social transitions, career outcomes, educational decisions, personality, locus of control.

1188

Transformation of Social Structure in Ukraine under the Post-Socialism: Towards a New Class Structure or a Classless One?

Elena Simonchuk[1], Olga Kutsenko[2]

[1]Institute of Sociology, National Academy of Sciences of Ukraine, Ukraine; [2]Taras Shevchenko National University of Kyiv, Ukraine

In the last three decades, Ukraine has passed a difficult path of transformation from a Soviet republic with state ownership of the economy into an independent pro-European state with market-based economy. The radical institutional changes led to significant changes in culture and social structure in the society: from the etatist industrial type with a predominance of the working-class positions, the leftist ideology and fordist employment to the post-industrial capitalism with post-socialism cultural legacy, new values and practices, and domination of the middle-class positions in the social structure. Does class differentiation matter in social structure of Ukrainian society after 30 years of its transformation? Or, do the middle class positions and flexible forms of employment shadow class differences in the social structure? In the political sphere, class rhetoric has lost its significance and is practically absent. However, in surveys, respondents still define society and "their place" in it in terms of class. There is a fairly strong correlation between class positions and class identities. Using a modification of the E.O. Wright's class scheme methodology within the structural-agency theoretical approach, we are testing empirically the hypothesis about increasing classlessness during post-socialist transformation of Ukraine. The relations between class positions are measured through the wellbeing, identity and agency parameters. The empirical analysis is grounded on the Ukrainian Society Survey (1992–2020) and the International Social Survey Programme (1999–2019).

Masculinities in Transition in a Mining City: Changing Homosocial Relationships and Spatial Practices of Mineworker Men during the Pandemic in Zonguldak, Turkey

Atilla Barutçu

Zonguldak Bulent Ecevit University, Turkey

This presentation, based on the assumption that mineworker men represent a local form of working class masculinity specific to mining cities, focuses on the changing homosocial relationships and spatial practices during the pandemic as a crucial factor transforming working class masculinities in Zonguldak, a coal mining city in Turkey. Working class masculinities as local forms of masculinity in mining cities are not usually constructed within the framework of the ideals and norms of hegemonic masculinity, even they sometimes complicit. They represent different models which are more complex and multi-faceted. Places like coffeehouses, clubhouses and pubs which gain their character within homosocial relations represent the key areas where these working-class masculinities are formed and reproduced. In this sense, the impact of restrictions on social life and long-term closure of places during the pandemic on mineworker men cannot be ignored, as is the case with every social group. In this presentation, with the interviews conducted with mineworker men in Zonguldak, I elaborate on two basic questions: (1) How do the places that are produced by homosocial relationships and practices affect the production and reproduction of working-class masculinities? (2) What has changed with the restraints of pandemic on everyday life activities of mineworker men?

Modifications of Life Style Options Caused by the Pandemic COVID 19 – the Case of Belgrade

Mina Petrović, Vera Backović, Jelisaveta Petrović, Milena Toković

Faculty of Philosophy University of Belgrade, Serbia

By affecting social interactions and solidarity as well as life style options, the pandemic COVID 19 has caused certain modification in the use of both public and private spaces in the cities. Although the durability of the effects that these changes could have on the city depends primarily on future risk assessments related to pandemics (or similar challenges), the paper suggests that it could also be associated with the people's pursuit of safer, healthier and more manageable living conditions generated by the pandemic COVID 19. In an attempt to gain initial insights into related issues, an online survey was conducted in Belgrade in January 2021. Teachers and associates at the University of Belgrade were chosen as informants (N=250), as a representative group of people who significantly have transferred the sphere of work to their private space (work from home). In addition to recording changes caused by the pandemic in the use of private, semi-public and public spaces related to work and free time activities, mobility patterns and consumption, the survey includes respondents' intentions to accept some of the reported changes even after the end of the pandemic, including their inclination to change the place of residence or even move from Belgrade. According to the obtained results, possible modifications in urban practices and associated spaces caused by the pandemic COVID 19 in Belgrade are discussed.

1190

Becoming City Region in the Times of Pandemic. The Case of the Aglomeracja Beskidzka.

Joanna Wróblewska-Jachna

University of Bielsko-Biała, Poland

The aim of this article is an empirical illustration on the impact of the pandemic during the creation of the city region. Bielsko-Biała, like many medium-sized cities in Poland, is transforming into an urban region, where the functional boundaries go far beyond just the administrative area. The structure of the emerging urban layout is concentrated around the core: Bielsko-Biała (the city and the county) where metropolitan functions are developed, and neighbouring counties: Cieszyn and Żywiec. Integration of the area, as well as the development of the function, is handled by an association established in 2019 under the name of the Beskid Agglomeration. The formation of this city region is described from a sociological perspective, taking into account the transformation challenges associated with: cooperation and competition between local governments, multilevel governance, the structures population (an ageing population in the whole city region) and air pollution. According to the adopted model, a development strategy implemented in this urban region was based on the cognitive-cultural economy for the last 5 years. Positive profound economic, socio-cultural changes in 2020 have become a development trap during the ongoing impact of the Covid-19 pandemic. Proposed article contains an analysis of ad hoc development strategies carried out during the progressing socio-economic collapse. The article contains the results of empirical research conducted in 2010-2020.
Key words: city regions, cognitive-cultural economy, the Beskid Agglomeration

Children's Practices on Urban Parks in Times of Covid-19

João Teixeira Lopes[1], Lígia Ferro[1], Júlia Rodrigues[2], Eunice Castro Seixas[3]

[1]Institute of Sociology, University of Porto, Portugal; [2]Research Center on Education, University of Minho, Portugal; [3]Center for Research in Economic and Organizational Sociology - ISEG, University of Lisbon, Portugal

This paper is written under the research project CRiCity: Children and their Right to the City: tackling urban inequity through the participatory design of child-friendly cities, funded by the Portuguese Foundation for Science and Technology (FCT). Based on a research carried out in the city of Porto, Portugal, on the use of public spaces by children from different social backgrounds, we discuss children's practices in two urban parks in times of pandemic: one is in an area inhabited mostly by upper middle-class families; the other is in the periphery, and it is surrounded by neighbourhoods where lower-class families live.

The fieldwork took place between June and October 2020 through direct and participant observation of children´s practices in both parks. To understand the broader effects of the pandemic on children´s use of public spaces and on their daily lives, we also carried out interviews with the adults accompanying them.

With the Covid-19 pandemic, public space, and the parks, have suffered enormous transformations. Our findings point to an enhanced control of children by adults; an increase in solitary play; and a radical change in the perceptions of desirable proximity and distance. The most vulnerable social groups, especially those of the working classes and ethnic minorities, became more exposed to socioeconomic and cultural inequalities. Hence, if we want more inclusive and sustainable cities, we need to rethink the city and urban dynamics in the light of what the pandemic taught us. Urban sociology can play a decisive role in addressing these challenges.

keywords: children, right to the city, public spaces, Covid-19.

RN37_T01_02 | Understanding urban vulnerabilities

Interpreting Vulnerabilities Facing Women in Urban Life: A Case Study in Madrid, Spain

Marjo Kuronen[1], M. Victoria Gómez[2]

[1]University of Jyvaskyla, Finland; [2]University Carlos III of Madrid, Spain

Urban life has a gender dimension, which is most often discussed in feminist urban studies in terms of gendered use of space and city planning. This paper, instead, focuses on local welfare policies, and its consequences on women in vulnerable situations, from the standpoint of women's daily life in a gendered urban environment. It analyses the interpretations of vulnerabilities that women face in different settings; in local policymaking, in welfare services and in women's daily lives, by presenting a case study from Madrid, Spain. Three datasets are used in this analysis; local policy documents, interviews with women in one of Madrid's central neighbourhoods and interviews with professionals in the local welfare services. The findings indicate that even if the interpretations of local policymaking, welfare professionals and women themselves differ, vulnerabilities are connected with social structures and economic conditions instead of being interpreted as characteristics of individual women or specific groups of women. The findings further emphasise the importance of (female) family relations and social support but also neighbourhood ties in protecting women from and in vulnerable life situations. Thus, our findings somewhat question the idea of modern urban life characterised by the weakening of local ties, individualisation, and the sense of lost community. The question remains as to what extent these vulnerabilities are specifically urban, which requires further intersection of research on vulnerabilities and social welfare with the sociological research on urban life and urban environments.

The Effect of Social Disorganization on Juvenile Delinquency

Melek Kırtıl

İstanbul Üniversitesi, Turkey

Since the beginning of sociological studies on the city, there are many studies that have been designed around the question of what makes a neighborhood safe and why a neighborhood causes the increase of crime rates. This research takes the International Self-Report Delinquency Study as an empirical criminological data source and tries to explore the urban causes of juvenile delinquency. ISRD was first conducted in 14 countries in 1992-1993, secondly in 31 countries between 2005-2007, and lastly in 35 countries between 2012-2019, by surveying children aged 12-16. These questionnaires have been prepared in order to determine the early deviance behaviors observed in children and their reasons and to identify victimization/offender situations that are not reflected in official institutions. Studies conducted in Western Europe and US show that the interventions (punishment, rehabilitation, deterrence) carried out after the criminality has taken an official appearance, are quite ineffective at the point of preventing the recurrence of delinquency. Preventive designs for risk applied in early childhood are based on the aim of protecting and supporting children through family, school, peer groups and neighborhood. In this study, urban risk factors related to juvenile delinquency will be investigated by examining neighborhood-based studies using the ISRD results. Especially the analyzes based on the social disorganization theory will provide the necessary framework to discuss the current treatment of the theory. Thus, we will be able to have a foothold on what can be done to minimize urban risk factors in juvenile delinquency and to introduce neighborhood-based protective factors.

EU Urban Initiatives and Local Well-being: Applying the Gender Mainstreaming Perspective.

Maria Jesus Rodriguez-Garcia[1], Francesca Donati[2]

[1]Centre for Sociology and Urban Policies, Pablo de Olavide University. Sevilla. Spain; [2]Centre for Sociology and Urban Policies, Pablo de Olavide University. Sevilla. Spain

Since the 1990s, the European Union has been promoting comprehensive intervention initiatives in disadvantaged urban areas. These initiatives aim to improve the conditions and quality of life of the population residing in these areas from a comprehensive perspective. This implies attending to different areas of exclusion and inequality (housing, education, employment, conciliation, dependency) that explain the processes of exclusion and socio-spatial vulnerability in urban areas, given that exclusion is a multidimensional phenomenon. In this context, gender, or rather gender inequalities, constitute a transversal area in the design of these intervention initiatives, as a reflection of the centrality of this public policy area within the framework of the EU Cohesion Policy in which these initiatives are included. The main objective of this work is to analyse the place of gender in comprehensive intervention projects in disadvantaged urban areas developed in Spain, within the framework of this type of European initiatives. The application of the gender mainstreaming principle in urban policies is analysed applying a specific tool to capture how the gender perspective has been included in neighbourhoods' projects. This will allow us to know the presence of the gender perspective in this type of urban initiatives.

RN37_T02_01 | Culture and urban transformation

The City as Scenery and as the Audience- Following the Flows of Cinema Circuits in Brazil and Portugal

Renata da Silva Melo

Federal University of Rio de Janeiro and University of Porto, Portugal

In this work, I am interested in discussing the role of cinema in the formation of urban lifestyles through the analysis of cinema circuits located in Brazil and Portugal. My analysis is based on ethnographic fieldwork carried out, before the confinement caused by the pandemic, in the Baixada Fluminense, in Rio de Janeiro, and in the cities of Porto and Lisbon. In both countries, I followed film clubs and participated in festivals considered by their producers as part of an alternative and counter-hegemonic scene, where films - produced by young filmmakers who have the urban space as the main setting for their recordings - are displayed. This research aims to reflect on these representations that sew the city in its multiple dimensions, and by doing that questions, through cinema, notions such as center and periphery. We are talking about an interesting object for reflections in the field of urban sociology and anthropology, because while the films seek to represent the city, the same urban space is also the privileged location for the projection and exhibition of these films, which were watched in squares, bars, cultural spaces, as happens with the groups linked to Baixada Filma, in Brazil, and to Porto Femme, in Portugal, which are examples of some of the cases studied. Furthermore, we are talking about representations that continue to be reproduced on the internet even during the pandemic. Without neglecting to take this into consideration, I highlight some differences and similarities between the representations produced and propagated by these cinema circuits studied to reflect on the sociabilities and the ways of making the city stemming from this type of experience in different contexts.

Placemaking, Festivalisation and the Aestheticization of Interculturality: Staging Postcolonial Lisbon as the City of the 'Encounter of Cultures'

Claudino Ferreira[1,2], Paulo Peixoto[1,2]

[1]Centre for Social Studies - University of Coimbra, Portugal; [2]Faculty of Economics - University of Coimbra, Portugal

The paper addresses the performativity of festivals as technologies, 'actants' and mediators of the material and symbolic production of urban cultural landscape. Taking recent research on "Todos" festival at Lisbon, we debate the role of a particular type of festival that became notorious as a tool in policies and strategies of city placemaking and urban development: the intercultural or multicultural festival. The paper proposes a reconceptualization of the processes of festivalisation and eventisation of culture, urban policies, and city life, as processes that articulate the interests and dynamics of the arts and cultural industry spheres, the urban economics and politics, and the social and political management of cultural and social diversity in cities. The "Todos" festival is approached as one of the various modes through which the articulation between those various fields generates effects on the rhetoric and the practical production of the intercultural city. The analysis reveals how the festival reframes the Portuguese colonial history and memory, and the contemporary tensions deriving from increasing social, ethnic, and cultural diversity in postcolonial Lisbon, through the aestheticization and exacerbation of interculturality. The festival (re)produces ideologies of consensus and a rhetoric of the conviviality of differences, with the performative result of reframing politically and aesthetically the "contact areas" where different groups meet and struggle, under the unstable convergence between the local independent arts scene logics, the ongoing commodification of urban cultures by tourist market, and the instrumentalization of culture for purposes of placemaking strategies by local authorities and city planners.

Big Cultural Events and the Growth of Creative Industries: a Real Impact or a Pious Wish? The Case of European Capital of Culture Wroclaw 2016

Mateusz Błaszczyk, Dawid Krysiński

University of Wrocław, Poland

In the presentation, we call into question the effectiveness of urban development policy based on the organization of big cultural events. We examine the impact of the European Capital of Culture Wroclaw 2016 (ECoC) on the growth opportunities for local creative industries by referring to the survey carried out among managers of enterprises which operate in Wroclaw creative sector.

The results of our study show that the respondents believed that ECoC stimulates the economic growth of local creative industries. However, in-depth analysis suggests that the demand for local creative goods and services is conditioned by long-term and multifactorial investment climate, while the impact of ECoC is statistically insignificant. We conclude that the beliefs and expectations on the influence of ECoC on the growth of creative industries remain unproven. One can rather assume that Wroclaw gained the 'ECOC capital' title due to the wider and long-term process of transformation of the city's economy towards cognitive-cultural capitalism. Basing on the results achieved, we suggest that the reorientation of the urban development theory is needed to avoid false conclusions on the cultural and promotional determinants of future growth in the urban economy.

1194

The Public Space Artists' Paradox: Commodification of Art in Light Festivals.

Manuel Garcia-Ruiz

ISCTE - Instituto Universitário de Lisboa (ISCTE-IUL), Centro de Investigação e Estudos de Sociologia, Lisboa, Portugal

Light festivals are present today in practically all large cities on a global scale. Its intended benefits include attracting unintentional tourists (displacement effect), stimulate visitation on residents of neighbouring cities, and fomenting in-home ongoers: promoting the nowadays desired "cultural tourism" (Richards, 2017). They are also used to produce favourable narratives that contribute to city branding and positive city images (Kavaratzis, 2004). Many municipalities have adopted them as tools for creating new nocturnal economies (Garcia-Ruiz, 2019), and others have used them as part of territory recover strategies through the so-called "artwashing" (Sheldon, 2015). They could be understood as culture led initiatives for territorial development, but that's only a side of the event. These festivals -many times- end up by Disneyficating the areas in which they take place due to a perceived loss of authenticity (Sorkin, 1994; Zukin, 1995) and the intensive but ephemeral occupation of the public space often have terrible impacts. In the limited specific literature, it is often presented the institutional voice, while other actors involved tend to be overviewed. What is the artists' position on the commodification of their works and its instrumentalization for this type of urban speculation? In this paper, I will present the ethnographic work carried out between 2016 and 2019 and the results of the analysis of 32 in-depth interviews with renowned artists within the world of light festivals. Here, I will introduce the public space artists' paradox: spatial content generator, critic artist, and precarious culture worker.

RN37_T02_02 | Women, urban space and everyday life

Alive, Free and Without Fear. Urban Safety and Care in Argentina.

Anna Bednarczyk

Graduate School for Social Research, Poland

Under the lockdown in Argentina, there was a 30% increase in reporting gender-based violence (GBV), and only in the first 44 days of 2021, there were 46 femicides registered. At the same time, in the sanitary regime, the movement for women's reproductive rights organized massive protests across the country successfully pushing for changes in the national abortion law.
All of this social dynamic takes place in cities as Argentina is the most urbanized country in South America, with 91% of its population living in urban areas. In my research, I explore the intersection of gender, urban spaces, and urban safety from the perspective of care. In my presentation I will explore the questions:
*how do practices of voluntary and reciprocal care shape strategies of resisting GBV in urban spaces?
*how have girls and women, active in the women's rights movements in Argentina, been redefining the concepts of care and safety?
Following Linda Peake's call for a new feminist urban theory that takes into consideration women's everyday struggles and challenges the binaries (2015), I aim at analyzing the concepts of 'care' and 'urban safety' as an intersection of daily life and political strategies.
The presentation is based on the data from preliminary research in Argentina. During two visits in 2017 and 2018 (six months in total) I participated in the 33rd National Meeting of Women in Trelew and I conducted in-depth interviews and observations of local feminist initiatives in Córdoba.

Un/safe Home. Looking The City As A Social Reproduction Sphere

Alina Dambrosio Clementelli

University of Genoa, Italy

This contribution fits into the discussion on the feminist city not by suggesting urban planning solutions but by looking at feminist practices in the urban context. The focus will be on those practices that redefine the home as a political space. To this purpose, it is necessary to firstly investigate the new re-articulation of the public and private boundary within and beyond the pandemic, the continuities and discontinuities in urban governance and the changing political forms. In the Italian context, the outbreak of the pandemic has profoundly affected the way we experience urban space, relegating us to domestic space wherever possible. During the outbreak the home became central to the government's narrative as a safe place to stay as a preventative measure against the spread of the Covid-19 contagion, reinforcing the narrative that made public space an unsafe and less accessible place. The intersectional perspective shows how the lockdown and the pandemic produced different consequences, and how the home became paradigmatic as a lens of inequalities. On the other hand, feminist urban practices have shown how the home, or rather "making home", can be a site of resistance that invests the whole city as a site of social reproduction. Reasoning about the politicization of the home from the pandemic redefinition of domestic space is not only necessary, but can illuminate the dimension of needs and desires for the construction of the feminist city.

Everyday Spaces of (Non)Belonging: Syrian Refugee Women's Navigation of Urban Life

Sara Fikry Abdelshafy Eltokhy

Independent

Belonging as a spatial concept is frequently linked to the notion of place as practices of belonging can exist in a variety of geographical settings starting from the scale of home to the neighborhood and the city. Using belonging as an analytical tool is important to grasp the complexity of subjective experience as well as the meaning of place. Naturally, belonging becomes particularly complex for refugees due to their multiplex relationships to different locales; the preexisting ties to their home country they have left behind and the new ones that they form in the host environments.

Highlighting the significance of gender differences in spatial experiences, this paper explores the way female refugees relate to the physical places in their new everyday urban settings and the spatial meanings of belonging. The research draws on in-depth interviews and cognitive maps of the past and the present environments of six Syrian female refugees in Milan. The use of two maps was to retrace the differences in the participants' spatial practices and activities post-displacement.

The research findings highlight that major changes between the participants' past and present daily environments are centered most prominently around their gender identity which often entails specific uses of the city. The participants' maps of the present convey a localized way of life that is usually concentrated at the scale of the neighborhood. The participants' mapping and interpretation of their environment can help to better understand their experiences and address their needs accordingly by principles of spatial planning and policies.

RN37_T03 | Urban and tourism related mobilities

The Effects of Barcelona Tourism Flows in the Metropolitan Area of Barcelona: the Case of the Metropolitanization of Tourist Houses

Montserrat Crespi-Vallbona[1], Sofia Galeas Ortiz[2]

[1]Universitat de Barcelona, Spain; [2]Cluster Development Builders

The rise of the tourist phenomenon in the city of Barcelona has its momentum in the 1992 Olympic Games. At that time, it is placed on the map of potential visitors as a destination of interest, and then the number of international tourists increases year after year. One of the characteristics of tourism is that its effects expand on the immediate environment. In this sense, the purpose of this study is to analyze the evolution of the tourist houses in the city of Barcelona to forecast its expansion in the nearest cities and functional areas, specifically in the so-called AMB (Metropolitan Area of Barcelona). Specifically, this research aims to analyse first the type and the form of growth that this specific typology of accommodation follows. Secondly, which are the variables that explain this growth of tourist houses in Barcelona and its territorial boundaries, such as tourist atractions and communication hubs. Secondary data used in this research comes from official registered tourist houses (Catalunya Government), Open Data (Barcelona municipality) and from the AirBnb tourist platform. Results show how these variables must lead the future public policies of Barcelona and AMB to prevent tourism negative effects.

Arrangements, Mobilities and Attachments in Crisis Contexts in the South Europe: A Comparative Analysis in Madrid and Barcelona Urban Areas.

Cristina López Villanueva[1], Margarita Barañano Cid[2], Montserrat Crespi Vallbona[3], Marta Domínguez Pérez[4]

[1]Universitat de Barcelona, Spain; [2]Universidad Complutense de Madrid, Spain; [3]Universitat de Barcelona, Spain; 4Universidad Complutense de Madrid, Spain

This research enables better understanding of main specificities about mobilities and supports that are characteristic of the South Europe, particularly, of Madrid and Barcelona. It focuses on the framework of residential strategies and home arrangements developed by households of this two major Spanish urban areas. This work tackles, from a qualitative analysis based on 40 interviews to neighbors of both cities, those happened changes regarding mobility/immobility strategies and household organization concerning the care of dependent individuals in the successive crisis contexts: 2008 recession and restrictions derived from COVID impact.

The structure of this work has the following assumptions: 1) Spatial attachment, basically in the care dimension, has a huge role in the South Europe, and in Madrid and Barcelona; 2) Tackled crisis contexts make difficult the attachment in urban places and weaken closeness relationships, assistance and care to dependents, and it contributes to intensify vulnerability.

This work belongs to an extend research: COMURES (funded by the Madrid Community and the European Social Fund); GENDERAB (funded by UIU/Banco de Santander); CAMVISOC and MOVIURBES (both funded by Science and Competitiveness Ministry in 2007 and 2018 I+D+i calls)

1197

Mobility And Inequalities: Between Infrastructures And Practices

Francesca Lacqua

Università Milano Bicocca, Italy

My research intends to focus on the relationship between mobilities and socio – territorial inequalities, starting from the analysis of infrastructural policies and narratives involved, highlighting whether and how they shape the patterns of possible people movements. My interest is to deepen the case study of the Italian railway system and specifically focusing on the North – West area.

The issue of territorial fragility is thus connected to mobility infrastructure planning, highlighting how the political and strategic choices have contributed to reshaping the territory and the relations between them (Curci - Kercuku - Lanzani, 2020; De Rossi, eds, 2018), drawing "new gaps" and new "hierarchies" in terms of power differentials.

Infrastructures are a factor of territorial integration (Colleoni, 2009) and, at the same time, they are a vector of reproducing inequalities, as a key factor of everyday life and of 'foundational economy' (Foundational Economy Collective, 2018), socially, these differentials lead inequalities in terms of "capabilities" (Sen, 1995).

Starting from the fields of urban and regional studies and of mobility studies, methodologically, it is necessary to define a framework that relies on an interdisciplinary approach that looks "from the inside out", including sociotechnical approaches (Amin - Thrift, 2017). In addition, a mixed-method based on quantitative and qualitative analyses (Semi, 2010) would characterize the research agenda. Moreover, this topic should be placed within an analytical framework in which mobility is considered as an essential key to understanding territorial systems as relational and in terms of individuals' motility conveyed by infrastructural assets (Urry, 2007).

To conclude, the purpose is to entangle the territorial complexity through mobility infrastructures that allow redirecting political and economic strategy towards a more just space.

The Social Life Of Michael Jackson's Statue In The Favela: A 'Mobilities Turn' Approach

Apoena Dias Mano

University of São Paulo - Department of Sociology, Brazil

The objective of this paper is to present a social biography of the Michael Jackson statue in the Santa Marta favela, a slum in the city of Rio de Janeiro - Brazil. Examining the time frame between 2010 and 2018, the dynamics of urban space govern and production are analyzed considering tourist commodification and urban violence. Inspired by 'mobilities turn' and 'social life of things' theoretical frameworks, the exposed analysis come from an multi-sited ethnographic research carried out under interlocutions with a network of residents, entrepreneurs, tour guides and local leaders of the favela. Debating about connections among the (i)mobilities of policies, capitals, images, meanings, objects and bodies conducted by the Pacifying Police Units public security program, I interpret that the social life of the statue in the favela can be determined by the regimes of value surrounding its uses, disputes and meanings over time and space. In final considerations, to stress the definition that the statue is converted into a symbolic landmark that identifies and influences the territory in the chronology of temporal and socio-spatial conjunctures of the city, I present dynamics about Covid-19 pandemic at the favela using examples of local appropriations and images of the statue.

Keywords: urban space; social life of things; mobilities; favela tourism; pacification.

RN37_T04 | Migrants, refugees and city-making

Migration, Small Commerces and City-Making: a Case Study in Bonfim, Porto

Priscilla Silva Santos

University of Porto/Universidade do Porto

Considering the role of migrant emplacement in city-making (Çağlar and Glick-Schiller, 2018), this paper aims to present some findings of an investigation in which small commerces (eg. coffeeshops, bars, bakeries and restaurants) run by foreign entrepreneurs at Bonfim neighborhood in Porto were analyzed. Porto is the second largest city in Portugal and became known as a touristic destination. Through an ethnographic approach, I conducted a six months field investigation using participatory observation and in-depth semi-structured interviews with foreign small business owners. The main objectives were: firstly, to understand how those foreign entrepreneurs originating from different places (eg. England, Spain, France, Brazil, Mali and Korea) have placed themselves – through their small business – in the urban dynamics of this old industrial zone previously marked by an artistic scene and in process of urban rehabilitation since 2015; secondly, I sought to find out who were the foreigns entrepreneurs included and/or excluded of the competitive-city narrative constructed by the local government, while attempting to reflect on how those new urban dynamics can, on one hand, produce cultural hybridity, and, on the other hand, reinforce ossified notions of ethnic-racial frontiers (Keith, 2005). This paper aims at contributing to a more broad discussion on the so-called urban turn on migration studies while, at the same time, exploring an epistemological decentering on urban studies, considering not only how foreign entrepreneurs produce the city, but also how they produce knowledge about the city through their own narratives.

Refugee Life, Refugee Space: Migrant Agency and an Alternative Space in Ankara

Allan Cooper Dell[1,2]

[1]Middle East Technical University; [2]Ankara University

During research conducted in the summer of 2020 for the Refugees in Towns Project of Tufts University, I observed the precarity of the refugees in Turkey. A couple authors have examined this precarity. Some others have examined how the refugees have begun to live in a spatially distinct section of certain cities, in certain situations forming what can be called a 'ghetto'. What this paper intends to do is to combine these spatial and precarious aspects using the observations of Wacquant (2016, 2008, 1999, and 1996) in his various analyses on the ghetto in France and the United States. In Wacquant's work, we can begin to see a spatial conception of precarity, and an investigation into this intersection of space and precarity is what is needed in debates on refugees in Turkey. We can further extend this to the point that as space is a production and its subjects are also a co-constitution of that space. If the underpinning truly is spatial as claimed by Lefebvre (1991), then a precarious subject produces a precarious space, and that precarious space likewise produces a precarious subject. We should, however, recognize the particular situation of the migrant denizen as Standing (2014) points out in this work. Therefore, I would like to investigate how this dynamic of the mutual spatial production of precarity works in the refugee space of the Önder neighbourhood in Ankara, Turkey. I would further like to investigate how we can fit this new example into Wacquant's larger set of archetypes.

1199

Sounds of Asylum Bristol: Music-making And Forced Migrants' Affective Practices Of Diasporic Belonging

Nicola De Martini Ugolotti

Bournemouth University, United Kingdom

Amid the normalisation of xenophobic narratives surrounding migration, and an overarching 'hostile environment' regulating asylum in Britain, this paper explores music-making as a unique lens to highlight the negotiation of belonging, uncertainty and marginality amongst a group of fifty forced migrants in Bristol. Through a focus addressing the nexus between power, affect and the everyday, this paper discusses how the dehumanising processes that characterise the British asylum regime operate in and through the spaces, bodies and objects constituting its 'ordinary' materiality. Concurrently, this paper addresses how the entanglement of bodies, 'things' and sounds emerging from the co-creation of weekly music groups enabled the group participants to negotiate pleasure, expression and sociality in a context of enforced marginality and uncertainty. Consequently, this paper discusses the music-making sessions as affective practices of diasporic belonging: relationalities arising from multiple forms of displacement that enabled momentary, but productive domains of sociability, co-presence and solidarity beyond ethnic, national, gendered and religious lines. The conclusions consider the contributions of theoretical approaches enabling researchers (and potentially advocates and community organisers) to recognise the stakes and significance of forced migrants' (in)visible forms of sociality that take place beside the discursive and institutional frames of State and humanitarian interventions.

Migrant Churches in the (Post-)Secular City: the Construction of Evangelically Inspired Solidarities in Ghent and Antwerp

Lise Dheedene, Stijn Oosterlynck, Patrick Loobuyck

University of Antwerp, Belgium

In today's European (post-)secular city, evangelical migrant churches are seen as spaces of alterity. The transnational orientation of these churches and their invisibility in the streetscape – due to being located in marginal urban areas – have led urban sociologists to approach these churches predominantly as 'parallel worlds', existing outside 'regular' urban life. In this paper, we aim to challenge this one-sided view on evangelical migrant churches by exploring the multiple ways in which evangelical migrant churches engage with the local environment and construct localized practices and discourses of solidarity. Through (visual) document analysis, interviews and participant observation in five evangelical migrant churches (of which four Sub-Saharan African and one South American) in the Belgian cities of Ghent and Antwerp, we examine how migrant evangelicals are building communities of givers and receivers by engaging in localized practices and discourses of solidarity and interact with their immediate, often secular, surroundings. Our focus is both on migrant churches' 'vertical' interactions with public authorities and on 'horizontal' contacts with neighbourhood inhabitants and associations. Specific attention is paid to how evangelical churches attempt to negotiate secular-religious boundaries. Our study demonstrates the need to recognize the transformative potential and agency of diasporic evangelical activity in developing practices and discourses of solidarity in the post-secular city.

RN37_T05_01 | Exploring processes in urban areas and metropolitan regions

An Urban Sociology of Disenfranchised Classes. Milan, Naples and Rome Compared (2013-2018)

Tommaso Vitale[1], Jonathan Pratschke[2], Bruno Cousin[1], Niccolò Morelli[3], Matteo Piolatto[4], Matteo Del Fabbro[1]

[1]Sciences Po (CEE), France; [2]Department of Economics and Statistics, University of Naples "Federico II"; [3]Department of Sociology, Università Cattolica del Sacro Cuore, Milan; [4]Department of Economics and Management, University of Brescia

In this paper, we explore the role of urban sociology to inquire into the relationship between space, place and population characteristics, on the one hand, and political behaviour, on the other.

Theoretical framework: Political behaviour is shaped by the social environment, which comprises a population structure and an opportunity structure. The relationship between these two elements gives rise to a socio-spatial structuring of opportunities, whereby the local context can filter, reflect or amplify existing political, socio-economic and cultural divisions. The central aim of our analysis is to identify the ways in which this process manifests itself in different areas.

Method: We compare three metropolitan regions in Italy - Milan, Naples and Rome - using data from the 2011 census and the 2013 and 2018 general elections. We employ a sociologically meaningful boundary for the study of these three regions, excluding the outer commuter zone. Using a new spatial methodology that we exemplified in previous papers, we construct Voronoi polygons around polling stations based on relative distance and link them with small area data in order to obtain a set of micro-spatial units for which electoral data and social indicators are available.

Results: Using regression, we show that in the three metropolitan regions the success of populist political parties in recent years is related to a reconfiguration in the geography of social class and changes in social and economic conditions. In the three regions, these processes have led to the emergence of socially and spatially peripheral areas which are home to what we refer to as "disenfranchised classes".

Urbanity in the Shrinking City – a Contradiction? Conceptualizing the Urban along Spaces of Possibilities

Bettina Knoop[1,2]

[1]TU Dresden, Germany; [2]Universität Passau, Germany

Urbanity is defined as a social quality of the city in its demographic and spatial structures. The notion of urbanity furthermore relies on a "'constitutive outside' of the urban" (Roy 2016). Analogous to the urban, this outside encompasses both a social and a structural dimension. Rural settlements were classically defined as counterparts of the urban on both dimensions. At times of global urbanization, societal delineations between the urban and the rural are increasingly contested, though. Instead, the shrinking and/or peripheralized city comes into play as a constitutive outside of the urban (Lefebvre 1970; Dirksmeier/Stock 2020). Urban processes of centralization are reversed here: the shrinking city does not only loose inhabitants, but it is increasingly disconnected from, meanwhile dependent on, superordinate power relations (Kühn/Lang 2015). However, the depiction of the shrinking city as a structural backdrop for societal de-urbanization overlooks the built city space, which is much more persistent than dynamically evolving population sizes or power relations. If the shrinkage endures, demand for space decreases, relieving conflicts of use and allowing for new spatial appropriations and experiments. In other words: physical free space in the urban fabric creates social spaces of possibilities. Such spaces of possibilities are in line with dominant notions on urbanity. Portraying the shrinking city as a constitutive outside of the urban falls short, accordingly. While the precise manifestations of urbanity in the shrinking city might differ from those in the prosperous city, their underlying functional logics and resulting social qualities resemble one another. The conceptual framework for urbanity in the shrinking city forwarded in this contribution is augmented with empirical insights from the German-Polish border city of Görlitz/Zgorzelec.

1201

Drivers of Residential Instability in European Urban Areas

Riccardo Valente

Rovira i Virgili University, Spain

The research is based on two different analyses, one at pan-European scale, and another with a zoom-in on the city of Barcelona. First, we combined data from three different sources (EU-SILC survey, Eurostat regional statistics, and the AirDNA dataset) to run a path analysis model with the objective of exploring the relationship between tourism pressure (i.e., number of guests per 100,000 inhabitants and its evolution over time) and residential displacement in urban areas. The results show that the Airbnb and traditional tourism's supply intensity lead to a significant increase of rental prices and, indirectly, to the displacement of long-term tenants. On the other hand, homeowners' displacement is only to a lesser extent related to tourism pressure and more dependent on gentrification. In an attempt to provide an analysis at a finer geographical level, the specific case of Barcelona was addressed. The output of a OLS regression revels how pressure derived from the spread of short-term rentals in Barcelona is forcing long-term residents (those who were living in the same neighbourhood for more than 5 years) to move out. Interestingly, no statistically significant relationship exists between the ratio of bed-places in traditional tourism accommodations and the outcome variable. Taking the two analyses together, our results corroborate the conclusions of previous studies indicating tourism as a sub-genre of the gentrification, while they add to the literature by establishing a significant relationship between tourism and the forced displacement of most vulnerable residents living in tourism destinations.

Beyond sprawl? Ambitions and problems in land use management. The case of 2040 Plan in Minneapolis

Gabriele Manella

University of Bologna, Italy

Urban sprawl has increased in many areas of the world since the mid-20th century and, although a recent slowdown, it is still important to affect the growth of the city. Nevertheless, it is clearly unsustainable for environmental, economic and political-administrative reasons, with ambivalent effects also on the local quality of life. The United States have been the first country to experience a "mass diffusion" of this trend as well as some of the most widespread forms of land use. It could be interesting to see what ambitions and problems are emerging there to stop the sprawl, in the hope to find some useful elements also for European cities.

This contribution will focus on Minneapolis. The capital of Minnesota has recently tackled land use with very ambitious projects: with the approval of the 2040 Plan, in particular, the local institutions are trying to densify some neighborhoods totally occupied by single-family houses, in order to increase housing affordability and the social mix of population. Which actors favored this change? Which ones opposed it? And above all: what are the "unwanted effects" in trying to promote densification and social equity through land use management? These questions are considered through the case of a city with a very a high quality of life but also with one of the highest racial inequality and racial segregation rates in the US.

The research is based on some historical, morphological, and demographic elements about the metropolitan area of Minneapolis-St. Paul. Minneapolis is also considered through a few weeks of direct observation and 17 interviews to key-informants (people from local institutions, university professors, architects and planners, members of local associations, residents).

RN37_T05_02 | Spatial justice and the right to housing

Theorizing Spatial Justice as a Product of Field Relationships: Use of Practice Theory in Critical Urban Studies

Václav Orcígr

Charles University, Prague, CZ, Czech Republic

The article calls for broader involvement of the elements coming from the classical approach of Pierre Bourdieu in critical urban studies in the context of discourse perspectives and the role of social actors. As several scholars have shown (Mace 2017; Savage 2011; Shin 2013), reconceptualization of Bourdieu's concepts of field and capital can bring new perspectives into critical analyses of the urban area and its processes. More specifically, the article uses the redefined concepts of field and capital in the context of critical discourse analysis and within the frames of dominant ideology reproduction systems as characterized by Bourdieu and Boltanski (1976) in comparison with Lefebvre's (1991) definition of physical and social space. Therefore, through the theoretical reconceptualization of practice theory based on literature review, the article aims to answer the following research questions: What are the possible benefits of practice theory for the exploration of spatial inequalities in current cities? And how can reconsideration of the concepts of field and capital be used within planning practices? The general answer stands in the rendering of spatial positions and connected relations between the actors, which helps to understand how the principles of governance are reproduced in different forms and legitimized.

The Classification of Social Housing Residents as the Foundation of De-humanization

Kristian Nagel Delica[1], Troels Schultz Larsen[2]

[1]Roskilde University, Denmark; [2]Roskilde University, Denmark

In the light of COVID-19, we have seen a further intensification of territorial stigmatization of neglected housing estates as infested and the residents as potential disease carriers. Analyzing how people living in neglected housing estates react toward territorial stigmatization enables us to open the social space of the neglected housing estates to a nuanced analysis. This not only of the different groups of residents but also of the classification systems applied to them by the state. The dominant terminologies in social policy and in media based accounts of 'the residents' represent sources of territorial stigmatization in its own right by evoking homogenizing effects of mass categorization and 'minority of the worst' logics. Seemingly neutral categorizations assimilate those living in tainted places to prejudgments of the stigma of that place. In contrast, we construct a model of the differentiated social groups residing in the estates that encapsulates how they react to territorial stigmatization by combining knowledge on their volume of capital and by drawing on the rarely used concept of illusio (a concept tailored for analyzing how meaning is produced, maintained and transformed). The concept of illusio enable us understand how the residents as emotional agents come to take an interest in and invest themselves in different social struggles including their place of residence. This model provides central elements in unmasking the de-humanistic foundation of contemporary ghetto politics and COVID blaming rhetoric, thus demonstrating how forms of bureaucratic and state classification is based on preconceptions rather than sociological knowledge.

From "Wir bleiben Alle" to "Housing for All": Examining the Ramifications of the Squatting Movement on the Fight for Fair Housing in Berlin and New York City

Lorraine Minnite, Natasha Fletcher

Rutgers University-Camden, United States of America

More than a decade after the collapse of the global housing market, the coronavirus pandemic has accelerated a crisis of homelessness and affordability worldwide, resulting in mass human rights violations (https://undocs.org/en/A/HRC/43/43). The wealthy northern countries are not immune. The U.N. Special Rapporteur on Adequate Housing has found that the housing crisis, as a driver of inequality, is not caused by a lack of resources or an economic downturn. Rather, it is being fueled by economic growth and the increasing power of private developers and investors to dominate housing systems in an unprecedented fashion by treating housing as a commodity for speculation.

This approach to economic growth is unsustainable. Our paper uses a 'right to the city' framework (Lefebvre, 1968); theories of the role of squatters movements in the formation of 'autonomous geographies' and social movement 'scenes;' and Castells' (1983) and Massey's (1992) notion that, 'the spatial is integral to the production of history, and thus to the possibility of politics,' to explain divergent contemporary local governmental responses to the on-going housing crisis in two global cities, Berlin and New York. Both have long histories of housing activism and muscular local governmental responses to past housing crises. But only in Berlin have activists been able to mount a serious challenge to the power of the private real estate market. We hypothesize that experiences with the 1970s and 1980s squatting wave and its legacies explain why decommodification of housing as a policy goal is playing a larger role in Berlin today. Our research methodology includes historical analysis and interviews with housing experts and activists in both cities.

The Voices That Come out of the Walls: Images of the Struggle for the Right to Housing and the City in Porto (Portugal)

Inês Beatriz Barbosa

University of Porto, Portugal

The communication presents the main results of a autonomous research carried out in Porto, the second largest Portuguese city. During the last two years (2019-2021) we proceeded with the photographic registration of inscriptions on Porto walls referring to the right to housing and the city. About 150 plural, divergent and insistent images were collected, reflecting the citizens' plea regarding gentrification and touristization processes.More recently, the walls also denounce the insufficient state and municipal support given the consequences of the pandemic on income and access to the housing market. Framed in a visual sociology and in a walking sociology, the act of "walking" is assumed here as a method of investigation, a form of immersion and exploration of the city that makes it possible to capture and interpret its signals. According to Léfébvre (1996), the city sends and receives messages that must be decoded from an analysis in different planes and dimensions, in order to account for ideologies, hierarchies, interactions, discourses, daily practices or rhythms. Interventions such as "Out with airbnb", "hostel mafia", "weapon of mass tourism", "Porto is not for sale" or "fuck landlord" were analyzed, seeking to unveil their arguments, the criticism underlying them and the discursive and aesthetic strategies (such as humor, irony, subversion, etc.). As expressions of insurgent citizenship, these counter-visualities clutter, resignify and challenge a view of the market city. They mark the territory, marking it with collective memories, tracing a history of resistance, instigating new oppositions. They are also a barometer of the tensions that occur in this clash, revealing contradictions between center and periphery, resident and traveler, owner and tenant, government and people.

Shared Economy As A Vector For Gentrification Airbnb Case Study In The Vidigal Slum During The Great Events In The City Of Rio De Janeiro

Rodrigo Nunes Limoeiro de Sousa[1], Daniel Neves da Costa[2]

[1]Faculdade de Economia da Universidade de Coimbra; [2]Faculdade de Economia da Universidade de Coimbra

Economies and cities are constantly changing. When observing that such changes have as main catalyst the advancement of technology, the approach taken aims to elucidate the role played by the emergence and use of shared economy platforms in the Vidigal slum, in particular Airbnb, and thus, verify its relationship with the gentrification process, supported by a scenario of holding mega events held in the city of Rio de Janeiro between the years 2014 to 2016. For its realization, a mixed research strategy was used, composed of quantitative and qualitative aspects, a case study in the Vidigal slum, being supported by a triangulation between document analysis, semi-structured interviews, and participant observation. In addition to this, the presence of four main new concepts about the term gentrification was verified because of the use of the Airbnb platform in the slum, which are commercial gentrification; gentrification of public spaces; tourist gentrification; and finally, peripheral gentrification. However, it appears that the economic impact of Airbnb in the Vidigal slum was momentary, where at first there coexisted a necessity to supply the demand of the hotel market with the possibility of generating extra income for its residents. However, after the realization of mega events, the demand in the hotel sector decreased as well as the use of this platform. Added to this, there was a reduction in public and private investments just like the return of illegal activities in the slum, which made it difficult to continue generating extra income.

Transformation Process of the Historic Centre of A Coruña (Spain): commodification of urban life

Estefanía Calo, Raimundo Otero-Enrríquez

University of A Coruña, Spain

The present work analyses the process of transformation and commodification of the historic neighbourhood of Orzán, in the city of A Coruña (Spain); a scenario of change that encompasses social, economic and symbolic aspects and masks the commodification of urban life through an intense commercial gentrification phenomenon. The applied methodology is based, mainly, but not only, on qualitative research techniques. Special emphasis will be placed on the visual aspects of the change process.

The paper proposes that factors such as the substitution of old-style shops for alternative shops, the regeneration of its "brand image" and the consumption and leisure preferences of the so-called creative classes, explain the current stage of private economic reinvestment which is challenging the traditional bonds of belonging to the neighbourhood. Thus, this re-development process is contextualized within the framework of a "rent gap" logic what means that maximizing the differential of economic investment in the area, certain economic agents seek to generate speculative opportunities associated with the revaluation of the space.

To conclude, this phenomenon is linked with a general commercial restructuring framework: a macro-project of regeneration of the city´s seafront. This seeks to promote tourism in the historic centre and the neighbourhood of Orzán plays a key role as space for nightlife and "creative" consumption.

Place-making re-considered: residents' perspectives in post-gentrified Old Town, Tallinn.

Anneli Leemet[1], Katrin Paadam[2], Liis Ojamäe[2]

[1]Tallinn University, Estonia; [2]Tallinn University of Technology, Estonia

Post-gentrified Old Town in Tallinn with its symbolic heritage value plays a central role as in the process of residents' place-making, business and cultural activities, in tourism industries and essentially in city's destination branding strategies. As such, the Old Town represents the acknowledged urban heritage case under the pressure of tourism, where the multifaceted stakeholders' interests collide.

Departing from an understanding of inevitability of the mix of residential and tourism space the discussion lays its focuses on Old Town residents' constitutive role in place-(re)making, place identity maintenance and (re)production of the symbolic value of shared, though contested heritage space. Discursive narratives representing heterogeneous dispositions of the otherwise relatively well-off middle-class residents are drawn on the findings of a recently (2021) completed case study, as part of a broader mixed-methods research in Tallinn Old Town. This is to offer insights into interlaced processes of meaning-making and practices of residing in a turistified location, yet seductive heritage atmosphere one tends to be disposed to identify with as home space. Genuine resident experiences set in the time-space of 'normality' of high tourism seasons and unprecedently enduring pandemic circumstances allow nuanced interpretations of the dynamic of (re)considerations of the place, (re)construction of individual and collective identities, views on representative institution of residents (Neighbourhood Association) and sustainable life quality prospects as concerns the interplay of other involved stakeholders' ambitions.

A case study of transnational gentrification in South Portugal

André Guerreiro, João Filipe Marques

University of Algarve, Research Centre for Tourism, Sustainability and Well-Being

Gentrification has been discussed in sociology for several and just as gentrification seemed to have gone out of fashion, the subject was rekindled by the new forms of gentrification associated with the mobilities paradigm and a new generation of researchers and cases studies began to contribute to novel theories on how gentrification takes place in today's world. Transnational gentrification is one of such cases. Caused by the influx of residents of foreign origin, with higher economic capital than the original residents, transnational gentrification has been linked to the housing market boom in several destinations in Southern Europe and occurs parallelly to retirement migration and lifestyle mobilities. This presentation will share data from a study conducted in Algarve, South Portugal, where an old neighbourhood went through major changes in the last decade as the number of foreign residents rose and the original residents were forced to leave their neighbourhoods.

Between Affordability And Social Interaction In "New Forms Of Social Mix": The Case Of Ospitalità Solidale In Milan

Maria Chiara Cela

Università di Milano Bicocca, Italy

In most European countries, the 21st century is characterised by a wider and more varied demand for affordable housing. In cities such as Milan, social mix is promoted also to respond to the housing needs of other targets than the most disadvantaged (Bricocoli and Cucca, 2016). Social mix usually refers to different socioeconomic profiles, ethnic groups or tenure typologies. In the new millennium, the concept of hyper-diversity has inspired new forms of social mix (Costarelli, 2017) in which other variables are taken into account to classify diverse social groups, such as personal skills, attitudes, and lifestyles. The residential proximity of "resourceful" and vulnerable tenants is seen as contributing to mutual support and community building (Costarelli et al., 2019). Many studies have already shown that socioeconomically mixed neighborhoods do not automatically produce a positive effect on social cohesion (Bolt, van Kempen, 2013). More research is needed to study the impacts of allocation policies based on people's commitment and skills to interact with others. Building upon a qualitative study of the Milan-based project Ospitalità Solidale, a pilot program that offers affordable housing to young people who, in turn, engage in community work, the paper contributes to answer to the following research question: what factors help "new social mix" initiatives in enhancing social interaction? Contextual elements, the projects' governance and their specific practices all play a greater role.

Living in Community in Today's World: a Study of Gated Communities in the Metropolitan Area of Granada.

Henar Baldán1, Nayla Fuster[2], Joaquín Susino[1]

[1]University of Granada, Spain; [2]University of Málaga, Spain

Since the last decade of the 20th century, gated communities emerged as a residential phenomenon increasingly present in the urban landscape that, through self-exclusion and privatization of space, seek to reinforce a sense of 'living among equals' in its residents. However, despite its increasing popularity, especially in Anglo-Saxon and Latin American countries, neither the socioeconomic status of its residents nor the degree of physical enclosure determines how closed a community is symbolically. Its complexity as a residential model of community responds to the socio-urban particularities of each socio-spatial context, as is the case in Europe, and more specifically in Spain, where this residential phenomenon has manifested itself in different ways. Therefore, our interest has focused on quantifying the number of what we call 'residential communities', which is a broader and more flexible conceptualization of the phenomenon from which they arise. For this purpose, the metropolitan area of Granada was chosen as the spatial frame of reference, since it is a territory with a consolidated metropolitan structure whose central city has more than 200,000 inhabitants and its metropolitan crown with more than 40 municipalities. In this way, it was possible, firstly; to quantify the number of residential communities through the use of web applications such as Google Earth and the Cadastre, as well as their location and social characterization and, secondly; to create a typology of residential communities more focused on the common spaces enabled for the use and possible development of interpersonal relationships among residents than on the physical restrictions.

Understanding (Ethnic) Segregation in Southern Europe. The Case Study of the Residential Dynamics of Foreigners in Bologna

Maria Grazia Montesano

University of Bologna, Italy

International migrations are strongly affecting contemporary urban societies worldwide. While being global in nature, migrations have relevant local impacts and studying them may contribute to a better understanding of urban transformations. However, only a few studies focused on the residential patterns of migrants in Southern European contexts, showing that in this regard Southern European cities follow different dynamics than North American and North European ones.

This study contributes to the debate on the residential patterns of foreign populations in Southern European urban contexts. The paper analyses the medium-period (2011-2019) location dynamics of foreign residents in the city of Bologna (Italy) in order to investigate changes in residential patterns and identify emerging trends. To this aim, I collect data provided by the Municipal Registry of Bologna and I elaborate them using Quantum Gis and Geo-Segregation Analyzer (GIS). I analyze residential patterns of foreign residents by computing an array of indices which consider five different dimensions of segregation (Massey and Denton, 1988). Furthermore, the localization quotient (QL) is calculated to evaluate the over- or under-representation of the foreign population in different neighbourhoods.

Preliminary results of the analysis confirm the absence of residentially segregated macro-areas. At the same time, I show that a growing process of "peripheralization" is in place, and that Bologna's foreigners residents seem to follow the pattern of "urban diaspora" – as already observed in other Southern European cities. Finally, this study highlights some specificities of Bologna, demonstrating the role of local factors in influencing the residential patterns of foreign residents.

Social Housing As Urban Infrastructure Shaping The Interrelation Of Living & Working

Julia Edthofer

TU Vienna, Austria

In my contribution, I discuss the biographical intertwinement of living, learning and working in the peripheral Viennese council estate area "Siemensstraße" from a gender-specific perspective. I build on the ethnographic observation that older residents remember and recount their life stories via spontaneous "narrative mappings" of urban infrastructures provided within the estate that point to a close connection of housing, in-/formal education and work. Furthermore, I observed a gender-specific gap between the accounts of female and male interviewees: men recounted a range of in-/formal educational opportunities on-site that determined their paths into apprenticeship and gainful employment, while women mainly addressed reproduction- and care work, albeit many of them had been working in paid jobs for decades. I thus exclusively focus on women's perspectives on the biographical intertwinement of housing, living and un/paid labour.

Methodologically, I combine sociological perspectives on community studies that reference the "Chicago School of Sociology" as primary methodological source and biographical research with focus on approaches addressing the biographical rupture caused by the transition from Fordism to post-Fordism. I interview several generations of "female workers" within the same family and analyse their individual pathways regarding education and work. Furthermore, I integrate a socio-spatial view by conducting a "Social Area Analysis" of relevant social infrastructure on-site that determined those pathways.

My approach aims to contribute methodologically to the analysis of social housing as urban infrastructure by focussing the "spatiality of life-experiences". Furthermore, I aim to enrich current sociological debates on post-binary life spheres (public/domestic, work/life) with regard to the relation between so-called "productive" and reproductive labour.

Tales of Two Cities: Urban Poverty in Neoliberal Tehran and Ankara

Mehrdad Emami

Middle East Technical University, Turkey

This paper aims at investigating the production of space in the capital cities of two neighboring countries, i.e., Tehran and Ankara, as developed through the neoliberal era since the 1980s. In order to do so, I'll firstly locate my problematic in a theoretical framework which is based on Henri Lefebvre's concept of the production of space and also David Harvey's interpretation of it. Moreover, I'll define neoliberalism in alignment with Bob Jessop as a new economic project manifested in different forms ranging from policy adjustment to regime shift and radical system transformation. In this context, neoliberalism has specific effects on urban space. Neoliberal city is where the class cleavage reaches its extreme; it is where the state and capital dominate over all spheres of social life; over everyday life of all people from different classes, genders, ethnicities, minorities, citizens and refugees. Tehran's and Ankara's urban development in the twentieth and early twenty-first centuries will be discussed in this framework. This paper also seeks to show that how political Islamists in Iran and Turkey have been the main protagonists of neoliberal policies despite their discourses of so-called defending the poor. So, displacement and dispossession policies of Tehran and Ankara municipalities will be discussed in this context through different examples. I'm inclined to ask that how similar or different have been the neoliberal policies implemented in these two cities. What mechanisms were actually put into practice to produce abstract space in Tehran and Ankara? Which social groups have been mostly the target of these policies?

Key Words: urban development, neoliberalism, Tehran, Ankara, urban poor

Ode: An Insight On The Uses Of Photography In Portugal's Coastline Touristic Imagery After The 25th Of April 1974

Eduardo Silva

Instituto de Sociologia da Universidade do Porto,

Faculdade de Letras da Universidade do Porto, Portugal

This proposal stems from an ongoing doctoral research project on the evolution of the dynamics of occupation and use of touristic activities in Portugal's coastline after the 25th of April 1974, a date that signals the end of Estado Novo's dictatorship and, following Boaventura de Sousa Santos, the beginning of the country's transition to its "new Modernity" which prompted democracy and, ensuing global trends, neoliberal economic policies which permeated hitherto State regulated sectors – such as tourism. It overviews Portugal's coastline touristic photographic imagery to address how this territory was commodified and promoted through photography for touristic consumption, as it opened itself to globalized tourism flows which have jeopardized socio-economic and environmental sustainability of highly affluent touristic locations – such as its coastline. In this sense, it posits that Portugal's coastline touristic affluence can be framed within the structure of globalized mass tourism: while the free market provides the material conditions for travel, amusement and accommodation under mass tourism logics, a promotional discourse that instrumentalizes photography – inscribing it in the "tourist gaze" discussed by John Urry and Jonas Larsen – is manufactured to attract a global audience of tourists. The analysis of this photographic imagery establishes the theoretical framework for the project's qualitative, quantitative and comparative research on the impact of the dynamics of occupation and use of touristic practices in contemporary Portugal's coastline – forming a picture that unifies the territory's past and present – and its discussion provides clues to approach mounting concerns about the uncertain future of tourism in the post-covid19 world.

1209

Pasolini and the Defense of Monuments as a Means of Preserving National Culture

Emanuele Stochino

Università degli Studi di Brescia, Italy

The abstract aims to highlight the thinking of Pier Paolo Pasolini (1922-1975) regarding the issue of the importance of maintaining monuments as a source of historical memory. Pasolini argued that the minor works of the past such as small monuments, artifacts of everyday life, streets and walls had the same importance as the masterpieces of the Italian Renaissance in understanding the culture of nations.

For Pasolini, the culture of a nation was made up of all the expressions of all forms of culture, popular and cultured, expressed in a given historical period.

Pasolini through his works such as The Walls of Sana 'highlighted a parallelism in the change of the architectural elements of the cities and social changes.

The walls of Sana 'is a short documentary where Pasolini appeals to UNESCO to protect the centuries-old and unspoiled beauty of the Yemeni capital from building speculation.

The short film represents a metaphor for the anthropological transformation of Italian and Western society, increasingly geared towards consumption and homologation, that is, progress and less towards development.

The demolition of the walls of Sana 'was the expression of progress, that is of the industrial-economy which is expressed through a radical economic pragmatism at the expense of the history of the national team. In recent years, the issue of development has returned to being central. Today, the creation of an asustenable urban development for is based by giving answers to citizens cannot be separated from the quality of life, from human relations and therefore from the particular history of each settlement, large or small.

Keywords: Development, City, Monuments, Pasolini, Progress.

Doing Urban Ethnography in a changing world: building bridges between Portugal and Brazil

Patrícia Pereira[1], Rita Cachado[2], Renata Gonçalves[3], Manuel Garcia-Ruiz[2], Lígia Ferro[4]

[1]Universidade Nova de Lisboa, CICS.NOVA FCSH, Portugal; [2]ISCTE - Instituto Universitário de Lisboa, CIES, Portugal; [3]Universidade Federal Fluminense, PPGA, Brasil; [4]Universidade do Porto, IS-FLUP, Portugal

ETNO.URB (Urban Ethnography Network) is a collaborative international network created in 2016 that brings together Portuguese-speaking social scientists, based mainly in Portugal and Brazil, who use the ethnographic method to tackle different aspects of social life in cities.

This presentation aims to discuss a set of recurrent topics of debate within the network: what is the reciprocal intellectual impact of production in the fields of urban sociology and urban studies to understand the current socio-political contexts in Portugal and Brazil? How can urban ethnography contribute to the understanding of agencies, resistances, and the dispute of identities in the main Brazilian and Portuguese cities? How should we approach urban contexts in times of COVID-19 and beyond? Considering previous and current research projects developed within the ETNO.URB network, we will open the debate on the potentialities of urban ethnography and on the power of collective work to understand the complexities of our changing urban world.

RN37_T08_01 | Housing and residential dynamics 2

Finding One's Way in Urban Residential Markets: The Case of Students in Private Rental Sector in Tallinn

Liis Ojamäe, Katrin Paadam

Tallinn University of Technology, Estonia

With expansion of higher education, students are making a significant group among dwellers in cities and notably in urban residential markets. However, finding accommodation for this particular life phase is a considerable challenge, the more in structural circumstances of increasing individualisation of societies and neoliberalisation of higher education. Observing the students to form an important group of actors, particularly, in private rental markets, pertaining also to their distinct lifestyles and hence patterns of urban spatial practices, suggests further inquiry into construction of their urban residential strategies. The presentation discusses, on the one hand, the ways students' choices in housing market interlink with structural conditions and substantial urban processes (e. g. segregation), and, on the other hand, how the experiences from private renting, often entailing compromises in quality and security, form an important part of students' housing histories, shaping their dispositions and capacities to act knowledgeably in urban housing markets in future. The evidence from a recent multi-method study (a survey and in-depth interviews) conducted amongst private rental sector students in Tallinn, inspired by Bourdieu's theory of practice, allows contributing to the discussions on housing aspirations of younger generations and, in particular, the students' heterogeneous socio-cultural preferences driving housing choices also beyond accessibility in economic terms and the dichotomy of private ownership/renting. The relevance of the research findings is continuously highlighted against the neoliberal housing policies and a strong owner-occupation orientation in cities with young people's constrained access to housing market.

Selective In-migration Of The Elderly From Suburbs To Inner City. A Qualitative Insight from Poland

Katarzyna Kajdanek

University of Wroclaw, Poland

This paper looks into one aspect of spatial differentiation implied by population aging, namely, a selective and micro-scale return of the elderly (for study defined as people aged 55 and older) from suburban homes to urban apartments in central districts of large cities in Poland.

There has already been some quantitative as well as qualitative research on the selective in-migration in Polish and Czech cities. The latter was usually focused on analysing housing biographies of younger individuals. Other studies, of residential mobility later in the life course, were conducted in Western societies, which are more mobile than in Eastern central European countries. Mobility of the elderly in Poland, as an example of an ECE country, remains an understudied phenomenon.

Using qualitative data from 15 (so far – the research is an ongoing one) semistructured interviews with elderly movers and adult children whose parents consider moving back to the city, this paper seeks to address the experience of moving from surburbs to a city by linking the microperspective of the household (decision making process and effects on housing career) and macro-scale changes (housing provision, local quality of life in suburbs and cities).

As a result of the qualitative data analysis (categorial analysis of themes using MAXQDA software), the paper shows:

-Changing meanings attached to a suburban home, and transformation of home as a nexus of family relations;
-Perceptions of local quality of life in suburbs and cities in decision making process, and their implications on economic development of urban districts;
- A tentative socio-demographic profile of an elderly mover, and relations between socio-economic position and affordable housing market in cities.

Home That Cares: Design And Healthcare Technologies For Future Of Home Living

Simona Totaforti[1], Carlo Gelosi[1], Uberta Ganucci Cancellieri[1], Lorenza De Carolis[2]

[1]Università per Stranieri Dante Alighieri; [2]Fondazione Magna Grecia

Aging and increasing neurodegenerative diseases in the population have determined – and will increasingly determine– changes in living and designing houses with regard to the relation between security, accessibility and well-being. At the same time, e-health technologies and innovation in specific diagnoses are available at consumer level; this marks a shift in diagnosis spaces that will move from medical facilities and hospitals to private housing. This research will present the results from a study conducted on a representative sample of the Italian population and its aim is twofold: understand how and to what extent the silver population's needs are modifying real estates' uses and interior design; how and to what extent new connected care technologies and specific diagnostic instruments designed for the consumer level are influencing and will influence the organisation and use of living spaces. The research is multidisciplinary and it has been conducted through the use of both qualitative (in-depth interviews) and quantitative (surveys) methods.

The city of the future? Exploring Up Town, the smartest and greenest district in Italy

Filippo Borreani

University of Turin, Italy

This contribution focuses on the presentation of the first empirical results originating from a research project dedicated to the construction and gradual settlement process of new residents in a smart district on the outskirts of the city of Milan, called Up Town. The district, conceived as the residential part of an impressive hub dedicated to technological innovation, offers innovative smart services (neighbourhood apps, domotics, car sharing for residents, ubiquitous video surveillance) and is inspired by the principles of the so called "social mix", with the coexistence of luxury houses and social housing.

In this empirical context, the aim of the research is to analyze the influence of the urban socio-technical imagery of the smart and green-eco city on residents' housing choices and to frame this influence in a sociological perspective. Moreover, the case study offers the possibility to observe the interaction between different social groups in a semi-experimental context: a neighbourhood with no urban memory conceived by a group of private companies as a social engineering experiment. The research is embedded in an analytical-critical theoretical framework through which the construction of the neighbourhood is framed within a general process of transformation of the capitalist economy in global cities, increasingly focused on the construction of innovation clusters, new urban infrastructures, data exploitation and platform capitalism.

The research is carried out with a qualitative approach, based mainly on discursive interviews and field observation.

Strategies of Social (In)visibilization at the Urban Margins: Roma Experiences in Romanian Slums

Filip M. Alexandrescu, Ionut M. Anghel

Research Institute for Quality of Life, Romania

Recent research on the racialization of poor Roma in Europe has documented a host of new and acute spatial processes of separation and segregation of this "problem population" (Wacquant 2009:288). This happens at the end of chains of expulsion that push impoverished Roma centrifugally towards the urban margins. The creeping subterranean process (Sassen 2014) that accompanies these expulsions is the invisibilization of the precarious conditions under which many Roma are forced to live (Powell and van Baar 2019). In this article, we use recent critical research on the invisibilization of suffering (Herzog 2020) to point an anthropological lens at forms of invisibilization associated with expulsions. We use Herzog's new articulation of the Third as complex mediator between aggressors and sufferers. The

narrative material (interviews and observations) collected in two mid-sized cities in Transylvania, which have carried out expulsions of their poor Roma inhabitants over the last two decades, is used to distil various figures of the Third, such as materials/infrastructures, legal and political assemblages and neoliberal normativity. Such Thirds are employed to illuminate experiences of invisibilization, based on their dialectical qualities of separating dominant visibilities from suffering-inducing invisibilities. We conclude by showing how contemporary political-economic processes occurring at the global-urban level can be recognized and richly interpreted at the micro level through situated anthropological reconstructions.

No Pain, no Gain? Rooted Social Inequalities in City Centres: the Case of Barcelona

Montserrat Simó-Solsona, Gemma Vilà-Bosqued

University of Barcelona, Spain

After the deep crisis, the Spanish economy shows signs of starting a new stage of recovery from 2014. Although this economic improvement has not benefitted the entire population, it has an impact on housing market, activity and employment. Besides, it generates changes in the mobility flows that cause social and spatial transformations in urban areas.
The objective of this paper is to analyse the economic dynamics and their impact on urban transformation processes trough three axis: housing market evolution, changes in residential mobility and demographic changes in the social structure of the population through households in urban centres.
Urban centres have experimented deep changes since the late 1990's, and have set the stage of various processes of inequality, polarization, and even gentrification. Economic recovery introduces even more elements of instability that influence on a strong bubble in rental prices; an increment of tourist accommodation; growth of vulnerable population and internal residential movements flows in the metropolitan regions that are not organized and predictable.
Our analysis focuses on three periods: pre-crisis (before 2008), economic crisis (2008-2014) and post-crisis (2014-18). We will focus concretely on the urban centres of Barcelona using secondary sources such as Population and Housing Census (2011), Residential Variation Statistics (1998-2018) and Sociodemographic Survey of Barcelona (2017). This work is part of the research project

New Motilities and socio residential reconfiguration in post crisis (RTI2018-095667-B-I00) funded by the Spanish Ministry of Science, Innovation and Universities. Multivariate analysis provide a typology of neighbourhoods according to the contribution of these new and multiple urban processes. In conclusion, new factors play a key role contributing to more fragmented urban areas and generating new social inequality processes.

An Alternative Way Of Producing Space: Social Production Of Habitat And The Portuguese Context

Daniel Filipe Lima de Azeredo Lobo

Lisbon School of Architecture - University of Lisbon, Portugal

This research follows a critical theoretical line of socio-economic and spatial injustices and inequalities originating in the current capitalist mode of production. In this line, the alternatives to this mode of production are close to those advocated in notions such as the right to the city (Harvey and Lefebvre) and "autogestion" (Lefebvre, 1968), in which the notion of the State assumes a preponderant role. Examples of these alternatives are the processes implied in the Social Production of Habitat (SPH), which are taken here as the main reference.
Therefore the research strives to know if SPH is a viable alternative to the hegemony of the capitalist mode of production in Portugal?
The causes that may be at the basis of the transition to an alternative mode of spatial production and its consequences are analyzed, a bibliographic and empirical material of 5 years of involvement in the collaborative process of a SPH in Loures, Portugal, are also analyzed as case study, and alongside examples of PSH worldwide, reflected having as main theoretical guiding concepts, the "right to the city" and "autogestion".
These cases shown as alternatives have been important opportunities to rethink and improve the practices and policies of space production in Portugal.
The context of change, alongside that of economic and institutional reorganization that we have witnessed, bring a new hypothesis of development to Portugal, which is resulting in a convergence between a cultural vanguard and the masses of consumers who have had to adapt to a new way of being.

Unequal Landscapes: Integrating Digital Social Systematic Observation in a Place-based Inequalities Study

Daniela Craveiro[1,2], Sara Franco da Silva[3], Luís Cabrita[3], Maria do Carmo Botelho[3], Rosário Mauritti[3], Nuno Nunes[3]

[1]CSG/SOCIUS, ISEG-ULisboa, Portugal; [2]ICS, ULisboa, Portugal; [3]CIES-IUL, ISCTE - Instituto Universitário de Lisboa, Portugal

The place where we live has a profound influence on our lives. It structures opportunities of education, leisure, income and access to services, and even the exposure to health and wellbeing hazard/beneficial factors. Assessing which features are crucial in differencing places with different socioeconomic profiles may help to understand the territorialized mechanisms of social inequalities.

By ensuring new analytical possibilities to study place-based inequalities, publicly available images banks such as Google Street View have been promoting a renewed interest in systematic social observation methods. Building upon the potentialities offered by digital visual audits at street level, this communication describes a methodological approach to assess unequal landscapes at the municipal and parish level.

The study is part of a wider project on territorial differences in wellbeing in Portugal. It targeted five (municipal) case studies selected to represent unique territorial profiles in social inequalities. A social observation protocol based on Google Street View visual audits was translated, adapted and pre-tested. In each case study, two parishes were targeted and a sample of streets was selected randomly (N = 97). The team of observers started collecting data after reaching a good level of inter-rater agreement. A multivariate approach was taken to identify key dimensions differencing the places observed. Two dimensions are identified as most relevant: one related to the offer of infrastructure and services and another related to urban density and public maintenance. Place inequalities are discussed analyzing the relative positions of the municipalities and parishes in the bidimensional plan defined by the analysis.

Changing Discourses of Social Sustainability in a Swedish Urban Development Project

University of Gothenburg, Sweden

While sustainable development is a general political goal for urban development the implementation of sustainability policy is difficult, particularly the social aspect. The income gap is widening, even in Nordic countries which historically been described as the world's most equal countries. Gothenburg, Sweden, is one example of a city struggling with income gaps, segregation, and gang violence. To address these issues, the municipality put social sustainability as an overarching goal for city development. However, research shows that social sustainability policy is rarely successfully implemented in urban development. Several challenges have been identified for social sustainability in practice, relating to its multiple meanings; changing focal points; and a lack of resources, knowledge, and ways of measuring. These challenges hint that implementation of social sustainability is depending on who is interpreting the concept and in what context. In my research project, I explore how the concept of social sustainability gains meaning in strategic urban planning practice. I focus on how and which knowledge is integrated into the process when forming the meaning of social sustainability in a context of conflicting interests and goals. By conducting a case study of a key development project in Gothenburg, I trace the discourse of social sustainability from 2012 until today. I address the research question: How and why is the meaning of social sustainability changing during the planning process? In this paper, I will present my empirical findings so far and reflect on the use of concepts such as social sustainability in urban sociology.

Are Innovation Districts the Future of the City's Work Landscape? Reflection Based on Longitudinal Studies of Innovation Districts in 5 Polish Cities.

Jacek Gądecki[1], Łukasz Afeltowicz[2], Karolina Anielska[3], Ilona Morawska[1]

[1]Institute of Urban and Regional Development, Poland; [2]AGH University of Science and Technology, Faculty of Humanities; [3]Jagiellonian University, Faculty of Geography, Institute of Geography and Spatial Management

Our presentation concerns the so-called innovation districts. Our longitudinal, mix-method research started in 2017 in 5 Polish cities allows us to ask questions about the future of urban and work environments: their attachment to specific places, and (in)dependence on the city's infrastructure. Additionally, under the influence of the COVID-19 pandemic, our research project opens up the question of the future and composition of work landscapes.

The longitudinal mix method of research (data analysis, mapping, multi-sited ethnography) helps to understand the meaning of infrastructure and so-called inverted infrastructure in the creation of innovative milieus in contemporary urban landscapes. We capture the dynamic and contradictory relations between bottom-up, naturally occurring innovation districts and spaces of science and technology parks, representing top-down design. As a result, we analyze the future relationship between the city as a place to live and a workplace.

Additionally, our research introduces some new methodological solutions resulting from research conducted during the COVID-19 pandemic, using mapping tools, mind mapping, on-line interviews that raise challenges but also provide important methodological and theoretical insights.

The Asynchronous Path to Urban Mobility Transitions: Temporality and Responsible Intervention in Public Spaces

Alexander Wentland, Manuel Jung

TU Munich, Germany

Living labs in public spaces are intended to stimulate long-term transformation towards sustainable cities. Mostly, such interventions are organized as projects. However, projects entail their own temporal logic, which does not coincide with the temporal logic of the actors, urban neighborhoods, and residents' everyday lives involved. In this paper, we examine three dimensions of asynchronicity based on two mobility projects in Munich and Barcelona and highlight the tensions arising from them: First, the interventions quickly created conflicts, while mobility routines persisted. Second, the projects were tied to limited-term funding and election cycles. Actors were under pressure to act quickly and achieve symbolic successes, regardless of developments in the neighborhoods. Third, the expectation of transferability led to a paradoxical situation in which local particularities and promises of participation had to be reconciled with the development of scalable solutions. Our paper builds on concepts from urban sociology, transition studies, and science & technology studies.

1215

Urban Regeneration and Social innovation in Bon Pastor

Javier Vergel, Santiago Eizaguirre

Universidad de Barcelona, Spain

Interventions in vulnerable and disadvantaged neighborhoods are a recurrent topic in the Urban Studies field. Departing from our research in progress, we propose an approximation to a territory of Barcelona where vulnerability has become a chronic issue.

This neighborhood, called "Bon Pastor", has suffered the effects of outskirts' intensive urbanization, intra-urban industrialization and administrations' forgetfulness. Among other problems, urban segregation, the real estate market or previous inaccurate planning, tend to concentrate there different collectives of excluded people.

On the contrary, for the last 20 years, the territory is also experiencing a long change process brokered by an injection of governmental resources oriented to different

fronts. Our research analyses how this may be explained by the way that inhabitants have used their civic capacities to reverse an adverse situation. Either by social mobilizations, by intern cooperative and solidarity initiatives or by negotiation and direct participation in governance frames, we observe the substrate of the current interventional process.

That said, the research we present aims to identify the hypothetical reciprocity linkage between Urban Regeneration Processes and Social Innovation initiatives and, to which extent, both phenomena can work as mutual catalysts

Stakeholders' And Experts' Perceptions And Acceptability Towards Barcelona's Superblocks Model

Sergi López-Asensio

CIEMAT, Spain

Air quality and traffic congestion have become a more visible problem in urban areas in the recent years and, in response to that, cities across Europe have started to introduce different kind of policies to mitigate these problems. In the case of Barcelona, among the various interventions introduced in recent years, the Superblocks model has been proposed as an innovative land use intervention to reclaim space for people, reduce motorized traffic and air pollution, and mitigate the effects of climate change. In this study we conducted semi-structured interviews among different experts and stakeholders from the two of the firsts Superblocks fully implemented in Barcelona to understand their attitudes, beliefs and acceptability towards the Superblocks model. The analyzed variables were the previous attitudes, problem perception, familiarity, perceived legitimacy and trust and other specific beliefs about the policy.

The Commodification of Safety and Inclusion in City Branding: Practices of Excluding Inclusiveness in the Becoming of the 'City Center of the Year'

Ida Sjöberg

Mid Sweden University, Sweden

On an annual basis, the organization Swedish City Centers awards the prize 'City Center of the Year' to the Swedish city or town that in recent years, through cooperation between private and public actors, has made the greatest progress in its renewal of the city center. In August 2017, the municipality of Sundsvall together with the private company City Development Sundsvall, announced a joint venture to win the title in 2021. To win the award, Sundsvall aims to create a safe, attractive, and inviting city center where people thrive and can grow together. Drawing on interviews with seven central actors within the urban planning and development of Sundsvall city center, the present study asks (1) how the concepts of safety, inclusiveness and economic growth are linked together and made sense of in the interviews, and (2) which bodies/subjects are included (and excluded) in the speech regarding the commodified form of safety.

Using critical theories on neoliberal urban development and feminist theories on safety, the present study shows how the conceptualization of 'flows' (of e.g. people, money, and goods) becomes a central signifier for how safety and inclusion become interlaced with neoliberal values of attractiveness and economic growth. In this process safety and inclusiveness are put in a causal relationship to economic growth and turned into a commodity for city branding. The paper also shows how, through the commodification of safety, strategies of inclusion are turned into practices of exclusion.

1216

Conflict Resolution In Urban Planning. The Role Of Multilevel Knowledge Integration.

Olga Stepanova, Hannah Saldert, Merritt Polk

University of Gothenburg, Sweden

Despite the long history of research on collaborative planning and admittance that planning inevitably entails conflict of goals and interests, the study of conflicts has often been left in the background in urban planning studies or taken for granted as a given part of urban complexity and planning challenges. However, the ways in which conflicts are managed are decisive for social justice, human rights, and democratic participation all of which are central for reaching sustainability. Practices of knowledge use and integration play an important role in tackling complex and contested issues such as planning conflicts. This study aims to better understand knowledge-related aspects of conflict development and resolution.

Utilizing qualitative methods – semi-structured interviews, participant observation, document and text analysis, - this study takes a deeper look at mechanisms of conflict resolution in urban planning focusing on practices of knowledge use. We analyze what types of knowledge are used in decision making in the context of conflicts and what implications this has for conflict resolution. The analysis is performed in two large, high impact and highly debated urban development projects in Gothenburg, Sweden – the underground railway called the West Link project (Västlänken) and the development of a new, centrally located city district Frihamnen/the RiverCity (Älvstaden). An interdisciplinary knowledge typology constructed for conflict analysis in the context of multiple actors and high institutional complexity is applied to facilitate the analysis. The results shed light on shortcomings of resolution processes and may contribute to improved conflict resolution in urban planning towards better informed, more lasting, long-term oriented, and therefore more sustainable solutions.

RN37_T10_02 | Collective action to meet urban challenges

Exploring The Contradictions Of 'Community Building': Liverpool's £1 Houses

Abi O'Connor

University of Liverpool, United Kingdom

Liverpool's boasts one of the highest average rental yields in the UK, sitting between 7-8% - above London's 4.7%, it has also consistently had one of the highest proportions of deprived neighbourhoods nationally. An oversupply of old terraced housing has resulted in high vacancy and dereliction rates in the city, in the climate of continued economic decline. Resulting, various housing policies have been rolled out under the guise of 'saving' Liverpool's housing market.

This work draws on empirical research conducted with residents on 'Britain's cheapest street', who bought their houses for £1 as part of Liverpool City Council's push to offset their vacant housing stock and increase home ownership. Since moving into the streets residents have drawn on different techniques in an attempt to establish a community – which has been particularly important as many still live amongst 'empties', owing to the slow pace at which the council have transferred ownership of homes. Their movement includes residents associations, community interest companies, arts-led events and the creation of green spaces, yet they have been met by resistance from the very authority that began the process: Liverpool City Council. In drawing out understandings of the complex relationship between class, race and place – and the ferocity of the 'rent gap' (Smith, 1979) - this research explores how residents are navigating the complexities of home ownership and community building against the backdrop of continuing local state control.

1217

Rethinking Urban Spaces Though Citizen's Participation: the Case of Street Gardens in Lyon (France)

Frédéric Bally

Grenoble Ecole de Management, France

Producers of waste (Sassen, 2004), places of consuming more than production (Parham, 2015), cities are now subject of a social demand for nature (Bourdeau-Lepage & Vidal, 2012), participative democracy (Beierle & Cayford, 2002) and recently more political interest for climate change. Citizens are invited to participate through collective gardening (like community gardens) to produce and manage public green spaces (Ernwein, 2019). These citizens' initiatives contribute to create new imaginaries about cities with spaces of plants, flowers and vegetables accessible to everyone, in each neighborhood. Street gardens (Bally, 2019), wild herbs emerging from the concrete, flowers on the space between a habitation and the pavement, managed by residents, also produce new imaginaries: a nature close to the house, in the street, where everyone can garden and benefits from these gardens. From this perspective, ecology is then interactions with vegetal and between residents.

We draw on H. Lefebvre theory of spaces to identify how these gardens can be used differently (they are space of education, appropriation, environmental, socialization...) by participants, as they appear to be more than just gardening spaces. Based on those different lived spaces (Lefebvre, 1974), this text shows how residents shape vegetal places through street gardens and how they create new representations on the city that can influence urban population and public policies, like community and shared gardens did.

We base our analysis on 20 interviews with street gardeners and institutional actors on the territory of Lyon, observations of gardens and collect of secondary data such as charts, notes on events, newsletters.

Reading the City: Participatory Surveillance and the Governance of Minor Offences

Lior Volinz

Vrije Universiteit Brussel, Belgium

New digital and mobile technologies (re)configure the relations between citizens and the state: they allow local authorities to crowdsource real-time information on the urban environment and enable citizens to file reports and complaints directly to the relevant authorities in a direct, rapid and simple manner. These modes of participatory surveillance allow local authorities to collect, sort and process data on their geography and population - to schematically map spaces and people through 'schemes of legibility and standardization' (Scott 1998: 343), embedding sensory and crowdsourced data in their reading of the urban. But these new interactions and interfaces are not devoid of social and political implications. On the one hand, citizens' expectations of mobile digital technologies can translate into exaggerated expectations towards public authorities. Local authorities, on the other hand, adopt mobile city application with trepidation, fearing an untenable burden, loss of control over municipal priorities, an excess of (irrelevant) information to sift through, and the redistribution of resources towards tech-savvy, well-informed residents at the expense of others. Through a focus on the governance of minor offences - such as illegal trash dumping, graffiti or noise disturbances - this paper explores the case of FixMyStreet, a mobile city application where residents report nuisances and incidents to their local authorities. Through the case study of a municipality in Brussels, I critically examine the possible consequences arising with the introduction of such new participatory surveillance schemes, both within municipal authorities' structures and within the wider social and political landscape.

Mapping The 'Invisibility' And Resistance of the African And Afro-descendent Communities, Through Their Associative Social Network, in the City of Porto, Portugal

Beatriz Lacerda

Master´s in Sociology, University of Porto, Portugal

Portugal has been commonly described as a country with "soft customs" where racism has no place. At the same time, remains an idea of a "smooth" colonization process, based on the myth of the friendly Portuguese colons. These representations are visible in the landscape of the cities, where it is still possible to find colonials reminiscences, glorified in the name of some streets and places. Despite the efforts of Black Associative Movement, these representations are still ignored and/or accepted, as public policies in Portugal continue to ignore this topic, and fail to deepen the knowledge about Afro-descendant and African communities in the country, with the striking example of the 2021 Censuses, that keeps excluding the collection of data on ethnic belonging. This community continues to be marginalized and suffers from great invisibility, even in cities where they have been growing in number, like Porto, Portugal. Through an ethnographic approach to the Portuguese-African associations in Porto, Portugal, and other key actors of the Black Associative Movement, becomes clear that this is a city of various landscapes, representations and networks of sociability that have not crossed, especially among whites and non-white. Moreover, while mapping the history of these associations in Porto, we can see their forms of resistance in this changing and "touristicized" city, still represented as a white space. Methodological tools such as photography, document analysis and mental maps were applied to make visible the associative network, formal and informal, of these communities, and to contribute to their empowerment in the city.

RN37_T11 | Neighbourhoods and neighbouring

Effects Of The Social Composition Of The Neighborhood On The First Required School Choice In Germany. A Small-Scale, Ego-Centered And Multiscalar Approach.

Hinrich Wildfang, Stefanie Kley

Universität Hamburg, Germany

This research contribution investigates the effect of the social composition of various scales of the neighborhood on the first required transition from primary school to secondary school in Germany. The first transition has a long lasting effect on a variety of outcomes throughout the life course, as it sets the course for a further educational career. The social and geographical environment provides different sets of resources, such as information, peer networks, social norms and role models that enhance or restrict opportunities, which in turn shape the individual framework of action. Thus making action, behavior and decisions deeply entangled with the social and physical environment.

Based on data from the German Socio-Economic Panel, I can control for a wide array of individual and household level variables, while geographically situate the household in small-scaled, ego-centered and multiscalar neighborhoods. The neighborhood information is generated by the combined usage of georeferenced consumer marketing data, GPS coordinates of all schools in Germany and 100x100 meter raster data from the population census 2011. This research design overcomes widely known challenges in analyzing neighborhood effects. The effects of the social composition in dependence of the scale of the neighborhood, different thresholds of the concentration of social groups (affluent vs. disadvantaged) and in interactions with household characteristics (effect heterogeneity) are analyzed under the general counterfactual framework.

The results indicate small but significant effects of the social composition depending on concentration

1219

thresholds, neighborhood scale and characteristics of the household of origin.

Discovering And Improving Shunned Neighbourhoods In European Cities.

Juan José Ogáyar

Universidad Nacional de Educación a Distancia, Spain

The planners of the globalization cities need to solve the marginalization of shunned neighbourhoods. What are these urban areas? How are they built? What role has the public administration in their configuration? What are relevant actors to build an alternative? What is the future of these areas in a globalized European city? From the theory of social fields, I search answers in this paper where I discuss several cases that I have found in Spain. I begin to differentiate three social fields in a city: the formal, the informal and the illegal. This permit to understand which is the main difference among integrated, vulnerable, and shunned neighbourhoods. And this analytical categorization helps to discuss if we can need a way to improve one class of urban areas, and another to transform shunned neighbourhoods because the trouble of everyone can have its own nature.

Interethnic Contact and Social Capital in European Immigrant Neighborhoods.

Rui Carvalho

Brown University, United States of America

European cities have been receiving growing numbers of international migrants in the last decades. This has led to many studies examining the effects of migration-driven diversity for the livelihoods and cohesion of European neighborhoods. Many such works have found a negative association between ethnic diversity and social capital. However, this effect tends to be shaped by individual and contextual features like the quality of social, mainly interethnic, contact with neighbors. Here, I query: What sociodemographic and attitudinal elements are associated with the establishment of interethnic contacts in European ethnically diverse neighborhoods? I answer this using data from a unique survey applied to the residents of twelve multiethnic neighborhoods located in four European cities (Bilbao, Spain; Lisbon, Portugal; Thessaloniki, Greece; Vienna, Austria). Using logistic

regression models predicting interethnic contacts of various types and levels of intimacy, I find that: (a) being an immigrant (or not), is the most important predictor of neighborhood interethnic ties; (b) claiming a religious affiliation is associated with lower levels of interethnic contact with neighbors; (c) engaging in the neighborhood's associational life is associated with higher levels of weak interethnic ties but also with more conflictual interactions; and (d) stronger ties are associated with sociodemographic features (migration background, occupation, educational levels), while one's values and neighborhood social capital (religiosity, anti-immigration attitudes, neighborhood attachment, civic participation) are associated with weaker ties and negative interactions. These results highlight the importance of viewing interethnic contact and social capital as multifaceted concepts, shaped differently by demographic, cognitive and behavioral aspects.

Neighboring Practices, Meanings and Contexts in a Lisbon's Changing 'Zone of Transtion'

João Pedro Nunes[1], Bernardo Fernandes[2], Luís Baptista[3], Patrícia Pereira[4]

[1]NOVA FCSH - Faculty of Social Sciences and Humanities, Portugal; [2]CICS.NOVA - Faculty of Social Sciences and Humanities, Portugal; [3]NOVA FCSH - Faculty of Social Sciences and Humanities, Portugal; [4]CICS.NOVA - Faculty of Social Sciences and Humanities, Portugal

Neighboring practices and contexts have long been discussed subjects within urban sociology, still polarizing debates, setting routes to policy innovations and fostering research. Recent extensive research suggest that neighboring ties still count, and ethnographic and qualitative research elucidate the multifarious nature of neighboring ties, meanings and contexts. This paper explores the notion that contemporary neighboring practices assume different and contrasting forms and meanings and compose significant ways of relating and exchanging between neighbors that bear upon metropolitan experience and neighbourhood construction. First, a brief and critical presentation of the research setting is put forward: the Arroios district (Lisbon) often depicted as 'multicultural' and qualified as 'cool' (the later according to Time Out 2019 survey) is then examined within the framework of migrant urbanisms formation, community building practices and gentrification. Second, an ongoing qualitative research is

1220

presented (its methodological strategy and sampling techniques) and followed by the results obtained from residents' interviews. A close examination of the residents' neighboring practices and positions, along with the meaning of their connective or avoidant conducts, is put forward and discussed within the district's urban changes and social coexistence dynamics. At the end, this paper suggests that contemporary neighboring practices can be understood not only as spatial proximity and social distance management but also as residents' contextual affiliation/disaffiliation practices on which and within they meaningfully engage their changing residential surroundings.

1221

JS_RN01_RN13 | Doing Family in Times of Covid: the Case of Older Persons

How Events There Shape Feelings Here: Comparing the Subjective Well-being of Italian International Migrants, Internal Migrants and Non-migrants During the Covid-19 Pandemic

Sarah M. Ludwig-Dehm, Oana Ciobanu, Luna Dones

University of Geneva, Switzerland

Italy was one of the first countries in Europe that was hit by covid-19. It was also one of the hardest hit countries in Europe in the first wave of the pandemic at the beginning of 2020. Persons aged 65 and older are one of the risk groups of the pandemic. In this paper, we examine the relationship between the development of the covid-19 pandemic in Italy and the subjective well-being and worry about the pandemic among older (65+) international migrants from Italy living in Switzerland, internal migrants within Italy, and non-migrants in Italy. We will examine how this relationship differs between these groups and whether social networks and transnational ties influence this effect.

We make use of a unique dataset, for which data of 2400 respondents was collected between June and November 2020 in Italy and Switzerland, including Italian non-migrants living in Southern Italy, Italian internal migrants from Southern Italy living in Northern Italy, and Italian international migrants from Southern Italy living in Switzerland. Using these three different populations, we will answer several research questions:

First, how does the country and region of residence influence the relationship between the covid-19 outbreak and subjective well-being?

Second, do stronger social networks mitigate the effects of the outbreak on subjective well-being?

And third, do transnational ties to the home country influence this relationship for Italian migrants living in Switzerland?

Intergenerational Family Relations of Older Arabs in Times of Covid-19 First Wave in Israel

Dafna Halperin, Samir Zoabi

Yezreel Valley Academic College, Israel

Israel is still a familistic society and cultural norms are still strong. Respect for the elderly is a significant value in both Jewish and Muslim traditions.

Intergenerational family relations comprise different dimensions, such as emotional relations, functional help, filial expectations, and conflict. Emotions have been identified as one of the driving factors for association with and exchange between the elderly and their children, especially in old age.

To prevent the public from contracting the Corona virus one of the guidelines that were issued by the Israeli Ministry of Health was social distancing. This was directed to the overall population but considered extremely important for people over 60.

The aim of the current qualitative study was to explore the perceptions of older Arabs on intergenerational family relations, and their coping strategy during the Covid-19 1st wave in Israel.

Data were collected using in-depth, semi-structured face to face interviews with purposeful sampling of 17 Arabs, men and women, 62-82 years old, retirees, independent in their daily activities, living in north Israel.

Three main categories were identified: Intergenerational family relations as coping resource; Physical vs. social distancing; Between fearing to longing…

Family relation during the Covid-19 pandemic were still relatively strong and close, though they take on a different form, and were accompanied by mixed feelings, fear of the disease alongside longing and a desire for physical contact with family members.

Each one of the categories are explained, using intergenerational solidarity model, coping theory and cultural context.

1222

Intergenerational Care in Corona times. A Study of Relationships, Commitments, and Practices of Care in Swedish Families during a Pandemic

Sara Eldén, Terese Anving, Linn Alenius Wallin

Lund University, Sweden

The corona pandemic has put intergenerational relationships in focus in ways previously never experiences. In many national contexts, lockdowns and restrictions have caused forced generational separation in families. In Sweden, the official government standpoint of generational separation – all citizens over 70 were to avoid contact with others, and especially to stay away from interactions with grandchildren – has severely affected practices of care and emotional support between generations. This has brought attention to the persistent significance of care between generations in Sweden, contrasting sociological theories depicting the country as the 'most individualized' society in the world where the expansive welfare state is seen to have led to 'defamiliarisation' and weakening intergenerational ties (Bauman 2003; Berggren,Trägårdh 2006). Previous research, including our on-going study Intergenerational care in Sweden (SRC Eldén 2018-01053), show that involvement by grandparents in everyday care of adult children's families has increased in recent decades, as has engagement of adult children in everyday care of grandparents. During corona, these engagements are challenged, and the consequences thereof are multifaceted (Kivi et al 2020; Iversen et al 2020).

This paper analyses the effects of the corona situation on intergenerational care relations, focusing how care is done, understood and negotiated (Morgan, 2011; Mason, 1996) between elderly parents and their adult children and grandchildren. Of special interest is the effects of forced separation on relationships regarding practical care arrangements, emotional support and commitments. Our point of departure is a study where data (biographical interviews, diary interviews, lifelines, drawing exercises with grandchildren) from grandparents, adult children and grandchildren has been gathered. So far, 45 individuals have been interviewed, several in repeated encounters, before and during the pandemic.

No Children, No Partner: Loneliness Among Older Adults Before and During the COVID-19 Pandemic

Bruno Arpino[1], Christine Mair[2], Nekehia Quashie[3], Radoslaw Antczak[4]

[1]University of Florence, Italy; [2]University of Maryland, Baltimore County, USA; [3]Institute of Sociology, TU Dortmund University, Germany; [4]Institute of Statistics and Demography, SGH Warsaw School of Economics, Poland

1223

Although physical distancing and other restrictions designed to slow the spread of COVID-19SARS-CoV-2 likely increased loneliness among all older adults, the impact of these changes may have been particularly salient for childless and unpartnered older adults. Using data from the SHARE-COVID module collected between June and August 2020 and pre-COVID data from SHARE wave 6 (2015), we examine two indicators of loneliness: 1) "have you felt lonely recently?" (2015 and 2020), and 2) "have you felt lonelier than before the pandemic?" (2020). Before the pandemic (2015), childless and especially unpartnered individuals were at higher risk of loneliness (e.g., AME = about 22 percentage points (pp) for unpartnered vs partnered, and 4 for childless vs parents). These associations between being childless and unpartnered and higher levels of loneliness do not change significantly in 2020, suggesting that the pandemic itself may not have increased the already higher general levels of loneliness for unpartnered and childless older persons. However, when asked directly about their loneliness during the pandemic from their perspective (2020), unpartnered older adults were significantly more likely to report increases in loneliness (AME=10 pp). Childless older adults did not report feeling an increase in loneliness, and interactions between childless and unpartnered were not significant—indicating that partnership status is a more important predictor of loneliness than childlessness both before and during the pandemic. Our findings highlight the importance of examining the heterogeneous impact of kinship ties on loneliness among older adults during the pandemic and raise several questions for future research.

Linking Ages – An Approach towards Un/Doing Age while Un/Doing Family in the Covid-19 Pandemic

Cordula Endter[1], Anna Wanka[2], Grit Höppner[3]

[1]German Centre of Gerontology, Germany; [2]Goethe University Frankfurt am Main; [3]Katholische Hochschule Nordrhein-Westfalen

The spread of the coronavirus and the attempts of governments to slow it down affect the youngest and oldest in society in particular. Intergenerational relations, enacted, inter alia, through practices of eldercare or grand-parenting, are significantly limited in the current pandemic, as older adults are framed as an 'at-risk group', children as 'silent transmitters', and young adults as 'risky group' (Ayalon et al. 2020; Stokes and Patterson 2020). These attributions contribute to the (un-)doing of age while (un-)doing family in the pandemic.

In this paper we ask how and through which social practices age is being un/done in the course of the pandemic in Germany, how these doings shape, shift or even break intergenerational relations and are thus entangled with the un/doing of families. We do so with from the perspective of older adults and present findings from 15 qualitative problem-centred interviews conducted between March and August 2020 with persons aged 60 years and older in Germany. Based on this we reconstruct the practices of un/doing age and un/doing family in the pandemic. Findings show how age-based differences are stabilised, intensified, questioned or made irrelevant when intergenerational family relations are rearranged, and how this contributes to the in- und exclusion of older adults on a family and societal level. In conclusion, we link our findings to concepts of un/doing age (Schroeter, 2012) and un/doing family (Jurczyk, 2020) and outline the potential of a 'linking ages' approach for the study of family lives and of intergenerational relations in times of crises.

Reshaping Social Capital During Pandemic Crisis: Age Group Differences In Face-To-Face Contact Network Structures

Emese Túry-Angyal[1], Fruzsina Albert[1], Beáta Dávid[1], Boglárka Herke[1], Éva Huszti[2], Gergely Tóth[3]

[1]Centre for Social Sciences, Hungary; [2]University of Debrecen, Hungary; [3]Károli Gáspár University of the Reform Church in Hungary

COVID-19 related measures restricted physical contacts, thus affected relationship structure. In our research we investigate how ego-centric face-to-face contact networks changed in Hungary. In two representative surveys of the Hungarian adult population from 2015 (N=372) and 2020 (N=1001), during the first wave of the COVID-19 epidemic we used contact diaries to gather network-related data. This innovative method tracks all meaningful interactions of the respondents in a given time, providing a more direct and comprehensive view on one's egocentric network. Based on the two cross-sectional databases we compared the contact network structures to see if during the first lockdown any epidemic-specific social capital can be identified. We expected that the measures affected kin and non-kin ties differently and that the extent of their effect vary between age groups. As a result, we could distinguish an epidemic-specific social capital in that the number of kin and non-kin contacts diminished from 2015 to 2020 and the shrinking was more significant regarding non-kin, especially friendship ties. Among close family ties, the proportion of contacts with children increased. Analyzing the changes in the structure of daily interactions we were also able to detect the different effects COVID-19 measures had on the young and middle-aged people and highlight how the elderly were the most vulnerable group.

JS_RN01_RN21 | Quantitative Analysis in Ageing Research

What is the Impact of Time on Inequalities in Access to a State Benefit? Territorial Inequalities in Social Policies on Ageing Implementation

Loïc Trabut, Alexandra Garabige, Joëlle Gaymu, Eva Lelièvre

Ined, France

Background Since the 1980s, the articulation of public policies, particularly in European countries, has been characterized by a trend towards territorialization, which equates to the differentiated application of national policies according to the territories. This trend raises the issue of equality of access to state benefits within a population, given the diversity of territorial realities.

Objective This is the issue that we propose to explore in this article, based on the study of French social policies on ageing and, more specifically, on the main support measure for the loss of autonomy in old age: the Allowance for Personal Autonomy (APA).

Methods Based on an original method of trajectory analysis (the sequence analysis) and using administrative data on the APA (since its inception in 2002 until 2016), this article analyses changes in public policy indicators at departmental level over around fifteen years to see if there was any homogenization, or indeed any type of heterogenization, in the practices employed for the local application of a national system.

Results This article shows that despite the increased load on this welfare policy instrument for supporting older people, territorial differences in the allocation of the APA not only remain significant but persist over time.

Contribution our study has demonstrated the full relevance of sequence analysis for capturing the dynamics of social policies and reporting phenomena that are difficult to observe—here changes in territorial inequalities—using other statistical methodologies.

How To Study The Future Of Pensions: Modelling Different Types Of Uncertainty

Kathrin Komp-Leukkunen

University of Helsinki, Finland

Population ageing draws attention to the state of old age pension schemes. Can these schemes be maintained when the life-expectancy increases? Can they be maintained when the ratio of beneficiaries to contributors shifts? Researchers consider these issues in numerous studies, and policymakers use the insight gained to reform pension schemes. In this context, studies of possible, probable, and preferred future developments of pensions are especially important, because they are particularly well-suited to guiding policymaking. Considering this pronounced societal relevance, the studies' methodological setup needs to be carefully selected. The present study explores this issue. It investigates whether appropriate types of uncertainty are used in studies on the future of pensions. Futures research discerns four types of uncertainty and specifies suitable methods: shallow uncertainty explores possible futures over few years, using point estimates; medium uncertainty explores possible futures in the medium-range and assigns probabilities; deep uncertainty describes plausible futures over a longer time horizon as alternative scenarios; recognized ignorance avoids quantitative statements. This study conducts a structured literature review of scientific peer-reviewed journal articles on the future of pensions. It determines which types of uncertainty are used, and which type should ideally be used considering the state of knowledge presented. Findings show that shallow and medium uncertainty are by far the most common types of uncertainty used, even when the article setup calls for a different treatment. The uncertainty about the future of pensions is underestimated. As a result, policymakers may be surprised by some pension developments in the future.

Finding Love In Older Age. The Gendered And Age-Specific Dimensions Of The Transition Into Couplehood In Later Life.

Luisa Bischoff

Goethe-University Frankfurt, Germany

This contribution poses the question of how indicators of social inequality – especially gender and ageing – do influence the transition into a new relationship in later life.

Theoretically it is based on an exchange-theoretical understanding of the mating process. Since this perspective is gender and age sensitive only in a structural way, I propose to enrich it with an intersectional doing-perspective especially focussing on subjective ageing. Longitudinal hybrid panel regressions are being modelled for 3.496 respondents, 10.165 observations and 207 new intimate relationships using data from the German Ageing Survey (1996–2017).

The results illustrate, how repartnering becomes increasingly unlikely, the older one gets and the more adverse the attuites towards ageing become. The likeliness of a new relationship is higher for men than for women and for widowed than for divorced individuals. In contrast to theoretical expectations, education does not influence the formation of new relationships. This leads to the suggestion that sociopsychological and relationship-biographical factors – possibly influenced by education – can be seen as pivotal impacts on relationship formation in older age.

In reflexively enriching an exchange theoretical perspective with social constructivist concepts this article demonstrates how categories of social inequality, and the multidimensional – subjective and chronological – ageing process can be empirically combined to analyse life course transitions in older age. The paper thereby points out how not only the gendered normativity of mating, but also ageing well in an ageing society is being (re)negotiated in later life relationship formation.

Life-course-sensitive analysis of group inequalities in old age: Combining Multichannel Sequence Analysis with the Kitagawa-Oaxaca-Blinder decomposition

Carla Rowold[1], Emanuela Struffolino[2,3], Anna Hammerschmid[4], Anette Eva Fasang[2,3]

[1]University of Oxford, United Kingdom; [2]Humboldt-University Berlin, Germany; [3]WZB Berlin Social Science Center, Germany; [4]German Institute for Economic Research (DIW Berlin), Germany

The analysis of inequalities in life-course-sensitive outcomes becomes more and more relevant against the background of ageing societies. Recently, Multichannel Sequence Analysis (MSA) has been used to describe and analyse the multidimensionality of life courses considering how different domains (e.g. employment and family formation) unfold jointly and determine outcomes in later life. Meanwhile, the Kitagawa-Oaxaca-Blinder (KOB) decomposition has long been established to analyse group inequalities in outcomes. We propose to combine these approaches in a stepwise application to achieve a life-course-sensitive analysis of group inequalities in outcomes.

We apply this procedure to the case of Gender Pension Gaps (GPG), which are so far decomposed based on one-dimensional summary measures (e.g. number of years worked full-time). This approach does not take into account the interdependencies of the work and family life-courses properly. In fact, the strength of the interlink between work and family trajectories as well as the relative importance of each domain for future pension income is likely to differ between men and women.

First, we run a MSA to identify gender differences in work-family life-course patterns. We then decompose the GPG based on this gender-specific distribution on the different work-family life course types. This reveals which share of the GPG is due to gender-specific work-family life courses and which share is due to unequal pension rewards for men and women with the same life course pattern. Using SHARE data for Italy and West Germany, we additionally highlight the added value of this procedure for comparative welfare state studies.

1226

Measuring Generic Health via the Minimum European Health Module: Does It Work and Is It Better than Self-Rated Health?

Patrick Lazarevic

Austrian Academy of Sciences, Austria

Background: Health is a fundamental aspect of many scientific disciplines and its definition and measurement is the analytical core of many empirical studies. Comprehensive measures of health, however, are typically precluded in survey research due to financial and temporal restrictions. On the other hand, self-rated health (SRH) as a single indicator of generic health exhibits a lack of measurement invariance by age and is biased due to non-health influences. The three-item Minimum European Health Module (MEHM) complements SRH with global questions on chronic health conditions and health-related activity limitations and can thus be seen as a compromise between these two approaches.

Methods: Using data from the German Ageing Survey (2008 & 2014; n = 12,037), we investigated the feasibility to combine the MEHM into a generic health indicator and judged its utility in comparison to SRH as a benchmark. Additionally, we explored the option of an extended version of the MEHM by adding information on multimorbidity and the presence and intensity of chronic pain.

Results: Our analyses showed that both versions of the MEHM had a good internal consistency and each represented a single latent variable that can be computed using generalized structural equation modeling. The utility of these indicators showed great promise as it significantly reduced age-specific reporting behavior and some non-health biases that affect SRH.

Outlook: To further attenuate systematic response behavior, approach can be extended by priming the meaning of health in SRH and the use of MIMIC-modeling.

Beyond The Averages: A New Method to Differentiate Official Demographic Projections

Carlo Lallo, Sergio Ginebri

University of Roma Tre, Italy

We developed a method to differentiate official population forecasts by educational level, and Italian data were used. The mortality rates of the High and Low Education groups were projected using an iterative procedure, whose starting point was the official life tables by education level. We provide a set of different scenarios on the convergence/divergence of the mortality differential. In each scenario, the demographic size and the life expectancy of the two sub-groups were projected annually over the period 2018-2065.

We found that in all of our projections, population life expectancy converges to the life expectancy of the High Education group. We call this feature of our outcomes the "composition effect".

For instance, assuming stability in the mortality differential, we estimated a life expectancy increase at age 65 of 2.9 and 2.6 years for men, and 3.2 and 3.1 for women, in the Low and High Education groups, respectively, over the whole projection period. Over the same period, Italian official projections estimate an increase of 3.7 years in life expectancy at age 65 for the whole population. Moreover, the distance between the Low Education group and the whole population increase from -2.2 to -3 year.

Our results have relevant implications for retirement and ageing policies, in particular for those European countries that have linked statutory retirement age to variations in population life expectancies. We show that the statutory retirement age can increase faster than the group-specific life expectancies and this potential future outcome seems to be an unintended consequence of the indexation rule.

1227

Understanding Unequal Ageing: Towards A Synthesis Of Intersectionality And Life Course Analyses

Daniel Holman, Alan Walker

University of Sheffield, United Kingdom

Intersectionality has received an increasing amount of attention in health inequalities research in recent years. It suggests that treating social characteristics separately—mainly age, gender, ethnicity, and socio-economic position—does not match the reality that people simultaneously embody multiple characteristics and are therefore potentially subject to multiple forms of discrimination. Yet the intersectionality literature has paid very little attention to the nature of ageing or the life course, and gerontology has rarely incorporated insights from intersectionality. In this paper, we aim to illustrate how intersectionality might be synthesised with a life course perspective to deliver novel insights into unequal ageing, especially with respect to health. First we provide an overview of how intersectionality can be used in research on inequality, focusing on intersectional subgroups, discrimination, categorisation, and individual heterogeneity. We cover two key approaches—the use of interaction terms in conventional models and multilevel models which are particularly focussed on granular subgroup differences. In advancing a conceptual dialogue with the life course perspective, we discuss the concepts of roles, life stages, transitions, age/cohort, cumulative disadvantage/advantage, and trajectories. We conclude that the synergies between intersectionality and the life course hold exciting opportunities to bring new insights to unequal ageing and its attendant health inequalities.

Transitions Into Dependency With Ageing In Europe

Alejandra Marroig[1], Graciela Muniz-Terrera[2]

[1]Instituto de Estadística, Universidad de la República, Uruguay; [2]Centre for Dementia Prevention, University of Edinburgh, Scotland

Aging has been related to the onset of dependency in older adults, and help from others may be needed to perform daily activities. Some individuals have care needs earlier in life or more urgently whereas others may preserve independence for longer.

In this project we analysed transitions towards dependency in older adults. We used data (baseline until 2013) from ten countries that participated in the Survey of Health, Ageing and Retirement in Europe (SHARE). We used limitations in Basic Activity of Daily Living (BADL) and Instrumental Activity of Daily Living (IADL) to define dependency states in individuals aged at least 65 years old at study entry (n=20128) and fitted Multi-State Models. We evaluated and compared the association of age and sex on transitions across states and countries, including transitions to death.

Results show transitions varied with increasing age and individuals had an increased risk of dependency until they reach the age of 70 years old. International variations were identified. In most countries, women had lower risk of death but higher risk of transitioning into dependency. Further, sex differences are more pronounced when dependency was defined based on both BADL and IADL. The type of home care distribution at baseline varied by country and sex. Differences in care policies across countries may partially explain these results. Our approach facilitates the early detection of dependency in an aging population and could inform the design of sex-specific prevention strategies and care policies for better quality of life of older adults and their families.

Inequalities in Extending Working Lives: Latent Growth Modelling of Older-Age Employment Trajectories in Seven Countries

Konrad Turek[1], Kene Henkens[1], Matthijs Kalmijn[1], Thomas Leopold[2]

[1]NIDI - Netherlands Interdisciplinary Demographic Institute / University of Groningen; [2]University of Cologne

Although public policies encourage later retirement, they often do not account for the dramatic discrepancies in the capacity for extending working lives (EWL). Both job demands and job resources are unequally distributed across the socioeconomic structures. In effect, high-positioned workers tend to work longer than those in the lower social strata. In this paper, we trace the trends and inequalities in EWL over the last three decades in a comparative perspective (Australia, Germany, Russia, South Korea, Switzerland, United Kingdom, United States). By applying latent growth analysis, we identify employment trajectories between the age of 60 and 70, such as continuous work till later ages, late-exit or inactivity. Latent class regression models serve to measure the time trends, gender dimension and educational inequalities in EWL. The data come from the Comparative Panel File (CPF) that harmonizes household panel studies from seven countries. The results show that the trend toward extended employment is universal and especially dynamic among women. However, socioeconomic inequalities in EWL remain large and stable. During the presentation, I will discuss the application of latent or mixture growth modelling for longitudinal ageing research. I will also present the Comparative Panel File - the new open science initiative (by Turek, Kalmijn, Leopold; www.cpfdata.com) that provides powerful data for observing the lives of several generations against a changing historical background.

Extending Working Life in Germany – A Cohort Perspective on Inequalities in the Length of Working life

Christian Dudel[1], Elke Loichinger[2], Sebastian Klüsener[2], Harun Sulak[2], Mikko Myrskylä[1]

[1]Max Planck Institute for Demographic Research, Germany; [2]Federal Institute for Population Research, Germany

Little is known about how the length of working life, or working life expectancy (WLE), has developed in Germany, and how it differs by socio-economic group. In this paper, we use data from the German Microcensus 1996-2019 to calculate WLE by birth cohort. Results are further stratified by gender, region, education, and occupation. Overall, WLE has increased in Germany. For instance, for German men WLE during ages 55 to 64 increased from 5.4 years (cohort 1941) to 7.4 years (cohort 1955). However, there are strong differentials in WLE by socio-economic group, and some of these differentials have been widening. Men and women in east Germany with low educational attainment and men working in elementary jobs are at risk of falling behind.

Development of Age Management Practices before and during COVID-19 in Poland

Maria Varlamova[1], Jolanta Perek-Białas[2]

[1]PhD student and Research Assistant within the Marie Skłodowska-Curie Actions ITN EuroAgeism at the Jagiellonian University, Poland; [2]Institute of Sociology, Jagiellonian University and Warsaw School of Economics, Poland

Age discrimination, stereotypes and prejudice (ageism) prevent workplace fairness and inclusion in the labour market. Only a few scientific studies are devoted to quantitative research in the countries of Central and Eastern Europe, although, the region faces the fast ageing of the population, which is accompanied by low employment rates of the older workers and rather low effective exit age. The analysis database is the unique representative survey of employers conducted in 2009, 2010 and 2017. The new wave (2020) ensures the possibility of combining existing cross-sectional research into a longitudinal perspective and investigating the influence of COVID-19 pandemic on ageism manifestation in Poland's labour market. The current study focuses on age-management practices and their development since 2009, emphasising the before-after pandemic state and whether COVID-19 and governmental containment measures have changed the previous longitudinal trajectory. The questions of micro-level biases of the employer's surveys and possible measurement invariance challenges are discussed in the methodological section.

JS_RN01_RN22 | Risk and Dignity in Older Age

Older People's Approaches to Trust in Adjusting or Re-Evaluating Everyday Life During the Covid-19 Pandemic

Clara Iversen[1], Marie Flinkfeldt[1], David Redmalm[2], Marcus Persson[3]

[1]Uppsala university, Sweden; [2]Mälardalen University, Sweden; [3]Linköping University, Sweden

This paper examines how older people make sense of their situation in 108 calls to a helpline in Sweden, a few months into the Covid-19 pandemic. By drawing on the sociology of everyday life to analyze callers' various understandings in interaction with call-takers, the paper nuances current knowledge about older people's management of risk and safety during the crisis. The thematic analysis shows that the callers make sense of the crisis linked to social relations on a personal, anonymous, and abstract level. The callers' responses to challenges to their everyday routines – adjustment or critical evaluation – are connected to different approaches to trust: basic trust in a shared social reality with someone or regulating trust in a set of norms independent from that other. Whereas the calls demonstrate very few positive adjustments in personal relations, anonymous and abstract relations serve as important resources for both maintaining and re-evaluating everyday life in crisis. Although the older callers' lack of experiences of supportive personal relations during the pandemic points to risk and vulnerability, the paper highlights that their active engagement in safe anonymous and abstract relations showcase resourcefulness.

Community Care For The Seniors In Russia Under COVID Self-Isolation Regime: Risks and Advantages

Elena A. Bogdanova[1,2], Elena Zdravomyslova[1], Aliia Nizamova[1], Konstantin Galkin[3]

[1]European University at Saint Petersburg; [2]Centre for Independent Social Research; [3]Institute of Sociology of the Russian Academy of Science

Since 2017 Russian policy makers make efforts for establishment of a long-term care system. Community care is considered as a significant element of it, especially in the Russian countryside, which suffers from shortage of public socio-medical welfare. It is not uncommon for local communities to provide informal elderly care in the Russian rural communities from the side of neighbors, local administration and activists.

Pandemic of COVID-19 has exacerbated the issue of elderly care in the Russian countryside and emphasized importance of the resources of local community care. Under the pandemic connections between many settlements were closed or restricted. Relatives, volunteers, and other actors, which used to visit the elderly in the rural settlements, could not come regularly, or simply stopped their activities for the period of pandemic. This situation has called into a question the existing organization of community care: if rural community may be comprehended as a reliable provider of care for senior residents; whether this type of care should be formalized, or saved in its informal way? What are the risks and advantages of both ways of care?

Within the framework of the project we carried out an empirical study of 18 cases of informal and formal neighborly care in the Leningrad region and the Republic of Karelia is carried out. In each case we made interviews with local residents over 75 and their neighbors - caregivers (n=36). There were also used such methods as expert interviews (n=12), and ethnographic observations in countryside.

1231

The COVID-19 Pandemic as a Catalyst for Self-neglect Among Older Adults – the Premise of Risk and Dignity Jeopardy

Magdalena Rosochacka-Gmitrzak, Magdalena Lukasiuk

University of Warsaw, Poland

The presentation focuses on the impact of the COVID-19 pandemic on the processes of self-neglect as premises of risk and dignity jeopardy. The perspective draws form sociology of ageing and sociology of dwelling. We present preliminary results of exploratory research using the method of case studies.

First, the isolation is viewed as influencing older adults' home spaces. New, pandemic understanding of this space is referred as an asylum from the outside world and connected with the pandemic-driven impossibility to present the space on the social stage. The lack of both, this stage and the social status confirmations via presentation of the home space, results in backstage spreading over the entire area of the apartment and the facade of the tenant.

Secondly, self-neglect phenomenon is considered at individual level - as a tendency to sink into loneliness and apathy, also in reference to the Diogenes syndrome or losing the performance of an inhabited place. Breakdown of temporal structures is mentioned as inscribed into the apartment and its equipment. The role of the social environment and the pandemic-forced absence of families and social networks is taken into account, too.

Finally, the legitimacy and rationale of COVID-19 interventions directed to older adults are analyzed in the context of older adults' subjectivity and dignity put in jeopardy as a result of social (family, care services) perceptions of (in)adequate resources and/or willingness and failure to self-care.

The Risk Of An Undignified End: The Role Of Agency In Euthanasia Debates

Bernhard Weicht

University of Innsbruck, Austria

Old Age is often marked by increasing risks for mental and/or physical decline, suffering or pain. Stigmatised deaths in institutions after periods of dependency symbolise the antithesis to a dignified (end of) life. Recently the imagination of a "dignified death" has gained additional momentum by the possibilities of choice and control. Various countries have seen debates on euthanasia and assisted dying taking up the ideals of choice and control in order to combat the challenges and fears associated with the latest life stage. Opponents stress, however, that the mere possibility might lead to a risk of dependent people being coerced into decisions by relatives or medical staff. In both cases - once proposing assisted suicide to ensure a dignified death, and once arguing against it due to the risk of coercion and abuse of power – the limits of agency to avoid the risk of an undignified death are central. One side emphasises vulnerability and a lack of agency, while the other side sees assisted suicide as a potential means to avoid a state of lacking agency.

In this paper I explore the underlying understanding of agency in euthanasia debates and its relationship to the ageing person. I will argue that conceptions of (very) old age shape the assumed limits and possibilities of agency and thus form an understanding of dignity based on the avoidance of risking an undignified end. Drawing on examples from European public debates I seek to show how the conception of old age is lacking a concept of dignity that allows for vulnerability, suffering and fear while, at the same time, does not disregard older people's agentic potentials.

1232

How To Protect The Vulnerable Elderly? Opportunities For Improving Social Situation And Prevention Of Violence Against The Elderly

Danijel Baturina

Faculty of Law, University of Zagreb, Croatia

Croatian, as well as European societies, are inevitably demographically ageing. Addressing the needs of the elderly and improving their position in society is a challenge for social policy and maintaining social cohesion in society. The elderly in Croatia are at multiple disadvantages in terms of financial status, social status and characteristics of social care (Dobrotić, 2016, Kvakić and Baturina, 2019).

The goal of the paper was to present the perspectives and opinions of experts on the specific position of elderly in society and the communities, their vulnerability to violence and the possibilities of violence prevention.

The paper is based on a qualitative method of data collection and analysis, within which focus groups were conducted in five northern Croatian counties. Framework analysis (Ritchie and Spencer, 1994) fallowed topics: knowledge of experts on the frequency, types and sources of violence against the elderly; characteristics of the elderly and risk factors for violence against the elderly; characteristics of social care for the elderly that may make them vulnerable to violence; and prevention and mechanisms for prevention of violence against elderly. Categories and concepts related to topics will be presented in the paper.

The discussion puts the results in the context of what Croatian social policies (Bežovan, 2019) and other aspects of society are currently doing but also what they can do to prevent violence against the elderly and build bridges to their greater social inclusion in society. The conclusion provides certain recommendations for policies and professional work as well as for future research.

1233

JS_RN01_RN37 | Urban Ageing: Towards an Enhanced Spatial Perspective

Doing Everyday Life: Patterns, Resources and Adaptive Mechanisms of Older People in Sofia, Bulgaria

Deljana Iossifova

University of Manchester, United Kingdom

This paper draws on observation and interviews to demonstrate how Bulgaria's abandoned older people deploy newly found agency to cope with uncertainty in their everyday. It explores their patterns of everyday life in the city, discusses the domains of health and energy and presents older people's accounts of managing meagre pensions, sustaining ailing bodies and making do in tattered homes. The paper argues that older people in the city display astonishing resilience in the face of adverse financial, material, physical, political, social and cultural circumstances.

'A Dream Come True'? – The Development of an Urban Senior Community

Outi Hannele Jolanki

University of Jyväskylä, Finland, Tampere University, Finland

During last decade many European countries including Finland have seen a rapid growth in new models of senior housing. Retirement villages, multigenerational communities, collaborative and co-housing communities are among the new housing options available for older people who seek a new place to live in but shun service housing. This study looks at the Finnish community of seniors living in the collaborative senior apartment building. This apartment building is in deprived neighborhood next to the small mall built in 70s which has basic services and amenities. The senior apartment building was initiated by a senior's association with the aim to have a living environment which would offer not just accessible low-maintenance apartments and an easy access to amenities, but social activities and the hope to escape lonely old age.

Data come from five-year (2014-2018) follow-up interviews (N=18) of 14 women and 4 men. The participants age ranged from 66 to 84 at the time of the first interview (2014). The study draws from ideas of geographical gerontology and actor-network-theory. The changes within the neighborhood such as the relocation of a senior service center, emergence of new apartment buildings and a school of 1000 pupils had affected the residents' sense of community and sense of belonging. The senior community had gone through several phases from a 'honeymoon' to a disillusionment and a recovery. While most participants were still happy with their moving decision their community was still in the making.

Third Places and the Elderly. The Role of Madrid's Bares and Cafeterias in Sociability of the Old Age

Francisco Javier Rueda Córdoba

Universidad Complutense de Madrid, Spain

In this contribution, urban spaces are addressed not as a social problem to be solved but as a social reality to be analysed. The aim of the reflection is to determine the influence of non-formal, ordinary ways of sociability among people over 70 in Madrid's "bares" and "cafeterías" in the suburbs, primarily focusing on old people living alone. Interviews and ethnography will be conducted to figure out the complexity of ageing sociability in an urban context, emphasizing the crucial role of aforementioned places and underlining the effect of SARS-CoV-2 in this group's sociability. Such a perspective will allow to think deeper about urban care networks as well as an improving of old ages wellbeing based upon a micro-sociological approach.

1234

Everyday Dial-a-Ride Bus Journeys of Older People Ageing in Place

Henna Luoma-Halkola, Outi Jolanki

Tampereen yliopisto, Finland

We studied dial-a-ride bus as a way to support older people to 'age in place' in their existing homes and communities. We conducted go-alongs and sit-down interviews with 12 older people living in a Finnish suburb and explored their everyday dial-a-ride bus trips to the local mall. We utilized actor-network theory and the concept of motility to show how what at first glance seemed simple dial-a-ride journeys were in fact produced by a complex actor network consisting of people, rules, norms, practices, technical devices as well as other objects and things. The dial-a-ride actor network compensated for participants' restricted physical abilities, and enabled them to run their daily errands independently and to engage with their communities. Nevertheless, using the service required a wide range of knowledge and skills. This raises the question whether everyone, who would need such service, is able to use it. Our findings also showed that specific details of the dial-a-ride service and participants' living environments, such as height of a seat or heaviness of a door, really mattered to our participants. We argue that developing age-friendly environments – with inclusive services to support older people age well within their community – requires a detailed understanding from their perspective of the actor networks that produce those services. It is also necessary to consider how older people with varied know-how and (in)abilities are able to use the services. It is therefore important to engage diverse older persons as co-producers in planning the old age services and age-friendly environments.

Homeownership and Material Security in Old Age

Claudius Garten[1], Michal Myck[2], Monika Oczkowska[2]

[1]TU Dortmund, Germany; [2]CenEA Centre for Economic Analysis, Poland

Housing markets in European cities have been undergoing significant changes over the past decades with substantial increases in property prices. This represents a challenge for non-owners for whom both renting and acquiring a home has become less affordable, and important gains for owners who have seen the value of their real assets appreciate. These developments are of particular importance for older citizens whose incomes tend to be stable and whose standard of living depends to a large extent on the level of living costs and the value of their wealth.

Previous research has demonstrated a positive relationship between homeownership and well-being and the effect of rising housing prices on well-being of homeowners. However, there is little evidence on the role of homeownership for perceived material security in old age. We argue that this perception represents an important dimension of overall well-being of older people and examine its relationship with homeownership.

Using data from the Survey of Health, Ageing and Retirement in Europe, we analyze the relationship between homeownership, home value, residence and material security in 15 countries. Material security is measured by subjective expectations of being better or worse off in the future. Our results suggest that homeowners are more optimistic than renters and this effect is especially strong for homeowners living in urban areas. Our analysis extends existing evidence that recent changes on the housing markets in Europe contribute to divergence in living standards between owners and renters. This has particularly strong implications for well-being of older citizens.

1235

The Importance of Neighborhood Networks for Ageing in the City

Liv Christensen, Marie Glaser

ETH Zurich, Switzerland

For the widely recognized goal of "ageing in place" to succeed in an urban setting, some important conditions must be met: Access to housing and access to urban life. The results of a Zurich case study conducted as part of the international project "Geographies of Ageing: Older People's Access to Housing and to Urban Life" reveal that access to housing can be a considerable hurdle for older people. In a city like Zurich, the tight housing market is characterized by low vacancy rates, high rents and digitized and rapid application processes. In addition, a growing trend towards replacement housing and renovations puts older tenants in particular at risk of losing their homes and being displaced from their familiar surroundings. Finding new housing can pose a major financial and emotional challenge. Our qualitative research has shown that the immediate living environment plays a crucial role as a center of life in old age. Informal encounters in various public and semi-public spaces from the entrance area to the local pub are of great importance for sense of well-being and place attachment in late life. Taken on their own, the many encounters in the neighborhood may seem insignificant, but it is in the sum total that they unfold their potential. The opportunity to participate in social urban life should therefore be given high priority and ensured both through affordable and secure housing options and through inclusive urban spaces with barrier-free access in financial, physical and social terms. Our research shows that this is challenged by ongoing urban gentrification processes.

JS_RN02_RN09 | Economy of the Arts, Alternative Forms of Copying with Economic Pressure and Crises?

Following Market Trends or Promoting Local Artists? How do French Museums cope with the Increasing Role of Super-collectors in the Contemporary Art World

Brianne Dubois

Sciences Po, France

Several French billionaires have recently built art foundations to exhibit their private collection. At a global level, the influence of the richest collectors has also transformed the market, leading to the rise of prices and the emergence of new geographical centers (Velthuis 2013). How do French museums, located in a declining "semi-periphery" of the global art world (Buchholz 2018), cope with the increasing importance of "super-rich collectors" (Crane 2009)? Do they keep promoting artists, playing a role of "certification" (Moulin 1992), or do they follow evaluations already made on the market?

To analyze French museums positioning toward the market, I study the characteristics of the artists they show. I selected 4 main French museums (2 public and 2 private) and built databases listing all the artists exhibited between 2016 and 2020. Using data available online, I built indicators of renown, positioning on the market and visibility in the exhibitions, and a set of classic sociodemographic variables. A classification allows to identify 5 types of artists and to study the diversity of museums' portfolios.

Public museums have very diversified assets and a strong national bias. If their program does integrate "international stars" valorized on the global market led by collectors, they are far from being fully aligned and keep showing French and off-market artists. On the contrary, foundations are much more in adequacy with international hierarchies and are specialized in showing foreign artists well integrated on the global market.

Theatre Without Theatres: Investigating Access Barriers to Mediatized Theatre During Covid-19 Pandemic

Laura Gemini, Stefano Brilli, Francesca Giuliani

University of Urbino Carlo Bo, Italy

Italy is one of the first European countries to be deeply affected by COVID-19 and one of the first in Europe to have adopted lockdown measures. Since the early stages of the lockdown, Italian theatres and companies have developed several online initiatives to counterbalance the suspension of their activities, such as circulating unpublished archive material, creating ad hoc domestic performances, engaging enthusiasts in collecting memories of past seasons and experimenting with plays on videoconferencing platforms. These efforts have aimed at maintaining contact with the remote theatre audiences, by extending the presence of artists, theatres, and performances in the online context. They have also provided an opportunity to reason about the digital transformations of performing arts.

However, much of the debate among scholars, critics and artists focused on definitional questions about whether online theatre "was really theatre", failing to observe digital performative initiatives as an autonomous phenomenon. Simultaneously, empirical research on the theatre sector during the lockdown has been carried out with short-range methodologies and objectives, with online questionnaires distributed by theatre organisations to assess already-loyal audiences' satisfaction and spectators' opinions on the propensity to return to physical venues. Little or no attention has been paid to investigating the dynamics of inclusion and exclusion of performing arts artists and audiences in the digital transposition.

Our study attempts to provide a first exploratory research on this issue through 1) 10 focus groups with theatre artists who participated in online-only theatre seasons, 2) analysis of followers engagement in the social media profiles of the main Italian theatre organisations in the last 12 months.

Hanging onto what? Impact of Covid19 on cultural entrepreneurs

Sara Malou Strandvad, Marije Miedema, Nathalie Schram

University of Groningen, Netherlands, The

Creative work is notoriously precarious, and organized in a flexible manner where individuals take responsibility for their own circumstances. Cultural entrepreneurship - where creative workers set up their own businesses - is often done out of necessity rather than opportunities (Serviere 2010) as self-employment may be the easiest or only option to carry out creative work (Oakley, 2013, Naudin, 2013, Ball, 2010). In the Netherlands, the country which this research focuses on, 73% of the workforce in the cultural and creative industries are self-employed with no personnel (Hyema et al. 2018). Many of these cultural entrepreneurs earn very little. In 2017, a third of the self-employed cultural entrepreneurs in the Netherlands earned less than 15 euros per hour (Kunsten '92, 2020). To investigate this precarious situation, exploring how cultural entrepreneurs experience their own work-life situations, we initiated a qualitative research project about cultural entrepreneurship together with the business support program 'Cultuur+Ondernemen' (Culture+Entrepreneurship) in 2019. On March 6 2020 we carried out the first of thirteen interviews for our research. Nine days later, the Netherlands went into a lockdown. Our dataset therefore reflects the circumstances of cultural entrepreneurs from the start of this lockdown up until October 2020. The precarity in the sector worsened during the pandemic when projects were cancelled or put on hold. In this presentation, we describe the effects of the Covid19 pandemic on income, mental health, creativity and general situation of cultural entrepreneurs, raising the question about what this group can hold onto to get through the crisis.

At the Margins of Hegemonic Sexuality: Male Identity and Love Dolls

Mark Benjamin Bibbert

University of Kassel, Germany

Today privileges are challenged along numerous dimensions, while those who feel threatened by these dawning changes form oppositions. At first glance the oppositions manifest in political (e.g. the GOP) and direct (e.g. Proud Boys) action. But there are also more private forms of opposition, which of course can be linked to the former, foremost by their desire to police sexuality and sexual identity. In my talk I will discuss one 'private coping' strategy of the "angry white male" (Kimmel 2013): the use of love dolls. Starting from the assertion that sexual identity can only be understood in its relations (Connell 2015) I map the "sad career" (Goffman 1973:149) of harmed male identity constructed in online spaces. I will also highlight how this "sad story" relies on the construction of a feminist boogeyman. This works together to establish a male identity centered on control, where the doll is the controllable other in regard to modern unchecked female identity. I will then discuss connections to online communities of the manosphere, like M(en)G(oing)T(heir)O(wn)W(ay).

Examining Intersections of Sexuality and Class among CEE LGB Migrants from a Biographical Perspective

Tanja Vuckovic Juros

University of Louvain, Belgium

This paper examines intersections of sexuality and social class in the lives of middle-class Central Eastern European (CEE) LGB migrants married or raising children with a same-sex partner in Belgium and the Netherlands. Based on biographic-narrative interviews with the highly specific group of eleven LGB migrants coming from CEE countries with constitutional protection of heterosexual marriage, the study focuses in particular on one case – the case of Dominika – whose life story is a mix of both typical and distinctive elements compared to other study participants. Building on the insights provided by this life story, situated in a comparative framework with other collected narratives, I explore how the middle-class

positionalities and non-normative sexualities of CEE individuals shape both their migration trajectories and their transnational family practices. Specifically, by adopting a biographical perspective focusing on an in-depth analysis of an illuminative case study, I highlight intersections of sexuality and social class as continuously reappearing and disappearing privileges and disadvantages. These are manifested across both individual and (same-sex) family mobilities of non-heterosexual individuals, and across their transnational family practices, where the latter also encompass LGB migrants' families-of-origin. From this perspective, the study highlights class advantages as consistently alleviating the disadvantages of non-normative sexualities, but also simultaneously further restricting and additionally benefiting married CEE LGB migrants, particularly those with children.

Pride Parades And Gay Marriage Law As Events Of Political Sociability From Argentinean Gay Men's Biographies

Maximiliano Marentes

Universidad Nacional de San Martín, Argentine Republic

The aim of this communication is to reflect on the complexity of political sociability of contemporary Argentinean gay men that emerges from two politicizing events: pride parades and gay marriage law. Based on a biographical approach with 30 Argentinean gay men, the purpose of this work is to analyze how these events are introduced in their personal trajectories. In both activists and nonactivists' narratives, pride parades and 2010 gay marriage law take starring roles that update their original strains. Referring to parades, the tension between the celebratory and the vindicative character allows us to think as a continuum of political sociability that produces different kinds of connections. Because of that, parades could be experienced as a start of a political career or a place where to meet guys and partenaires. The very nature of gay marriage law, passed in 2010, showed how private and public realm were intertwined. In these guys' biographies, this event became as a motive to start or reinforce political activism, a proof of compulsory heterosexuality in workplace, schools and families, and a keystone in love stories. The main goal of the paper is to highlight how studying this kind of political events of sexual diversity from a biographical approach allows us to recognize different modulations and scales of them. In doing so, we can observe how the proper tensions of these events are updated in the biographies of contemporary gay men.

Love and Life History in a Polyamorous Context

Stefan F. Ossmann

University of Vienna, Austria

Who we are today and how we got there is determined by, amongst other things, how we live our relationships, intimacies and sexuality. From a scientific perspective, this not a brand-new new finding, sexual biographies have been subject of investigation. Yet, so far, some aspects have been falling short in academic discussion: Polyamory - understood as a consensual relationship between more than two people based on emotional love and intimate acts over a longer period of time (Ossmann, 2020) - has so far widely been overlooked with regards to the love and live history of involved people.

Financed by the Austrian Science Funds FWF, I have explored the self-perception of 33 people in 14 polycules that live a polyamorous life by the method of narrative biographical interviews (Schütze, 1983). The introductory question "What happened in your live that we now talk about polyamory?" led not only to a detailed description of experiences, it allowed furthermore the attempt of an empirically based type generation (Keller & Kluge, 2010). The result is a draft of poly (proto)-types specified by either intrinsic desire or choice, predominately based on key moments in emotional and intimate biographies that shape sexual identities. In detail, the intrinsic desire was furthermore split in sexual desires and ideological believes; while choice indicated differences regarding self-determination, external determination, or a consensual decision.

The findings can help to understand poly people better – if the model has its entitlement, which I would be happy to discuss with fellow researchers at the 2021 conference.

Children's Experiences and Views of Covid-19 and Responses to it

Francesca Viola[1], Maria Rosaria Centrone[2]

[1]UNICEF Office of Research - Innocenti; [2]UNICEF Europe and Central Asia

The COVID-19 pandemic and governments' responses related to it have huge short- and long-term implications for children's physical and mental well-being. Differential impacts may depend on individual child characteristics and contextual factors and may be stronger for children who already face disadvantages. There have been many attempts to explore the impact of the pandemic on children with broad quantitative survey-based studies, but few have explored the issues in depth. In light of this, UNICEF Office of Research – Innocenti, together with other partners in UNICEF and academia, is developing a multi-country qualitative research project to explore with a grounded theory approach children's perceptions and experiences of the COVID-19 crisis, as well as their recommendations for future management of similar crises around the world. The pilot study in Italy involves ca. 120 children and adolescents aged 10-19 years (girls, boys, children living with disadvantaged socio-economic conditions, LGBTQIA+, migrant children and children with disabilities) through focus group discussions and semi-structured interviews. Using a participatory approach, consultations with children are organized throughout the research process to discuss design, preliminary findings and dissemination strategies. Starting from an ecological framework of reference, the results of the study will shed light on how the pandemic has influenced children's and adolescents' lives and on thematic areas relevant for them. The research aims at identifying key messages and implications for policy and practice, ensuring that children's perspectives and voices on this global issue are heard, documented and considered in formulating child-focused responses that reflect their needs for support.

Covid-19 Pandemic and Children's Subjective Experiences during Lockdown and Post-Lockdown

Eunice Castro Seixas[1], Sara Gonzalez[2], Paulo Castro Seixas[2]

[1]SOCIUS, ISEG, Universidade de Lisboa, Portugal; [2]CAPP, ISCSP, Universidade de Lisboa, Portugal

We present and discuss the findings of an online survey (n=84) carried out within the scope of the FCT Project CRiCity (Children and their right to the City: Tackling urban inequity through the participatory design of child-friendly cities), and focusing on the subjective experiences of Portuguese children during the first lock-down in March and April 2020, and the subsequent months. We analyzed children's descriptions and perceptions of their home, the activities carried out, general feelings regarding lock-down and post lock-down periods, and the practices of returning to public space. Findings reveal the importance of children's subjective perceptions of their home as a place that provides them with positive sensations (such as comfort, security, fun), as well as spatial and social opportunities to play and interact with siblings, parents and pets. Most participants report feeling bored and homesick for school, friends or family, although some report positive or ambivalent feelings. During lock-down, participants have reported spending most of their time studying or attending online/TV classes, followed by playing and engaging in various recreational digital activities. In general, the return to the public space after lock-down is perceived as very positive, associated with feelings of happiness, freedom and relief, but some concerns related to Covid still arise. These findings highlight the relevance of socioeconomic and housing conditions during lock-down, and show the impact of Covid-19 crisis on children's health, mobility, socio-spatial rights, contact with nature and non-human species.

Screen Time During COVID-19 Lockdown: Magnitude, Relation with Other Determinants of Health and Social Inequalities in Child Population in Spain

Yolanda González-Rábago, Andrea Cabezas-Rodríguez, Confisalud Group

OPIK Research Group, University of the Basque Country, Spain

Background. Lockdown due to COVID-19 pandemic imposed to child population in Spain occurred in a context of pre-existing inequalities in social determinants of health. Exposure to screens (TV, videogames, mobile, and computer) is considered one of the main determinants of health among children, which is related to worse health and obesity, associated with less physical activity (PA) and worse diet habits, and socially unequal. The objective is describe the social inequalities in screen time of children in Spain during lockdown.

Methods. Cross-sectional study based on an online survey that collects information on the population aged 3 to 12 years living in Spain (n = 10,763). The variables analysed were screen time, PA, consumption of processed foods, as well as parents' educational level and difficulties making ends meet of the household. Average of screen time by age groups, and prevalences of excessive screen time according to PA and consumption of processed foods by socioeconomic status of family were calculated.

Results. Children in families of low educational level and economic difficulties had a higher exposure to screens, lower physical activity and higher consumption of processed foods. Higher screen time was associated with lower physical activity and higher consumption of processed foods, and even more as the socioeconomic status of the family decreases.

Conclusions. The confinement conditions have been unequal among the child population, producing an unequal adoption of healthy behaviors. Confinement measures that do not incorporate the perspective of equity can increase social inequalities in health.

Explorations Into The Socio-ecological Context Of Wellbeing: Perspectives From Young People Living Under CoviT

Leanne Monchuk[1], Barry Percy-Smith[1], Sara Rizzo[2], Laurie Day[2], Malika Shah[2]

[1]University of Huddersfield, United Kingdom; [2]Ecorys UK

Covid has had significant impacts on children youth and families across the world impacting in diverse ways on different areas of young people's lives. Policy and public media have disproportionately focused on the impacts of the pandemic on young people's mental health. Young people are not solely passive victims of the negative impacts of Covid on their health and wellbeing; instead evidence reveals the extent to which the pandemic has simultaneously provided an opportunity space for personal development, social actorship and political agency that have impacted positively on young people's health and wellbeing.

In this paper, we draw on evidence from the Nuffield funded Politics, participation and pandemics: Growing up under Covid-19 project involving 7 countries to articulate a more holistic and asset-based perspective to understanding wellbeing from a social perspective. We highlight the ways in which young people as social actors are able to actively, creatively, critically and reflexively engage in prosocial behaviours that can mediate the negative impacts of the pandemic. These are manifest for example, through new social roles, identity development and a heightened sense of communitarianism, political awareness and active citizenship. We reflect on what young people's perspectives tell us about how they feel about the societies they are growing up in and reflect on the implications for policy.

The Emerging Social Impacts of Covid-19 on the Young Population in Disadvantaged Areas of Naples. A Qualitative Study Trough the Perspectives of Social Activists

Stefania Leone[1], Niccolò Morelli[2]

[1]University of Salerno, Italy; [2]Catholic University of the Sacred Heart, Milano

Mitigation measures of Sars-Cov2 Pandemic such as home confinement, school closing and the impossibility of face-to-face social contacts are seriously influencing children and young people's everyday life and psycho-social well-being. Moreover, the consequences of these measures are affecting more seriously younger generations living in advanced urban marginalities which are experiencing a sense of abandonment. These children experienced, and still experience, the impossibility to live a positive socialization, a guided school or non-formal education path or any other growth experience. This paper analyses the adverse impact of Covid-19 on young people conditions, through the perspective of the activists operating in the disadvantaged areas in the functional urban area (FUA) of Naples. This study is based on 20 case studies using documentary materials and in-depth interviews of local associations, made after the Italian total lockdown of 2020 (September-November). This paper contributes to the sociological debate on social impacts of Covid-19 on fragile youth population, giving current and future perspectives of increasing inequality in three forms: educational poverty (early school living, low educational level of many families and digital divide), affective poverty (reductions of all forms of sociality in the physical space) and economic poverty (job loss, needs of primary goods, technological equipment limits). Moreover, through an analysis on perspectives and practices deployed by associations to mitigate the negative impacts of Covid-19 on young people, we want to reflect on effective initiatives and measures needed during and after the pandemic to better support youth living in disadvantaged urban areas.

Locking Down Adolescence. Coping Strategies to Face the Pandemic

Anna Rosa Favretto[1], Manuel Finelli[2], Cristina Calvi[1]

[1]University of Eastern Piedmont, Italy; [2]University of Modena and Reggio Emilia, Italy

During the various phases of the pandemic, Italian adolescents have been the objects of two polarized and contradictory social representations. On one hand, according to a "criminalizing" vision, they are considered as medically incompetent, socially irresponsible towards safeguarding public health. On the other hand, a "victimizing" representation depicts adolescents as subjects suffering the Covid-19 consequences more severely than adults.

These conflicting representations reflect deep-rooted and opposing views of childhood and adolescence that have been highlighted and critiqued by New Childhood Studies for over thirty years (James, Jenks, Prout 1998). The first would be linked to the representation of adolescents as active subjects who represent a danger because of their immaturity. The second view is that young people are portrayed as passive subjects, incapable of making decisions in any field.

On these foundations, the paper presents the results of a pilot study carried out with the aim of understanding the coping strategies of adolescents during the pandemic and the consequences on their lives and their psychophysical well-being. The research adopted a qualitative method with the focus group technique involving about two hundred adolescents (15-17 years old) from the metropolitan area of Turin (Northern Italy).

Data analysis will focus on the following key issues: the coping strategies boys and girls adopted throughout the different phases of the pandemic; their perceptions of the pandemic in relation to the institutional policies implemented; the health competences they could afford in making choices for their behaviours; their perception about health risks and their own psycho-physical well-being.

Waves of adultism? A Sociological Perspective on the Position of Spanish Children in Times of Pandemic

Iván Rodríguez Pascual

University of Huelva, Spain. COIDESO. Research Group E6

Times of the pandemic are a challenge for sociology of childhood, since it is a possible hypothesis that the context produced by the emergence of COVID-19 has led to an adultism exacerbated by health alarm. In this contribution we start from an approach based on the study of secondary sources, as well as the discourse produced in traditional and digital media to identify signs of this adultism in the context of the management of the COVID-19 pandemic in Spain. We find both evidence of a clear invisibility of children and of a tendency towards their stigmatization that extends to the young and adolescent population. In conclusion, we understand that the relationship between the pandemic and the exacerbation of adultism is confirmed. We also demand more comparative research to understand if this should be considered a global phenomenon that could lead to a regressive context for social welfare of children and adolescents.

Support of Early Childhood Education and Care for Children during the Covid-19 Lockdown

Maarit Alasuutari[1], Mimmu Sulkanen[2]

[1]University of Jyväskylä, Finland; [2]University of Jyväskylä, Finland

In March 2020, the Covid-19 pandemic abruptly changed the daily life of many families with children and broke down their support networks as schools changed to distant teaching, the provision of early childhood education and care (ECEC) was limited and all face-to-face contacts had to be restricted to a minimum. At the same time, white-collar parents, especially, had to switch to remote work, while many blue-collar workers were laid off from their job. Hence, the home became a nexus of the care of young children, the schooling of older children and the parent's work issues. In Finland, schools were given clear instructions and guidelines for how to arrange teaching, but the same did not concern ECEC. Firstly, this meant that it was unclear which children were allowed to attend ECEC during the (partial) lock-down. Secondly, there were no guidelines about whether/how ECEC should provide support for children who stayed at home with their parent(s). In this paper, we examine how ECEC supported these children during the two-month lock-down. Moreover, we analyse which contextual and family factors predisposed children to not gaining any support or contact from ECEC during the exceptional circumstances in spring 2020. The research is based on parental survey data (N = 1835 parents; data of N = 1558 children) which were collected in Finland in December 2020. The analysis is in-progress and uses statistical methods. The results may reveal issues that should be addressed in the future, for ECEC to be better prepared to support young children equally.

Staying at Home – Staying Fine? Health and Psychosocial Well-being of Pupils During Covid-19.

Elisabeth Zehetner[1], Gerlinde Janschitz[2], Karina Fernandez[1]

[1]Pädagogische Hochschule Steiermark, Austria; [2]Universität Graz, Austria

1243

The pandemic with its consecutive phases of lockdowns, different restrictions and uncertainties has massive impacts on the everyday lives as well as on the learning environments of children and young people (cf. eg. Ravens-Sieberer et al. 2021, Grewenig et al. 2020). In a research project started in October 2020, we examine these impacts on schools and pupils aged 6 to 14. Schools are not only places where knowledge is acquired, but social spaces constituting an important part of pupils' life. Thus, focusing on the educational system provides promising perspectives to survey the well-being of children and young people in the Covid-19 crisis.

Our research is based on a mixed-method-survey that includes qualitative interviews as well as questionnaires, considering multiple perspectives: teachers, persons who work for the school support system such as social workers, doctors or psychologists, but also pupils and parents. In all of the survey phases we look at psychosocial and health-related effects, ranging from missed medical check-ups or a lack of exercise to anxiety issues and diminished perspectives, just to name a few.

Throughout the research process, our project emphasizes the effects of inequality: What circumstances can support children and young people in dealing with the restrictions during the pandemic, avoiding severe problems? What contexts, on the other hand, make them especially vulnerable, such as a precarious social status or pre-

existing mental problems? We focus on strategies, actions, and contexts that prove to be helpful in particular for children and young people in disadvantaged positions.

Assessing the Impact of the Covid-19 Pandemic on Children and Youth's Wellbeing. Insights from Romania.

Sorana Alexandra Constantinescu, Gabriel Bădescu, Viorela Ducu, Daniela Silvia Angi

Babes-Bolyai University, Romania

During 2020, as the spread of the new coronavirus showed worrying developments, countries responded through various restrictions and measures of prevention. The newly enforced mobility restrictions also affected children and youth, who had to rapidly adjust to online classes and limited possibilities of social interaction. In Romania, the state of emergency was enforced in March 2020, resulting in closing down schools and moving the classes online. This process lacked a consultative dimension that would include children in a discussion about their educational needs, thus depriving them of the possibility to make their voices heard. Seeking to counteract this oversight, we conducted a survey and interview-based research, meant to capture and detail the most important difficulties faced by children and youth throughout this period. Moreover, we aimed to uncover the input that children and youth could offer regarding the problematic ways in which their transition to lockdown conditions and online learning was handled. In practical terms, we targeted school-age children and youth through a national online survey (4225 respondents) and carried 13 interviews with children living in childcare institutions. The data, collected during April-May 2020, covered the following topics: (1) sources of information; (2) socialization issues; (3) communication and leisure; (4) emotional wellbeing; (5) direct experience with the pandemic (6) challenges of online school. The results reveal the complex ways in which the pandemic affected children and youth's education, social lives, and wellbeing, and the need for increased consideration of children's needs and struggles in the context of the unexpected alterations of their surroundings.

Student Employment during COVID 19 - The Influence of the Epidemiological Situation on the Work of Students during their University Studies

Zsófia Kocsis

University of Debrecen, Hungary

Previous research has indicated that employment of university students is increasing. Due to COVID -19 there have been mass redundancies in the labor market and the measures have also greatly affected student workers. Our research aims to examine how COVID -19 has changed student employment opportunities. From an educational research perspective, a very important question is how the current situation affects students' academic engagement. Is it possible for a student to drop out of college because they cannot finance their studies without work? The sample consists of full-time, working students in the 2020/2021 academic years (n=230). The novelty of our research is that no scientific study has been conducted in Hungary to investigate the impact of the epidemic on student work. We examine the characteristics of student employment and its impact on student performance through quantitative analysis, bivariate and multivariate statistical methods, and the inclusion of various social background variables. 74% of the students worked weekly before COVID -19, but a quarter of them lost their jobs. 37% of them reported that work became more important to them than learning. Students who have an unfavorable family background despite their difficulties or who are disappointed with higher education are particularly at risk. 54% of students believe that it is much easier for them to combine work and study. Through the research, it is possible to identify the problems of the student risk groups affected by the epidemic and the faculties where the proportion of working students is the highest.

1244

Corona Crisis As a Critical Moment In Young Adults' Life Courses

Päivi Maritta Honkatukia, Jenni Kallio, Annika Valtonen

Tampere University, Finland

The paper presents findings on young adults' experiences of the corona crisis in Finland. It bases on longitudinal interviews with young adults who have been customers of the Emergency Youth Shelters and youth services provided by the Finnish Red Cross. The participants are a heterogeneous group of young adults who were initially interviewed in 2019 (N=25). The follow up interviews in 2020-2021 focused on Covid-19 and its consequences. As based on the interview narration, the corona crisis is analysed as a critical moment in young adults' life courses which has a multi-layered impact on the dynamics between young adults' agency, everyday lives, life events and societal arrangements. Attention is paid to structural vulnerabilities defining the studied young people's possibilities to express their wishes and act accordingly, but at the same time, and despite their multiple challenges, they are viewed as active citizens instead of only targets of societal measures. In our analysis we are sensitive towards their own ways of making sense of their experiences during the waves of the corona crisis. Within this framework, the paper brings out complex, multi-layered and less discussed impacts of the global pandemic on young adults lived realities and future horizons in the context of the Nordic welfare state.

Alcohol among University student in Italy during Covid19. An empirical research on deviant behavior.

Nicola Malizia

University of Enna " Kore" - Italy.

Alcohol use represents, according to sociological literature, a deviant act, and is normally perceived as the result of an individual state of social disorganisation, a lack of integration of the subject with society's values, or temporary stressful situations (Censi, Padrevecchi, Salvador, 2019). The COVID-19 pandemic has had a strong impact on individuals, families and communities worldwide. Recent studies have shown an upward trend in alcohol use during COVID-19 as a psychological comfort substance (Ornell et al. 2020) and a general worldwide increase in alcohol sales from March 2020 (Martin 2020). This study, through an online survey conducted between March and December 2020, explored the relationship between alcohol and the university environment during the early stages of COVID-19 in Italy (2020), in relation to individual, family, social and psychological factors. The research also investigated university students' knowledge of the risks associated with alcohol use, and finally sought to understand whether boredom and other psychological factors, as a consequence of restrictions in terms of social isolation and staying at home to avoid contagion, might drive alcohol use at home. This research represents a novelty in the field, as it showed that alcohol use by young people is no longer linked to conviviality and traditional forms of gathering. Data were taken from a study of 351 Italian university students with the aim of understanding alcohol use during the Covid-19 pandemic in the year 2020 and identifying the consequences. To this end, the Alcohol Use Disorders Identification Test (AUDIT) and a self-report questionnaire were used as instruments to assess associated problems.

Free Repair Against the Consumer Society: How Repair Cafés Socialize People to a New Relationship to Objects

Julie Madon

Sciences Po, Centre de Sociologie des Organisations (CSO), France

Several authors have described contemporary consumption behaviour as part of a "throwaway society". However, some movements try to offset this process. Among these, Repair Cafés — places where volunteers help people repair their household items for free — allow items that would otherwise be discarded, considered as waste, to be revalued and restored for reuse. These collective actions, which are flourishing around the world, are part of a transition towards a more circular economy. But beyond their reparation action, what is their socialising power with consumers? Do these events help to establish different habits among consumers, more oriented towards recycling and repair?

I propose to present an article in the process of being published in the Journal of Consumer Culture, in which I show how a different relationship to objects can be transmitted by collectively practicing repair. By conducting qualitative field observations, semi-structured interviews and quantitative questionnaires in three French Repair Cafés, I show that these organizations, which are intended to be places of learning, aimed at empowering individuals to deal with their household goods by teaching them repair techniques, cannot help but drift towards a logic of service, where audiences play the role of consumers rather than learners. But I argue that this service relationship has the advantage of attracting many individuals who are not familiar with the issue of product durability, and of socializing them, through concrete practice, to a new reflex of repair.

The Global Value Chain of Bolivian electronic "waste"

Juliane Müller

University of Munich, Germany

The sense of environmental crisis on a global scale has converged with an older critique of consumerism and unequal North-South relations to give rise to the international political agenda on domestic waste, recycling, and the circular economy. Electrical and electronic waste figures prominently in this field. An estimated 75% of electronic residues worldwide are dumped, recycled, and traded under unknown conditions. Bolivia has moderate but rising levels of middle-class consumption and discardable electronic equipment. Supranational institutions have started to co-finance a municipal e-waste take-back and recycle system in the city of La Paz. The main aims are to establish a formal system of recollection, transport, and separation and to inform the population about health and environmental risks.

In this paper, I analyze some effects of this program: the emergence of new market actors and global value chains based on Bolivian e-waste. Bolivia, and South America more broadly, is not a receiver of e-waste streams (as some countries in Africa and Asia). Until recently, residues remained within the country and region, being repaired, dismantled, commercialized, burnt, and dumbed in informal ways. The public support enables a small number of e-waste start-ups to build a business model on the separation and export of electronic parts and components for their processing, recycling, and valuation in the Global North. The paper discusses the notion of the circular economy in a context as Bolivia where its intentions are at odds with socioeconomic realities and technological capacities, as well as international power relations.

Transition Towards a Circular Economy in Households and Retail Business: The Ethics and Valuation of Food Waste

Taru Tuulikki Lehtokunnas

Tampere University, Finland

Circular economy is often presented as one of the most prominent alternatives for the unsustainable economic model of take-make-use-dispose. However, there is still lack of profound understanding on what kind of practices, resources and changes the transition towards the circular economy would require in the everyday routines of, for example, households and businesses. In this presentation, focusing on the production and prevention of food waste, I will examine the underpinnings of this transition in two nodal points of food consumption: homes and supermarkets. I will draw from practice theories, Foucauldian ethics and the pragmatist approach to valuation. In the presentation, I will discuss food waste as a complex societal issue, paying attention to the socio-material orderings that shape food waste and related practices. The research material is collected in Finland between the years 2018 and 2019 and it consists of food waste diary material collected from households and ethnographic observations in food waste cooking workshops as well as ethnographic fieldwork conducted for one month in a retail store. Based on the analysis of these materials, this presentation will contribute to the understanding of the transition towards the circular economy by analysing the partly contradictory ethical sensitivities that shape food consumption practices in households as well as valuation and normalisation of food waste in the retail business. By doing this, it will highlight the possible challenges of the transition towards the circular economy.

Caretivating and the Moral Economy of Urban Prosumers

Atle Wehn Hegnes

Norwegian Institute of Bioeconomy Research, Norway

Contemporary initiatives of urban agriculture (UA) are intended to enhance global sustainable development, food security, nutrition and social integration. Reviewing existing literature on the practice of growing and consuming in and near cities shows that the activities and their underlying aim for contributing to social change is based on a complex set of motives, understandings and practices. In this paper I focus specifically on how a diverse set of motives of caring is a crucial element in UA and the moral economy of prosumtion.

The empirical material was collected in June 2020 in two perisub-urban gardening initiatives in the municipality of Aarhus (Denmark). It comprises a combination of participant observation, 26 semi-structured interviews, informal conversations and field diaries.

The analysis presents urban cultivation as motivated by a complex of caring practices and their impact on social change. Opposed to solely understanding caring as something that is done or directed towards others, cultivation in perisub-urban spaces also includes caring for oneself, as well as for the environment and other social and material conditions. This nexus of cultivating and caring is denoted as a practice of caretivating and a typology of different caring practices through cultivation is developed.

The results show that caretivating is an expression of different and non-exclusive meanings that explicitly or implicitly characterise the moral economy of urban agriculture and urban prosumers.

From Opium for the Spirit to Esport with Chinese Characteristics: Embedded Moralities of the Gaming Markets in China

Thomas Amadieu

ESSCA School of Management, People's Republic of China

The interplay of consumption moralities mutually shaped by institutional frameworks and everyday activity (consumer groups (Nessel, 2016) or households - Laamanen, Wahlen, & Lorek, 2018) are at the core of sociological investigations on contested markets (organ and blood markets for instance) (Schiller-Merkens & Balsiger, 2019), and controversial consumption or industries (gambling, cannabis, etc.). The question of the influence of the variability of national market environments on the moral economies of consumption has been relatively scarcely addressed, particularly in the case of state capitalism economies. This communication proposes to present the study of a formerly morally questioned consumption - video games - becoming an instrument of economic growth and a tool of political power - both in terms of population control and international influence. The history of gaming in China is tumultuous: Chinese psychiatry was prompt to recognize video games as an addictive disorder and consumption was illegal for a long time, as the games were perceived as a harmful foreign influence for youth, giving rise to episodes labeled as moral panic (Golub & Lingley, 2008; Szablewicz, 2010). Yet today the market represents more than 661 million gamers, making it the largest in the world. This development goes hand in hand with institutional recognition, under the more legitimized notion of Esport, which is, however, accompanied by strict and fluctuating regulations and controls. Based on a field survey conducted on the gaming industry in China and archival data this research proposes an exploration of the dynamics of the construction of moralities in controversial markets.

Becoming a vegetarian at the End of the 19th Century (Switzerland, France)

Alexandra Hondermarck

Sciences Po, France

At the end of the 19th century, short-lived vegetarian societies were established in several places in France and Switzerland. The initiators of these attempts were two men, Dr. Dock from St. Gallen and Pastor Raoux, a former professor at the Academy of Lausanne. Their ambition was to reform the way of life and consumption in order to solve social problems. Vegetarianism was supposed to improve both the health of bodies and souls and should eventually put an end to wars in Europe. But what does it mean to become a vegetarian at a time when vegetarianism is not yet institutionalised, neither as a social movement nor as a consumption pattern? How can we create and promote a new way of consuming when everything is still to be built and how can we manage to mobilise other citizens to follow us?

Through the case study of Pr. Raoux and with a sociological approach, this paper explores how ethical orientations can shape consumption practices, assuming than vegetarianism comes with a set of conceptions about other social issues, so that consumption reform is not limited to food practices. It shows that the conversion to vegetarianism involves an interweaving of two dimensions: self-reform of lifestyle and commitment to various social movements to promote this lifestyle. Furthermore, it explores how vegetarian practices require access to a range of organisations and knowledge, and how they circulate and spread, in Switzerland but also in France, in a transnational perspective.

Music Taste, Fandom and Political Polarisation: Mainstreaming Populism through the Consumption of Popular Music in Hungary

Emilia Barna, Agnes Patakfalvi-Czirjak

Budapest University of Technology and Economics, Hungary

Our proposed paper is based on research conducted as part of the international research project "Popular Music and the Rise of Populism in Europe" (Volkswagen Stiftung, ref. 94 754). We look at the relationship between populism and popular music as a cultural form in the particular case of Hungary with the aim of understanding how popular music affords populist interpretations across Hungary. We intend to answer this through analysing the reception of a number of selected popular music examples. The selected bands and artists can, in a variety of ways, be associated with values and identity politics propagated by the government; they are typically favoured by cultural policy and they participate in propaganda events. For the analysis, we combine different methods, namely anthropological field work (conducted [pre-pandemic] at live shows and online), interviews with music fans, and Musicological Group Analysis. Developed by André Doehring as part of the research project, MGA conjoins musicological knowledge with the individual, but at the same time structured, interpretations of musical consumption. Our analysis focuses on the ways in which expressions of music taste, positive and negative value judgments regarding the songs and artists in question, and practices of fandom, gain moral significance through being embedded in political, social and historical contexts.

Consumption and Energy Citizenship: Perspectives from Finnish Housing Cooperatives

Senja Laakso[1], Jani Lukkarinen[2]

[1]University of Helsinki, Finland; [2]Finnish Environment Institute, Finland

The transition of the energy system, i.e. the ways of producing, distributing and consuming energy towards carbon neutrality involves more than substituting fossil fuels with renewable energy. It implies changes in technical infrastructures, social practices, governance institutions, and cultural meanings, as well as the emergence of new social roles. The present energy systems are structured to obstruct agency of their users, leading to disconnection and disempowerment of consumers and forcing them a passive role in relation to energy policy and technology. However, the on-going transitions that include influx of distributed energy technologies, novel policy incentives and more volatile energy prices create conditions, and even demands, for actively participating energy citizens and prosumers, challenging old narrow consumer roles. Despite these developments, less attention has been devoted to the ways in which consumption in itself may be able to transform energy systems. Taking examples from studies with Finnish housing cooperatives, this presentation focuses on the role of consumption in creating energy citizenship. The findings illustrate how the present practices in housing cooperatives often make residents disengaged from decision-making processes where sustainable energy solutions could be applied and from active management of shared and private energy consumption. To counter this trend, initiatives supporting empowerment in and sufficiency of daily energy-consuming practices provide spaces that attach residents with energy system transition and open up possibilities for diverse kinds of energy citizenship.

1249

Sustainable Citizenship vs. Political Activism? Crowding-in and Crowding-out

Robbe Geerts, Frédéric Vandermoere

University of Antwerp, Belgium

In this study, we examine whether pro-environmental behavior crowds-in (i.e., associates positively with) or crowds-out (i.e., displaces) political activism. This line of inquiry is part of a wider debate centering on the question whether individual pro-environmental behavior can be seen as a political act. While previous studies generally show a positive association between pro-environmental behavior and political activism, very few have differentiated between types of pro-environmental behavior. Consequently, little is known about the relationship between political participation and different modes of individual pro-environmental behavior. Against this background, we use Flemish survey data to examine the relationship between political activism and different types of pro-environmental behavior i.e., sustainable transport, shopping decisions, energy curtailment and waste sorting. The results are generally consistent with previous studies: political activism was positively related to sustainable transport, shopping decisions, and waste sorting. However, our study also indicates that political activism may be negatively associated with energy curtailment behavior. Consequently, results suggest that energy curtailment may displace political action. In conclusion, by broadening the scope to include different modes of pro-environmental behavior, our study confirms but also nuances the usefulness of concepts such as sustainable citizenship. Such notions often attempt to frame individual pro-environmental behavior as a part of broader political and collective strategies to address environmental issues. Our study shows that this may exclude some forms of ecologically significant behaviors such as energy curtailment. Energy curtailment seems individualized and apolitical.

Practicing Ecological Citizenship: Rights, Obligations and Inclusion in the Zero Waste Communities in Chinese Cities

Xinyu Mallory Zhan

University of Geneva, Switzerland

Ecological citizenship has been widely studied as a normative and prescriptive account of social action, in that it breaks an alleged global political impasse in responding to the urgent threats of the climate crisis. This research seeks to provide an empirical account of ecological citizenship through the emerging environmental movement of 'zero waste' in Chinese cities. The zero waste movement aims to reduce individual and household waste to the maximum through long-term commitments that involve transforming everyday consumption practices. The movement has been growing in Chinese cities in the last decade, led by lifestyle activists and supported by hundreds of thousands of citizens in online and offline movement communities. Using in-depth interviews with movement participants, as well as online observations of communities in selected cities, this contribution illustrates in what way sustainable consumption and lifestyle are conceived as being practices of ecological citizenship. To do so, I examine discursive practices of ecological citizenship through their shared meanings and understandings around both rights and obligations of citizens in relation to the environment. This research shows that taking up responsibilities, motivated by a sense of duty and virtue, emboldens and empowers citizens to claim and assert environmental rights that are not legally conferred – especially in context of limited political maneuvering in China. This research also reveals how ecological citizenship is practiced differently by individuals in different spaces, of opposite genders and with disparate social and economic capital – all of which points to ways in which enabling conditions for equitable 'access' to ecological citizenship could be promoted and realized.

1250

Communities in Sustainability Transition - Impacting Individual Lifestyles

Gabriella Kiss, Tamás Veress, Ágnes Neulinger, Kata Kasza-Kelemen, Orsolya Lazányi

Corvinus University of Budapest, Hungary

Natural sciences research has shown the ongoing radical degradation of Earth's ecosystems to support the conditions for life as we know it. Multiple socioeconomic processes drive the loss of nature. One main driver is affluence fueled consumption. Shifting from the material and energy-intensive economies and lifestyles toward an environmentally sustainable society is one of the main challenges ahead. Even if efforts are taken, gaps between intentions and impacts are occurring (Csutora, 2012). Sustainability cannot be addressed solely by the increase of efficiency; to reduce society's material metabolism the decrease in total material footprint is inescapable. We deliberately avoid methodological individualism, and accordingly consider individuals' actions as embedded into and influenced through their memberships in various communities. In our empirical research, we focused on the role of communities on individuals in the transition to sustainable consumption. We conducted qualitative research on initiatives in Budapest (Hungary) and looked for the answer: what kind of impact do they have on their members and the broader society from the perspective of the transition to sustainability? In our research we found out, there are many factors that communities foster from learning to reinforcement. Most of these communities aim to change consumers practices, but their intentions, the tools applied and the real impacts differ in a wide range. In our presentation, we are drawing a colourful picture of these results that can promote the future of alternative visions for a sustainable lifestyle in our society.

Competing Visions of Sustainable Food Systems in a Complex Food Governance Framework

Carmen Lozano-Cabedo[1], Guadalupe Ramos-Truchero[2]

[1]Universidad Nacional de Educacion a Distancia, Spain; [2]Universidad de Valladolid, Spain

Promoting sustainable food systems has become an important goal across society. Governments and businesses are increasing measures to find solutions to the negative effects of unbalanced diets on the health of people and the planet. However, a variety of data indicates this objective is far from being attained.

Our principal thesis is that the conflictive relationship among the actors in the agri-food system forms one of the main barriers to the achievement of sustainable food systems. Food governance framework has become more complex with the emergence of new dimensions, new objectives, and new actors. Different actors are lobbying, from unequal positions, to impose their views in the arena of food policy and to mark out the route to achieve sustainable food systems.

In this paper, we analyse the changes that have taken place in the agri-food system and how these changes affect the foundations of the conventional model of food governance, enabling and giving rise to innovative forms of global food governance. Then, we examine how the appearance of "more aware" consumers, with new and more active values with respect to food, have changed the basis for relationships among the different actors in the agri-food chain. The need to acknowledge these consumers and respond to their demands has obliged most of the actors in the agri-food system to shift their focus and modify strategies and practices, generating conflicts in many cases. We explore the competing visions on healthy and sustainable food systems between traditional actors and conscious consumers.

How to Make Food System Sustainable? Practices of Political Mobilisation within Alternative Food Networks

Ewa Kopczynska

Jagiellonian University, Poland

Alternative food networks are considered to be seeds of transition into more resilient, sustainable and just food system. Both formal and informal initiatives are often analysed as communities of shared political values, realising their own scenarios of social change. Therefore they are often seen either as food system' alternatives, good examples, inspiring niches or as reservoir of new ideas. In my paper I will take another perspective and identify different strategies of social change, which are developed and practiced on the margins of conventional food market. Empirical data are provided by qualitative study of three cases of food networks: 1) food banks focused on food aid and minimising food waste; 2) farm-to-fork initiatives and shortened food supply chains linking green customers and ecological production; 3) small-scale vegan food producers and distributors. The results of these three case studies, together with theoretical tools of practice theory and Actor Network theory, will be used to identify different kinds of political strategies for implementing more sustainable food system, from political lobbying, bottom-up activism, finding allies, scaling-up to "hacking" conventional food market, creating alternative-conventional hybrids, to re-defining the very categories of conventional and alternative. Understanding how those networks actually "work" help to see how and why they mobilise particular social and beyond-human actors in order to pursue their collective interests. It also shows how sustainability goals are locally adjusted, e.g. to economic and structural context, geographical location, everyday food practices, work habits, family patterns.

Foodscapes – Considering Diversity In Food Systems

Baerbel Mahr, Stefan Wahlen

Justus Liebig University Giessen, Germany

The current COVID-19-pandemic has unsheathed the importance of sustainable and resilient food systems. The majority of contemporary food systems is characterised by industrialised production and consumption of highly processed food. Standardized and uniform food products are considered less healthy and their production to be less sustainable. In addition, increasing world population and urbanisation proves challenging to advance more sustainable food systems. We assume diverse food systems to be more resilient and, in the end, more sustainable. Our research aims at disentangling diversity in food systems. We would like to explore how the concept of "foodscapes" might assist in better grasping relational characteristics of diversity. Methodologically, therefore, we review existing literature on foodscapes to explain characteristics of diversity. Our research question accordingly asks how the concept of foodscapes supports a better understanding of diversity in food systems. The food environment is a common denominator conceptualising foodscapes. An immanent spatial dimension links food and place (e.g. household food preparation, (alternative) market places, linking urban and rural etc.). However, foodscapes also consider culture and practice (i.e. meaning and identity, but also embodied and sensory aspects). Additionally, the foodscapes concept is also interested in a systems of provision perspective, considering relevant stakeholders in food systems (producers along the food chain, policy makers, and other stakeholders). The foodscapes concept relationally links dimensions that are relevant to understand diversity in and supporting a transformation of contemporary food systems towards more sustainable development.

1252

Values-Based Territorial Food Networks (VTFN): conceptual framework spanning Local Food Systems (LFS), Short Food Supply Chains (SFSC), Civic Food Networks (CFN) and Alternative Food Networks (AFN)

Rachel Reckinger

University of Luxembourg, Luxembourg

Localized food growing and livestock rearing initiatives with more direct transformation and commercialization structures, often at comparably small scales, gained ground worldwide. They represent various types of 'alternatives' to industrialised agri-food processes and to standard producers/consumers divides characterizing the global food system. While these alternatives are not always new, they have sparked growing scholarly interest.

Over time, the literature has addressed them via four main conceptual denominations: Local Food Systems (LFS), Short Food Supply Chains (SFSCs), Civic Food Networks (CFS), Alternative Food Networks (AFN). These concepts have distinct foci, partial overlaps, and they seek to capture an immense heterogeneity of empirical phenomena. Yet this conceptual plurality risks to conceal that these empirical initiatives, despite their differences, have structural commonalities at food system level, relevant for understanding pathways to a sustainable food system transformation.

Therefore, I argue for an overarching concept subsuming the existing ones. Values-based Territorial Food Networks (VTFN) would take into account the diverse perspectives from the four main concepts in this field, classify their specificities and address their shortcomings. The social critique at their core, leading to transitions, is constructed around values of 'doing things differently', at the level of specific territories. The more robust and authentic these sustainability values in VTFN are – in terms of environmental integrity, social well-being, economic resilience and ethical governance – the more likely they are to be incorporated into practices, to become more and more legitimate and gain a voice at negotiation tables, in order to help reorient the current corporate agrifood regime.

Form Grassroots to Platforms: Alternative Food Provisioning Practices During the Coronavirus Emergency

Alice Dal Gobbo, Francesca Forno, Magnani Natalia

University of Trento, Italy

Throughout the last decades, food movements have constituted a significant part of mobilisations in the sphere of everyday life. Practices of social reproduction have become forms of direct action against the commodification and acceleration of life. This has produced innovation, building concrete alternatives to an agro-industrial food sector that is socially, economically and ecologically damaging and unequal. Movements' action has gone "deep" in transforming food practices, meanings and discourses, influencing consumption preferences and policies. Since the very first lockdown weeks, these grassroots innovations have attracted the interest of capital investment. Online and offline horizontal networks for direct food shopping have provided a 'blueprint' for the development of private digital platforms. In such a rapidly changing landscape, we investigate the potential for digital technologies to foster alternative, more sustainable and just, food systems. We draw on data from the European project PLATEFORMS https://plateforms.oslomet.no/, looking at everyday provisioning practices through diverse online and offline platforms, both private and grassroots. After mapping the key design features of the different platforms under examination, we focus on data from 45 in-depth interviews. Looking at practices illuminates how the Covid-19 crisis might be an opportunity for food movements to "scale out and through", building on past efforts and experimenting with digitalisation to reach an ampler spectrum of subjects. Yet, as capitalist platform economy appropriates social innovation, emerging food platforms also show the potential to turn into a further means for consolidating market niches, revamp accumulation and re-invent exploitation and inequality while not contributing to overall sustainability.

Digital Communication Tools and its Affect on the Relation Between Parents and Kindergarten Teachers in a Norwegian Context

Karoline Jangård Selliseth

Western Norway University of Applied Sciences, Norway

This presentation's research question is: How is the relation between parents and kindergarten teachers affected by digital communication tools? The study is based on a qualitative case study of three different kindergartens. The three are chosen as a result of strategic selection based on different communication practices towards parents. At all three kindergartens, kindergarten owners, kindergarten employees and parents are interviewed.

One of the kindergartens in the study use an app called Vigilo towards the parents. Further, one kindergarten which use an app called My Kid is studied. Lastly, one kindergarten which do not use digital communication tools, is studied. The interviews were based loosely on an interview guide, and the questions mainly revolved around how the parents and kindergarten teachers experienced the relation between them in conjunction with the apps, to inquire how the apps affect this relation. The interviews were audiotaped and transcribed. The data is analyzed by using theory of professions and theory concerning parent's user- or consumer role, along with relational theory, to create solid knowledge about what implications the communication tools can have for the relation.

This study is a work in process, and a part of a PhD project.

The tentative results of this unfolding study implicate that the communication and collaboration between kindergarten teachers and parents could be characterized as profound and deep-rooted in kindergartens that have deselected digital communication tools. In kindergartens that have introduced such tools, on the other hand, the actors appear to have a more effective and rational relation.

Teenagers' Understanding Of Online Commercial Privacy

Sonali Srivastava, Jussi Nyrhinen, Terhi-Anna Wilska

University of Jyväskylä, Finland

Although commercial use of children and young people's online data is an important policy concern, children's own understanding of how their data may be used for commercial purposes is under researched. Employing Livingstone et al's. (2019) typification of online privacy and van der Hof's (2016) digital data typology, this study draws on FGDs with teens aged 13-16 years in Finland to explore their perspectives on various everyday experiences in digital environments. The main research questions guiding the study are (i) How do children understand commercial privacy online? How do they feel about being targeted by commercial advertising? What kind of harms, if any, do they think data harvesting by commercial actors could pose? What negotiation strategies, if any, do they employ to protect their privacy in relation to commercial actors? An initial analysis of data from our ongoing data-collection indicates that while teens mostly understood the potential sources through which their data could be collected for targeting them with advertisements, most, especially younger teens, could not draw clear links between how their various online activities were interconnected. Teens expressed varied feelings in relation to targeted advertising such as, "annoying", "creepy", "fascinating", "useful", and "not bothersome". Harms arising from marketers' use of their data were conceptualised more as minimal or short-term as opposed to long-term. Negotiation strategies were rarely adopted primarily due to long privacy terms indicating frustration and helplessness with technological architecture. The study will have implications for policymakers, online marketers, and media literacy educators.

1254

Technology-mediated Daily Practices --- Cases from Blood Glucose Monitoring and Insulin Delivery Technologies

Yu-cheng Liu

Soochow University, Taiwan

This research will be based on perspectives from ethnomethodology, the philosophy of technology, and postphenomenology to explore the technology-mediated daily practices of people with type 1 diabetes for blood glucose monitoring and insulin injections. Following this, a question will be further investigated in the era of artificial intelligence and automation: what is the correlation between embodiment and technological intervention and its possible inspiration for the interaction between actors, technological development, and society. As far as the purpose of this research is concerned, the intervention of technological objects in daily life involves many adjustments and changes. These adjustments and changes are related to how the users and their bodies accept the intervention of technical objects on the one hand, and on the other hand, are related to the intervention of technical objects itself which constitutes a vision or perspective of technology-human relationships. In terms of the technical intervention mentioned above, the problematics of this research will include: the development of full automation or artificial intelligence technology, on the one hand, provides more convenience and higher accuracy, but at the same time, does it also weaken the observation and imagination of a person's own body? In the user's technical implementation, how do the interactions with technological objects look like? It should even be, how to complete a journey of perception of the surrounding world and environment together with technological objects? How does technology enter the daily life of users? How do users respond to their intervention?

Practices with Wearable Technology in Digital Media: a Toolkit to Choose from

Daria Morozova, Olga Gurova

Aalborg University, Denmark

Wearables are a blend of design and technology that can be worn on one's body. A smartwatch measuring health indicators or a swimsuit that tracks a UV level are examples of these devices. Regardless initial enthusiasm over wearable's potential to solve societal problems (e.g. improvements in elderly care), recent trends address that users abandon their wearables quite soon.

In this research, we look at a variety of practices with wearable technology disseminated in Finnish digital media. We ask who the consumers of the wearable devices are, what meanings are attached to use of these devices, and what skills are needed to become a practitioner. We are drawing on a practice theory that focuses on daily routines established through linking of different elements: materials, skills and meanings. We argue that a wearable device is a material element that needs to become inscribed into various consumers' practices by blending with other elements. With Python coding, we scraped two Finnish digital news platforms for all the articles related to wearable technology, and analyzed these data for repeating repertoires.

Digital media is a powerful tool to shape public opinion, and many consumers learn about technological innovations through it. Previous research addresses that technology is often portrayed in media in either utopian or dystopian terms, i.e. as a solution or a source of societal problems. However, in this study, we adhere to the view that wearable technology is not about tools and devices exclusively, but as much about the practices within which it is used. Hence, it is within the routine activity of daily life that wearables' connection to larger societal phenomenon occurs.

Keywords: wearable technology, practice theory, digital media

Still Hungry for Perfection? A Longitudinal Analysis of Appearance-related Pressures on Social Networking Sites

Erica Åberg, Aki Koivula, Kirsti Sippel

University of Turku, Finland

During its existence for over a decade, social media has profoundly altered human interaction. In addition to its positive influence on social life, social media is often blamed for generating appearance-related pressures, body dissatisfaction and a wide range of bodily pathologies, particularly for young female consumers.

This study is a follow up to our previous research paper examining social networking sites (SNS) as a source of appearance-related pressures for men and women in Finland. This time we focus on examining whether over-time changes in the appearance-related pressures were related to changes in usage frequency of different SNS and changes in the size of social media networks measured by the number of followers. In line with our previous research questions, we also explored the differences between users of Facebook and Instagram and differences experienced by gender. We compare the previous findings to a nationally representative novel three-wave panel data representative of the Finnish population aged 18–74 (N =2,205) collected 2017-2020. Multilevel hybrid models were used to separate within-individual and between-individuals associations.

Our findings suggest that increased use of SNS is related to increased experiences of appearance-related pressures. Moreover, our findings suggested that an increased number of followers boosted the likelihood of experiencing appearance-related pressures. We aim to offer insights into the discussion on the relationship between social media and appearance-related pressures, as well as discuss social media as an objectifying or empowering social space on a population level.

Keywords: Social media, Gender, Physical appearance, Appearance-related pressures, Longitudinal analysis

Learning How to go on with Smart Home Technology

Kirsten Gram-Hanssen, Toke Haunstrup Bach Christensen, Line Kryger Aagaard

Aalborg University, Denmark

Smart home technology is expected to become widespread in the future and might accommodate a green transition as regards making energy consumption and production meet better, but it may also have social consequences, which are important to understand. At a basic level, we need to know more about how it is to learn to live with these technologies, and how they influence our everyday practices and routines. This paper is based on auto ethnography, a two-year diary of one of the authors, and it uses theories of practice in investigating to what extent learning to live with new smart technologies are different from learning to live with other types of new materiality. Theories of learning have a well-established tradition within theories of practice, and include the collectivity of learning processes. The concept of "knowing how to go on" is central in some of this work. Smart home technologies are appropriated within the context of the private home, and learning processes are thus done alone or collectively within the household. This raises new questions of how to understand the collectivity in learning processes. This paper will utilize the in-depth knowledge from an auto ethnography to gain insights on how adoption of new smart home technologies interacts with learning processes and the establishing of new everyday practices. Such an approach can lay the ground for further empirical work with a broader empirical material and provide knowledge that can help in designing better technologies and make policy and regulation to promote this.

Datafying Energy Relations: Apps and Platforms as Mediators in Digitalising Energy Infrastructures in Sweden

Julia Velkova, Harald Rohracher

Linköping University, Sweden

Digital technologies are today at the core of collective socio-technical imaginaries about sustainable energy and environmental futures. These imaginaries have opened up a new arena into which data markets could expand after having transformed fields such as health, online sociality, and public governance. In the field of energy, as consumers are increasingly becoming microproducers and 'prosumers' of energy, a proliferating array of software companies are rapidly expanding the media ecology of online platforms, apps and tracking devices to capture value from them, becoming important mediators between energy utilities, housing landlords and consumers, and the infrastructures that they each manage. This paper explores how such new digital intermediaries reconfigure consumers' relations to energy and to data markets through particular energy-related devices and app interfaces in a Swedish context. Combining STS with cultural studies approaches, we draw on walkthroughs (Light et al 2016) on several popular in Sweden energy infrastructure apps (Tibber, Nordpool, Ngenic, Zappi) and a series of "media go-alongs" (Jørgensen 2016) with microproducers to analyse the ways in which these devices 'configure' their users and their practices in relation to both energy and data markets, and how users in turn configure these apps and embed them in their everyday life. Our results suggest that data relations established by these new digital intermediaries in the energy field configure users to both produce data for multiple digitalising markets, but also actively engage them in sharing their own energy infrastructures for collective or market use, mediated by energy platforms.

From Warehouses To Platforms: Reinventing Foodbanks Through The Lens Of The Digital Economy

Liliana Arroyo-Moliner, David Murillo

ESADE Business School, Ramon Llull University, Spain

The global model of food distribution is characterised by a paradox: while a third of food goes to waste, about 25% of families are suffering from food insecurity (Michelini et al, 2018). Foodbanks have been relevant actors in tackling hunger and food waste, but their current intermediation model is both inefficient & insufficient. With the pandemic, the number of families demanding food has increased approximately 30% since last spring across Europe. This food emergency is pressing FoodBanks as well as their distribution ecosystems. In the context of social distancing and limited contacts, their dependency on volunteers (most of them elders) has supposed a risk to the whole functioning. While digitalisation may bring opportunities to Foodbanks, current research at the intersection of food and technology is focused on food delivery apps, food sharing, sustainable consumption communities, or digital technologies applied to the agri-food sector.

The purpose of this research is to analyse to what extent and under which circumstances the digitalisation of Foodbanks would increase their impact and efficiency; as well as provide with opportunities to overcome the beneficiary approach which affects the dignity of food receivers and perpetuates poverty.

To do so, this paper offers in first place a map of the main issues that Foodbanks are facing (i.e. inefficient logistics, volunteering system or unequal access to technology). Secondly, analyses 21 digital innovations operating in the sector of food distribution. The sample is composed by worldwide selected case studies. The analysis is based on secondary data and digital ethnography in order to identify their key factors for success.

1257

Practicing Everyday Life In The Smart Grid: Gender, Technologies And Home Comfort

Line Valdorff Madsen

Aalborg University, Denmark

The transition to low carbon societies necessitates a transition towards widespread use of renewable energies. The vision of a smart grid to foster the transition and a future exchange of energy between households as consumers (and prosumers) and energy providers is a cornerstone in this transition. On this background a range of smart technologies related to energy is entering the everyday life of households with the implicit purpose to change energy consumption and the related practices in the home. It is therefore vital to investigate how such technologies enter the homes of consumers and in what ways these technologies might change everyday practices that consume energy. In this vein, it is essential to understand the differences in how daily practices are carried out and how technologies take part in energy-consuming practices. Daily practices in households are inherently gendered and are also materially and socio-economically dependent. Thus, the introduction of new technologies in the home also have the potential of creating new ways of performing gendered everyday practices, including new forms of (un)equity among energy consumers. Therefore, this paper analyses data from qualitative interviews and home tours in different types of households, in two differing localities of Denmark, to investigate how smart heating technologies take part in forming energy-consuming practices related to home comfort. And furthermore, how these technologies and practices related to energy and comfort are performed between gender structures and daily life in the smart grid.

The Future Of Tech Jobs: A Socio-Technical Temporal Dynamics Analysis Of The Labor Market

Andrea-Mariana Budeanu[1], Valeriu Budeanu[2]

[1]Tech Lounge Association, Romania; [2]Freelancer, Romania

From a constructivist perspective, looking at the possible imagined jobs futurescapes (Adam, 2008) is subject of the interpretation of the temporal dynamics of the social, economic, financial and environmental envisioned changes. Our knowledge related to the emerging technologies and our experience with previous technological disruptions are leading to the construction of certain frameworks about how the labor market will look like in the near future. In this study we analyze the pitches of teams in the largest Romanian tech accelerator, Innovation Labs, 2013-2020, in order to identify their relationship with projected tendencies on the labor marked linked to automation.

Automation and datafication are the coordinates that will shape the alternative futures of the labor market. These two processes, which emerged from digitalization, the Internet of Things, Big Data, Machine Learning and Artificial Intelligence (AI), are continuously adjusting the relevance and quality of work across all professions, including tech entrepreneurship.

The transformation of the society, at large, is influenced not only by the willingness of adopting (or rejecting) certain technologies, but also by the policies democratically adopted or enforced due to the competing visions about the role of the technical developments in our social lives that shape different social organizations of work. In this context, matching our present future assumptions with the future present realities should not be seen only as a matter of time, but as a matter of choice.

1258

Technology, Metrics and Trajectories : Understanding The Digital Self-Tracking Practices

Julien Onno

Université de Caen-Normandie, France

Quantification of daily activities has taken a prominent place in the modern societies. Using moble apps, digital devices or biosensors, the individuals are prompt to measure their physical activities, their health or their productivity. These types of practices are particularly discussed by the Quantified Self movement (QS) created in California by Gary Wolf and Kevin Kelly in 2007, two editors of the American magazine Wired. Simultaneously, numbers and metrics now shape public policies, organisations, social media and social representations.

We propose in this communication to question the practices of self-quantification (or Quantified Self) in regards to its numerous stakes. Using various fieldworks such as comprehensive interviews with users of self-tracking devices, online observations of the MyFitnessPal forum (an online calorie counter) and an observation of a conference by the movement Quantifief Self, we seek to interrogate the relation between tracking technologies, individual trajectories and boarder social and cultural context. How quantification came to become a privileged way to act upon onself ? How the relations between technology, sensors and metrics affect individuals bodies and subjectivities ?

Meet Your Crafter! The Impact Of Digital Technologies On Craft Consumption

Judith Nyfeler

University of St. Gallen, Switzerland

The current pandemic has promoted all kinds of online consumption. Yet, while online giants scaled up, local craft manufacture also regained territory (e.g., "buy local", or "support small labels"), and its consumption became a means of expression and distinction. The contribution argues that crafts experience a tremendous uplift due to the advancement of digital technologies. Currently, examples can be found from cocktails to beer brewing to handcrafted jewelry. These crafts do not refer to technical skills only, but also encompass a (morally) suitable realm of consumption that is increasingly conceived of as an antidote to globalization.

Conceptually, the paper creates a dialogue between the historical economy perspective of craft manufacture and current streams in anthropology and cultural studies on craft and the creative economy. Having an interest in the latest "craft wave", this ethnographic study focuses the post-production of craft products, such as marketing, sales, distribution, as interfaces mediating between consumers and producers in various micro to small enterprises in Switzerland. Therefore, it asks: In what way does the new craft wave differ from the old, and what are its current peculiarities? In so doing, it questions the sole production-centered perspective and examines the significance of complementary and hybrid forms of production and consumption (or presumption), knowledge and infrastructure, physical experience and digital communication.

Finally, it is argued that digital technologies and infrastructures account for distributed knowledge and changes in consumer behavior. By means of technologies mainly in the post-production, various details of the manufacture processes are communicated, alluring consumers. Eventually, the contribution joins current debates in organizational and economic sociology as well as research in the sociology of production, consumption and digitalization.

Video Gaming: Do Aesthetics Matter?

Joschka Baum

University of Mainz, Germany

In recent decades, video gaming has become an ever more relevant leisure-time activity supplied by a fast-growing industry. However, its consumption has barely been subject of sociological research so far. The most striking distinctive feature of video games is that they contain both ludic and aesthetic elements. Thus, "gamers" may share ludic, competitive and social orientations with people doing sports or playing board games. But they may also share aesthetic orientations with those consuming music, movies or art. Therefore, the debate about whether video games should be considered an art form is not easy to settle. It is necessary to study how relevant aesthetic elements are for gamers and to develop adequate research designs for such an investigation.

In my presentation, I point out what distinguishes video games from other cultural goods. One feature is that they vary widely in how important aesthetic, ludic or social elements are. While communication science is mainly interested in multiplayer games, research on aesthetic elements should concentrate on core games and neglect casual games as well as esports games that are mainly about competition. I further discuss how gaming research can benefit from theories on cultural consumption. Among theoretical approaches, the influence of cultural capital on game preferences and consumption styles is supposed to be particularly important. Players with high cultural capital are assumed to favour games that are appraised for their aesthetic features.

Videogaming as Craft Consumption

Tom Brock, Mark Johnson

Manchester Metropolitan University, United Kingdom

This article repurposes Colin Campbell's (2005) concept of 'the craft consumer' to generate a new theory of videogame consumption, which proposes that we identify the material practices typically associated with craft labour within acts of digital play. We draw on case studies from popular and community-driven videogame titles including Dark Souls and Super Mario Maker to make our argument, suggesting that a grasp of the controls initiates material practices, like repetition, which provide the groundwork for craft skill. It is from this position that we argue that consumers initiate a craft-like 'dialogue' (Sennett, 2008) with the game's design that reveals the experimental and creative nature of videogame consumption. Importantly, these case studies provide evidence to meet with Campbell's definition of 'craft consumption' as an: 1) 'ensemble activity' and 2) as a 'collection' of handmade things. The result is a better understanding of the consumer as someone who initiates experiences of skilled labour and creative self-expression through the craft of playing a videogame. This article presents a new understanding of the (gaming) consumer whilst also challenging the idea that the experience of 'craft consumption' is typically reserved for the middle or professional classes, as Campbell maintains.

Civilizing Process of Cannabis Cultures

Michal Wanke

University of Opole, Poland

Cannabis is the most prevalent illicit drug in many global contexts. It has been undergoing decriminalization and changed legal status under many legislations. Simultaneously, liberalization of attitudes towards cannabis is occurring in many local contexts, but at the same time, cannabis user culture remains a stable global subculture (Sandberg 2012) and is associated with the processes of stigmatization, normalization or neutralization. The distribution of both social norms and legal solutions towards using cannabis is uneven globally, making its status and the associated culture ambiguous and contradictory worldwide.

Cannabis is subjected to the civilizing process (Elias 1982) which is evident in the changes of reflexivity of the user.

The 'modernization' of cannabis cultures and markets involves the risks and paradoxes identified by modernization scholars (Beck 1992). This paper draws on thematic literature review of recent papers (N=121) yielding evidence in the areas of identity of cannabis users, challenges of potentially stigmatized use and the users' biographic shifts amid cultural transformations. It discusses changes of attitudes, but also emotional, moral and practical dilemmas for the individuals, who experience a softer kind of stigma, discrepancies between different legislations, marketings and local cultures, and also increasing potency of the substance, few harm reduction programs, the ambiguous status of other legal cannabinoids and, last but not least, different reactions of other users and societies to the liberalization of law.

Drawing on evidence from all continents (controlling the westernized skew of publications) this paper theorizes the recent transformations of cannabis global cultures as contradictory and controlled de-control (Featherstone 1998).

Mapping Artists' Selection. The Case of the Berlin Art Institution "House of the Cultures of the World"

Séverine Marguin

TU Berlin, Germany

At the interface between the sociology of the arts and the sociology of space, my lecture aims to make a spatial-sociological contribution to the understanding of global circulation in the art world. Carrying empirical research in the famous Berlin art institution "House of the Cultures of the World" (HKW), we wanted to determine how global or local this institution is in its artists' selection. Through a double-layered collection of data (based on the geographical and the social accessibility of the institution) we worked out the resources and rules/regulations of inclusion and exclusion at work.

Within an interdisciplinary teaching project, we conducted a methodical experiment on mixing different mapping techniques (Corner, 1997). For the global scale, two data sets were used. The first consisted of a statistical record of all (n=600) artists represented at the HKW between 2013 and 2017, operating with information on place of birth, place of residence, gender, and age. The second dataset consisted of biographical interviews on a selection of artists from the Global South (n=15).

The superimposition of both data sets in a world mapping has made it possible to read that German political foundations (such as the Heinrich Böll Foundation) or state cultural representations (such as the Goethe-Institut) only functioned as door openers for the artists there in certain regions of the global South (including the Near and Middle East or Far East Asia). Particularly with the help of these spatial patterns, far-reaching analyses can be made of the complex and ambivalent way in which a decidedly critical and postcolonial Western cultural institution deals with statehood, nationality, and territoriality.

Testing the Omnivore Hypothesis in Russia

Iuliia Papushina

National Research University Higher School of Economics, Russian Federation

In the last thirty years, a significant shift from the homology to omnivore argument has occurred in musical preference studies. Studies on the omnivore argument mainly come from North and South America, Western and sometimes Eastern Europe. To the best of our knowledge, there are no empirical tests of musical omnivorousness in Russia. The aim of this paper is to reveal omnivore musical preferences in Russia, and analyzes the links between musical preferences, social-demographic profiles, tolerance, and urbanization. The research setting is the Perm Region. Perm Region is a large industrial area located in the Urals. The population is 2,610,800. Perm region is the 18th Russian region in the number of inhabitants. A survey of 2,400 Perm Region citizens is analyzed using principal component analysis and linear regression provides evidence for the research. Our findings do not indicate omnivore musical tastes in Russia that contradicts the conclusions of the research in other cultures. Instead of finding the omnivore pattern, we found Bourdieu-like patterns of classical versus pop music taste and nostalgic taste versus contemporary taste. Representatives of each taste pattern have a specific social-demographic profile. The urbanization factor influences musical preferences as well. Comparing our results with the previous ones, we can conclude that highbrow taste exists in many highly industrialized societies with a complex social structure. Other patterns are perhaps strongly dependent on the historically developed classification of musical styles and cultural practices of music consumption. As a result, they find similarities in the studies much more rarely.

Changing Temporalities, Changing Youth Futures and the Pandemic

Carmen Leccardi

University of Milano- Bicocca, Italy

Reflecting on young people's relationship with the future enables us to explore a number of strategic issues that concern their representations of the social world, as well as their trust in institutions. Moreover, given the strategic importance of the future in the construction of biographical time, reflecting on this topic provides an opportunity to explore the ongoing changes in youth as a life stage. In this context, the paper sets out to understand how the relationship with the future has been influenced in the last decades by both structural and cultural changes - including changes related to contemporary temporal cultures. Consider, for instance, the so-called 'biographical presentification', related to a sort of 'suspended transition' to adulthood, young people have to deal with today in place of the modern 'deferred gratification model'. However, the COVID-19 pandemic has strongly impacted these changes. Ongoing Italian research on youth experiences shows how young people seem to be making use of the 'suspended time' of the pandemic to redesign their capacity for agency in spite of a negative social context. In particular, the paper will focus on the redefinition of generational relations in connection with the pandemic, as well as on the restructuring of the forms of young people's projectuality. According to the first results, the pandemic does not simply force young people to redefine their aspirations; rather, and particularly for individuals with high social and cultural capital, it seems to offer a positive chance to re-elaborate these aspirations, creating a sort of 'new moratorium'.

Children of the Revolution: The Impact of 1960s and 1970s Culture on Baby Boomers' Views on Retirement.

Orlaith Catherine Tunney[1,2], Kène Henkens[1,2,3], Hanna van Solinge[1,2]

[1]Netherlands Interdisciplinary Demographic Institute/KNAW; [2]The University Medical Center Groningen; [3]Department of Sociology, University of Amsterdam

Background and Objectives: Having broken the mold of the traditional life course, baby boomers are expected to exact similar changes to retirement. Some attribute these likely changes, at least in part, to countercultural movements this generation pioneered during the sixties and seventies. However, empirical investigation into the long-term impact of countercultural identification (such as with the hippy movement, feminism, anti-establishment) in youth is scarce. This study examines associations between baby boomers' retirement styles and identification with counterculture in their youth; hypothesizing that greater identification with counterculture will be associated with more active retirement styles.

Research Design and Methods: Identification with retirement styles and various aspects of counterculture among 6,024 pre-retired Dutch older workers aged 60-65 were measured as part of the NIDI Pension Panel Study (NPPS).

Results: Those who reported greater identification with counterculture were much more likely to identify with 'active' retirement styles, such as the view of retirement as a continuation or a new beginning. This pattern of results remained when controlling for potential confounders.

Discussion and Implications: These results highlight the diversity amongst the baby boom generation and the potential for novel insight in applying a cultural approach over a traditional cohort approach. Our findings support the idea that (counter)cultural identity in youth has an impact across the life course and may therefore have implications for other key questions of life's third age beyond retirement.

1262

Towards a New Urban Community: Ethnography of 'BEK' Squat in Zagreb

Dino Vukušić[1], Rašeljka Krnić[2], Vanja Dergić[3]

[1]Institute of Social Sciences Ivo Pilar, Croatia; [2]Institute of Social Sciences Ivo Pilar, Croatia; [3]Institute of Social Sciences Ivo Pilar, Croatia

The phenomenon of squatting occurs in European countries in the late 1960s, primarily as a result of economic and social turbulence caused by a whole series of social changes in the postwar period. Very soon, it is no more related exclusively to the solution of the housing issue and passes into the domain of political and ideological action based on counter-cultural values. Squatting as a social phenomenon has aroused the curiosity of many scholars, but the majority of researched squats are located in Western European cities while very few studies are interested in squatting in post-socialist countries of Eastern and Central Europe. The intention of our research is to contribute to increasing the knowledge about squatting in the non-western part of Europe. BEK-squat and social center in Zagreb, Croatia - is a subject of our ethnographic research which was conducted during 2019. BEK was founded in early 2018 as a platform for various social, cultural, and artistic content with the purpose of generating an innovative socio-cultural climate in order to holistically develop the local community. We focused our study on analyzing forms of organization, activities and motivations of actors within squats. Special interest is given to the research of squatters understanding of the concepts of culture, interculturality and attitudes towards "others". Furthermore, one of the focuses was related to the term "urban struggle", in the context of the occupation of a certain urban locality and different types of activities in newly constructed spaces.

Saudi Youth: National Identity and Social Transformation

Awadh Alotaibi[1,2]

[1]University of Leeds, United Kingdom; [2]King Saud University, Saudi Arabia

This study addresses the first part of ongoing qualitative PhD research, inquiring how Saudi national identity is perceived by Saudi youth considering recent social-cultural and economic transformations. It is based on thirty semi-structured interviews conducted between October 2019 and March 2020, with young Saudis (male and female) from the cities of Riyadh and Jeddah in Saudi Arabia. It presents and discusses the basis and location of Saudi national identity, and how Saudi identity is constructed, developed, and shifted over time. It illustrates an account of Saudi generational changes and how the current generation leads a very different life from that of their parents and grandparents. Emerging findings of this Study show that the identity of Saudi youth is located between traditional and modern forces, and reveals that self-identification is impacted by internal and external forces such as religious belief, the royal family, political culture, globalization, and benefits received from the state. The current brand of Saudi nationalism takes the form of demanding adherence to the state over any other affiliations, including religious and tribal affiliations. What makes this generation distinct from any other is its size, its interest in change, and its position in a time of rapid transition. Lastly, the current generation of Saudi youth ambitiously represent themselves as the main contributors to the development and future good of the country, particularly in relation to Saudi Vision 2030, rather than simply receiving benefits from oil revenues.

„The Kitchen Became my Home Office" The Impact of Pandemic on Female Teachers from Hungary and Romania

Orsolya Gergely[1], Réka Geambașu[2], Beáta Nagy[3], Nikolett Ivett Somogyi[4]

[1]Sapientia Hungarian University of Transylvania, Romania; [2]Babeș-Bolyai University, Romania; Centre for Economic and Regional Studies - Eötvös Loránd Research Network, Budapest, Hungary; [3]Corvinus University of Budapest, Hungary; [4]University of Antwerp, Belgium

The spring of 2020 brought a long-drawn lockdown period for educational institutions and started the era of online learning-teaching for younger and older children and for their pedagogues as well. This sudden change had to be implemented by the teachers often without any governmental help or institutional assistance. In lot of cases teachers struggled to connect, to be able to teach, and to get feedback, since the virtual learning environments are so different from the face-to-face ones. This requires a particular form of pedagogy, but the majority of the teachers have not been trained in. What kind of challenges had to face the teachers? What kind of experience report the pedagogues? How could they cope with the new situation, when their children and families were part of their working time and space?

In order to answer these questions, during May 2020 we interviewed 24 female pedagogues from Hungary (13) and Romania (11). All of them were full-time working mothers, who lived in dual-earner families with children under the age 14. Our findings showed that their job-related activity has changed radically, but in the same time the family and household activities, tasks and expectations have also changed. Furthermore the flexible working hours were not an option for those who had real-time teaching obligations. Although all of them are dedicated, their professionalism and sense of responsibility was significant, they had to face a lot of difficulties.

School «Stayed at Home». Remote Work for Public Teachers during the COVID-19 Pandemic

Marcello Pedaci[1], Daniele Di Nunzio[2], Fabrizio Pirro[3], Emanuele Toscano[4]

[1]Università di Teramo, Italy; [2]Fondazione Giuseppe Di Vittorio, Italy; [3]Sapienza Università di Roma, Italy; [4]Università Guglielmo Marconi, Italy

The coronavirus crisis has imposed, in most European countries, the introduction of home-schooling, which means remote work for teachers an many other school workers; a very rare modality of working in this organizational context. How was remote work managed in schools? With what consequences for working conditions? The paper starts from these questions, with the aim of contributing to the wider debate on work dynamics during and beyond the pandemic and especially on the impact of the expansion of remote work. Our analysis focuses on public school teachers in Italy and draws on the findings of a research funded by the sectoral union FLC-CGIL, conducted throughout the country, through an online questionnaire (CAWI technique) in April-May 2020, which collected 1.197 valid questionnaires. The sample includes public teachers of the various Italian school degrees and territories.

Our findings show some peculiarities of remote work for public school teachers, but also some similarities with other contexts. The analysis highlights many differences in the way in which home-schooling/remote work for teachers has been implemented, depending on various factors, in a context lacking coordination, support and overall shared orientation. And the analysis highlights relevant impact of home-schooling/remote work on working conditions, above all on working time, workloads and work-life balance. However, our findings show significant variations across teachers, influenced by the management style and the decision-making approach, i.e. the level of workers participation to the design of home schooling/remote work, and the training possibilities. Higher levels of participation correspond to lower negative consequences (and often more successful home-schooling practices).

Effects of Online University Education on Students during Covid 19 in Turkey

Esra Gedik[1], Samet Talha Turgut[2]

[1]Yozgat Bozok University, Turkey; [2]Yozgat Bozok University, Turkey

After the first Covid 19 case was seen in Turkey in March 2020, the state sent the university students home for three weeks break. Later, when the cases were raised and the pandemic was spread in the country, the state decided to continue with online education for all the universities in Turkey. For one year, universities have been given online education. Although it prevented the extension of the Covid 19 in Turkey, online education has negative effects on students, especially young girls. This study examines the effects of online education for female and male students of the Sociology Department at Yozgat Bozok University. We conducted an online in-depth interview with 20 female and 20 male students. Since Turkey is a patriarchal and conservative society, going back home means doing housework, taking care of the older, sick people, or the siblings for those girls. For many young people in Turkey, studying at university means being free to live their own lives without the pressure of their families because many universities are abroad from their hometowns. When they went back home, they have to deal with the gender division of labor in the house. Thus, education becomes nothing compared to housework for those girls' parents. Many female students dropped out. Many others froze registrations. Some of them have difficulties balancing housework and school duties. Male students are pushed to work outside or at the family businesses for money. Thus, they cannot continue to follow the lectures. Different from female students, male students can leave the home and go to different regions in Turkey when they feel the pressure. Both female and male students' school success has got worse.

Problems with Digital Learning Environments: Cheating in Chess

Andre Uibos
University of Tartu, Estonia

Digital means of education are a necessity to provide effective and reachable education within our contemporary society. The need for effective implementation of digital education environments is amplified by the COVID-19. However, modelling digital education environments and putting them into practice cause emerging problems. This presentation, based on an analytical case study (cheating in Estonian youth chess players, n=4), investigates how to mitigate the effect of cheating within the framework of digital (distance) education. Cheating is viewed as a specific affordance of digital education environments which can be understood as a limitation of communication possibilities. This allows for latent behaviour not seen in face-to-face practice. Inquiry into cheating in online chess provides several generalisations to address the shortcomings of digital education environments. The cases inhibit a three-level problematisation paying regards to a) accusation and evidence (i.e. qualitative and quantitative data), b) "student-parent-teacher" communication and c) inclusion of higher-level structure for governing ethics (e.g. school, educational institution). A preliminary categorisation of structural problems of online cheating in the context of digital education is presented. Concluded from the cases, problems with cheating are non-trivial for effective communication between agents included in digital education in general. Nevertheless, the paper suggests that the effect of cheating in education processes can be mitigated, possibly by reassessing elements of digital environment itself: paying attention to properties such as competitiveness, communication affordances and supervision (i.e. agents governing ethical behaviour).

Keywords: digital education, online cheating, learning environment modelling, chess

The Myth of Being on the Same boat: The Experiences of Research Assistants During Covid-19 in Turkish Academia

Esra Demirkol Colosio[1], Duygu Yurttaşen[2]

[1]Çankırı Karatekin University, Turkey; [2]Dokuz Eylül University, Turkey

In the early days of Covid-19 pandemic, implementation of partial lockdown and strict warnings about staying at home was seen as a privilege for those who had a proper place to stay and the opportunity of working from home. However, remote work has also brought its hierarchical and gendered working conditions in various occupations, as academic labour is one of them. This paper aims to investigate the impacts of Covid-19 on research assistants working in Turkish universities as being precarious workers at the bottom of the academic hierarchy. Since the 1970s, the discussions on precarious employment have been important to understand the transformation of the labour market. The discussion is grounded on how remote work and flexible hours transform the job definition and the professional identity of the research assistants. As the structural and cultural arrangements of universities constitute the hierarchical relations, the research assistants' working conditions are redefined with more uncertainties and anxieties during the pandemic. Since the research assistants work in a precarious position in universities in Turkey, they are expected to perform both academic research and administrative work, online education brings along more workload based on an ambiguous job description. The under-representation of the research assistants blurs the boundaries between private and work life during the Covid-19, which causes the crisis on professional identity and burn out. To understand the increased inequality in academic labour during Covid-19 through the experiences of research assistants, this study will refer to 30 in-depth, semi-structured interviews from various departments in Turkey.

Consequences of School Lockdown on Austrian Students' Performance, Wellbeing and Future Planning

Gerlinde Janschitz[1], Karina Fernandez[2], Elisabeth Zehetner[2]

[1]University of Graz, Austria; [2]University College of Teacher Education Styria, Austria

The COVID-19 crisis hit the Austrian school landscape in spring 2020 and continues to keep it on edge a year later. Most schools are still in lockdown and classes are mostly held online. One of the most central issues are pre-existing social inequalities in education and how these evolve whiles the COVID-19 crisis. Although neither the discussion about the influence of students' family background on their educational performance (Bourdieu & Passeron 1977; Jackson 2013) nor about possible effects of digital inequalities in school context are new, the COVID-related changes in schooling might lead to a reinforcement of social and also digital inequalities of already disadvantaged students.

Based on this assumption, we take a closer look on the consequences the lockdown had on students' performance, future planning, and their general wellbeing. We do so by using a mixed-methods approach. The Austrian Corona Panel Data as well as a dataset on students' learning conditions during COVID-19 are used to emphasize the consequences the COVID-19 crisis has on students in general and especially on already disadvantaged students. Additionally, interviews are conducted with students (aged 6 to 14) attending a primary school, a secondary academic school or a regular secondary school in order to analyze how students from different school types and at different ages cope with the COVID-19 crisis. Furthermore, interviews are conducted with persons working at school support to better understand the impact the pandemic learning conditions have on already disadvantaged students.

Investigation of Experiences of Access to Online Primary Education During the Covid 19 Pandemic in Turkey

Zafer Çelik[1], Asu Altunoğlu[2]

[1]Ankara Yildirim Beyazit University, Turkey; [2]Anadolu University, Turkey

After closing schools to face-to-face education on March 13, 2020 during the Covid-19 pandemic, Turkey opened the schools for two days a week for some class levels for about a month, while for the rest of the time closed schools to face-to-face education. There has been no face-to-face education at many class levels for about a year. In order for distance education to be successfully maintained, students must have a quiet environment, computer/tablet, internet connection and digital literacy. The socioeconomic and cultural levels of families directly affect access to the maintenance of distance learning. According to the data published by Turkey's Ministry of Education, only two-thirds of the students enrolled in the system participated in distance education; and two-thirds of these participants were connected to the courses via smartphones. Data shows that for about a year, a significant number of students have had difficulties accessing and maintaining education. This study aims to examine how students in Turkey have been experiencing online education, what kind of difficulties they have been facing, and how digital inequalities are affecting the reproduction of educational inequalities. Therefore, in-depth interviews are planned with parents of children who need more parental support, especially those who are studying in advantageous, disadvantageous and private primary schools. According to preliminary findings of the study, socioeconomic and digital inequalities are deeply affecting children's access to and maintenance of online education; and already existing educational inequalities have dramatically deepened in the pandemic process.

The Effect of School Closures Due to Covid-19 on Human Capital Disparities among European Countries

Caner Özdemir

Zonguldak Bülent Ecevit University, Turkey

This research aims to investigate the potential effect of learning losses due to COVID-19 pandemic on human capital disparities among countries across Europe. Recently Reiter et al. (2020) introduced SAMYS (Skills-Adjusted Mean Years of Schooling), a human capital indicator that captures both quantity and quality of schooling. They showed that South European countries have a lower level of human capital than the rest of Europe both in terms of years of schooling and quality of education. In this research, I demonstrate that school closures during COVID-19 pandemic may lead to bigger losses of human capital for these countries that are already performing worse. For the last year, there have been several studies on calculating or simulating the potential learning loss due to COVID-19 school closures. While some studies in high income country contexts such as Switzerland (Tomasik et al., 2020) or the USA (Kuhfeld et al., 2020) have not identified any significant learning losses in literacy due to school lockdowns, some others estimated huge losses especially for low-income countries (Azavedo et al.; Kaffenberger et al., 2021). Adjusting some of these estimates to the latest school closure data from UNESCO, I found out that South European countries that have below average SAMYS also have higher estimates of learning losses due to school lockdowns. This result indicates further inequalities of human capital between nations of Europe.

Disadvantaged Pupils During the COVID 19 Pandemic: Changing Roles and Opportunities of Extracurricular Catching up Services

Kiss Márta1,[2], Perpék Éva[1]

[1]Centre for Social Sciences, Hungarian Academy of Sciences Centre of Excellence, ELKH; [2]Corvinus Institute for Advanced Studies, Corvinus University of Budapest

According to education-related researches, in Hungary like all over the world distance learning increased the burden on all actors affected (especially teachers, students and parents), but that burden varied across different segments of society. (See the report "World Bank COVID-19".) Online education caused the most significant difficulties for the lowest strata (poor schooling access, high dropout rates, etc.) amplifying the disadvantage-mediating role of schools.

The present research aims to examine the operation of EU funded complex development programs implemented in the most disadvantaged Hungarian sub-regions during the COVID-19 pandemic period. In our presentation we will focus on the changing roles, activities and opportunities of this program in the process of learning support, with particular reference to extracurricular catching up programs and institutions (i.e. community houses and spaces). We also analyze from different aspects (quantity, quality and changes) the relationships between the institutions/professionals aiming to help disadvantaged pupils.

Our data suggest that these projects could play an intermediary role between schools, social welfare institutions (like family and child welfare centers and services) and families. This role mainly implied reaching, supporting and mentoring those disadvantaged pupils who were not involved in distance learning because of material and immaterial barriers (i.e. digital illiteracy, lack of ICT devices and Internet connection, etc.). Researches showed that day childcare was also a central problem as most parents – especially low-educated ones – were not able to work from home (Fodor at al., 2020). It seems that beside the learning support activities, the community houses and spaces could also have child caring functions and prevent dawdling if they were able to comply with the epidemiological rules.

Consequences of School Lockdown on the Education of Disabled Children and Inclusion

Eleni Damianidou[1], Andri Georgiadou[2]

[1]European University Cyprus, Cyprus; [2]University of Nottingham

The aim of this research was to explore the ways in which disadvantaged students, i.e. disabled students and students from low socioeconomic status, experienced school closure and their placement in the online learning process. The main research questions were: a) Who was kept close and who was kept afar during the lockdown? b) How induced fear became the path towards the legitimization of exclusion? c) What were students distanced for? To address the above questions, we employed a qualitative methodology. The research was guided by the feminist approach, which emphasizes the dualistic nature of the world. We focused on two dualistic counterparts, i.e. powerful/disadvantaged and eligible/not eligible to learn, trying to inform scientific explanations that might help us understand and transgress the above intersecting bifurcations. Seven disabled students and eighteen parents of disabled students from Cyprus were selected with a purposive sampling method and interviewed. A grounded theory method was employed; thus, the interviews were driven by the participants perceptions. Each interview lasted between one to two hours and was based on the informed consent of the participants. Discussions with the participants focused on what they thought about the way education systems responded to the pandemic; how they understood the process and the factors that defined equal opportunities in learning; what place they had and what identity they attributed to themselves in the above learning process; how they experienced the effort to keep some students close and others afar; and what were the implications of school closure on managing to stay 'close' to more advantaged students.

1268

From Home to School and Back Home: Daily Children Mobility Before and During the Covid-19 Pandemic

Elena Nekhorosheva, Ekaterina Enchikova

Moscow City University, Russian Federation

Daily mobility of schoolchildren is mostly happening between their homes and schools. This is an important factor in urban planning and the general daily mobility of the citizens. Based on the data from one autonomous territory of Moscow metropolis, we explore the daily trajectories of schoolchildren and explore the impact of Covid-19. The sample contains 16 large schools, including a total of 116 educational buildings and a total of 84,746 students (2 to 18 years old). The first part of the presentation is focused on the analysis of the situation: what schools these children are attending, how far they are travelling and what are the main factors contributing to the school choice. The second part is focused on the changes that were observed during 2020, which had two directions: (1) regulation of the movement using administrative and socio-economic mechanisms and (2) development of online education. The lockdown restrictions affected both middle and senior classes, so they have lost the ability to move around the city and were forced to stay home for distance learning. Meanwhile, the junior classes continued attending classes in person. Thanks to this natural experiment, we can explore the shift in mobility paradigms, that was discussed by sociologists long before 2020 (Sheller & Urry, 2006). The movement was traditionally understood withing physical frames, but the new approach advises to consider the technological sight of it. If before it was more of a theoretical proposition, the pandemic proved that this factor should not be ignored.

Rethinking Education in Times of Crisis: Assessing and Addressing Educational Inequities Using Systems' Frameworks, Trauma-Informed Care, and Social Justice Education

Rina Manuela Contini[1], Cinzia Pica-Smith[2], Christian Scannel3

[1]University of Chieti-Pescara, Italy; [2]Assumption University, Worcester, Massachusetts, USA; 3Assumption University, Worcester, Massachusetts, USA

The global Covid-19 pandemic is changing education within society and is pushing educational psycho-sociological research to seek new theoretical frameworks to face the educational inequities accentuated by the current pandemic to promote the inclusion and the active participation of students in higher education.

1269

This paper, through its reflections on the experiences of students' socio-political context and educational and emotional wellbeing during the school lockdown during the Covid-19 pandemic (Pica-Smith, Scannell,2020), focuses on the systemic theoretical frameworks and pro-justice and transformative approaches, specifically Critical Pedagogy and Social Justice Education (Giroux, 2011; Pica-Smith, Contini, Veloria,2019) and Trauma-Informed lens (Crosby,2015; Sweeney,2018; Bohannon,2019), to re-think education for this changing time, to build cohesive and supportive academic environments, to reduce educational inequalities and close the educational gap in relation to the world of work expectations (European Commission,2013; PPMI,2017; Besozzi,2017; De Rosa,2018; Grimaldi, Landri,2019).
Particularly, this paper deals with:
1)contextualization of learning in the socio-political context;
2) recognizing the link between learning, students' socio-cultural identities and lived experiences (Bozkurt, Sharma, 2020; Veloria et al.,2020);
3)building a positive academic climate and respectful relationships (Zehr,2002; Pranis,2005; Vaandering,2010);
4)empowering students and developing social-emotional well-being and critical skills (Morgan et al.,2015);
5)the benefits of a flipped classroom (Partridge, et al.,2011; Menzies, Tredinnick,2017), peer mentoring (Bussu et al.,2018), and "blended learning models" on the increasing students' life skills, such us problem solving

(Suebsom,2020), self- efficacy, intrinsic motivation and satisfaction (Thai et al.,2017; Pica-Smith, Scannell,2020), and self-regulation (Zimmerman,2000).

Perceived Justice Of Cost Distribution During An Epidemic

Raman Kalinin[1], Inna Deviatko[1,2]

[1]Higher School of Economics, Moscow, Russia; [2]Institute of Sociology FCTAS RAS, Moscow, Russia

During an epidemic, concerns about justice rise due to the necessity of making decisions to whom the scarce resources should be allocated and who should bear the costs. Our study examines the effects of social interaction level and the type of allocated resources on ordinary normative judgments about distributive justice during the epidemic. We investigated the effect of allocating the costs in the local community of neighbors compared to the residential community of town inhabitants. The types of allocated resources we tested were money compared to work. All evaluations by participants were made from the third party's point of view. Employing the factorial online survey (N=380), we received both theoretically predicted and unexpected results. As predicted by social resource theory (Foa&Foa, 2012 [1974]), the participants were more inclined to the compensatory distribution while allocating working hours rather than monetary payments. The participants were more inclined to the compensatory distribution of costs when the allocation took place among town inhabitants rather than among neighbors. However, the opposite effect was expected due to the higher perceived level of interdependence and the probability of further interaction among neighbors compared to the town-level distributions. Age, gender, income level, city size, or degree of "belief in a just world" (Dalbert, 2001) did not show any significant effect or interaction. We provide some alternative explanations, propose further research directions, and discuss the implications of the results for public policy decisions during the epidemic.

Remote Work and Social Change: Experiences of Polish Employees in the Context of Covid-19 Pandemic

Piotr Binder

Polish Academy of Sciences, Poland

The proposed paper aims to reflect on the phenomenon of remote work, which gained significant popularity in Poland during the ongoing coronavirus pandemic. In a broader sense, it attempts to reflect on social change related and new work-related social practices. The analyses are based on the first wave of a qualitative study comprising 150 IDIs collected in spring-summer 2020 with three categories of respondents: young adults, parents of minors, and seniors.

The first part is focused on the research participants' pre-pandemic experiences of remote work. It is argued that various remote work components were gradually used more frequently in various on-site work settings long before the pandemic outbreak. Their essence was growing demand for (often additional) work performed outside the place of employment, which was achieved through ICT-based solutions. Experiences related to the dissemination of work performed partially remotely (even if to a minimal extent) were significant facilitation when entire professional groups were forced to transit to the remote mode of work.

The second part is concentrated on the remote work experiences from the period of the first lockdown. Although the process was not planned or announced in advance, all participants' categories remained open to remote employment, also after the pandemic ended. Simultaneously, they explicitly emphasized their interest in hybrid forms, which would allow them to combine work at home with work in the office. Finally, they presented consistent, albeit different, arguments in favor of the attractiveness of remote work. These findings support the inclusion of a lifestyle perspective and discussion of the life cycle effect in remote work research.

Autonomy And Control In Mass Remote Working During The Covid-19 Pandemic. Evidences From A Cross-Professional and Cross-National Analysis

Marta Fana[1], Enrique Fernández-Macías[1], Angelo Moro[2], Francesco Massimo[3]

[1]JRC Seville; [2]INRAE Dijon; 3Sciences Po Paris, France

The global pandemic induced by the spread of the Covid-19 acted as an exogenous shock which forced organisations to adopt telework as a daily and common form of work along the whole occupational structure. Drawing from a real-time cross-professional, cross-organisational and cross-national qualitative survey (50 interviews, conducted in France and Italy in the midst of the pandemic, between April and May 2020), our research investigates two main and interrelated aspects. In order to analyse the data collected we elaborated a theoretical framework which investigated three dimensions of telework, all related to work organization: a) workers' autonomy and management control; b) the degree of routine/standardisation of the labour process; c) the impact of remote work on teamwork - as a form of horizontal and vertical cooperation within the organisation – in those jobs for which it constitutes an essential element of productivity.

Our findings confirm some predictable facts but also show some unexpected elements. On the one hand, we found polarisation in terms of autonomy and control not only along the axes high/low skilled workers but also within these two categories: between professionals and managers among high skilled workers and between employees of large and employees of small organisations among the low skilled workers. On the other hand, we found that those jobs usually considered as easily teleworkable – because of their standardised or, conversely, highly creative and autonomous character – suffered from a lack of real time in-presence interaction and teamwork. Contrarily, jobs conventionally considered as uneasily teleworkable, because of the centrality of direct service relation, proved to fit, to a certain extent, with a remote work regime.

The Relationship Between Remote Work And Work Addiction – Does Regulation Matter?

Beatrice van Berk[1], Christian Ebner[2], Daniela Rohrbach-Schmidt[1]

[1]Federal Institute for Vocational Education and Training (BIBB), Germany; [2]Technische Universität Braunschweig

While several studies focus on the benefits of remote work, there is also some evidence of detrimental effects. The lack of physical separation between office and home makes it harder not to think about work. In addition, work tasks can in principle be performed around the clock. This makes it more difficult to cognitively separate work from other areas of life.

For this reason, our first hypothesis is that one of the negative effects of remote work could be an increased risk of work addiction (resp. workaholism). Secondly, we hypothesise that the frequency of remote work may have an impact on work addiction. This frequency of home-based work is an important aspect, especially because employees are likely to have the opportunity to work remotely over a longer period in the post-pandemic period. The potential impact of remote work regulation on the quality of work is an important indication of possible policy regulation needs in the post-pandemic period. Hence, our third hypothesis is that the type of organisational regulation of remote work has an impact on the risk of work addiction.

We use representative survey data of 6307 German employees from 2018 to test our hypotheses. Work addiction is operationalised with the Dutch Work Addiction Scale (DUWAS). According to this, work addiction is defined as the combination of excessive and compulsive work. The survey data includes questions on how remote work is contractually regulated and whether overtime during remote work can be credited. The results from multivariate regression analyses clearly support our hypotheses.

1271

Remote Work Experience during Lockdown in Catalonia: a Gender Approach

Sara Moreno Colom[1], Vicent Borras Català[1], Irene Cruz[2], Sergi Porcel[2]

[1]Universitat Autònoma de Barcelona, Spain; [2]Institut d'Estudis Regionals i Metropolitans de Barcelona, Spain

The covid-19 pandemic has made teleworking one of the most relevant measures to reduce the spread of the virus. As a consequence, the adoption of teleworking has increased, worldwide, beyond all precedent. Nevertheless, this adaptation has often occurred in a forced and hasty manner, given the exceptional circumstances. Such widespread implementation created a unique opportunity to evaluate some of its effects, particularly from the perspective of gender and the sexual division of the total workload. This presentation analyses the experiences and the assessment of remote work of men and women in Catalonia, during a context defined by home confinement and the closing of schools. A survey on uses of time during confinement (carried out by an institution dependent on the Catalan government), has been used. Preliminary results show that teleworking, far from favouring co-responsibility in domestic and care tasks, has reinforced even more the gender gap in reproductive work, as well as increased the hours of dedication to productive work. More notably, individuals' assessment of remote work does not seem to depend so much on classic structural factors explaining labour conditions, like gender, the life cycle or social class. Instead, other contextual factors, such as the organization of work arrangements among household members, take greater importance. Our conclusions highlight the risks and the opportunities that should be taken into account in the regulation of telework beyond the pandemic context from a gender perspective.

Impact of Covid in Homeworking and Working Hours in Spain

Juan Vicente Castellanos Quintana, Alberto Veira Ramos

UC3M, Spain

Since the outbreak of the covid19 pandemic, restrictions to mobility let to an unprecedented expansion of remote work with a great impact in people working lifestyles.
According to the Spanish National Statistical Institute (INE), the number of people working remotely in Spain has increased from 447,000 to 700,000 between 2014 and 2019, an increase of 2.5% to 3.5% of the percentage of "teleworkers" over the total occupied population (17.3 million in 2014 and 19.8 million in 2019). Compared to the rest of Europe, Spain occupies a discreet place in the implementation of telework, still far from reaching levels such as those in the Netherlands, where 14% of its occupied population normally works remotely. However, this trend could accelerate over the coming years because of the situation caused by the COVID-19 pandemic. In the UK, the number of workers working mainly from home raised from 5,7% in 2019 to 43.1% in April 2020 even if falling to 36,5% in June, (Feldstead, A and Reuschke, D., 2020).
Our research would show how the working timeframe has evolved as a consequence of the recent increase of the telework in Spain. To analyse this impact we will compare the situation before and after the COVID pandemy in terms of working hours, working journey and working days in relation with the place of work and ocupation.

Surveillance Capitalism and a New Dialectic of Self-exploitation. The Case of Drug Selling Platforms

Meropi Tzanetakis[1], Stefan Marx[2]

[1]University of Vienna, Austria; [2]University of Vienna, Austria

This paper's purpose is to examine the embeddedness of drug selling platforms within information capitalism. These platforms bring together various actors for the exchange of illicit drugs and require anonymising software like Tor to be accessed. Research has shown that drug platforms have important implications regarding the reduction of harm as they make available higher-quality drugs with a lower risk of contamination, less violent encounters compared to offline drug acquisition and enable peer-to-peer information sharing (Bancroft 2017, Barrett et al. 2016, Martin 2014). Moreover, drug platforms enable more efficient market structures compared to traditional drug distribution (Bakken et al. 2017; Tzanetakis 2018).

In this paper, we aim to extend these accounts and situate them in digital capitalism (Staab 2019) by arguing that the dialectic of harm reduction practices and market efficiency outlined above have an origin in the political, social and economic regime of information capitalism. Depicted as a new economic order that claims human experiences as free raw material for hidden but legal commercial practices of extraction, prediction and sales, and an economic logic that subordinates the production of goods and services to a new architecture of behavioural modification, Zuboff (2015, 2019) coined the term surveillance capitalism. Based on digital ethnographic fieldwork between 2015 and 2021, we argue that actors perform mostly illicit transactions on drug platforms in a similar vein as on aforementioned legal digital markets. Our contribution reflects on the juxtaposition of surveillance capitalism and the capitalist practices on illicit drug delivery platforms on the Internet.

Surveillance Capitalism And The Subject: From Self-Government To Big Other

Christopher Dorn

Trier University, Germany

Recently, the idea has been advanced that workplace governance and the commodification of labor have shifted to increasingly rely on individuals' self-control and subjectivity (e.g., Voß & Pongratz, 2003). Instead of being mainly passive actors under direct organizational surveillance, workers are charged with organizing and monitoring their own work processes, commercializing their labor capital, and conducting their whole life according to an entrepreneurial model. These "entreployees" (Voß & Pongratz, 2003) are thus subject to a form of power that acts through individuals' capacities for self-government. In contrast, the emerging forms of commodification and power associated with surveillance capitalism (Zuboff, 2019) largely bypass these internal regulatory capacities and instead depend on "Big Other", that is, processes of "datafication" (Sadowski, 2019) and constraints resulting from the technological infrastructure. Using examples from self-improvement apps, the proposed talk compares these two different mechanisms of power to determine to what extent the logic of surveillance capitalism rests upon a modified distribution of external and self-government.

Surveillance in the Big Data Era. A Theoretical Approach Based on Human-centred Design

Amparo Coiduras-Sanagustin

University of Zaragoza, Spain

This research is developed from the point of view of the union among design, communication and sociology. Big Data is one of the most powerful revolutions in the technological field and all the numerous applications that has to: social media; IoT; smart cities; wearables, etc... are changing society. Industrial designers have the necessary tools to develop products and services which should have the user's new needs. Human-centered design has enough tools to find creative and alternative solutions to the problem posed oriented to give instruments for sustainable design. The two first and main RQ are: 1) Is the concept of big data surveillance present in user-centred design research? And 2) Are

smart products sustainable throughout their life cycle in the three main dimensions of sustainability: environmental, economic and social? So, we present a theoretical approach trying to answer the RQ. From the idea that industrial design is not only a production tool but a way to improve society, responding to current needs and challenges. Preliminary conclusion, it is necessary a new way of ethical users' interaction design and awareness about big data and smart products.

Sex Work and Financial Citizenship: Navigating Cryptocurrencies and Financial Moralities

Isabel Crowhurst

University of Essex, United Kingdom

The expanding field of sex industry research scholarship has looked at the multiple exclusions from full (economic, sexual, health, bodily) citizenship that sex workers face in most parts of the globe due to the partial or outright criminalisation of commercial sex and the lack of institutional and social recognition of sex work as work. Far less explored are the ways in which the stigma and criminalisation of commercial sex impact upon sex workers' management of money and economic assets.

The paper explores ways in which financial citizenship "a concept that recognises the significance of the financial system to everyday life and confers a right and ability on individuals and households to participate fully in the economy and to accumulate wealth" (Leyshon 2009: 153) can be useful in understanding the financial exclusions faced by sex workers. These exclusions happen at various levels regardless of the legal status of sex work itself. Posts on social media, blogs, and sex worker-led organisations' websites reveal that for sex workers in the global North, access to financial products can be easily denied or retracted. In this context, blockchain technologies (e.g, cryptocurrencies) claim to economically empower populations, including sex workers, who face financial exclusion. Drawing on documentary analysis collected online, the paper looks at how cryptocurrencies are used by sex workers to be paid for their services, to pay for advertising, or to save in hardware wallets in lieu of 'conventional' retirement options. I ask: are cryptocurrencies, with their challenge to the authority of conventional currencies and the institutions behind them, offering new opportunities for the financial inclusion of sex workers?

"As Straight As They Come": Reflexions On Hearing Men's Commercial Sex Stories

Helen M Rand

University of Essex, United Kingdom

Including men in sex work research, as customers and workers, challenges the binaries and stereotypes that often perpetuate the woman as a whore and/or a victim and men as perpetrators of violence without complexities. This article is based on a digital ethnographic study where I conducted 29 qualitative interviews with people who sold and/or purchased sexual services online. Nine identified as men. Their sexuality was not clearly definable using heteronormative and homonormative ideal categories of homosexual, heterosexual and bisexual. Using a queer lens, the analysis presents a more complex picture of men's sexual practices, sexual desires and sexual identities within digital sex markets. However, many of the men drew on existing gender structures in the interview exchange to maintain and assert power based on gender binaries so they could "live up to" dominant definitions of masculinity. The findings from this research suggest the market does provide a space for men to express and explore potentially stigmatising aspects of their sexualities, but at the same time, this is not solely an act of resistance as it is based within the maintenance of hegemonic masculinities.

1274

Meanings and Practical Aspects of Money in the Context of Male-for-Male Escorting in France

Kostia Lennes

Université Libre de Bruxelles, Université de Paris

Despite the expansion of sex work research beyond criminology, psychology and public health in the past two decades, social sciences tend to analyse sex work through gender and sexuality studies at the expense of other approaches such as sociology of work or economic sociology. Indeed, money is often seen as an essential aspect defining what sex work is, but it is rarely taken into account as a research topic per se. Even socio-economic insights on sex work and its links with economic markets tend to overlook money as an object, despite a few exceptions. This contribution will explore symbolic and practical aspects of money in the context of male-for-male escorting in France. Based on digital ethnography of a male escorting platform and about 40 interviews with escort boys and clients, I will examine the meanings and concrete aspects of money in this form of transactional sex. How do escorts determine, negotiate and change their rates? What is the influence of their pricing strategy on clients' desire and the authenticity of their relationships? When and how are escorts paid by their clients during encounters? What is the impact of pricing on the categorisation of different (sexual) services offered on the website? Drawing on my investigation, money plays multiple roles that go beyond its intrinsic value: it can be seen as a pretext, an adjustment variable of desire and authenticity, or as a component of sexual arousal.

Groping In The Dark? A Capture-recapture Approach To Estimate Prostitution Supply With Online Data

Jef Hendrickx, Anahita Azam, Stef Adriaenssens

KU Leuven, Belgium

People involved in prostitution, and even more so their activities, often go unregistered. There are good reasons, for instance those related to evidence-based risk-prevention policies, to build reliable estimates of their population size. We aim to make a twofold contribution: to derive population estimates of female sex workers in the Netherlands and Belgium, and propose an appropriate methodological framework and novel data source for measuring such hidden populations in other advanced economies. We calculate a single registration capture-recapture estimate using the truncated Poisson and Zelterman approaches. The former allows us to estimate the population size lower bound and the latter estimates the upper bound for active sex workers. The count data are exploited from the number of reviews posted about sex workers on a commercial sex review website, from which we crawl detailed information about the population of interest. Breakdowns of the population size by country are smaller than previous guestimates. We find that relative to the overall population of the two countries, the proportion of sex workers are roughly identical despite differing legal environments between Belgium and the Netherlands.

1275

Like Lava: Qualitative-Quantitative Follow-up Study of Families Before and During the Pandemic

Diana Carvalho, Magda Nico, Maria Silva, Ana Caetano

Instituto Universitário de Lisboa (ISCTE-IUL), Centro de Investigação e Estudos de Sociologia (CIES-IUL), Portugal

The outbreak of the covid-19 pandemic and its associated lockdowns turned individual, intimate, relational, and identity experiences, inside out, on pause, and/or in a reflexive loop. Routines, time management, as well as visions of the self, the world, of politics, health and relationships, have been impacted.

The sociological interest for these topics is inversely proportional to its immediate access or understanding. On one hand, because the pandemic is (part of) a process, and as such, the pre-pandemic conditions of existence should be necessarily included in grasping the impacts of the pandemic. On the other hand, because in order to understand the pandemic experiences we must take into account its multilevel effects; the impact of this experience in each individual, but also in relation to its family and society. Additionally, as the pandemic is still unfolding, its analysis poses risks to its social understanding. Pandemic data is like lava: has not cooled down, has not taken up definite forms, is not yet safe to touch.

The team of the project "Linked Lives: a mixed, multilevel and longitudinal approach to family life course", developed a follow up study of families during the pandemic. From April to June of 2020, a longitudinal online survey (with 4 rounds) was applied to members of 15 previously interviewed families in Portugal. Longitudinal information on health, politics, work, relations, and feelings was collected, as well as reflections on the meanings of the pandemic, and photographs of the lockdown. This presentation is precisely based on these exploratory results.

The Imagined Pet: Families and Children in Face of Choosing, and Living With, a Companion Animal

Henrique Tereno, Verónica Policarpo

Instituto de Ciências Sociais, Universidade de Lisboa, Portugal

The decision and process of getting a pet are intricate and entail many different aspects within the family. In this presentation, we ask: what can such decision tell us about the place and importance of animals in contemporary families? And what are the emerging tensions between ideals/expectations, and lived experiences? We explore this topic drawing on results from project CLAN (PTDC/SOC-SOC 28415/2017), and data from its 60 interviews to 24 Portuguese families, collected between November 2019 and July 2020. Common reasons mentioned by both parents and children to choose a pet are their aesthetic qualities and "cuteness"; their appearance being reminiscent of another animal – either a previous family pet, or a wild unobtainable counterpart; assumptions on their personality, commonly associated with the breed/species at stake; certain physical characteristics, such as small/large size, deeming them suitable for certain types of housing or role; or to fill in a desired role within the family, for instance that of a new baby or brother to take care of. However, such expectations often clash with the daily life reality of sharing lives with other species. In this presentation we explore the main tensions and obstacles that arise, contrasting the experience of families before, and after, the first stage of lockdown due to the current COVID-19 pandemic. We advance the hypothesis that, just as the "families-we-live-by" are distinct from, and frame our effective relation with, the "families-we-live-with"; also the "pets-we-live-by" frame our relation with the "pets-we-live-with".

1276

Towards an Understanding of Familial and Personal Relationships in Organ Donation: Challenging the 'Gift of Life' Discourse in a Global Context.

Stephanie Jessica Parsons[1], Lissette Aviles R[2]

[1]Anglia Ruskin University London, United Kingdom; [2]University of Edinburgh, United Kingdom

Background: Official discourses associated with 'gift of life' and 'saving lives' has characterised organ donation literature on a global scale. These narratives have shaped the understanding of this complex phenomenon that intertwines donors and recipients in ways that have drawn little attention. Organ donation, from the perspective of the sociology of emotions, is limited and recent studies under this perspective are challenging those narratives.

Aim: This paper presents the reflections of two researchers investigating the experiences of healthcare professionals, donor families and organ recipients in two international contexts.

Method: Two doctoral projects carried out in Chile and the United Kingdom examining the experiences of healthcare professionals, donor families and organ recipients were analysed. These two different studies used emotion work theories as theoretical insights, providing new conceptualisations and challenging the status-quo for the organ donation narrative and literature.

Results: Both international studies provide enacting data of how 'the gift of life' narrative is contested. Despite the projects developed different questions and methodologies and being carried out under different regulations and healthcare systems, both groups of participants challenged the current policies concerning post-contact between donating families and organ recipients. The current narrative seems to pressure families and recipients alike, adding constraints to an already complex and under-researched social phenomenon.

Conclusion: Sociology of emotions provided a novel and in-depth understanding of the key actors involved in the organ donation process and this paper highlights how dominant narratives are unable to wholly reconcile the tensions between organ recipients and donor families.

The Complexities of Triangulated Care: Gender Socialization and Essentialization in Families Who Hire Migrant Domestic Workers

Iris Hoiting

University of Hong Kong, Hong Kong S.A.R. (China)

1277

The academic literature on gender socialization supports the notion that children's attitudes towards gender roles are significantly influenced by the family in which they grow up. With that, parents often function as models for gender roles that can reinforce, or resist, children's adoption of gender-stereotypical behaviors. One gender-stereotypical behavior that has been the focus of an emerging body of family/gender research is domestic work, and who performs it. However, research that investigates the effects of parental divisions of household labour on children remains sparse and is, thus far, mainly concentrated on families in Western settings. Yet, a global trend has emerged in which domestic work has become an undervalued commodity, encouraging working families in advanced economies to buy out domestic labour, including childcare, and transfer these duties to live-in migrant domestic workers (MDWs). The current piece explores the effects of growing up in such 'domestic worker families' in Hong Kong—a global city that can be regarded as one of the most vibrant sites for domestic work research. In families who hire MDWs, gender arrangements become increasingly complex, as mother-employers often share in the 'breadwinning' role with their partners—something that has been suggested to encourage more flexible gender role socialization. But housework and childcare are now largely embodied by a migrant woman. Drawing on interviews with children and young adults who grew up with a MDW, this study demonstrates that this familial care model reinforces gender-stereotypes that now intersect with race. Whereas MDWs generally embody a positive 'motherly' role in the lives of children/young adults, simultaneously, they also become essentialized for the work they are hired to do.

Emotional Perception of the President as a Marker of Political Divide (the Case of Ukraine)

Olena Zlobina[1], Evgeniya Bliznyuk[2]

[1]Institute of Sociology National Academy of Sciences of Ukraine, Ukraine; [2]Gradus Research Ltd

The case of Ukraine is unique because it makes possible to evaluate a full palette of emotions in relation to a non-systemic politician that became the President. As a popular comedian, the current President was perceived totally positively. Therefore, one could expect rich palette of feelings when perceiving him in a new role. To study, a methodological solution was proposed that made it possible to present Plutchik's wheel of emotions as a system of closed questions in the questionnaire. For each of the basic emotions, presented by the options that differ in the degree of intensity, the respondent could choose one variant, or indicate that he did not feel such emotions toward the President at all. Complex emotions arising from the mix of basic emotions were integrated into one question with compatible alternatives where all suitable states could be selected. 1420 respondents took part in the survey conducted in an on-line panel. Analysis of the data confirmed the split of emotional attitude towards the personality of the current President between those who voted for him and for his opponent. The split is most clearly seen along the "trust versus disgust" axis. 95% of those who did not vote for the President answered that they did not feel any acceptance, trust or pride towards him. At the same time, 88% of them experienced loathing, disgust and rejection.

Racism Unspoken: Race, Discrimination and (white) Privilege in Emotional Narratives of Young Migrants

Magdalena Nowicka[1], Katarzyna Wojnicka[2]

[1]DeZIM Institute, Germany; [2]University of Gothenburg

This paper investigates how young migrants narrate about racism and which role emotions play in these accounts. Emotions are central to the racial edifice of societies (Bonilla-Silva 2019). Past research pointed to emotional responses to racialization. We follow Fanon (1967) and Baldwin (1963) in how we view racism as infused with emotions that precede the cognitive awareness of being a racialized subject. Our interest is twofold: first, we ask which emotions are involved in young migrants' experiences of racism. Second, we explore how different research methods allow for triggering narrations that include racialized emotions at different levels of consciousness. We base our paper on data collected in 2019 among young (16-29) first- and second-generation migrants living in Berlin, Germany. While our research focused on gender, family and friendship, the collected narrations included explicit accounts of experienced racism which were stronger the more we encouraged to express non-verbally or offered them a safe space to talk about emotions rather than sharing their thoughts and opinions. Racism remained silent in the in-depth interviews and was even denied if we asked explicitly about it but the focus group interviews and the art-based workshops helped the same participants to express their emotions involved in experiencing racial offences. Racism and racial oppression as a feeling could best be expressed with help of visual elicitation and drawings which we also applied during our research. We draw conclusions from our research for how social sciences could study racism beyond the classical focus on its material foundations.

1278

Angry Posts Go Viral: The Negativity Bias In The Online Communication Of Western European Rightwing Populist Leaders

Paolo Gerbaudo1, Ciro Clemente De Falco2, Giulia Giorgi3, Silvia Keeling3, Antonia Murolo3, Federica Nunziata2

1King's College London; 2University of Naples Federico II; 3University of Milan, University of Turin

The recent rise of right-wing populist formations in Western Europe has often been seen as deriving from the way they have managed to exploit social media affordances to gather supporters and channel anger. However, to date, these assertions have been mostly impressionistic and unsystematic. In this article we develop a comparative analysis of how right-wing populists increase their engagement on Facebook by playing on users' emotions. Looking at the Facebook posts of Matteo Salvini in Italy, Marine Le Pen in France, Santiago Abascal in Spain and Alice Weidel in Germany, and comparing them to those of their most notable national opponents, we provide evidence that an anger-focused rhetoric is fuelling online mobilisation especially for the populist right. To this end, we adopt a mixed methods approach by using quantitative analysis of Facebook metrics, informed by a qualitative investigation of the communicative strategies. We use the 'Angry Reaction' as a reflection of the users' anger towards the content of the post. We see that anger is particularly prominent when the topic of discussion is migration; we also find that anger has a high correlation to user engagement (namely sharing). Our findings point to a "negativity bias" content - one that collects more Angry Reactions and is hence likelier to capture attention and acquire visibility. They also raise important questions for both political science and new media studies research and call for a more in-depth understanding of processes of political communication on social media.

Hate and Love as Social Media Political Mobilising Forces

Sara Araújo[1,2], Sofia José Santos[1,2], Cristiano Gianolla[2]

[1]Centre for Social Studies - University of Coimbra, Portugal; [2]Faculty of Economics - University of Coimbra

The European Social Model (rooted on solidarity and equality) is under erosion as the neoliberal agenda is shrinking social justice programmes and increasing citizens' vulnerability by deepening inequalities grounded on class, gender and race. Further, neoliberalism is modelling individualistic citizens, weakening social solidarity and increasing fear, rage and resignation. Considering how fear is differently experienced by citizens (as vulnerability is asymmetrically distributed in civil society), this paper will explore how online social media allows the mobilisation of different emotions towards the construction of alternative political projects and alliances within the current European neoliberal order. The main hypothesis is that the technocratic reason that sustains the "no alternative" neoliberal discourses and the narratives of success focused exclusively on individual competitiveness left an apparent collective void of hope that is being filled by radical political parties and social movements. Specifically, it will be observed how resentment and hate have been mobilized on online social media textual and semiotic discourses, turning citizens against citizens and building alliances based on common resentment, while also exploring how love and empathy are mobilized to build communities of hope and resistance.

Style Over Substance? The Discursive Sanctioning of a High Schooler's Public Profanities Towards the Political Elite

Dorottya Egres

Budapest University of Technology and Economics, Hungary

Waves of protests washed through Hungary at the end of 2018 over the new legislation labelled the 'slave law.' A high school girl named Blanka Nagy spoke up at one of the protests with such profanities that it became the top issue in political, media and public discourses. She called the ruling party of Fidesz a 'cleptocracy', referred to the President of the Republic as the 'dick with a moustache', and even borrowed Tom Cruise's 'fuck your own face' line from Tropic Thunder.

Incivility from political actors as well as civilians is performed when speakers intend to ignore, hurt or humiliate. Speakers can deliberately choose to utter profanities in front of a large audience, knowing that it will reach even more people through the media, because they have a higher purpose – that of political mobilisation. In hopes of getting their message across by shocking, they even risk discrediting themselves.

This research analyses how the media and the public framed the girl's profane statement, whether they focussed on the content or style of the speech. Framing refers to making an aspect of an issue salient. This research discusses how the media and the commenters discursively sanctioned the high schooler's incivility and how they echoed the profane expressions in their own discourses. The articles about the event published on Hungary's six most visited new sites are examined in the six weeks following the event, and all the comments under the Facebook posts corresponding to the articles. This research aims to explore the relationship between political communication and incivility by analysing an actual debate over what is acceptable.

Narratives of Nostalgia and Crisis in the Swedish far-right

Josefine Landberg

Lund University, Sweden

Recently, we have seen an upsurge in populist far-right, anti-gender and ethnonationalist movements across the world. Such movements have often been studied and linked to various sorts of crises. In particular, the strongly emotive narratives of how crisis is discursively constructed have been claimed key for understanding their success (Mouffe, 1995). It has also been emphasized how the far-right draw on nostalgia within their political narratives, and how such narratives are particularly effective in times of crisis and abrupt social change.

Drawing on a critical discourse analytical approach based on a wide range of material consisting of newspaper articles, political speeches, statements and campaign videos, this paper examines the role of nostalgia within Swedish public debates. The paper argues that far from unique for the far-right, Swedish public debate is at large characterized by a widespread nostalgia and melancholia over the Social Democratic "People´s home". More specifically, it analyses how this widespread nostalgia plays an essential role for how the Sweden Democrats are able to construct a narrative of "Sweden in crisis".

In dialogue with critical and cultural theory, it furthermore engages with a critical discussion on the concept of nostalgia and its application within research on right-wing populism. Using the case of the Sweden Democrats, it argues that the "politics of nostalgia" of the populist right is not sufficiently captured by primarily relying on the concept of nostalgia. In order to understand the influence and implications of their politics for growing xenophobia, homophobia and anti-feminism, it must be analyzed in combination with other emotions such as ressentiment and hate in order to accurately capture the political implications of their emotive narratives.

The Politics of Grief, Shame and Risk in the English Lockdown

Jo Warner

University Of Kent, UK

This paper reports on empirical work on the role of British Members of Parliament (MPs) in events leading up to the end to the Covid-19 lockdown in England in 2020. Drawing on Lupton's theory of the 'emotion-risk assemblage', the research involved the documentary analysis of written exchanges between MPs and their constituents concerning the breach of lockdown rules by the British Prime Minister's Chief Advisor, Dominic Cummings. The analysis shows how risk and emotion were mutually constitutive in a rapidly shifting political context. Emotion is defined as highly relational, contextual, and collective, and risk is viewed as constructed via sociocultural processes.

Correspondence from constituents to their local MPs was noteworthy for its high volume and profound emotional intensity, particularly by reference to the level of suffering people had experienced during the lockdown. Dominant emotions were grief and anger but also an emerging sense of shame and regret at their own adherence to the lockdown rules. Specifically, the maintenance of social distance in the expression of love and grief was experienced as shameful. Responses from MPs are categorised into three discrete groups according to how they empathised or engaged with these emotions. Crucially, these responses also hold concomitant risk positions – implicitly or explicitly – particularly on the likely impact of the Cummings' case on future adherence to public health messaging. More broadly, contradictions within both imagined and real positions on nationhood, the secure state and the role of personal sacrifice and collective remembrance of the dead are thrown into sharp relief.

Collective Emotions Mismatched. Dogmatized Meritocracy and the Political Failure of the Liberal Camp in Poland

Tomasz Rawski

Faculty of Sociology, University of Warsaw, Poland

This contribution uncovers one of the main reasons for the political failure of the liberal camp in Poland using the examples of two key 2015 election campaigns: the presidential campaign and the parliamentary campaign.

I argue that the liberal camp lost power to the conservative right because their political narrative for the 2015 elections completely – and very unfortunately – mismatched with the complex nexus of intense collective emotions: primarily a sense of frustration, humiliation, and disillusionment with the results of neoliberal economic policies in post-1989 Poland, which culminated in the emergence of new social expectations towards the role of a politician in a democratic society. To be precise, the liberal camp lost because it held on to a dogmatized meritocratic narrative rooted in a technocratic vision of an extremely individualistic society, where the politician plays the role of a manager, while the collective emotions of the time translated into a strong expectation of a return to politics as a process of (re)building the common good in which the politician would be the main person taking responsibility for it.

In my contribution I show how exactly this failure happened by analyzing public statements made in the 2015 campaigns by the main representatives of the liberal camp, including Bronisław Komorowski (the presidential candidate) and Ewa Kopacz (chairwomen of the Civic Platform, the then 'party of power'), which together form a picture of what Michael J. Sandel called "the tyranny of merit".

Politics and Affectivity Between Families of ABC Metalworkers

Maria Silva

Instituto Universitário de Lisboa (Iscte). Centro de Investigação e Estudos de Sociologia (CIES-IUL). Lisbon, Portugal.

The family can be the "starting point" for the acquisition of values, norms, attitudes and political behaviour. Looking at the importance of family in this process brings us to the transgenerational approach, implying a diachronic view of political phenomena, since it is in the family that the first symbols, the first points of reference, and the first ideological orientations, are fixed.

Based on the research "Ferrazópolis: a neighbourhood, two generations and politics (2017)", in this presentation we will address the place of affections in the constitution of political positions of different family generations. The research was developed combining qualitative and quantitative methodology and had as locus a neighbourhood of working-class tradition, in which citizens are protagonists of an important episode in the history of workers in Brazil, the "ABC Strikes". This movement gave rise to the Workers' Party and the political leadership of former President Lula da Silva. We address the processes of intergenerational transmission of politics between two generations, the "peons of the ABC" and their children, in a moment of political and institutional crisis and depreciation of the image of the Workers' Party. The results showed the existence of different types of political transmission in the family environment, related to the type of understanding and political action of the parents. But it also revealed the existence of contradictory feelings and distance between the political position of parents and children, and showed that discouragement, resentment, and distrust, are part of the relationship of both generations with politics.

Commitment as a Mood: Women's Rights Movements in early 20th Century Istanbul

Demet Gulcicek

University of Warwick & Munzur University, United Kingdom & Turkey

Discussions on emotion and affect are increasingly referred to as the 'affective turn'. However, some scholars are hesitant to use the term 'affective turn' emphasising that investigations of emotion and affect in sociological research is not new. To illustrate, feminist sociological research has thought about these concepts actively especially through the claim 'personal is political'. In a way, feminist research itself, or at least certain kinds of feminist research, can be considered as an affective turn (Cvetkovich, 2012). Having said that, the current interest in emotions and affects, as objects of analysis, has opened the possibilities for new engagements with critically understanding social and political norms (Pedwell, 2012). To illustrate, Sara Ahmed (2014), invites to think about 'mood' inspired by Heidegger's concept of 'attunement'. In her definition, a mood is an affective lens that allows us to focus closely on some issues. Building upon this framework, this presentation conceptualises 'commitment' as a political mood, an affective lens, a dedication for a greater cause, not as a 'side effect' of social and political events. Based on an archival research and feminist genealogy, it argues that analysing the political commitment of the past, in the case of my research the commitment of women's movements in early 20th century Istanbul, is not simply about the past, but it allows to rethink today's political commitments. As a case study, this presentation focuses on a Turkish women's rights magazine, Kadınlar Dünyası (Women's World), published in 1913, engaged with modernisation and nationalism debates while demanding women's rights.

Public Narrative, Social Identity and Agentic-based Leadership

Emilia Aiello, Marshall Ganz

Harvard Kennedy School, United States of America

Extensive literature has argued for a more relational approach in the study of leadership, which moves from a leader-centric perspective, towards leadership as a process of social influence. Such approach involves the creation, coordination and control of a shared sense of 'Us' to achieve shared goals. Several works have explored the nuances of a social identity approach and its implications for successful leadership. However, less have been said on how this type of leadership can be learnt on the practice. In dialogue with this literature, this communication presents the "public narrative" framework for public leadership. We unpack the framework and discuss how by means of crafting and aligning the "story of self", with the "story of us", and with the "story of now", an agentic-based leadership grounded on a shared identity can be shaped and pursued. We argue that two are the elements that allow this. First, grounding itself into the narrative capacity of individuals, which enable accessing emotional resources, and through them, accessing shared values with others. Second, its pedagogy, rooted in an on-going process of learning that is itself relational, experiential and reflexive. We present empirical data derived from the Narratives4Change project (H2020, Nr. 841355), which studied how public narrative was used within different domains and contexts, as well as the impacts achieved. We illustrate how public narrative enhances an agentic-based leadership, providing a framework for the leadership practice which can be adapted to diverse geographic and cultural contexts, and areas of action.

Shiny Happy People Laughing: the Croatian Anti-Gender Movement's Mobilization of Emotions

Maja Gergorić[1], Ivan Tranfić[2]

[1]University of Zagreb, Croatia; [2]Scuola Normale Superiore, Florence

The wave of resistance to gender equality, LGBTQ+ rights and women's sexual and reproductive health has taken on the new form of an anti-gender movement. This paper is an analysis of the visual, performative and emotional mobilization of the March for Life as the most prominent campaign of the Croatian religious far-right movement which opposes the right to abortion.

In our paper we use a combination of visual and multimodal discourse analysis and frame analysis. Firstly, we employ multimodal qualitative analysis using the NVIVO software on 600 posts from the online Facebook page ´March for Life - Zagreb´ to investigate how visuals and text are used to portray and represent different actors, figures and symbols. Secondly, we extract several representative and salient visuals produced by the movement for an in-depth analysis of the symbolic, rhetorical and connotative meanings and framing strategies. Finally, we analyze the kinaesthetic and symbolic aspects and dynamics of the 2019 March for Life: music, protest signs, its route, organization and artefacts used by the participants.

With our paper we demonstrate that the movement's relative success is a consequence of a skillful mobilization and manipulation of emotions. The movement engages in mirroring repertoires of action traditionally belonging to the new social movements. Our analysis demonstrates that the innovation of this movement is not only located in the adoption of the scientific and human rights discourse, as argued by existing research, but also by a skillful cooptation of identity politics and focus on emotions, self-expression and construction of a positive, active and participatory political identity.

Climate Change and COVID 19: Local Responses to Global Phenomena

Gabor Sarlos

University of Roehampton, United Kingdom

This research focuses on understanding how young people in various cities around the world perceive interaction between climate change and COVID-19 by investigating issues awareness of urban youth in three cities: London, UK; Ho Chi Minh City, Vietnam and Budapest, Hungary. The research identifies patterns of perceptions, attitudes and behaviours of young people towards these phenomena. Two focus groups each have been organised in the three cities: one involving business students, and the other one with communication students. The research allows a more thorough understanding of individual and community attitudes and behaviours towards these important issues.

Findings of IPCC stated that human activities over the past 50 years have warmed our planet in a significant manner (IPCC, 2014). This was further confirmed by the next report proposing setting 1,5 degrees as the level for keeping climate change at control (IPCC, 2018). Public opinion agrees that 'the balance of evidence suggests that there is a discernible human influence on the global climate' (Houghton et al.1996: 5). Climate change hazards together with a range of logistical and operational issues make cities especially vulnerable (Tanner et al, 2009). The current situation raises the notion to what extent are these widely accepted perceptions also valid for the pandemic.

Findings of the research perceives the issues of climate change and COVID-19 as contemporary social constructs, where the attitudes of young people are strongly influenced by prevailing social structures, individual expectations and communication patterns. Complexity of perceptions include climate change and COVID-19 attitudes, perceptions of the responsibility of the individual, media representation of critical global issues, and acceptance and participation in prevailing communication patterns.

The Climate Catastrophists Facing The Covid-19 Crisis

Alexandre Pollien

FORS c/o University of Lausanne, Switzerland

The climate change issue is challenged by a crucial question: does the catastrophism nudge us to act or does it, on the contrary, incite to stop efforts and accept the future as inevitable? Some surveys already described people believing in collapse, showing that they are less involved in activities for the protection of the environment. But the events of 2020 make it possible to measure attitudes grappling with an actual and current crisis. From February to May 2020, the MOSAiCH survey was conducted in Switzerland. Including the ISSP module on the environment, the sanitary events led us to add questions about Covid-19 pandemic. The simultaneity of these two threats, with different temporalities, a current crisis and a future crisis, makes it possible to measure the relation of attitudes towards these two events. We are looking at the attitude believing in collapse facing the Covid-19 crisis. Proponents of collapse differ from those concerned with climate change on several dimensions. First, they have adapted less well to the Covid-19 crisis. Second, they show less confidence in the institutions to solve the Covid-19 pandemic. Finally, they are less compliant with civil restrictions. This picture will be refined.

Zoonotic Crises and Climate Change Mitigation: Croatian Scientists' Narratives on Societal Futures

Marija Brajdić Vuković[1,] Jelena Puđak[2]

[1]Institute for Social Research Zagreb, Croatia; [2]Institute of Social Sciences 'Ivo Pilar', Croatia

This paper deals with narratives and constructions of societal futures related to the climate change and Covid-19 pandemic crises as described and imagined by Croatian scientists of different disciplinary backgrounds. By societal futures we perceive futures of societies in general but also futures of science and technology specifically. Our framework is in the domain of sociology of expectations, which is in social studies of science often seen as a key element of understanding of scientific and technological change. In turn, scientific and technological change is a key factor in future development of society's

relationship toward climate change and zoonotic diseases. As Borup et al. (2006) argue, the main reason for this is because expectations frequently serve to bridge or mediate across different boundaries and otherwise distinct (though overlapping) dimensions and levels, they link technical and social issues, because expectations and visions refer to images of the future, where technical and social aspects are tightly intertwined. Also, expectations constitute 'the missing link' between the inner and outer worlds of techno-scientific knowledge communities and fields. This paper analyses data from the interviews with 12 Croatian scientists whose main research interest is related to climate change mitigation/adaptation or to zoonotic diseases. Main topic of the interview was their perception of science and technology in the times of crises, with the significant part of the interview dedicated to the futures, societal and science and technology expectations. Based on their narratives, and in connection with their disciplinary - cognitive backgrounds, we discuss the potential of the experiences with the pandemic crisis for the future of science and technology in the context of climate change mitigation.

Achieving wellbeing through sustainable living? Lessons from the Covid-19 pandemic in Norway and Switzerland.

Orlane Moynat[1], Johannes Volden[2], Marlyne Sahakian[1]

[1]University of Geneva, Switzerland; [2]University of Oslo, Centre for Development and the Environment, Norway

Across the world, measures to combat the Covid-19 pandemic restricted people's daily lives. While these restrictions were seen by some as violating personal freedom, others have framed the pandemic as an opportunity to rethink everyday practices and their implications for environmental sustainability and human wellbeing. Our study investigates how the lockdown following the first wave of the pandemic affected sustainability and wellbeing in two European cities: Oslo and Geneva. Based on in-depth interviews with 48 households, we draw on social practice theories to understand how different (un)sustainable practices affected wellbeing in this context. We introduce two normative aims captured in the notion of 'sustainable wellbeing' (Gough, 2018): we uncover how disruptions in everyday life led to changes in the fulfilment of fundamental human needs (Max-Neef, 1991), and discuss the implications of this for the sustainable

consumption agenda. While our findings support the hypothesis that leading more sustainable lifestyles can enhance wellbeing, we note that the same can be true for certain unsustainable practices as well. We therefore argue that appropriate infrastructures must be in place to facilitate sustainable practices for a 'wellbeing dividend' (Jackson, 2008) to be realised. Locating 'sustainability' at the intersection between changing practices, needs, and wellbeing, we argue that the pandemic can be construed as a window of opportunity to address the potential for sustainable transformation of everyday practices. Finally, we point to some potential (policy) pathways towards this end, while keeping in mind the potentially distinctive effects of imposed limits versus limits voluntarily embraced by people.

Could Covid-19 Pandemic Foster Ecological Transition in Mountain Tourist Areas?

Anaïs Degache, Cécilia Claeys

Aix Marseille Univ, LPED, Marseille, France

Since the earlier 2000s, the increasing irregularity of snow cover due to climate change has accelerated the rate of closure of Alpine ski resorts (Metral, 2020), in particular in the French Southern Alps (GREC-Sud-2018). Thus, the Covid-19 pandemic is occurring at a time when the "white gold" economy was already running out of steam. Is the COVID-19 context therefore a foretaste of the change that will sooner or later be imposed on mountain tourism areas? The debates on the 'next world' for ski resorts tend to oppose a vision calling for a rapid return to a pre-pandemic world and another advocating the implementation of 'ecological transition' due to unsustainable tourism practices (Girard, Schéou, 2020).
Beyond the media debates, is the pandemic a constraint or an opportunity for the population and visitors of mountain areas? On the field, keeping the ski lifts at a standstill has led to other winter mountain recreational practices, especially "slow sports" (Lebreton et al., 2020). If, as Jacques Theys (2017) suggests, transition is the passage through a period of instability that defines a desirable future, what future do the population and visitors of mountain areas desire?
The corpus of data consists of a qualitative analysis of the discourse circulating in the digital public space and a quantitative section based on a questionnaire survey of more than 500 inhabitants or visitors to the Southern Alps. This questionnaire asks the stakeholders about their recreational practices in the mountain's areas in the face of the COVID-19 health crisis.

1285

Agenda 2030 within Portuguese Speaking Countries in a pandemic context: The perspective of Environmental Education and Sustainability Experts

João Guerra, Luísa Schmidt, Leonor Prata

University of Lisbon - Institute of Social Sciences

The political, historical and cultural ties between the member countries of the CPLP (Community of Portuguese Speaking Countries) are well known. Less well known will be the difficulties and potential shared in international cooperation in the context of the 2030 Agenda. Thus, in 2017, a pioneering study was developed, whose objective was to map and create a diagnosis of Environmental Education and the respective Legislation in force in these countries.
The EA2CPLP survey implemented in 2020 complements and streamlines a first edition (2017), now considering the context marked by the implementation of Agenda 2030 and the impacts and concerns regarding the COVID-19 pandemic. So, based on previous results that had already shown that Portuguese-speaking countries were at different times (levels) in the process of promoting Environmental Education and Sustainability, the questionnaire was divided into three main sections:
1)   Contexts and approaches to Environmental Education in CPLP countries.
2)   Place and role of children and youth in the field of Environmental Education.
3)   Coronavirus pandemic environment, in the context of Agenda 2030 and its repercussions of Environmental Education.
In the presentation proposed here, we will address the transversality of Environmental Education and Sustainable Development and the perceived impact of the current health crisis, which is worsening over the climate crisis. The result is a growing, and undeniable heightening of socioeconomic issues in these countries (particularly in the poorest, but not only), witnessed here by some expert stakeholders in Environmental Education and the promotion of Sustainability.

No Country for Old Men. Assessing Socio-spatial Relationships Between Air Quality Perceptions and PM 2.5 Exposures in Southern Chile

Àlex Boso[1], Álvaro Hofflinger[1], Boris Álvarez[1], Marcelo Somos[1], Aner Martínez[1], Christian Oltra[2]

[1]Universidad de la Frontera, Chile; [2]Universidad de la Frontera, Chile

Air pollution exposure is associated with adverse health consequences. However, our understanding of the relationships between exposures, public perceptions of air quality, and concerns about its associated health risks remains incomplete. We exanimated 586 individual responses to air quality awareness surveys administrated between in Temuco and Padre las Casas, two of the most polluted cities of the Latin American region. We first examine the spatial distribution of PM2.5 exposures and air quality perceptions and subsequently explore relationships between socio-demographic characteristics, air pollution exposures, and health concerns. We found evident spatial patterns of dispersion, with some neighborhoods more polluted than others. Our statistical results showed that age and percentage of roofs in poor condition in the participant's census tract are the best predictors of PM2.5 exposures. We found no correlation between perceived and actual levels of contamination. On the contrary, our multivariate analysis indicated that personal perceptions of air quality and air pollution health risk are significantly associated with gender, age, family structure, and heating behaviors. Such detailed depictions provide insights into potential meaningful strategies to improve air quality and highlight the need to incorporate measures to protect better elderly.

1286

The Climate Change Dilemma: How Cooperation Beliefs Influence Energy Conservation Behavior

Christiane Lübke

University of Duisburg-Essen, Germany

Despite widespread belief in anthropogenic climate change and high levels of concern about its consequences, behavioral changes necessary to address climate change adequately appear difficult to achieve. One important but under-investigated factor discouraging pro-environmental behavior is often assumed to be the widespread disbelief in others' willingness to engage in climate change actions (cooperation beliefs). Accordingly, people refrain from taking action because they believe others will not cooperate and thus fear being exploited by others who will not contribute but profit from successful climate change mitigation. This "worries about free-rider effect" has been demonstrated in studies using group discussions or field experiments. There are, however, hardly any studies using large-scale representative data on that issue.

This paper examines cooperation beliefs and their impact on individuals' energy conservation behavior to address this gap. Using data from the European Social Survey (Round 8, 2016/17), it is first explored how likely Europeans think it is that others will participate in climate change mitigation. Second, the behavioral consequences of individuals' beliefs in others' willingness to take actions to mitigate climate change are examined. It is thereby focused on curtailment and efficiency behavior as two important forms of energy conservation. It appeared that cooperation beliefs are rather low in Europe and that most people do not expect others to limit their energy use to help mitigate climate change. This low degree of cooperation beliefs contrasts with the generally high level of energy conservation in most European countries. This trust gap has important implications for pro-environmental behavior as this study further confirms that beliefs in others' pro-environmental behavior fosters individuals' attempts to save energy.

Pro-environmental Behaviour in Selected European Countries. A Cross-country Study Explaining Levels of PEB

Jacek Bieliński, Katarzyna Iwińska, Magdalena Kraszewska

Collegium Civitas, Poland

Pro-Environmental Behaviour (PEB) is defined as an effort undertaken by individuals to minimise their environmental impact (Stern, 2000; Chen et al., 2017). Previous studies used statistical models to explain the factors contributing to PEB mainly in the field of environmental psychology (e.g. Hines et al., 1987; Kollmuss and Agyeman, 2002; Bamberg and Möser, 2007; Heimlich and Ardoin, 2008). The lack of interdisciplinary analysis in explaining PEB has been recognized (Blankenberg and Harm 2019).

The study aims to explain PEB (operationalised in terms of daily habits) by a set of individual-level and country-level predictors. Based on a cross-country survey conducted in Poland, Greece, Sweden, Portugal, and the UK (CAWI, N = 2500), we analyse PEB levels via hierarchical linear models and discuss the results in the perspective of the countries' socio-economic and cultural properties.

Apart from respondents' socio-demographic characteristics, several correlates of PEB were studied including attitudes toward environment, environmental awareness, media use, and values. As the PEB level varies across all five countries, environmental awareness, as well as biospheric and egoistic values have the strongest impact on pro-environmental daily habits.

1287

Spatial models for exploring differences in perceptions for Protected Areas across Europe

Chrysovalantis Malesios, Nikoleta Jones

Agricultural University of Athens, Greece

The Designation of Protected Areas (PAs) is the most important policy internationally for the protection of biodiversity. In international level, approximately 15.4% of terrestrial and inland water areas and 10% of coastal waters consists of PAs. The importance of protected areas as a biodiversity conservation strategy is expected to be further strengthened in the immediate future. However, conservation policies will also need to consider issues of social justice, especially for local communities living near protected natural resources. There are certain challenges regarding the measurement of social impacts, relating to the establishment of PAs that remain under-explored. Due to the subjective nature of such measurements, differences are expected between individuals' perceptions, making the interpretation of these impacts harder when compared to environmental or economic indicators. This paper aims to propose a unified methodology scheme that aims to explore the differentiation of social impacts of PAs between communities and to propose ways to forecast how social impacts change through space by utilizing and developing novel statistical modeling approaches. In doing this, we propose suitably chosen alternative stochastic models to account for the spatial nature of environmental data of this type (e.g. spatial regression-type models, CAR models), which are mostly appropriate for spatially correlated data.

Assessing The Integration Of The Social Approach Into Flood Risk Management Plans In Spain

Angela Olcina-Sala[1], Guadalupe Ortiz2, Pablo Aznar-Crespo2

[1]Sciences Po Paris; 2Universidad de Alicante

Academic research on flood risk has highlighted in recent decades the need to integrate the social dimension and participatory processes into management models in order to overcome the weaknesses of the dominant technocratic approach. Within this framework, this paper aims to understand the extent to which a transition is taking place towards new forms of public management that are more open to non-structural solutions. In this sense, we analysed Flood Risk Management Plans (FRMP) in Spain in order to evaluate how they integrate attention to the social dimension and public participation. For this purpose, we carried out a qualitative documentary content analysis of fourteen FRMPs employing deductive and inductive coding. This coding process has been developed following the Social Capacity Building and Participation Assessment in Flood Risk Management models. The results reveal a weak inclusion of social measures as well as a low quality of participatory processes. There is an evident absence of a strong willingness on the part of the administration to deepen and improve social capacities to enhance the adaptive response of the population so as they can proactively cope with flood disaster risk. Consequently, this research argues that flood risk management in Spain continues to reproduce the characteristics of the technocratic paradigm without attending to the demands arising from the theoretical and academic spheres towards new models of integrated management.

1288

Extreme Weather Events in the UK Elevate Climate Change Belief but not Pro-Environmental Behaviour

Tobias Rüttenauer

University of Oxford, United Kingdom

The exposure to extreme weather events has been linked to higher belief in climate change and the likelihood of engaging in pro-environmental behaviour. Supposedly, personal exposure reduces the subjectively perceived spatial and temporal distance to climate events, and thus increases the belief in climate change and environmentally friendly behaviour.

This study exploits the variation in temporal and spatial distance to floods and periods of extreme temperature, and estimate the effect of personal experience on climate change belief and self-reported pro-environmental behaviour. Therefore, I connect individual-level panel data of up to 120,852 observations from 67,547 individuals to floods across England and heatwaves across the UK between 2008 and 2020. I control for large-scale spatial patterns and pre-existing differences between affected and non-affected individuals using person-fixed effects estimators.

Results reveal that individuals are more likely to believe in climate change when they are affected by floods or heatwaves, and the effect is stronger for spatially and temporally proximate events. However, this does not translate into more pro-environmental behaviour: results provide only slightest evidence for a positive overall change in behaviour. Still, people differ in their reaction to extreme weather events. While the effect on climate change belief is mainly driven by individuals with initially low trust-levels, only respondents with a high level of general trust show some signs of positive behavioural reactions to extreme weather events.

Extreme Weather Events and Resilience in Small Municipalities in the Wielkopolska Province (Poland).

Adam Choryński[1], Agnieszka Jeran[2], Piotr Matczak[2]

[1]Institute for Agricultural and Forest Environment, Polish Academy of Sciences, Poland; [2]Faculty of Sociology, Adam Mickiewicz University in Poznań, Poland

Increasing number of extreme weather events (EWE) poses a challenge for communities and agencies responsible for responding to risks. While large cities get attention due to significant exposure, there is a research gap concerning resilience in small communities, where losses are smaller compared with large cities but sever for a community.

This study explores challenges in building resilience in small municipalities endangered by EWE. Three types of resilience understood as a feature of every system were distinguished: (A) resistance – ability of a system to survive unchanged, (B) recovery – capacity to absorb and retain essential functions, structure, identity, (C) creativity – ability to adjust to external drivers.

40 local key-informers in eight small municipalities in the Wielkopolska province (Poland) were interviewed. They provided information about the means used to cope with EWE. Moreover, data on extreme weather events from meteorological stations localized in the municipalities were collected. These data consist of information on extreme rainfall since 1961.

The municipalities experienced EWE, i.e. in the years 2010-2016 the State Fire Brigades have intervened due to extremes more than 18 thousand times in the Wielkopolska province only. The factors triggering creative resilience have been identified. Notably, a specific type of innovative action appeared in the municipalities that were strongly affected by extremes. These municipalities focused more on structural (hard) innovations. The municipalities less affected by EWE concentrated on "soft" measures related to organization of the local risk management system, its functioning and legal framework.

1289

Social Impact Assessment for the Systematic Analysis and Management of Flood Disasters

Pablo Aznar-Crespo, Antonio Aledo, Guadalupe Ortiz

Department of Sociology I of the University of Alicante, Spain

In the context of climate change a significant increase in the flood risk is expected, which may lead to an intensification of the social impacts of disasters. Social impacts significantly affect the recovery processes of individuals, social groups, and institutions in the medium and long term. Hence, the management of such impacts throughout the disaster life cycle is essential. International institutions and frameworks for disaster risk reduction have claimed the need to generate tools for the systematic assessment and management of social impacts of floods. Recently, an innovative line of research has emerged aimed at adapting Social Impact Assessment (SIA), usually directed at the evaluation of planned interventions (programs, plans and projects), to the field of environmental disasters. In order to contribute to academic efforts in this emerging field, this work proposes an adapted SIA methodological framework for the identification, evaluation and systematic management of the social impacts of flood events. This methodological framework covers the three phases of the disaster cycle: 1) pre-event (preparedness), allowing the anticipation of potential impacts and supporting the proposal of preventive measures; 2) event (response), facilitating a strategic mobilization of resources and technical support towards previously identified critical disaster areas; and 3) post-event (recovery), evaluating the evolutionary dynamics of impacts, proposing measures to avoid their socio-territorial embedding and accelerating recovery processes. This tool is designed for strategic use by policy makers and managers responsible for flood risk management.

Spatial and Socio-psychological Factors of Environmental Risk Perception in Lithuania

Aistė Balžekienė, Audonė Telešienė, Vaidas Morkevičius

Kaunas University of Technology, Lithuania

Spatial analysis of public risk perception allows to better understand how experiential factors, local knowledge and psychological proximity to living place shape the differences in risk perception. Many studies confirm that risk perception of various environmental threats, such as floods, air and water pollution, biological hazards and others, depend on the proximity of respondents to the hazards (e.g. studies of Swapan et al., 2020; Sherpa et al., 2019; Quazim et al., 2015 among many others).

The aim of this presentation is to analyse spatial distribution of public environmental risk perception in Lithuania, to identify social- psychological factors that determine variances of risk perception across different municipalities and to contrast perception data with the objective data of environmental indicators.

Our study is based on the representative national survey of 2007 respondents, conducted during September – October, 2020 in Lithuania, including respondents from all 60 municipalities. GIS coordinates of respondents' living place were collected in the survey, that allows mapping environmental risk perceptions and spatial analysis in relation to the objective data

We will be analyzing these environmental indicators: flood risk, air quality, water pollution, forest fires, radiological pollution and related risk perceptions trends. The analysis of subjective vs. objective data on risk allows the identification of knowledge deficit of specific environmental threats and their spatial distribution.

Presentation is based on a research project "Mapping of Risk Perception in Lithuania: Spatial and Socio-psychological Dimensions" (Risk-Space), funded by Research Council of Lithuania (S-MIP-19-28).

Climate Change Resilience in Small Communities in the Nordic Countries

Nina Baron

University College Copenhagen, Denmark

Climate change is affecting the Nordic countries, and there are vulnerable geographical areas that will be particularly affected by an increasing number of devastating natural events. One of the many challenges, besides the violent and devastating events themselves, is that the areas can also be threatened with relocation if the locals are unable to cope with the rising threats of climate change – this is critical for the Nordic societies in general. The Climate Change Resilience in Small Communities in the Nordic Countries project (CliCNord) is a NordForsk funded research project running from 2021 to 2023. The project will examine how the small rural communities in selected areas understand their own situation, how they handle adverse events and build capacity, and under what circumstances they need help from the established system and civil society organizations. Many earlier projects have been focusing on risk and vulnerability in their climate change studies of smaller communities. Instead this project will use the concepts of place attachment as its theoretical point of departure. Thereby direct attention to how people are emotionally attached to a place and how this effects their climate change adaptation practices. The project will mainly draw on qualitative methods, especially with a dialogical and narrative approach.

One of the cases in CliCNord focuses on the consequences of storm surges for small Danish Islands. This case will be presented in more details and serve as a starting point for introducing and discussing the overall aims, methodologies, and theoretical approaches of CliCNord.

Disaster Research Through The Political Ecology Lens: An Environmental-justice Approach

Alexandra D'Angelo

University of Turin, Italy

The global covid-19 pandemic falls into what some scholars had previously foreseen as a potential future disaster that could overwhelm modern societies (Boin et al., 2006). Present times have produced a juxtaposition of old threats and new disasters, new risks and old vulnerabilities. That's why the present represents a great challenge for Disaster Research, a one-hundred years old discipline that combines different branches of social sciences. Two main objectives have prompted this contribution: the first is to welcome the invitation expressed by Ronald W. Perry (2006), one of the major scholars of the subject, who urged sociologists to renew and revitalize their focus on conceptual matters. For this reason, the history of the discipline will be retraced, in an attempt to identify the different currents of thought that have led to contemporary theorizations about the highly polyhedral concept of 'disaster' itself. As a contribution to the contemporary disaster debate and to a new conceptualization of disasters, the second objective is to systematize the application of the environmental justice approach to disaster studies, supporting the idea that the Political Ecology lens today represents the most appropriate approach to the understanding of disaster events. Inducted contemporary risks assume a great importance in the unequal distribution of produced socio-environmental vulnerabilities. That's why power relations embedded in the relationship between environment and society should assume an increasingly more central role within sociological disaster research. Along with the focus on power, it is hypothesized that a more-than-human approach to disasters might suggest important insights into addressing one of the most difficult aspects of conceptualizing disasters, namely their distinction into natural, environmental, technological, disruptive or slow disasters.

1291

Mobilizing For Climate Change. What Role For Foundations?

Anne Monier

Essec Business School, France

Research on climate mobilizations have examined the particularities of mobilizing for such an important, urgent and global issue as climate change (North, 2011; Nulman, 2015; Tindalll & Robinson, 2017; O'Brien, Karen & al., 2018), showing the difficulties, like finding narratives (Jerneck, 2014), addressing such a complex issue (Aykut & Dahan, 2014) or getting the politics on board (Dahan, 2014). While the first mobilizations were conducted by environmental activists, the problem seems to be tackled today by a growing number of actors in different sectors who try and mobilize to fight climate change.

Among them is the foundations world, where a new movement is emerging and developing. Indeed, in 2020 several coalitions were created in different European countries by foundations who want to contribute to fight climate change. In the UK, it was the Funders Commitment on Climate Change; in France La coalition française des fondations pour le climat; and in Spain, Fundaciones por el clima. These coalitions try and foster the creation of similar initiatives in other European countries and even worldwide.

In this paper, we will examine this new social movement that brings European foundations together to mobilize for climate change. We will analyze how they mobilize, the difficulties they face and the way they envision their role in the climate movement, hoping to play a key role in this major global issue, as intermediators between the economic, the political and the social world. This paper is based on a new beginning research I am conducting on the mobilization of philanthropic actors to fight climate change. It is based on a qualitative survey, mainly interviews, observations and document analysis.

What Makes A Global Movement? Analyzing The Conditions For Strong Participation In The Climate Strike

Thomas Laux

TU Chemnitz, Germany

The Fridays For Future movement and their global climate strikes put climate change on the political agenda worldwide and created a new generation of climate activists. The emergence of a global movement is a rare and contingent phenomenon that promises insights into the sociology of globalization and social movement research. The study consists of a qualitative comparative analysis (QCA) of 17 democratic countries from all continents to analyze the conditions for strong mobilization of the third global climate strike. The study applies different approaches from social movement research (framing, opportunity structures, resource mobilization) and aims at finding combinations of these conditions for explaining the outcome. Four mechanisms are identified, showing that trust in environmental movements, the availability of resources through international nongovernmental organizations (INGOs) and information and communication technologies (ICT), and frame resonance are sufficient for explaining strong mobilization. The results illustrate that global movements depend on several equifinal mechanisms for mobilization on the nation–state level. These findings complement the discussed features of a global movement on a global level that may be necessary but not sufficient for explaining its emergence.

1292

School Strike For The Climate! Organizational Opportunity Structures, Micro-Mobilization And Students' Participation In Fridays For Future Climate Strikes

Sebastian Koos

University of konstanz, Germany

Climate change and its detrimental ecological and social consequences are a contentious global issue, in which, political mobilization remains specifically challenging for several reasons. However, in summer 2018, 15 year old student Greta Thunberg started a weekly Friday school strike to protest against deficient climate politics. This "school strike for the climate" soon was copied by school children around the globe, eventually turning into the global "Fridays for Future" climate movement. Given the hitherto difficult mobilization in response to the climate crisis, the success of Fridays for Future is surprising. Why did school students participate in the climate strikes? To explain participation in the protest, I develop a novel perspective that focuses on the micro-organizational opportunity structures provided by schools and class context, while also accounting for students' micro-mobilization. I argue that the school and class contexts provide a unique setting for mobilization. Beyond close-knit networks of students, principals and teachers play a potentially important role in either facilitating or suppressing mobilization, generating micro-organizational opportunity structures. To empirically test the hypotheses I use data of a unique survey among more than 1000 school students, from 60 school classes, conducted in 10 schools during early 2019 in Germany and Switzerland. Using three-level hierarchical logistic regression models, I show that the perceived support by teachers and principals on class and school level increased participation, while prohibition bans do not suppress participation. School and class contexts also interact with micro-mobilization dynamics, such as the role of friendship networks, in mobilizing for school strikes.

On Conversion and Cooptation in Climate Movement: An Ethnographic Perspective

Selina Rosa Gallo-Cruz

College of the Holy Cross, United States of America

The broad range of tactics of non-violent activism are understood to operate through three general mechanisms: conversion of an opponent's understanding of an issue, persuasion that despite their understanding change would be favorable, and coercion, the mobilization of social forces to give an opponent no other choice than concession. Although the gas industry has spent a seemingly indomitable among of funding on lobbying politicians to be favorable to their cause and working against the climate movement through surreptitious alliances with trade unions, media, parallel industries, academic institutions and civic groups and, although scientists and pundits the world over have been asking us for bold action now coupled by strategies for fielding increasingly likely stages of societal and ecological collapse, many sincere and dedicated environmental activists still invest an incredible amount of limited mobilizing energy in methods of conversion. Why? In this study, I draw on in-depth ethnographic analysis of decarbonization movement to provide a typology of reasons as to why environmentalists spend so much of their efforts on a strategy that is sorely mismatched with the problems they face. I then provide a critical assessment of how this misaligned approach makes movement cooptation easier for wealthy industries primed to spend money on public relations capture of movement discourse with the explicit aim of demobilizing their opposition.

1293

The Dynamics of Climate Movement In Turkey: Dilemmas of Strategies and Networks

Dobroslawa Wiktor-Mach

Cracow University of Economics, Poland

As the international negotiations in resisting the climate change have not led to any effective solution, the role of non-governmental organizations and informal groups is increasingly relevant. In particular, the failure of the 2009 UNFCCC COP15 summit in Copenhagen marked a turning point in organizing pro-climate activities around the world. In many countries, including Turkey, many activists turned towards the concept of climate justice and began to search for cooperation with various local groups and transnational networks with various degree of success. The aim of the presentation is to show the preliminary findings from research on climate-related activism of some key organizations, informal groups and platforms in Turkey. It will explore the extent to which social movement theoretical propositions help understand the emergence and transformation of a climate movement. Drawing on 15 interviews conducted in 2020 and 2021 with Turkish activists linked to environmental organizations which formed the first Turkey Climate Network (İklim Ağı), as well as an analysis of texts produced by those actors, the presentation will focus on two aspects of the dynamics of climate action in recent years: shifting strategies (including also the use of framing and discursive tools) employed by the non-governmental actors and the changing process of networking at the local, national and transnational level. Besides, as the main part of the research was conducted during the Covid pandemic, the effects of restrictions on activism will be analyzed. Finally, challenges and dilemmas of effective activism in the climate area will be discussed.

Fighting Every Crisis in the Wake of Covid-19: The Changing Grounds for Mobilization among Friday for Future Protesters at Global Climate Strikes

Beth Gharrity Gardner[2], Michael Neuber[1]

[1]Technische Universität Berlin, Germany; [2]Humboldt-Universität zu Berlin

In upending much of what is usually taken for granted about politics in everyday life, the current pandemic is generating new puzzles for social movement scholars. The virus and restrictions on social interaction have not only increased the hurdles to in-person collective action, but also created fertile grounds for protest. To start addressing this puzzle, this study examines changes in the political engagement and political perceptions of participants at Fridays for Future (FFF) demonstrations before and after the emergence of Covid-19. We use time series data that compares a new survey of protesters at the September 2020 global climate strike in Berlin with those we collected at the pre-pandemic strikes in September and November of 2019. Drawing on social movement research, we analyze three features of protesters´ mobilization potential: their social characteristics, motivations, and perceptions of political opportunities across institutions. Findings show that younger, more politically-active FFF supporters joined the September 2020, pandemic strike. They also suggest ways in which the pandemic-mitigation efforts of political authorities had mobilizing and demobilizing effects on climate activists in Berlin, such as shifting protesters´ assessments of "traditional" political institutions. While we find some variation among age cohorts, it is particularly pronounced on items we asked concerning the pandemic. The article concludes by discussing the implications of these results for understanding broader climate justice mobilization in the wake of Covid-19.

Does Fridays For Future Movement Fit New Social Movements Theory? Qualitative Analysis Of FFF Croatia

Jelena Puđak[1], Vladimir Ivanović[2], Tijana Trako Poljak[2]

[1]Institute for social sciencies Ivo Pilar, Croatia; [2]Faculty of humanities and social sciences, University of Zagreb

Fridays for Future climate protests, which began as individual actions, soon morphed into a powerful global youth movement, with millions participating in Global Climate Strikes in 2019. This study examined the main characteristics of these protests and how they fit among new environmental social movements. We rely on the results from Wahlström et al.'s (2019) cross-national study of FFFs in 13 European countries, and our own qualitative empirical research that conducted interviews with 19 FFF Croatia organisers and participants. Our analysis revealed that, while NSMT is useful for understanding some of the FFF characteristics, it is clearly not a perfect fit. Challenging the suitability of the new social movements theory to adequately explain the FFF movement, we found many connections with 'contemporary' social movements of the 21st century. Social media use is crucial and qualitatively different; organizational structure is completely loosened; and the new generation of protesters is faced with precarious labour market. Furthermore, FFF goals combine post-materialistic (in line with NSMs) with more materialistic issues (e.g. feeling life threatening conditions, and an awareness of climate change consequences and climate change policy effects on specific local issues). Therefore, the issues encompass environmental protection and political economy, urging the transformation of both individual and social identities and socio-economic systems.

Ruled by urgency? Tense temporalities in the Climate Justice Movement.

Ewoud Vandepitte

Universiteit Antwerpen, Belgium

A sense of urgency is one of many possible drivers for climate action. But what happens when a movement gets ruled by urgency? In order to grasp the multi-faced and multi-paced climate (justice) movements, a closer look on movement temporalities in necessary. Through document analysis and twenty in-depth interviews with Belgian organizers in the Climate Movement, a tension emerged between on the one hand an urgent and fast-paced temporality and on the other a 'slowing down' approach rooted in climate justice.

Publicly dominant narratives place urgency central through slogans such as 'act now', or 'now or never'. More recent groups such as Youth for Climate and Extinction Rebellion added to this by emphasizing the concept of a climate emergency. While these group's actions and their narratives of urgency led to a short but heavy upsurge of protests in 2019, critiques soon followed.

Firstly, an emphasizes on urgency can lead to impatience and might enhance vulnerability to disappointment and resulting disengagement. Secondly, urgency-narratives can raise intra-organizational stress, limit space for reflection and reinforce interpersonal oppressions. Thirdly, a 'hierarchy of urgencies' that prioritizes climate-threats above e.g. racism or poverty stands in tense relation to attempts of connecting social movements under the meta-narrative of climate justice.

In contrast, an alternative temporality of 'slowing down' sees the climate-justice struggle 'not as a sprint but as a marathon'. Proponents state that doing it good' might be more important than 'doing it now. As such this approach invests in building multi-movement alliances aiming at profound system change through cultivating interpersonal relationships and spaces of reflection.

The Glocal Dynamics of Politicization of the New Climate Movement

Roger Soler-i-Martí, Sílvia Diaz, Mariona Ferrer-Fons

Universitat Pompeu Fabra, Spain

The paper analyzes the evolution of the politicization of the youth climate movement studying the case of a Fridays for Future (FFF) Barcelona local group and its social media discourse. From mid-2018, the unprecedented strength of the new wave of climate movement led to a sharp increase in the resonance of the movement's frame. FFF has placed at the center of the narratives on global warming the idea of emergency or the prominence of youth and their future. In contrast, the contribution to the prognostic framing has been more ambiguous, without clearly defining whether the movement is committed to a radical questioning of the social, economic and political system or just to measures more focused on mitigating global warming. Nevertheless, the monitoring of the local group of FFF Barcelona shows that, coinciding with the irruption of the coronavirus pandemic, the climate movement has accelerated its politicization process towards more radical positions. Still, its public positioning through social media reflects a negotiation between local activists' positions with the global FFF brand. The paper analyzes the evolution of the politicization of the movement through the content analysis of FFF Barcelona's Twitter and Instagram publications between 2019 and 2020. To understand the negotiation dynamics of the prognostic framing in a glocal movement, the study is complemented with the analysis of interviews with activists from the local BCN group and an analysis of Greta Thunberg's speeches in the same period.

Family of Origin and First Union Formation in Germany

Lea Kröger

Wissenschaftszentrum Berlin für Sozialforschung, Germany

Getting married, cohabiting with a partner, or being in a committed relationship are important events in the transition to adulthood. Recent studies have shown that the family of origin plays a vital role in determining the timing of marriage, for example, through the transmission of parental resources and parental values and experiences. However, the full scope of the influence of family background on union formation is not yet well understood, and little research has focused explicitly on the family influence on the timing of the first cohabitation and first living apart together (LAT) union.

In this study, I use 32 waves (1984 to 2015) from the GSOEP, including life history calendar data on union formation for about 10,000 siblings in 4,000 families. I estimate multilevel survival analytic models and use the sibling similarity in the timing of first union formation as a compound measure of family background to compare the influence of family background between the three types of unions.

The results indicate that family background and shared influences of siblings play a greater role in marriage timing than for cohabitation or LAT unions. Besides, the inclusion of observed parental characteristics moderately reduces the sibling similarity in the timing of marriage. However, this is not the case for cohabitation or LAT unions, as observed parental characteristics predict only these unions' timing but cannot explain the similarity between siblings.

1296

Choosing Between Wealth? Exploring the Trade-off Between Homeownership and Family Size in Europe

Francesca Tomatis, Tiziana Nazio

University of Turin, Italy

We investigate the interrelationship between housing tenure and fertility across European countries. We add to a growing body of literature highlighting the importance of housing for family formation and family size. In most European countries, homeownership and family formation seem closely connected. A delayed housing acquisition seems to have an impact on other subsequent life steps such as a later leaving of the parental home, postponing the first birth, and consequently reducing further parity progression (Flynn 2017a). Additionally, expensive housing markets directly compete with the long-term cost of children and with the prospective forgone earnings due to their caring needs. Finally, additional children require larger living space than what needed for a childless couple or with a single child, making parity progression a choice that could be affected by housing opportunities and costs. Our hypotheses are that (1) the housing tenure directly affects both the probability to have a first child and the propensity to have a(nother) child and (2) that the trade-off is segmented by social class, whereby households from lower background are more affected. We test these hypotheses drawing on the retrospective data gathered by SHARELIFE (waves 3 and 7) on both the family formation and the housing careers in 23 European countries. By means of multilevel panel models we analyse the possible trade-off between childbirth and homeownership. We further explore whether the intergenerational transmission of inequality that drives an unequal access to housing (Flynn 2017b) may also associate to smaller families.

The Effect of Parental Status and Child's Sex on Educational Outcomes, Testing Trivers - Willard Hypothesis.

Janne Kalevi Salminen, Hannu Lehti

University of Turku, Finland

In modern societies, education has a key mediating role for individuals' social status. Low educational attainment may lower social status and increase social exclusion. Yet, it has been shown that women have higher educational attainment compared to men. Further, boys suffer more from learning difficulties and they have a higher risk for social exclusion than girls have. Inequality between sexes can be even more pronounced between lower-status families thus parental resources influencing more boys than girls. To investigate, how parental status and resources influence sons and daughters' educational attainment, we apply a biosocial theory called Trivers-Willard (T-W) hypothesis. The T-W hypothesis states that parental investments in sons and daughters should demonstrate an asymmetrical relationship according to parental status because of sex differences in reproductive success. In the study, we apply sibling fixed-effect analysis that is based on sibling comparisons within families. The method allows us to study the educational outcomes of opposite-sex siblings within a family. Therefore, this study obtains causal estimates for the effects of parental status on sons' and daughters' educational outcomes. We investigate several educational outcomes such as school dropout, academic GPA, general secondary attainment, and tertiary enrollment and use reliable Finnish full population register data. The preliminary results show that sons with high-status parents indeed achieve higher educational outcomes compared to sons with lower-status parents. Respectively, parental social status does not influence daughters' educational outcomes. Thus, our preliminary results support the argument that the biosocial mechanism can explain boys' lower educational attainment in lower-status families.

1297

Why Women Quit? Women's Employment Decisions in Seven European Countries

Aleksandra Lipasova

Universidad Pompeu Fabra, Spain

Vast amount of research is devoted to motherhood penalty which is discrimination in hiring, salary, and leadership opportunities for working mothers relative to childless women. Female labour supply is considered to be adaptable and flexible. For a significant number of women, work is not a continuous uninterrupted status but rather an activity that can be put on hold temporarily in order to prioritize other life pursuits, such as raising a family. But large proportion of women do not return to the labour market after giving birth, go part-time or stay out of work for a long period of time. The main question of the current research is which factors influence the probability for European women employed full-time to go part-time or withdraw from paid work (i.e., become unemployed or inactive). The paper focuses on individual characteristics of women and their employment, as well as contextual factors. Analyses are conducted using the data of the first and the second waves of Generations and Gender Survey (GGS) (N=2337 childless women employed full-time during the first wave of the study). Results show that apart from transition to motherhood, the factors that influence women's participation in the labour market are traditional gender ideology and lack of state support.

From Danger To Uncertainty: COVID-19 and Changing Healthcare Practices In Households With Young Children

Christian Bröer, Gerlieke Veltkamp, Carolien Bouw, Noa Vlaar, Femke Borst, Rein de Sauvage Nolting

University of Amsterdam, Netherlands, The

Based on ongoing longitudinal research in families with young children, we investigate parents' changing everyday experiences and healthcare practices of dealing with COVID-19 policies in the Netherlands from March until June 2020. We identify four key themes developing over time. In relation to evolving Covid-19 prevention policies 1) the lockdown interrupted life and experiences of temporality. 2) Following the lockdown, risk management changed from fear to insecurities and 3) simultaneously, emotion management transitioned from solidarity to fragmentation. 4) Increasingly, pragmatic considerations allowed parents to tackle uncertainties and created room to normalize everyday life. We studied 'change' by using a novel conceptual model for temporality and found that a distinct temporalities in parents accounts. In sum, we interpret this as a shift from danger to uncertainty, induced by policy shifts and pragmatically translating those to life-world.

1298

Temporal Stories From Confinement

Pablo de-Gracia-Soriano
Complutense University of Madrid, Spain

This contribution presents an analysis of 100 stories written by different sociodemographic and geographical profiles of Spain. The stories are part of a set of personal documents (written, audio or video) collected in the author's doctoral thesis project, funded by the Ministry of Science, Innovation and Universities of the Government of Spain. These documents contribute to the understanding and primary knowledge of a specific biographical experience, such as confinement. The analysis of these documents has been carried out from an analysis of the discourse found in each story and combined with all of them, and on the other hand, a content analysis has been prepared from the codification of the different themes described in the documents. The

main results indicate to the experimentation of a turning point not previously experienced. This point is expressed through ideas such as: stopping, accelerating and pausing the rhythm of life, the restart of daily activities (mainly economic, cultural and leisure) and the transformation of personal relationships. Loneliness, uncertainty, fear, health, opportunity, work and the perception of time are some of the notions that are repeated more frequently.

Risk Consciousness and the Transformation of Intimate Life During COVID-19

Katherine Twamley, Charlotte Faircloth, Humera Iqbal

UCL, United Kingdom

Drawing on a digital ethnographic study with 38 families from across the UK, this paper discusses how social distancing measures around COVID-19 are re-shaping intimate life. We argue that COVID-19 has created a concentrated version of the 'risk society' that Beck observed in 1990s Germany, with similar effects on intimate life. There is a heightened sense of risk amongst our participants, related to the risk of the virus, and the responsibilities of individuals to respond to these risks. These risks lead individuals to turn to the perceived comfort and safety of familial relationships as an antidote to the feelings of insecurity experienced in the non-private, outdoor realm.

The study is on-going. Our main method of data collection is via multimodal diaries, collected over a period of a year (since mid-May 2020), using the mobile ethnography app Indeemo and in-depth interviews. Our findings indicate that the home, for our participants, has become a 'safe' location, where rules around social distancing are agreed and maintained. Those from outside of the home, in particular strangers 'in society', are considered with more suspicion and circumspection. Friends and other family members who are deemed 'untrustworthy' are avoided, while others are welcomed into an intimate 'bubble' of safety. These processes of inclusion and exclusion are related to perceptions of government trustworthiness, as well as that of intimate others. The paper will throw light on how perceptions of risk and risk consciousness are shaping intimate life during the time of COVID-19.

Walking back Home: Rural Migrant Workers in Urban Areas, the Pandemic and the Idea of 'Home'.

Smriti Singh

Indraprastha Institute of Information Technology, India

The idea of 'home' and 'backward yearning' among migrants has been explored in the context of displaced (refugees and asylum seekers). 'Home making' and 'emplacement' among poor families living under the constant threat of evictions has also been studied by scholars (Roy, 2017). Covid 19 global pandemic and the state enforced lockdown in India, however, has necessitated the need to reexamine the notion of home in the context of urban, poor migrant labourers. Poor migrant labourers from almost all major cities in India, in a desperate move, set off on foot, with their bag and baggage, to travel hundreds of kilometers to their 'home'. These migrants travelling with their families, in many cases small children are carrying with them loads are made up of clothes, toys, utensils, often mattresses and suitcases. These migrants treaded along national highways with little by the way of food or money, braving summer heat, police brutality, extreme uncertainty and precarity. Hundreds couldn't survive the harsh journey to even reach their destinations. The urgency and the desperation to leave the city and return to 'home' begs an examination of what constitutes 'home' for those who cannot be understood as displaced, in transition or on the move. This paper explores what dimensions does poverty and pandemic add to existing understanding of 'home'. The paper is built on insights from data collected from news media archives (videos and articles) and newspaper reports to offer a hermeneutical analysis.

1299

'Now it is About Money over Human Life.' Resistance Against COVID-19 School Re-openings Among Danish Parents

Barbara Fersch, Anna Schneider-Kamp

University of Southern Denmark, Denmark

In this paper we are focussing on a particular group among Danish parents during early stages of the COVID-19 crisis, namely parents who resisted the school re-opening after the first initial lock-down in spring 2020. In Denmark, parents of children in primary school found itself at the front line of the reopening after an early lockdown, as primary schools were among the first societal institutions to reopen. At that time this decision and its conceivable consequences were discussed amid much controversy among parents, and a day after the announcement of the school reopening a Facebook group called 'My child will not be a guinea pig for COVID-19' emerged. It soon gained many members, demonstrating the anxiety of parents and their willingness to resist the reopening plans. In this group, emotional and moralistic arguments for resisting the reopening were given based on the belief that children are the most important and most protection-worthy members of society, and thus need to be sheltered to be kept safe from infection risk. Based on the results of a qualitative study, we will discuss this groups' perception and handling of the situation with the help of Rosa (2019)'s conceptualisation of resonance vs. alienation, taking both the context of the Facebook group as an echo-chamber, and the in 2019 introduced element of welfare conditionality in the Danish school sector into account.

Evaluating Emergency Childcare Policies During the First COVID-19 Lockdown in Germany

Hannah Steinberg, Simone Schüller

German Youth Institute, Germany

Confronted with nationwide closures of schools and daycare facilities due to the COVID-19 pandemic in spring 2020, many parents in Germany suddenly had to adjust their work-care-arrangements. Only few parents with some specific constellation of systemically relevant occupations were granted access to so-called "emergency childcare" (EC). EC eligibility rules varied across federal states, which provides plausibly exogenous variation in EC accessibility and utilization to examine its causal effect on parental well-being and parenting practices. We employ a difference-in-differences design combined with instrumental variable estimation and draw on unique data from two waves of a German family panel (AID:A) that surveyed families before and after the first COVID-19 lockdown. Based on a sample of 564 parents, we find that EC could not shelter families from a considerable reduction in parental well-being. However, the provision of EC was effective in diminishing increases in harsh parenting among the EC-eligible parents. This effect of EC is more pronounced in families with children of preschool-age or younger and completely cancels out increases in harsh parenting among compliers.

Our results disentangle effects caused directly by school and daycare closures from general effects of the pandemic since among families with childcare usage we compare those with and–due to EC–without a complete disruption of external childcare provision. Thus, while decreasing parental well-being is likely a general pandemic effect rather than a specific effect of the closures, the observed increase in negative and potentially harmful parenting behavior is largely directly caused by school and daycare closures.

A Battle Over Birth – Contesting Restrictive Policies in Finnish Birth Care in the COVID-19 Pandemic

Kaisa M Kuurne, Anna Leppo

University of Helsinki, Finland

In this paper, we examine restriction policies and their contestation in Finnish birth care during the first wave of COVID-19 pandemic. In early April 2020, Finnish hospital districts restricted the presence of birth partner in hospital obstetric units to the actual birthing room. The birth partner could not participate in prenatal appointments, induction of birth, c-section or the postpartum care at the hospital. Expecting parents mobilized to battle the restrictive policies. Utilizing the concept of belonging, we ask to whom does childbirth belong to at times of risk and uncertainty: to the birth-giver, the family, or the hospital? How did different actors and institutions frame the situation? The WHO and the Finnish Government noted that the other parent (or other birth partner) should have the right to be present during all phases of childbirth despite the pandemic. Hospital districts, however, as the ones in charge of managing the risk of infection among their patients and staff, held on to the restrictions until July 2020 when they were released. The study draws on various qualitative materials, including institutional documents, birth narratives and qualitative interviews of birth-givers (N = 62) and interviews with activists, midwives and obstetricians (N = 14). The analysis examines the governing of intimate family lives during the pandemic through a thorough case study of the implemented restriction policies, their contestation and impact on experiences of childbearing that were suddenly intervened by an unexpected pandemic and the management of associated risks.

Increased Vulnerability for Families During COVID-19

Jolanta Pivoriene, Brigita Kairiene, Agata Katkoniene

Mykolas Romeris University, Lithuania

Lockdown caused by COVID-19 pandemic affected social life most of the people. International research showed that parents were rather unprepared during COVID-19 for the changes in family life. National Lithuanian research also reported that this situation affected people leisure time, work and financial situation, studies, for some families that time became rather challenging.

The goal of the presentation is to discuss research findings about changes in daily family life and increased vulnerabilities for families during COVID-19 situation. The research was implemented in the framework of Erasmus+ Strategic partnership project "DepCip - Digitised Education of Parents for Children Protection" (2019-1-TR01-KA204-077577) in the spring of 2020. Mixed methods research including survey and qualitative interview was done in five partner countries: Greece, Italy, Lithuania, Spain, Turkey. Descriptive statistics was applied for quantitative and content analysis – for qualitative data analysis. Comparative data showed that across the countries there were similarities as well as differences in changed families' life during the pandemic. Quantitative data revealed that most difficult situations in family life during the pandemic were child's disobedience, capricious; challenges in reconciliation of work and family at isolation; housekeeping/ daily routine; problems with children distance learning.

Pandemic situation brought bigger vulnerability to the families and children, however, support systems in the countries were not able to answer to new emerged needs on time. Due to changed situation families needed additional support, especially in finding new coping strategies in reconciliation work and family and ensuring children's distance learning.

Exploring The Intersectional And Intergenerational Impacts Of The Covid-19 Pandemic On Young Fathers And The Organsiations That Support Them

Linzi Ladlow, Anna Tarrant, Laura Way

University of Lincoln, United Kingdom

This presentation draws on insights from the first wave of 'Following Young Fathers Further', a qualitative longitudinal study in the UK that is intensively tracking the parenting journeys and support needs of young men who became fathers under the age of 25, over an extended four-year time frame. Drawing on multiple perspectives from young fathers and family and health services with a remit to support them, our paper explores both how young men adapted to the crisis and lockdown policies, and how different support organisations observed and sought to mitigate its positive and negative effects on low-income families. Analyses of these data reveal a varied and dynamic picture of new opportunities and constraints. For some young dads, confinement to the home produced valued space and time to bond with their child. For non-resident dads however, the lockdown became another barrier to contact as families sought to mitigate the physical and emotional risks associated with the virus. We seek to unpick the complexities of the spatialised constraints that social distancing measures engendered, as well as how the co-creation of community spaces for young fathers and their children came under threat but inspired new innovations. Advancing a small existing literature that interrogates continuity and change in fathering, we contribute timely insights about the dynamics of young fathers' lives via analysis of the immediate and medium-term impacts of the crisis on the lifecourse trajectories of these young men and their families.

Covid-19 Pandemic And Transnational Families: Challenges And Changes Of Family Displays

Irena Juozeliuniene, Ginte Martinkene

Vilnius University, Lithuania

The aim of this paper is to examine how global mobility restrictions related to Covid-19 and national policy may affect Lithuanian transnational families and cross-border practices of parenting. Building on the concept of 'family display' (Finch, 2007) the authors analyze which way parents, who leave to work abroad, convey to their underage children stay living in Lithuania that their actions constitute 'doing family things'. The paper highlights the challenges imposed by governmental policies to cross-border relations and explore new ways of family display in times of changing mobility regimes.

The authors present findings from the quota-based study (N=204) of two types of transnational families: mother-away and father-away their underage children continue living in Lithuania to introduce how displays of mothering/ fathering were performed across borders before Covid-19 pandemic, which way the relationships within 'caregiving triangle' were organized. The study was carried out in 2018 as a part of the study of migrant families financed by the Research Council of Lithuania. In their attempts to explore the challenges to cross-border family relationships posed by Covid-19 pandemic restrictions the authors carried out qualitative interviews with the members of 15 transnational families (January-February, 2021). The impacts (both negative and positive) of governmental policies on family practices were examined, namely, related to short visits and 'caregiving triangles" among others. The paper contributes to transnational family studies by expanding understanding how family display is enacted in transnational child-care arrangements in times of mobility restrictions and uncertainty.

The Corona-Crisis, Fathers' Short-Time Work and the Division of Child Care in Couples

Tabea Naujoks[1,2], Michaela Kreyenfeld[1]

[1]Hertie School, Germany; [2]Humboldt University of Berlin, Germany

Family lives have been affected by the Covid-19 pandemic in multiple ways. On the one hand, the closure of schools and daycare centers increased the caregiving responsibilities for parents. On the other hand, it abruptly changed their working patterns. One crucial labor market policy instrument to avoid layoffs in these times of crisis has been the implementation of short-time work. Germany was one of the countries which made use of this measure immediately and extensively. To some degree, the Corona-crisis, and more specifically the short-time work, may be considered an 'exogenous shock' that affected people's work patterns and the time budget available to the individuals subject to the measure. As a result, the Corona-crisis can be taken as a natural experiment in understanding how fathers' employment impacts care patterns and the division of child care tasks within the couple. In our paper, we use newly available data from IAB-HOPP to examine the relationship between short-time work and fathers' engagement in child care. IAB-HOPP is an internet survey monitored by the Institute for Employment Research. The sample has been randomly drawn from the German employment registers. IAB-HOPP consists of four survey waves, covering the period May 2020 to August 2020. As the questionnaires include retrospective information on the employment status and the gendered division of care, it allows us to investigate changes in the patterns before, during and after the COVID-19 outbreak.

A Vacuum of Regulatory Support": Risk and Family Life in the Midst of Sweden's COVID-19 Response

Kelsey Lauren Marr

Mid Sweden University, Sweden

The COVID-19 pandemic has wrought major changes for families and family life. Nascent academic literature illuminates how people's reproductive decisions during other global crises are strongly tied to concerns with political instability and health risks (Kearney and Levine 2020). In part, the risks experienced in connection with the pandemic are tied to the governmental response and policies enacted in particular national contexts. As of February 2021, Sweden has not implemented lockdowns, nor strict social distancing policies, relative to those enacted in other countries. Regulations regarding the use of facial masks extend only to use on public transportation during rush hour traffic. Schools, businesses, and public spaces remain open. Yet, the pandemic, and the associated risks are nonetheless impacting the formation of families in Sweden, as people must make decisions regarding their, and their children's, health and safety in what one participant has called "a vacuum of regulatory support" in the midst of global crisis. Through online participant observation in mammagrupper (Swedish support communities that share information and experiences about reproduction and family life) and ethnographic interviews, I explore how, within pro-natalist Sweden, COVID-19 has affected plans to have and raise children. I draw on a reproductive mobilities framework (Frohlick et. al. 2019), which builds upon the new mobilities turn (Sheller 2012) to show how interlocutors draw together personal experiences of the pandemic and risk and international pandemic discourses as they question their reproductive options/futures. This paper focuses on the role of risk, and attending uncertainty, in Sweden under the conditions of a pandemic.

1303

Flexible Working For All? How Collective Constructions At Austrian Workplaces Perpetuate Gendered Inequalities

Eva-Maria Schmidt

University of Vienna, Austria

The labor market in Austria is characterized by increasing gendered inequalities, as men continue to work full-time while women increasingly work part-time. In recent years, employers have expanded flexible working possibilities for all employees, also in leading positions and especially for those with family responsibilities.

This paper is based on a qualitative study that pursued the question as to how these extended possibilities on the labor market are legitimized and might have potential to change inequalities. We conducted six focus groups and 16 semi-structured interviews with employers (n=30) and employees (n=25) from 29 contrasting companies across Austria. An in-depth sequential analysis based on a hermeneutic approach facilitated to explore the collective notions and concepts associated with flexible work and career opportunities.

Respondents constructed part-time and flexible work as strongly connected particularly to women with (potential) family responsibilities who, at the same time, must be protected from negative consequences resulting thereof. The guiding principle involves that, consequently, women must be supported by employers through flexible working and career options, but not by their male partners that could make use of these options as well to take over childcare responsibilities. In a cultural context like Austria, flexible working opportunities thus rather perpetuate gendered inequalities than leveling it, because men's responsibilities to do childcare do not occur in the constructions and the lack thereof is not explicitly addressed or challenged.

Becoming A Father In 2020 In France: What Can Social Distancing Measures Tell Us About Fathers' Leave And Gender Equality?

Alix {Marie, Madeleine} Sponton[1,2]

[1]Sciences Po Paris - OSC, Observatoire Sociologique du Changement; [2]Ined, French Institute for Demographic Studies

Parenthood increases the gendered division of labour within couple. This process is partly linked to public policies. French remunerated paternity leave is short (11 days). International studies found that fathers taking longer leave are more involved at home. Yet, men who choose these working arrangements are assumed to be more family oriented than others. Thus, it is hard to disentangled whether the experience of a few months' leave can somehow influence men's attitudes and behaviors regarding childcare and housework.

In 2020, social distancing measures forced many French fathers with a newborn to spend longer time at home than intended. Their experience can be likened to an unexpected parental leave, especially for those temporary unemployed. Analysing their experience can help us identify future reforms for a stable social equilibrium between welfare and family.

This communication compares fathers' experience of the first three months with their baby depending on their work situation.

We draw on interviews with 29 fathers, conducted 1 to 3 months after childbirth since January 2020 during a thesis. We compare three situations: fathers who got between one and three months off (14), and fathers who used at most their paternity leave (=11 days) before returning to work, either onsite (10) or home-based (5).

Fathers' extended presence appears to have impacted their relationship with time and their attitudes towards childcare. Yet, among those not working outside the household, all men did not participate to care and housework to the same extent depending on the mothers' state of health, the presence of other family members, the fathers' work situation and their gender roles attitudes. Fathers' involvement appears greater when no other woman is available.

1304

What is the Future of the Family? Vision of Work-Family Balance in the Context of Increasing Share of Women – Professionals in Armed Forces

Vida Česnuitytė

General Jonas Žemaitis Military Academy of Lithuania

More and more women in nowadays enter armed forces as professionals. Women – military professionals go through life events like most other women: marriage, birth of children, raising children, solving of everyday problems, etc. At the same time, armed forces are attributed to so called „greedy institutions" (M. Segal) that create additional questions on work-family balance in comparison to other institutions: personal life of servants is strongly linked to career trajectory, and limited on possibilities to freely construct events in their daily lives. The research question is how women – professionals in armed forces reconcile work and family? What future of the family can be expected considering increasing number of women coming to professional service in armed forces?

The research is based on the data collected during quantitative questionnaire survey that was conducted in Lithuania, in August-September, 2020. In total 530 of women – military professions participated. Additionally, semi-structured qualitative interviews with 20 women and men – military professionals were conducted in June-July, 2020. These empirical data deepen quantitative research results.

The research results reveal that two thirds of women – military professionals did not take the paid parental leave to which they are entitled by law because they didn't want to be transferred to the temporary reserve of professional military service personnel, as it is usually applied in such cases. Sometimes they refuse to go to trainings or international missions because doesn't want to leave the family and children for long time, once duration of such events is half a year or longer.

The Predictions Of The Past And The Family Of The Future

Rosalina Pisco Costa

Universidade de Évora & CICS.NOVA, Portugal

In 1932, Aldous Huxley described the dystopia of a future society, where individuals would be conditioned genetically, biologically, and from a psychological perspective to conform peacefully to the social rules in an authoritarian state. In the "Brave New World", there is no institution such as the family; and babies are produced in laboratories where they have all their embryonic development controlled by scientists. In the 1970s, it was Alvin Toffler who described the "Future Shock". The tomorrow was perceived as the result from the convergence between transition, novelty and diversity; a revolution from an industrial society to a "super-industrial society". In the future, Toffler argued, the family will separate and disintegrate, to reappear in new and different forms. Finally, 30 years ago, Louis Roussel published a text called "The future of the Family". Based on demographic evidence and long trends, the author described "the right", "the probable" and "the scenarios of the possible". At the center of an epidemic of (un)predictable contours, this paper offers a revisit of the predictions from the past and visions for the future of the family regarding the key question of how to secure for the future a stable social equilibrium between welfare and family. By the end, the paper aims at reflecting upon the set of recent changes in family, namely the ones caused by COVID-19 pandemic and, at the same time, the power of sociology to offer a (still) current and heuristic reading about such changes.

1305

Synchronizing Childcare and Paid Work. Reinforcing or Weakening the Gendered Division of Paid and Unpaid Labor in Families with Children by Home-Based Work.

Jana Miktas

University of Vienna, Austria

Home-based work creates a specific spatiotemporal arrangement: one location serves as both the private home and the workplace. In the paper, I explore interrelations between home-based work and family practices by looking at Austrian families with young children and home-based working parents. I will examine how heterosexual couples attempt to reconcile home-based work and family life by negotiating, organizing and dividing childcare and thus divide and (un)gender paid and unpaid labor.

The analysis is based on a qualitative multi-method and multi-perspective study with 11 families in Austria. I analyzed the data by coding and mapping strategies of Grounded Theory and Situational Analysis

Parents faced various obstacles and problems (opening hours, lack of flexibility, ideological mismatch) with childcare and working at home was a way to adjust paid labor to the insufficient childcare services in Austria. However, analysis showed an ambivalent situation: While parents relied on formal childcare services as working in the co-presents of children was not an efficient mode of work, they also had to compensate lacks of childcare services by their presents and care at home. Further, the presents of parents at home shaped their overall responsibilities for care in the domestic domain. As a consequence, the division of unpaid and paid labor looked very differently in families in which solely women or both partners were working at home. In former the responsibility for the domestic domain was fully allocated to women, while in later the spatiotemporal flexibility of the home-based work nurtured an equal share of paid work and childcare. Consequently, home-based work can reinforce or weaken the gendered division of paid and unpaid labor between heterosexual parents.

COVID, Care and Conservative Welfare States - The Case of Austria and Germany

Laura Wiesböck, Barbara Rothmüller

Sigmund Freud University Vienna, Austria

Emerging evidence suggests that the regulations and restrictions due to the COVID-19 pandemic have initiated a significant reconfiguration of paid work, care and parenting. This paper draws upon this notion and provides a gendered analysis on changes in professional and private duties during the first two lockdowns in Austria and Germany.

Building up on the research project 'Intimacy, Sexuality and Solidarity in the COVID-19 pandemic' we will illustrate facets of gender-specific effects, e.g. caring responsibilities in the context of family and paid work, new requirements to fulfill several roles at a time (parent, teacher, employee and partner) or psychological stress and sorrows.

In methodological terms a mixed method approach is applied which encompasses the following data:

(1)An online survey conducted with respondents based in Austria and Germany during the first lockdown in March 2020 (N=4706)

(2) A follow-up survey during the second lockdown in November/December 2020 (N=2569)

(3) A retrospective qualitative survey comprising 15 in-depth interviews conducted in February/March 2021 with participants based in Vienna.

The results demonstrate crucial gender-inequalities in demands, pressure and stress when it comes to paid work, care and parenting. Our findings specifically reveal an intensified gendered expectation to provide psychosocial care at the workplace, thus blurring the line between the private and the professional to the disadvantage of women and non-binary people. Overall we argue that the COVID-19 pandemic provides another occasion for conservative welfare states to enforce traditional gender roles by contextualizing care-work as an unpaid female responsibility.

1306

Football and Young Immigrants - Everyday Life Interaction Norms and Roles in Three Finnish Football Teams

Kari Saari, Veronica Hellström

South-Eastern Finland University of Applied Sciences, Finland

Due to its global nature, football is commonly perceived as an effective way to integrate people with immigration background into the society. However, by far, there exists only limited number of studies in Finland on mechanisms and challenges of the integration in context of sport activities. This paper presents preliminary research findings of OFFSIDE-project. The presentation is based on the project's qualitative data (ethnographic observations and interviews) collected in three Finnish football teams of B-junior boys (ages 16 to 17) in 2020-2021. The findings of OFFSIDE-study show heterogeneous existing norms and roles that guide everyday life interaction of young people with immigration background in the teams. The aim of this paper is to describe and analyse theoretically diverse forms of inclusion and exclusion in 'front and back stages' (Goffman) of the teams as well as explore roles and representations of economic, social, cultural and symbolic capitals (Bourdieu) in the teams' activities.

Sport In The Context Of Recent Crises

Larisa Vdovichenko

Russian State University for the Humanity, Russian Federation

Sport in the context of recent crises, especially in the pandemic has become in very demand by people to maintain their social ties with the outside world and the social capital accumulated through sports in the previous decades. Transnational sports activity stimulated the development of social capital infrastructure by expanding the construction of sports facilities for holding competitions, for maintaining the good physical shape of people, for their leisure and free time, for communications with each other, and with athletes participating in competitions. A whole range of components provided the sports infrastructure: clubs and federations, facilities, volunteers, competitions, media broadcasts, budgets, etc. The economic crisis, the

pandemic had a strong impact on some components that ensure sports activity. However, it has acquired other forms and features. In my report, I will analyze these features, as well as how public opinion assesses the role of sport in recent crises and pandemics. It is important to help the sport overcome the negative consequences of the last year when its normal functioning was seriously hit. "Sport for all" affects the maintenance of physical condition, which improves the health and life expectancy of people, increases individual and collective social capital, playing an important role in the field of leisure, giving it a generally positive meaning, providing people with positive emotional support, fostering a consciousness of community, solidarity, social connectedness, and cohesion. Sport provokes changes in the collective and individual value systems and behavior patterns, creates a special atmosphere, which serves as a support for various reforms and policy implementation. My case study is based on the results of the analysis of sports activity in the pandemic and opinion polls on this topic.

Young Muslims and Sport: Italy as case-study

Fabrizio Ciocca

1307

La Sapienza University, Italy

Sport is generally considered as a tool to encourage the integration of young foreigners in diaspora land and of individuals from different ethnic communities. However, with regard to the Muslim population in non-Islamic societies, this concept poses critical issues, as emerges from various re-searches at the European level (Hargreaves 2007; Pfister 2008; Benn 2011).
In fact, for young Muslims, teachings and norms related to the Islamic religion and cultural as-pects of their background can conflict with practicing sports. As regards the Italian context, the Muslim population, about 2.5 million of which one million with Italian citizenship, sees a signifi-cant number of young people, grown up or born in the Country, who are in a position to practice sports since starting from schools.
The target of this paper is therefore to present some interesting indications concerning the atti-tudes and opinions of young Muslims towards sport came from a questionnaire and some focus groups, carried out between October and December 2020, to a sample of boys and girls of GMI, the oldest Islamic youth association in Italy.
The frame that emerges sees on one hand, the majority of interviewees to consider sport an im-portant activity that can promote social inclusion processes, on the other

hand a series of issues when they have to deal with the "sport environment", that requests to comply with specific regula-tions, to wear uniforms, to train in spaces that are not separated between genders or to forbid in several cases of being able to wear the Islamic veil (hijab), etc.

The Representation of the 'Refugee Crisis' and 'Sport' in the German Press: A Discourse Analysis of Newspapers

Enrico Michelini

TU Dortmund, Germany

The so-called 'refugee crisis' has been a highly mediatised event. Despite being considered an important engine for integration, the specific representation of sport within the media discourse on the 'refugee crisis' was never scientifically considered until now. Intending to close this research gap, this article explores the question: ''How do German newspapers represent sport in the context of the 'refugee crisis'?' To assess this query, a catalogue of 1840 articles was created, examined through discourse analysis and interpreted through Foucauldian theories. This article centres on six identified discourse strands: (1) Athletes - Concrete cases of refugees' sport career in elite sport. (2) Criminality - Sport as a setting, context or object of crimes committed on or by refugees. (3) Engagement - The sport systems' commitment in the context of the 'refugee crisis.' (4) Housing - The use of sports facilities as emergency shelters for refugees. (5) Integration - The capacity of sport to integrate refugees in German society. (6) Resources - The mobilisation of resources in sport for the 'refugee crisis.' The examination of these discourse strands shows that the theme sport is deeply embedded in the discourse on the 'refugee crisis' but not bounded to its turns. While sport has the paradoxical potential to both oppress and empower, the article focusses on the way the sport-related discourse strands support the reproduction of cultural hegemony. To discontinue its use as a palliative and as a means of biopower, sport has to display its brightest sides, which cannot be taken for granted.

San Lorenzo And Powiśle- Students' Districts In Two European Capital Cities Affected By COVID-19. Comparative Analysis

Ilaria Meli[1], Giuseppe Ricotta[1], Weronika Braun[2]

[1]La Sapienza, Italy; [2]Independent Researcher

This paper aims to present different approaches to pandemic reality encountered during the period between March 2020 and March 2021 in Rome and Warsaw. During the pandemic, typical metropolis' characteristics (Borja, Castells; Sassen) have become a critical isssue in the light of virus expansion. The effects have been suffered, in particular, by those districts usually distinguished as meeting place between city users and historical inhabitants. The chosen points of view for our analysis are the neighborhoods of San Lorenzo, in Rome, and Powiśle', in Warsaw, both vivid student- and night-life areas. As a result of this situation, their social functions had to be verified. They are facing challenges characteristic of late modernity (Giddens/Beck/Bauman). Different actors' attitudes may reflect the values and power in the production of space (Lefebvre). In Rome some bottom-up initiatives have involved local communities and changed functions of key public places in the zone, whereas in Warsaw the local institutions' and authorities' involvement prevailed. One of the goals of this paper is to understand what footprint this period had on affected communities, what conclusions can be drawn from these experiences for the future, and exploring the possibilities of alternative spatial and social constructions (Wright; Harvey).

In this paper a comparative approach using qualitative methods has been implemented. By conducting several interviews, participating in regular observations supplied by desk research in both of the cities, the authors have gained an insightful view of the local communities and authorities response to ongoing restrictions.

1308

Rethinking The Cities' Transformations After Urban Pandemics In Previous Centuries. A Possible Link With The Post-Covid-19 Era?

Varvara Toura

EHESS, Géographie-Cités, France

The paper tries to answer the question of how urban resilience policies could act as tools for cities' transformations in the post-Covid-19 era as were the urban planning policies adopted in previous centuries. The different dimensions of urban resilience force us to reflect on urban space and practices in a different way than in the past, in order to respond to the challenges arising from the health crisis.

The paper's methodology was used for my dissertation in deindustrialized cities in France, in which I proposed a framework for evaluating urban resilience policies both as measures against the consequences of deindustrialization at global level, and as tools of cities' redevelopment following the appearance of pandemics in previous centuries. The research is organized in two scales, that of the neighborhood and that of the public space. The study of urban projects at the neighborhood level revealed questions linked to urban functions, in particular those of cities' suburbs. Are working class suburbs well equipped with local shops, schools and hospitals? The scale of public space allows us to reflect on the issue of the inclusive city, which is a fundamental element of urban resilience. Are public spaces accessible to the elderly and disabled? How are they organized?

Research on urban resilience policies in deindustrialized cities in France shown that they had positive results, particularly on cities' quality of life and economic growth. It remains to be seen whether the same policies could be applied in different political and economic contexts at global level.

Transforming Cities in a (Post) Pandemic World (the Case of Moscow)

Inna Vershinina, Tatiana Martynenko, Kristina Khomyakova, Daria Dobrinskaya Lomonosov

Moscow State University, Russian Federation

The COVID-19 pandemic has caused millions of people to stay at home to prevent the spread of the virus, and noisy streets in global cities have become empty. The pandemic has contributed to the digitalization of social life and also changed the requirements for urban space. Narrow streets and other public spaces with a high urban density began to be perceived as places of potential danger. Agorophobia has begun a debate in the social sciences about post-pandemic urbanism and its main features.

Moscow is an example of the city that has shown a rapid change in housing requirements. The average square of apartments had been systematically decreasing before. In 2020 balconies and office rooms became very popular demands to the apartments because home turned into a multifunctional place. The significance of green areas and other public spaces also has raised as a result of pandemic urbanism. De-urbanization began to be discussed; however, in Moscow only few residents were ready to escape from the city because of the high level of medicine in the capital of the country.

It should be noted that despite the economic difficulties during the pandemic, the demand for real estate has increased, which is associated with the state program of preferential mortgages, which not only allowed many to buy apartments, but also supported the construction sector during this difficult time. Thus, the pandemic not only highlighted pre-existing social problems (for example, economic inequality), but also raised many new questions about transforming urban space to ensure security.

1309

Contagion speed rate as a social variable: a Spatial Durbin Model Analysis of Covid-19 in the city of Rome

Francesca Romana Lenzi

University of Rome "Foro Italico", Italy

Duration and speed seem to be indicative characteristics of all the pandemics that have occurred in human history. The protracted state of emergency, especially in economic terms, affects the social strata unfairly, increasing inequalities. The speed of the virus' spread matches with a sudden dismantling of social life, a strategic retreat to reduce the spread of contagion.

Both contribute to the erosion of shared values, to the disintegration of social cohesion, to the loss of trust in the Institutions.

This research aims to investigate the space-time dynamics of the spread of Covid-19 in the city of Rome (Italy) between October, 5th and November, 2nd (the initial phase of the so-called "second wave") starting from the detection of the infection in the 155 Urban Zones (ZU) in which the municipal territory is divided.

From a methodological point of view, the virus propagation rate is estimated with a Spatial Durbin Model (SDM), operationalized in terms of contagion speed rates variation between October, 5th and November, 2nd. The model considers the spillover effects (spatial delay of the contagion rate), the direct and indirect incidence of explanatory variables and the spinoff effects (spatial delay of explanatory variables).

The analysis classifies the spatial mechanisms of contagion, the speed of the pandemic spread, the effects of contamination between areas. In particular, the contagion speed rate can be assumed as an indicator of the speed of change in social habits, as it changes according to sociodemographic characteristics of the population living in different urban areas of the city.

Mobilizing Ethnic Diversity As a Strategy of Cosmopolitanism. Urban Governance, Culture and the Curation of Diversity.

Nuno Filipe Oliveira

ISCTE IUL, Portugal

This paper examines the interplay between discourses on diversity, urban governance and migrant agency in the frame of urban policies for accommodating cultural diversity driven by migration. Drawing from the concept of "regimes of diversity" we examine the institutional configurations and the narratives on diversity of two globalized cities. To illustrate the importance that the curation of diversity has gained in urban strategies on both sides of the Atlantic, we use the initiatives around cultural diversity that have been implemented in Lisbon and Buenos Aires. This comparison complements the excessive focus on developed cities in the western world that systematically appear as the elements of comparison in the specialized literature. Ethnographic and qualitative research was carried out in specific urban spaces where culture-led regeneration is underway. We integrate in our analysis a wide range of actors involved in urban governance, from municipal authorities, through immigrant organizations to migrant entrepreneurs to provide a complete interpretation of such mechanisms. Despite quite different migration histories and structural features, findings show that both cities pursue similar strategies of coping with migrant-driven cultural diversity implying three main dimensions: aestheticization, place marketing and "ethnic showcasing". We argue that migration cultural traits are brought into such processes through cultural mediatory mechanisms that are specific to entrepreneurial cities' models where cosmopolitan urban imaginaries are promoted. We raise some conceptual and policy related questions about new regimes of visibility and forms of social organization of cultural diversity specific to entrepreneurial models of urban governance.

1310

Analysis Of The Integrality Of Urban Policies Through The Network Approach

María José Dorado-Rubín, María José Guerrero-Mayo, Clemente Jesús Navarro-Yáñez

Universidad Pablo de Olavide, Spain

Policy integration has become a necessary tool to respond to the complexity of the problems of the urban phenomenon. It is recognized that urban problems are interrelated and that, therefore, their solution must start from the integration of the action of different areas or sectors of public policy. In this way, having overcome the consideration of urban policies in their basically spatial planning dimension, the European Union has been promoting an integrated approach, consolidating the comprehensive strategy as a method for urban development policies in the EU.

Taking as a starting point the need to adapt public policy analysis methodologies to new approaches, this communication proposes the application of the network approach to the study of intersectoral policies developed in urban policies in Spain. Through the use of specific software for network analysis, the interactions between the political measures proposed in the URBANA initiatives, developed in Spain between 2003 and 2007, are shown. From the characterization of these networks, highlighting their strengths and weaknesses, it will be possible to provide guidance, not only on the policy formulation process, but also on its own implementation. This work has been developed within the framework of the Jean Monnet Chair of Urban Policies in the European Union (EurPol) at the Center for Sociology and Local Policies - The Urban Governance Lab of the Pablo de Olavide University, a project funded by the Erasmus + program of the European Commission.

Participating In The City's Transformation: At The Interface Between Social Practices And Urban Policies

Brigitte Kukovetz, Annette Sprung, Petra Wlasak

Karl-Franzens Universität Graz, Austria

Cities worldwide are confronted with globalization, migration processes and the challenge how to actively deal with such developments. This is also the case for the city of Graz in Austria, where the percentage of inhabitants without Austrian nationality increased by ten percentage points within ten years (Stadt Graz, 2010; Stadt Graz, 2020). These changes imply a transformation of the city itself, social practices and its urban policies.

In a recent research project, we looked at the processes of how people understand and develop their agency as active citizens. A heterogenous group of women from different ethnic background took part in a so called "Living Lab" in a district in Graz, where the non-Austrian nationals make 37 % of the inhabitants (ibid). The group developed ideas for changing the district and for active participation within the city by means of photography and city walks. The research is based on theories of active citizenship and citizenship learning (e.g. Isin, 2008; Biesta, 2014).

On this basis, we want to explore forms of active urban citizenship as social practices that shape the diverse city. One aspect is to analyse how the political measures due to the Covid pandemic have affected the possibilities to engage as active citizens. We will discuss the questions which forms of active citizenship of migrants can be observed in the city of Graz, and in what way the city of Graz tries to shape the globalization process on the local level with regards to active participation.

1311

The Spectacle of Driverless Rapid Transit: The Role of Labor Politics and Sensationalism in the Automation of Metro Systems, 1981-2018

Youbin Kang, Jungmyung Kim

University of Wisconsin - Madison, United States of America

This study argues that sensationalism accounts for a larger proportion of automation, although factors such as the public/private ownership of metros mediates the effects of sensationalism. By drawing upon previous contributions of urban sociology and economic sociology, this study focuses on how sensationalism affects the diffusion of automation. We conduct an event-history analysis on an original database using a cox-proportional hazards model of the spread of driverless trains from 1981 to 2019 in 100 cities of 34 countries. Estimation results from the Cox proportional hazard model suggest that sensationalism, measured by a city's participation in global mega-events such as Olympic games and the FIFA world cup, has a positive association with the likelihood of metro automation, even after controlling for basic demographic and economic variables such as city population and country GDP. This suggests that automation is primarily driven by of the sensationalist drive behind automation of cities during mega events. While there is little evidence to support the claim that the strength of labor rights has a direct effect on automation, we also find that the effect of mega-events is substantially dampened for public operators. This implies that concerns about employment and labor rights are mediated through public governance of public services. Metro automation serves as a case study for the intertwined relationships among the global diffusion of city practices, industrial relations, and state regulatory policies. While status competition for technological prowess has been a driving force behind automation, we also find that concerns over public policy and labor rights have mediating effects, pointing to the importance of contextual variables on the implementation of technology.

"Pan tu nie stał." Socio-cultural Barriers faced by Foreigners Accessing Public Services in a Globalising City. A Case Study of Krakow.

Karolina Czerska-Shaw, Paweł Kubicki

Jagiellonian University in Krakow, Poland

A loaded expression harking back to times where long queues and opaque systems of priority were the norm in communist-era Poland, "Pan tu nie stał" symbolises norms and social interactions that are culturally-embedded, coded, and not easily deciphered by outsiders. "Ahem, this is not your place in the queue, Sir", is all the more puzzling to those who do not know the logic of the queue itself. While social norms have changed and public services have seen systemic developments, contemporary Krakow as a "globalising city" – one which has become intensively connected to a global network of influences relatively recently – is still in the process of learning to translate and adjust its public policies to its growing foreign population. The presentation reflects the outcomes of an empirical study conducted in 2020 which diagnosed the barriers faced by foreigners in accessing public services in Krakow, particularly in light of the COVID-19 pandemic, and how factors such as nationality, religion, skin colour, language abilities and gender influence the type and intensity of barriers as well as the nature of expectations. A quantitative survey (N:300) as well as in-depth interviews (N:20) were used in the study. The project seeks to fill the gap in research on globalizing cities and the growing pains they face in the context of integrating foreign populations, and further to understand where information gaps are present in public service provision, how shared information is interpreted by different groups of migrants, and what their attitudes are towards public services and institutions.

China's Belt & Road Initiative and the Changing Social Geographies of Cities

Elia Apostolopoulou[1,2]

[1]University of Cambridge, United Kingdom; [2]Harokopio University, Greece

In this presentation, I aim to show how China's Belt and Road Initiative (BRI) reconfigures social geographies in four cities (Athens, Colombo, Konza, London) that are key urban nodes of the New Silk Road. My analysis is grounded in Lefebvrian conceptions of the production of space, place and scale and, therefore, places are seen as articulated moments in complex networks of social relations, socio-spatial trajectories, histories, experiences and understandings, a large proportion of which are shaped on a scale that significantly exceeds each city's boundaries. My empirical material comes from primary research consisting on both on-the-ground and virtual ethnography, including in-depth interviews with policymakers, workers in the BRI projects, and local communities, as well as a document analysis of governmental reports and online sources. I selected these cities not only because they allow me to explore BRI's unfolding in three continents but also because in all of them the BRI is expected to profoundly remake urban space via a combination of new transport infrastructure, real estate projects and the establishment of special economic zones. By offering a relational comparison, I show how developments in four cities across the Global South and North are the products of intertwined socio-spatial processes that deeply influence the geographies of everyday life. I conclude that the BRI signals the global hegemony of infrastructure-led neoliberal urbanism engendering a new stage of revanchist and authoritarian urban development. This deepens spatial fragmentation, territorial stigmatization and social segregation intensifying inequality in all the cities explore here.

The Ghetto Beat. Music, Imagery and Segregation among Young People from Marginalized Territories

Otávio Ribeiro Raposo

University Institute of Lisbon, Portugal

The growing global interconnection has opened up new opportunities for the cultural production of young people from marginalized territories, in the face of a digital revolution that has multiplied the possibilities for them to make themselves visible. The intensification of symbolic exchanges between this youth has extended common ideas and hybridization, the result of greater awareness of the different lifestyles on the planet. This does not imply the loss of local influence. On the contrary, the increased awareness of segregation and the experiences of injustice causes them to develop particular forms of representation of the territories where they live. The term "ghetto" in his songs is an example of this ability to launch everyone towards a common place. This "transnational ghetto", in turn, expands sociability, making living in these segregated territories into a prestigious source. The "batida" rhythm is modeled on the aforementioned logic, giving young people from marginalized areas of Lisbon new local meanings and cosmopolitan "ways of doing". Known as ghetto music, it is influenced by African rhythms and electronic music, achieving success in the Portuguese and European music scene. Based on ethnographic research on this musical style on the outskirts of Lisbon, I intend to debate how young people question their experience in marginalized territories. An experience that can be understood through the representation that they make of these territories in their musical creations, when the "ghetto" is the synthesis of relationships, imaginary and affections that escape the dualist perceptions of the local / global type.

The Other Smart Cities: What Ethnographic Approaches Can Tell About Digital Workers' Discursive Production of Smart Cities

Mariana Fried, Isabel Awad, Jiska Engelbert

Erasmus University Rotterdam, The Netherlands

The widespread discourse around smartness promises that the best and most efficient way to solve urban challenges is through the integration of digital infrastructures in cities. According to recent scholarship, discourse is as central to 'smart city' developments as the data-driven technologies themselves (Engelbert, 2019; Sadowski & Bendor, 2019). Arguably, the techno-solutionist and entrepreneurial discourse promoted by tech firms and development institutions is seamlessly replicated by all kinds of citizens, spreading from global innovation centers to cities across the world. Not only are all cities seen as willing to become 'innovation complexes' and tech hubs (Zukin, 2020). City inhabitants working with smart technologies, also, have been described as persuaded and transformed into uncritical, action-oriented, isolated individuals (Irani, 2015, van Doorn, 2017). Our paper questions the determinism implied in understanding cities as reflections of the Silicon Valley-inspired smart city. We argue that research has largely overlooked the embeddedness of discourse in broader frames of meaningful human action (Blommaert and Bulcaen, 2000), and, thus, that smart city (discourse) is always subject to variation and change. We call for methodological approaches that, moving beyond the text, make other versions of the smart city visible. Paying attention to digital workers' everyday (discursive) practices is key in this respect. Tech company employees, digital startup entrepreneurs, and on-demand platform workers are locally and unequally positioned; they experience the smart city, reinterpret and reproduce it in their everyday (work) life. Their practices and views can help identify alternative, fairer, versions of the smart city imagined and imaginable.

Risk, Trust and Community: Peer-to-Peer Milk Sharing Among Exclusively Pumping Mothers in Poland.

Małgorzata Gawrońska

University of Warsaw, Poland

Breastfeeding is the recommended way of feeding infants, and when mother's own milk is not available, donor milk from a human milk bank is the second-best option. While awareness about both the health benefits of breastfeeding and human milk donation is rising among mothers, the access to human milk banks services in Poland remains limited, and so is the access to professional lactation support. In consequence, some women turn into informal practices of human milk sharing through online communities established via Facebook groups. Due to many health risks related to informal milk sharing, some international authorities (e.g. European Milk Bank Association, Human Milk Banking Association of North America) condemn this practice, however, there are no clear statements or recommendations from the Polish health authorities and no legal regulation regarding human milk sharing.

The aim of the paper is to present risk management strategies among mothers engaged in peer-to-peer milk sharing practices in Poland, based on 10 in-depth interviews conducted in 2018 with both mothers donating milk in this way and receiving it. The paper examines how the shared experiences, and the sense of community leads to trust among those mothers, and how the lack of professional lactation support and limited access to human milk banking services in Poland leads to distrust towards health care professionals. Finally, the paper discusses whether peer-to-peer milk sharing in the Polish context should be seen more as a public health threat or rather a strategy of support among women who face ineffective health care system.

Trust in Scientific Risk Assessment: the Role of Public Engagement

Leonie Dendler, Gaby-Fleur Böl

German Federal Institute for Risk Assessment, Germany

One avenue to strengthen trust in risk governance, that has been promoted by academics and policy makers alike, is to increase public engagement in scientific risk assessment. While public engagement in traditional science is fairly well studied, less is known about the effects of increasing public engagement in risk assessment conducted by so called regulatory scientific organizations. Against this context, this presentation will show empirical reactions to a potential greater participatory opening of the German Federal Institute for Risk Assessment (BfR), one of the largest regulatory scientific risk assessment organizations in Europe. Based on 40 qualitative interviews with BfR stakeholders from governmental, supra-governmental, non-governmental, corporate, academic and media organizations and a structured survey of 414 BfR stakeholders and 1004 members of the public, it identifies a general support for greater public engagement in scientific risk assessment, especially concerning consumers. Mobilizing a case study of a recent consumer conference on genome editing initiated by BfR, the presentation will also discuss challenges in acting on these findings. Drawing upon surveys and semi-structured interviews with participating citizens, professional experts, organizers and stakeholders it will illustrate difficulties in ensuring inclusive input from across society and facilitating events in a way that contesting demands emerging from deliberative prescriptions on the one and empirical practice on the other hand can appropriately balanced. Placing our findings in the context of wider developments in the field, the presentation will reflect on the institutionalization of more participatory practices and other potential paths to increase trust in regulatory scientific risk assessment.

COVID-19 Vaccine Acceptance: a 25-Countries Comparative Longitudinal Multilevel Analysis of the Role of Perceived Risks and Trust in the Acceptance of a COVID-19 Vaccine.

Mauro Martinelli, Giuseppe Veltri

Università degli Studi di Trento, Italy

Following the 2020 COVID-19 pandemic, scientists rushed to develop vaccines to protect individuals and ferry the world out of the health crisis. Unfortunately, recent research suggests that hesitancy against COVID-19 vaccines might endanger this process. In this paper we address this issue by exploring the impact of COVID-19 perceived risks on the probability to accept a Sars-CoV-2 vaccine, and how between-countries variation in perceived trust differently affect this relationship. We use data from a large-scale survey resulting from a joint effort of Facebook and the Massachusetts Institute of Technology (MIT) that collected data in 25 countries and 15 time-points in each country between June and December 2020. We use longitudinal multilevel models to estimate the impact of perceived risks on the probability to accept a COVID-19 vaccine, disentangling this relationship through time as a function of the worsening of the pandemic, and exploring how this relationship changes between countries with different average levels of trust. Preliminary results show that COVID-19 risk perception increased through time chasing the worsening of the pandemic. Still, vaccine acceptance did not, suggesting that perceived risks of vaccination could be endangering its acceptance. We account for this finding by showing that countries with a higher level of trust followed a different trend. At the intersection of heath sociology and sociology of risk, this paper contributes to the analysis on how perceived risks and trust can affect health protective measures, further contributing to vaccine hesitancy research.

A Controversial Balance between (Dis)Trust, Social Control and Public Health Empowerment? The Debate about the Italian Tracking App Immuni on Twitter

Alessia Bertolazzi, Maria Letizia Zanier

University of Macerata, Italy

The debate on self-tracking health devices can be traced back to two main perspectives: on one hand, critical approaches highlighting the bio-surveillance power connected to digital health devices and the self-disciplining effect on people; on the other hand, studies rooted in social constructionism focusing on the effect of awareness and empowerment that these technologies would trigger in individuals. A controversial balance between governmentality, (dis)trust and public health empowerment seems to be reflected in the current debate concerning the introduction of contact tracing apps, aimed at tracking contacts with SARS-CoV-2 positive subjects.

The objective of our study is to investigate public perception on Twitter regarding the Italian contact tracing app Immuni. A qualitative content analysis was performed on 1455 randomly selected tweets. The results show that the debate appears polarized around users who express support for the adoption of Immuni and users who express critiques. Tweets were classified into two categories, "supporters" (58.1%) and "sceptics" (41.9%). Subsequently, tweets for and against Immuni were reclassified into five sub-categories: a) cooperative/non-cooperative instance; b) politicization of the app; c) technical issues (which positively or negatively evaluate technical aspects of the application, e.g. on data security); d) conspiracy issues (which refer to misinformation contents). Tweets opposing the adoption of the app received more likes and retweets than tweets in favour. This difference is statistically significant with regard to the number of retweets (F = 5.26, p < .001) and the number of likes (F = 6.04, p < .001).

Even if limited to a single platform, this study can be useful to increase the understanding of the reasons, for and against, the adoption of a new instrument.

Risk Perceptions, Emotions and Decision-Making during the Coronavirus Crisis: A Field Study among Healthcare Workers

Shosh Shahrabani, Shiran Bord, Hanna Admi

The Max Stern Yezreel College, Israel

The current study was conducted during the first wave of the COVID-19 outbreak in Israel. The objective was to examine the relationships between emotions, self-risk perceptions and decision-making among healthcare workers under risky and uncertain circumstances. Healthcare workers are on the frontline of the COVID-19 epidemic. Therefore, their decision-making is important in preserving their health and that of their patients.

An online survey was conducted among 346 healthcare workers in the Israeli healthcare system who treated patients during the coronavirus crisis. The questionnaire included level of emotions, self-perceptions of risks regarding the coronavirus, constructs of the Health Belief Model and decision-making regarding their work at healthcare facilities during the pandemic.

The results show that most respondents (79%) reported complying with the Ministry of Health's behavioral guidelines. In addition, the mean of positive emotions was moderate (3.94 out of 7), while the mean of negative emotions was moderate-low (2.89 out of 7). Higher compliance with Ministry of Health guidelines was associated with greater perception of threat and higher perceived risk.

Negative emotions were positively associated both with perceived threat and with perceived risk, yet only perceived risk was positively related to decision-making among healthcare workers. Further, higher negative emotions were related to higher perceived risk, which in turn was associated with higher compliance with guidelines.

These findings point to the importance of emotions, and perceived risk as factors affecting the decision-making processes of healthcare workers. These results may help in designing intervention programs to improve decision-making in the healthcare system.

A Virus of Distrust. Existential Insecurity and Trust in Germany and the UK.

Leonie Christine Steckermeier, Jan Delhey

Otto-von-Guericke-University Magdeburg, Germany

Trust is seen as a critical resource for modern societies. Whereas social trust serves as a social glue among fellow citizens, institutional trust enhances the legitimacy of institutional actors. The importance of trust is even heightened in times of crisis, such as the coronavirus pandemic: Even more than usual, we depend on fellow citizens to behave responsible, and our lives are heavily influenced by institutional decisions made under great uncertainty. Based on the premise that existential insecurity shakes individuals' trust, this paper is interested in which way the covid-19 pandemic impairs trust. Specifically, we investigate how pandemic-induced health and economic issues relate to trust in others, the health care system, and the government. We differentiate between experiences of sickness and economic hardship (e.g., experiencing covid-19 symptoms or loss of employment) and respective worries (e.g., fear of falling ill or of being affected economically). We use high-quality online survey panel-data representative for the population 18-80 from Germany and the UK, collected in April/May 2020 (wave 1) and February/March 2021 (wave 2). The preliminary results from wave 1 suggest that economic worries undermine trust in both countries, while health-related worries strengthen trust. The effect of pandemic-related negative experiences is less consistent: they are negatively related to trust in the health care system in both countries and to trust in government in Germany, yet not to trust in others. For maintaining a cohesive society, our results particularly suggest that governments should address citizens' worries, e.g., through information campaigns and financial support.

The Urban Co-Production of Social Rights and Public Welfare

Lisa Vollmer[1], Laura Calbet i Elias[2,] Susanna Raab[1], Theresa Zanders[1], Aya Kleine[2]

[1]Bauhaus-Universität Weimar, Germany; [2]Universität Stuttgart

In recent years small, informal CSOs have gained a prominent role in governance constellations on the local level. Protest initiatives, self-help groups and coalitions of local actors are included in political decision-making processes, both because they claim to be recognized and because the local state profits from their legitimacy. Political and administrative bodies on the local scale are structurally more open to such cooperation than on higher scales. Furthermore, local institutions deliver public welfare services and are thus often the target of protest and demands.

In the paper we will present first research results from the study of three examples of negotiation processes between CSOs and local administrative bodies in Germany in three different domains of the welfare state. In the case study of housing a number of tenant initiatives prevented the privatization of an inner-city plot of land and are now cooperating with local administrations to develop a model project for affordable housing in Berlin. In the case study of healthcare a society of medical professionals and volunteers lobbied successfully for the introduction of anonymous healthcare for illegalized migrants in the state of Thuringia. In the case of food justice a civil society food policy council and a district government came together to establish food hubs to grant neighbourhood access to healthy and sustainable food. In these cooperations social rights are negotiated, the local delivery of public welfare is reshaped and the relationship between CSOs and public actors is transformed into one of co-production.

Co-production Ambivalence in Cross Sector Welfare Collaboration

Morten Frederiksen, Ane Grubb

Aalborg University, Denmark

In the public and scientific discourse on welfare innovation and new public governance, community co-production is thought to combine the best elements of the public and voluntary sectors, thereby creating better and more efficient responses to social need. However, co-production also blurs sectoral boundaries, potentially mixing incompatible practices, values, and goals. In this paper, we investigate how volunteers and public sector employees experience and handle the co-production ambivalence that results from cross-sector incompatibility. The paper is based on interviews and ethnographic fieldwork on welfare co-production among managers, employees, and volunteers in a large Danish municipality. We identify two opposing forces that result in co-production ambivalence. On the one hand, both the public and voluntary sectors perceive user needs as beyond their own capabilities in terms of creating respective public or voluntary value, leading to a state of permanent insufficiency. Co-production is perceived as a means to overcome this insufficiency, making the contributions of the other sector compelling and essential to 'completion'. On the other hand, representatives from both sectors experience their counterpart as incompetent, inefficient, or even dangerous due to incompatible goals and practices across the sectoral boundary. These opposing forces necessitate cautious collaborative strategies, in which organizations from both sectors carry out boundary work to gain the benefits of co-production without the disadvantages. However, public agencies seek to direct voluntary agencies at arm's length, while voluntary agencies seek to gain access to public resources free from direction—making these boundary work strategies fundamentally asymmetric, incompatible, and conflictive.

Future of Provision of Social Welfare: Which Role for Migrant Self-organisations?

Magda Nowicka, Sabrina Zajak

German Center for Integration and Migration Reseach DeZIM, Germany

Research on civil society and the welfare state has increasingly pointed out the relevance of civil society organization in provision of social welfare. German welfare organizations have historically played an important intermediary role between the state and society. With the demise of the corporatist model in Germany the principles of subsidiarity which privileges local civil society organizations in service delivery becomes central. This gives new powers to local civil society organizations. Research points to how these organizations have become more multifunctional and hybrid.

In our contribution we point out a significant empirical and theoretical omission in the debates on the future of the welfare model, which is the lack of engagement with migrant civil society organizations (MSO). While these organizations have been acknowledged as key actors providing support for migrants and for refugees, little is known about their structure, members, employees, collaborations, and external conditions for service provision. Our contribution is twofold: first, based on a recent qualitative and quantitative study on migrant welfare organizations in Germany, we add to our knowledge of their structural characteristics, networks, and conditions of service provision, in particular their relation to the established welfare organization. Second, we the data to argue that the new dynamics related to the arrival of many refugees in 2015 and 2016, as well as the growing strength of advocacy migrant organizations shifts the long-established power relations within the corporatist system of welfare work in Germany.

1318

Social Entrepreneurship in a Digital Economy. A Multidimensional Operationalization

Gabriel-Alexandru Toma

National School of Political and Administrative Studies, Romania

Digital technologies are both sources of economic disparities in the contemporary world and solutions to mitigate the negative consequences of social inequalities. Big data economy and platform analytics transform the market dynamics by restructuring the value chain processes, the practice of labour and the producer-consumer relationships. In this context, social entrepreneurship appears as an emerging phenomenon that blurs the traditional boundary between left-wing and right-wing ideologies by putting sustainable and validated business models in support of social justice. This paper proposes a framework to conceptualize social entrepreneurship in terms of cultural orientations, managerial strategies and political philosophies. Moreover, the discussion contains a multidimensional model to operationalize social entrepreneurship in current digital economies with reference to social, cultural and human capital. The results are based on a comparative analysis of European Union indicators to measure an aggregate potential of social innovation and economic growth.

Nonprofit Political Activities Within The Flemish Neo-corporatist Context. What Is Beyond Advocacy?

Björn Carré

University of Antwerp, Belgium

In the last two decades, nonprofit scholars have extensively examined the topic of advocacy. Although the literature is already quite comprehensive, two limitations remain: (a) an overreliance on studies conducted within a liberal nonprofit context and (b) the lack of interest in other nonprofit political activities beyond advocacy. In our research, we want to address both research gaps. First, we include public sphere effects next to advocacy as a nonprofit political activity. Second, considering both political activities, we look at their efforts, use of tactics and possible explanatory variables in a neo-corporatist context. As a particular system of interest representation, it is typified by its strong intertwinement between the government and nonprofit sector. Moreover, nonprofits are not only delivering social services but also actively taking part in the policy and design of these services in close partnership with the government (i.e. some parts of the nonprofit sector are even included in the state structure). In this context of co-optation by the state, we expect that (a) advocacy will be more important than public sphere effects, (b) nonprofits will prefer direct tactics over indirect ones and (c) neo-corporatist characteristics will be important explanatory variables (e.g. hypothesizing a positive relationship between public funding and advocacy). We want to analyze statistically whether our hypotheses can be confirmed. Therefore, we make use of a survey directed to NPO-managers (N = 496) active at the Flemish level (the northern region of Belgium) in the human well-being-, social economy- and sociocultural domain. This analysis thus allows not only to analyze if NPOs take up a political role but also whether a context of state co-optation (i.e. neo-corporatism) is of particular interest.

The Transformation Of The Italian Third Sector Between Marketization And New Politicization

Emanuele Polizzi

Università of Milano Bicocca, Italy

Throughout their history, the Italian third organizations have played different roles: innovators of approaches and repertoires of social action, advocacy actors claiming for citizens social rights, providers of social services. During the '80s and '90s, many third sector organizations have been shaped by the welfare public policies: after being acknowledged for creating or delivering goods and services that the public sector was not (or no longer) able to do by itself, they went through a process of incorporation in the welfare public programs. This shift implied a professionalization, standardization and formalization process in their organizations. In doing so, they strengthened their economic stability and their public legitimization but weakened their autonomy, their innovative potential and their political role of advocacy actors.

The economic crisis started in 2008 had a double effect on this dynamics. On the one hand, the social expenditure retrenchment of central and local

1319

governments led them to search for a less dependent relationship with public institutions and to become a private market player, also due to the third sector reform of 2016. On the other hand, some of them, particularly the less professionalized organizations, are starting to rediscover a more political attitude through the building of large advocacy coalitions, in order to influence the social policies.

Starting from the literature about civil society organizations, this paper focuses on these third sector transformations, by drawing from several case studies and tries to understand what role the Italian third sector and is going to play in the next few years.

Humanitarian Commitments, Public Initiatives, and Entrepreneurial Participation. Feedback on the Operation "Red Cross at Your Door" During the First Lockdown in France in Spring 2020

Jean-Vincent Pfirsch, Laure Hadj, Isabelle Parizot, François-Xavier Schweyer

Centre Maurice Halbwachs (CNRS-EHESS-ENS) Paris

Our field survey relates to the operation "Red Cross at your door" imagined and developed in France during the first lockdown due to the Covid 19 pandemic in the spring of 2020. We interviewed numerous Red Cross volunteers and employees in France involved in this operation, both in Paris and in other French regions. Across their statements, beyond the experiences, ideals and values widely shared within the Red Cross, different approaches and types of commitment as well as multiple visions of the nature, meaning and goals of the operation, and of the Red Cross' role itself, emerged. The survey makes it possible to identify different ways of arranging the relationships between the central "headquarters" and "local units" of the Red Cross. Through the results we obtained, as well as through the difficulties we had to face in accessing certain observations and data, the question of the articulation - varying in time and space - between the values, visions and resources present within the Red Cross had to be addressed. Last but not least, one has to consider relationships with other associations, with public authorities and - increasingly - with the world of business and the spirit of entrepreneurship. This contribution is also based on the seminar on "Humanitarian activities during the Covid 19 period" that we are leading at the EHESS in Paris.

The Social Construction of Frailty in Older Women in the COVID-19 Pandemic. Physical Exercise as a Form of Bodily and Mental Resistance

Ivana Matteucci

University of Urbino Carlo Bo, Italy

The current pandemic crisis provides us with an opportunity to reflect on frailty in the elderly, an age group that is particularly subject to this condition due to its recognized vulnerabilities. In the present work, the concept of social frailty in older women in the COVID-19 pandemic was analyzed using the theory of social constructivism.

Frailty in the elderly population is usually exacerbated through socially produced responses to the cultural discourse on surveillance and individualism. The concept of frailty used in public health and the social services represents a powerful practice in which the economic logic of cost reduction and the biomedical focus on aging are inscribed on the bodies and in the minds of older women. They resist these inscriptions by employing physical exercise to subvert the concept of frailty, to undermine the dominant notions of aging and to transgress the gender and age-based prescriptions that weigh on their bodies and identities.

The article draws on complex forms of resistance observed in two studies during the COVID-19 pandemic: narrative interviews on frailty with older women, family members and caregivers, and semi-structured interviews in community organizations hosting older women. The results reveal that powerful concepts such as frailty encompass both physical realities and socially constructed elements that can be negotiated. The older women's stories and actions show a resistance rooted in the bodies, identities and/or social places that shape experiences. Their forms of resistance invite a reflection on the concept of frailty that can be applied to the whole society.

1320

The Effect of Social Isolation on Physical Activity During the Covid-19 Pandemic in France

Alessandro Porrovecchio1, Pedro Olivares2, Philippe Masson3, Thierry Pezé1, Linda Lombi4

1Université du the Littoral Cote d'Opale, France, ULR 7369 - URePSSS - Unité de Recherche Pluridisciplinaire Sport Santé Société; 2Universidad de Huelva. Faculty of Sport Sciences; 3Université de Lille, France, ULR 7369 - URePSSS - Unité de Recherche Pluridisciplinaire Sport Santé Société; 4Università Cattolica del Sacro Cuore

This presentation focuses on the changes in physical activity's (PA) practice of a sample of French people during the lockdown. A descriptive analysis of participants was performed using relative frequencies. Chi-squared tests were performed to compare the responses of selected variables. Multinomial logistic regressions were performed to compare the variations of PA with all the variables identified.

A sample of 2099 participants was considered (81.6% females, mean age 41.1). Among people who practiced PAs before the lockdown, the probability to keep practicing PAs is higher among those with a lower level of education (1.96 times), housewives and retirees (2.94 and 2.86 times) and those who lived in small cities. For those who did not practice PAs, the probability of starting to practice is greater for those with a lower level of education (3.12) and those who suffered from a chronic disease (1.51 times).

Our results place the emphasis on the complexity and multifactoriality of the changes that emerged during the lockdown, in relation to the various profiles of respondents. In this complexity, the "education" factor emerges, as a significant determinant of PA that certainly has to be explored further.

Moving Employees Working from Home Towards a Healthy Working Day

Anne van der Put, Jornt Mandemakers, John de Wit, Tanja van der Lippe

Utrecht University, the Netherlands

Research question: Working from home has increased drastically since the outbreak of COVID-19 and is expected to remain common. At the workplace many employers offer worksite health promotion (WHP) initiatives (e.g. onsite fitness facilities) to help employees maintain a healthy lifestyle. These often cannot be used at home, calling for new initiatives. We study what factors induce employees to use different types of WHP when they work from home.

Theoretical framework: Working from home may lead to role conflict, leaving less time for physical activity. When WHP counts as working time, employees will be more likely to use it. Both colleagues (in the work sphere) and one's partner (in the home sphere) are important role models whose behaviour sets the norm, so when they join in using WHP, employees will be more likely to do so too.

Methodology: Data are currently being collected among employees in many organisations using a factorial survey design. Participants rate 6 hypothetical situations (vignettes) describing WHP at home on how likely they are to use it. Type of WHP (walking, taking short breaks, online physical activity class), duration of activity, number of days working at home, if WHP use counts as working hours, and colleague and partner joined use between vignettes. Demographics and current health status, among others, are measured in a survey. Multilevel models (as vignettes are nested within employees) will be used to analyse data.

Contribution: We show which WHP initiatives employees are willing to use at home and how to promote use of these. This informs employers how to successfully promote employee health when they remain working from home.

Keywords: working from home, physical activity, employees

Socio-economic Profile Of The Hiker In A Mountain Environment In A Spanish Region: The Case Of Valencia

Antonio Vidal-Matzanke[1], Laura Gisbert-Enrique[1], Pablo Vidal-González[2]

[1]Doctoral School. Catholic University of Valencia; [2]Faculty of Sports Sciences. Catholic University of Valencia

Depopulation is one of the most serious problems facing the European Union today. There are a large number of towns that continue to lose inhabitants every day, to the detriment of large cities, leading some of them to disappear (Granados, Rodríguez and Vilachá, 2018). Rural development depends largely on local economies being able to diversify into non-agricultural sectors. The practice of guided walking as a sport-tourism practice (Ramshaw, 2014; World Tourism Organization, 2019) can generate a positive socio-economic impact in rural areas. A qualitative methodology is used, which is necessary to gain a better understanding of social factors. A total of 16 semi-structured interviews and a discussion group of different profiles of interest (mayors, businessmen, technicians, etc.) from more than 14 different towns in the area under study were carried out. The categories or themes analysed were the socio-economic profile of the rambler, the use of heritage, company/business and company/public administration relations, sustainable attitudes and the use of social networks.

The results obtained indicate that the area in question is characterised by a very low degree of maturity, so there is a great opportunity to generate sports tourism products and services focused on walking. In addition, 4 walking profiles have been characterised which, combined with the categories analysed, can help the different stakeholders to segment the client and propose better public policies.

Nature Seekers From The City In Times Of Covid-19: Examples From La Comunitat Valenciana

Laura Gisbert-Enrique, Antonio Vidal-Matzanke, Pablo Vidal-González

Catholic University of Valencia, Spain

COVID-19 pandemic has led to a significant increase in the number of physical activity practitioners in the natural environment, especially in protected environments. This increase has triggered the appearance of a new hiking profile, essentially city-dwellers, and problems of a social nature (Jones & McGinlay, 2020; Kleinschroth & Kowarik, 2020). Currently, public authorities face the challenge of guaranteeing public health but also of minimising the impact on the natural environment (Derks et al., 2020) as the relationship between humans and nature is key to sustainability and economic recovery (European Commission, 2020).

The methodology of this study was qualitative, using a model questionnaire through which we interviewed 25 and 20 visitors from two Natural Parks in the provinces of Alicante and Valencia. In addition, we carried out an observational study of the interviewees and non-interviewees and of the state of the natural environment. The results indicate that a new walking profile has emerged. In the same way, visitors of the natural areas are concerned about the environmental impact caused by the increase in the number of people accessing these areas, particularly they notice a rise in the amount of waste and problems resulting from traffic. Nevertheless, they value very positively the fact that people have access to the natural environment, as long as its respect is guaranteed.

Dis_Empowerment through Sport or Dis_abled Killjoys

Corinna Schmechel

Ludwig-Maximilians-University Munich, Germany

This presentation bases on an ethnographic research in queer fitness culture, that was carried out between 2015 and 2018. It followed a Grounded Theory approach and a theoretical perspective informed by emotion-/affect-theory and theory of subjectivation.

Part of the subcultural and political self-building of the field as queer is the approach to be a non-normative and non-competitive space for practical empowerment through sports. The training groups that have been observed and interviewed claim themselves to be extraordinary inclusive not only for gender non-conforming and queer people but also for diverse levels of fitness and ability. Though the empirical material shows evidence that physical dis_ability is a factor that influences the potential of the empowerment through sport-approach and creates untransparent but important differences in the accessibility and experience of the training sessions and the self-empowering potential. The setting of the trainings as community-activity moreover creates a set of feeling rules (Hochschield) that make it extraordinary challenging to talk about these differences of experience and to stand out as affect alien or even killjoy (Ahmed).

It shows that gender-nonconformity and dis_ability form an intersection that extraordinarily raises the boundary for sports participation.

Coach Well-being in the Civilising Process of Modern Football in China: Aligning to the Europeanisation of football?

Ximing Fan

Loughborough University, United Kingdom

This article aims to find out how the specific 'habitus' of the football industry in China has led the figuration of Chinese football coaches to behave and exist the way they do. The existing knowledge in the sociology of sport has analysed Chinese elite football and its contribution to the country's 'soft power'. However, football development has led to social concerns due to the sudden changes in policies. One of the ignored issues is domestic football coaches' social well-being, facing unequal trust and rights compared to foreign coaches. This research article explores the process that has caused the struggle for the football coaches, and the power dynamics existing in the elite football industry from the perspective of figurational sociology. With the support of figurational sociology, this research incorporates the critical idea that modern football's Europeanisation has led a set of norms to be established in football clubs worldwide. As a highly-considered element in most European football clubs, well-being has been regulated in most clubs in Western Europe. In this sense, this research argues that China's action for not following this trend makes them not 'civilised' in the lenses of the established European clubs. Fifteen domestic football coaches in China have been interviewed and data is gathered through semi-structured interviews, as well as the available academic and policy sources on Chinese football. This research not only offers an innovative way of thinking for East Asian football, but also reveals the pessimistic reality of the modern sport.

More Public or Private? The Re-Assertion of the State in Health Policy and Its Consequences on Health System Regulation in the Italian NHS

Stefano Neri

University of Milan, Italy

In many European countries, the emergency policies adopted to tackle with the covid-19 pandemic seem to imply a renewed role for the State in health policy. However, the consequences of the State resurgence on the regulation of healthcare systems are not easily predictable.

In the highly decentralised Italian NHS, a more assertive role of the central State had already emerged over the last decade, promoting austerity policies and a substantial retrenchment of the public NHS. In 2020-21, the renewed role of the State might reverse the previous trend to privatisation and hybridisation or, quite the opposite, might intensify this longstanding process, concentrating the function of public providers on the Covid-19 treatments and attributing to the private sector a greater role in health service provision.

This paper explores this issue, by reconstructing and analysing objectives and relationships existing among the

main players in the arena of Italian health policy, such as central government, Regions, medical associations, trade unions and private provider associations. Our hypothesis is that the analysis of the interplay among these players can contribute to explain current changes in the regulation of healthcare system and make predictions on the consequences of the renewed role of the State.

For this purpose, a critical analysis of the existing literature as well of regulations and official documents will be carried out. This will be matched with interviews conducted with managers of the Ministry of Health, Regions and the State-Region Conference, as well as with representatives of medical associations and interest organizations.

Towards Centralization or Decentralization? How the Covid-19 Pandemic is Influencing Power Configurations. A Comparative Study between France and China's Fight against Covid-19

Jingyue Xing-Bongioanni[1], Jun Chu[2]

[1]Centre d'études de l'emploi et du travail (CEET), Conservatoire National des Arts et Métiers, France; [2]Institute of Cultural Anthropology/European Ethnology, Georg-August-Universität Göttingen, Germany

This paper aims to examine how the pandemic of Covid-19 has influenced the power configuration between central and local governments: does it lead towards centralization or decentralization? We rely on a theoretical model of decentralization developed by Schneider (2003) who proposes to analyze the relationships between governments at different scales on three dimensions: fiscal, administrative and political. We carried out a qualitative survey based on interviews and archives in two countries that appear to be both strongly centralized, but in fact have opposite policies: France, where public health policies are centralized and China, where social protection and health policies are decentralized to the provinces.

Our study shows that the Covid-19 pandemic can have a variety of effects on the power configuration : while the French central government has reinforced its power in all respects (health, social and economic policy decision-making) in the fight against Covid-19, the Chinese central government has just ensured a coordinating role and it is

mainly the provincial governments that have been taking health, social and economic decisions and have assumed the role of main financer with their local tax revenue. Our comparative analysis reveals that these different effects of the pandemic mainly depend on the degree of financial decentralization before Covid-19.

Varieties of Capitalism and Disease Control Policy: Comparative Study of Responses to COVID-19 in Taiwan and Japan

Mayumi Tabata

Senshu University, Japan

State has always played a central role in Taiwan and Japan similarly since the beginning of economic development. However, though Taiwan and Japan have similar historical background: East Asian developmental state, the challenges posed by COVID-19 have brought totally different control policy in these two countries. Comparing Taiwan and Japan's management of infectious disease control policy is not only important in exploring an effective prevention measures during the pandemic but also in understanding the institutional structure of the political economy of these two countries from varieties of capitalism (VofC).

This research examines the reasons behind Taiwan and Japan's different COVID-19 prevention and control policy. Taiwan's success with COVID 19 mainly lies in reliable mask policy, effective disease control and detection measures through the deployment of technologies, strong trust relationship between state and civil society promoting transparency, communication and collaboration. Recent decades, the relation between state and society in Taiwan totally shifted to participatory and deliberative democracy from authoritarian regime and representative democracy in developmental state. Japan's failure with COVID 19 is based on the weak trust relationship between state and society, less transparency, poor communication and the lack of mutual cooperation. In the development of post-war representative democracy, the authoritarian rule of the developmental state was completely overthrown. However, Japan missed the opportunity to transform representative democracy into participatory and deliberative democracy, this institutional failure made it difficult to strengthen trust relationship between state and society during COVID 19 pandemic. Democracy which was formalized and based in hierarchical

1324

institution in Japan impedes the revitalization of civil society and trust relationship between state and society, brought negative impact on the disease prevention and control measures.

Governing The Pandemic City: How Temporalities Of Covid-19 Responses Influence Public Values And Responsibilities Within Decision-Making

Sabrina Rahmawan-Huizenga, Hester Van De Bovenkamp, Lieke Oldenhoff, Roland Bal

Erasmus University Rotterdam, Netherlands, The

This paper describes the results of an anthropological study of decision-making within the Covid-19 crisis, in one 'safety region' – the (state) organisation responsible for crises and disaster control – in an urban region in the Netherlands. The first author conducted non-participatory observations of crisis-meetings starting March 2020 and proceeding to this day, as well as interviews with key actors. Being fully embedded gives us the unique opportunity to see how the Covid-19 crisis management unfolds.
We highlight that in regional state governance of the Covid-19 crisis different temporalities are at play. We identify a dominant flash time-logic which is the logic of firefighting, of acting now with limited knowledge. In addition, a holistic time-logic in which there is space for nuance and validation of knowledge plays a marginal role. These different temporalities have important consequences for the public values that feature in decision-making. We show how the dominant temporality of a flash time-logic prioritises safety as the most important value, moving other values such as (public) accountability, democracy and social-economic values to the background. Moreover, the time logics also impact the way responsibility is shared within the layered governance arrangement in which the security region operates. The dominant use of a flash time-logic makes different public values seem irreconcilable and prevents an intelligent sharing of responsibility. As Covid-19 is here to stay with us for a longer time we propose a shift towards the holistic time logic in order to move towards adaptive governance with room for balancing different public values.

The impact of Covid-19 on Cross-border Cooperation. The Case of Two Twin Towns in Central Europe

Justyna Kajta, Elzbieta Opilowska

University of Wroclaw, Poland

The Covid-19 pandemic has sparked numerous social and political consequences, especially in border regions, as many European states decided to temporarily close their borders. This decision has had a tremendous effect not only the work of the various actors in border towns, but also on the life of borderlanders whose daily practices are embedded in cross-border spaces. By applying a strategic-relational approach (Jessop 2001), our paper aims to explore the impact of the pandemic on institutional structures and the agency of various actors involved in cross-border cooperation in two selected twin towns – Frankfurt/Oder-Słubice and Cieszyn-Český Těšín. Based on both expert, semi-structured interviews with representatives of the above-mentioned towns and a document analysis, we will analyse the coping strategies deployed to counteract the challenges caused by the border closure, the factors impacting cross-border cooperation, as well as the similarities and differences between the selected cases.

COVID-19 and Freedom of Information: The Return of the Leviathan

Marco Marsili[1,2,3,4]

[1]Centro de investigação do Instituto de Estudos Políticos da Universidade Católica Portuguesa (CIEP-UCP), Portugal; [2]Centro de Estudos Internacionais (CEI-IUL), Instituto Universitário de Lisboa (ISCTE-IUL),Portugal; [3]Centro de Investigação, Inovação e Desenvolvimento da Academia Militar (CINAMIL), Portugal; [4]Centro de Investigação e Desenvolvimento do Instituto Universitário Militar (CIDIUM), Portugal

This paper aims to shed light on the right to information and the freedom of the media in the context of the COVID-19 outbreak. Infection disease outbreaks are invariably characterized by myths and rumors, boosted by social media accounts, that media often pick up and circulate. Under the justification to avoid panic and confusion, and to combat "fake news" during the COVID-

19 pandemic, some governments took emergency measures that curtail the freedom of information. The lack of a legal definition of the term "fake news" leaves room for arbitrary and broad interpretations.

Decrees issued during the state of emergency – including the practice of detaining journalists for their work and the abuse of pre-trial detention and Internet censorship – sound like measures adopted to restrict the freedom of expression and the freedom of the media, and to shout down dissenting voices. Any kind of pressure against journalists has an immediate consequence, not only on them but also on the public's right to be informed. Media play a key role in providing important information to the public, and a pluralistic and vibrant media landscape is indispensable to any democratic society. Access to information and a free working environment are therefore essential and need to be ensured at all times, even under state of emergency. Authorities cannot invoke the state of emergency or national security as a motivation to suspend or limit fundamental human rights. The fight against COVID-19 can be a pretext for restricting civil liberties.

Exempting the State and Responsibilizing Individuals during Pandemic Governance: Analyzing the Health Minister's Responses to the Covid-19 Pandemic in Turkey

Gonul Ezgi Akguloglu[1], Gulcin Con Wright[2]

[1]Middle East Technical University, Turkey; [2]TED University, Turkey

The COVID-19 pandemic pushed the governments of the world to implement public health responses composed of different regulative and protective measures. Although these measures required serious re-considerations of social organization and public health strategies, they were still grounded on pre-existing contexts of countries' health systems. The 'new model of health' is premised primarily around individual responsibility in managing infection-related risks, largely absolving the state's responsibility in public health. Turkey's neoliberal health reforms since 2003 coincide with the principles of this model. Yet, Turkey signifies a unique example due to its still on-going process of transformations that have produced a type of pandemic governance with varying degrees of flexibility, informality, and authoritativeness. Utilizing the tweets of the Turkish Health Minister

between March 13th and October 1st 2020, we conducted a thematic qualitative analysis in MaxQda investigating the Turkish state's response to the COVID-19 pandemic. Our analysis revealed that state responsibility was framed overwhelmingly around rendering efficiency to the healthcare market — such as building new pandemic hospitals and increasing the supply of related medical equipment and medication. Conversely, his tweets assigned Turkish individuals an active role in shaping pandemic outcomes through their 'informed' and 'empowered' agency. Defined as the sum of individual actions, 'togetherness' is coined as an indispensable goal, obscuring any potential structural interventions. The Minister's tweets regarding the pandemic reflect Turkey's mixed and unique form of governance, given the relatively imposing and swift response of the centralized power while maintaining its primary focus on responsibilized individuals' collective actions.

What Roles Do Studies On The Psychosocial Situation Of The Population Play In Pandemic Crisis Management In Germany?

1326

Nils Lüttschwager, Daniela Stelzmann

Freie Universität Berlin, Germany

In Germany, political decisions on measures dealing with the Covid-19 pandemic so far have been primarily dominated by virological and epidemiological statements. However, more and more studies indicate negative psychosocial consequences of such measures (e.g., fear, worry, and pandemic fatigue) within society. Against this background, measuring the negative outcomes on the psychosocial state increases political decision-makers' pressure to consider the available results when implementing new measures.

For this reason, it can be assumed that, in addition to scientific findings on the virus, scientific insights on the psychosocial situation are increasingly being discussed when new measures are implemented. To the best of the author's knowledge, no studies investigate whether and how studies on the psychosocial state are taken into account in political decision-making processes in Germany.

To fill this knowledge gap, we will present preliminary results from qualitative interviews we conducted with politicians, official representatives, and members of corona crisis staff at the federal and state levels in

Germany. The study focuses on questions concerning the extent to which studies of the psychosocial situation of the population were perceived, communicated, and dealt with in decision-making processes in pandemic crisis management. Moreover, the study thus contributes to a deeper understanding of decision-making processes in corona crisis management in Germany and provides insights into the challenges for the inclusion of psychosocial studies in political decision-making processes. Besides, practical implications will be derived from the results to provide crisis management-actors an adequate decision-making basis concerning the psychosocial state of the population.

Digital Communities as Prevention and Information Against Covid: Trust, Proximity and Legitimacy of Italian Public Health Administrations

Elisabetta Gola[1], Andrea Volterrani[2], Fabrizio Meloni[3]

[1]University of Cagliari, Italy; [2]University of Rome Tor Vergata; [3]University of Cagliari Hospital

In the mediated construction of social reality (Couldry, Hepp, 2017) and in times of deep mediatization (Hepp, 2020), public institutions need to build trust and new legitimacy through proximity and relationality with citizens and, more generally, with the inhabitants of the communities, buildineg a "popular digitization". Even between lights and shadows, this became evident during the crisis generated by Covid-19.

The main objective of the paper is the assessment of the ability to build trust and relationality around public administrations through the analysis of the construction (or not) of digital communities (Hepp, Hitzler 2016) inclusive and popular (Choudrie et al. 2018).

To show these aspects during and right after the crisis of pandemic, we have considered some relevant case studies referred to several public administrations. For each case, we have recovered both the quantitative data of significant digital relations with citizens (followers, fans, users of websites and social) and linguistic corpus and relational practices (Couldry, 2004) qualitatively emblematic. The case studies covered about ten public health administrations and the Italian Ministry of Health.

Choudrie J, Tsatsou P., Kurnia S. (2018) (eds), Social Inclusion and Usability of ICT-Enabled Services, New York: Routledge.

The Israeli Public Health Paradox – The Political Construction of an Efficient System and Popular Distrust During COVID-19

Lev Grinberg

Ben Gurion University, Israel

The Israel Public Health system became notorious during the Pandemic crisis mainly following the special agreement between the Israeli Government and Pfizer. The agreement made Israel the largest laboratory on Earth testing the efficiency of Pfizer'svaccine. The company provided enough vaccines for the whole population, and Israel promised to vaccinate the population immediately and provide extensive data on the effects of the vaccine. The government was in dire straits due to its failure to halt contagion, and a fourth round of consecutive elections was expected within 3 months. Indeed, a huge vaccination operation succeeded to shoot more than half of the population, but a strange paradox emerged: large numbers of citizens refused to take the vaccines, and big numbers of vaccines offered remained without a demand. The paper aims to analyze this peculiar situation from a historical political perspective. It will analyze first the political moments that led to the establishment of a very effective public health system, which was crucial in order to convince Pfizer to provide unprecedented numbers of vaccines relative to the population size –; and it will analyze later on the political crisis that led to deep distrust of the Government and its behavior during the pandemic. The article will show that politics matters, both for the construction of the health system and also for the ability of governments to overcome the pandemic crisis.

1327

Viral Stigma: Hate Speech Measurement on Online Media During Covid-19

Nuno Dias[1], Inês Pereira[2]

[1]DINÂMIA'CET_iscte; [2]ISCTE-IUL/FCSH-UNL

In early 2020, the first news of an accelerated respiratory virus spreading in China's Wuhan province were met with relative indifference, one that quickly turned into mistrust and stigmatization of Chinese populations living outside China. With the spread of the virus stigmatizing discourses encircled different population segments scapegoated for virus dissemination, with a particular focus, first on the elderly and young people, perceived as less compliant with confinement rules; second, on racialized populations, migrants, refugees or inhabitants of degraded neighbourhoods, already perceived as bearers of unhealthy habits and now as contaminated communities.

This paper aims to analyse how the health, political and economic crisis resulting from the pandemic has promoted, in Portugal, a resurgence of hate speech against minorities through the analysis of a set of news that cross the virus and minority populations and the comments made to this news.

Resorting to four main newspapers of great circulation (Expresso, Correio da Manhã, Jornal de Notícias e Público) we intend to explore what type of minorities are the preferred target of this discourse, which categories are mobilized, and which narrative patterns and lines are used to promote hate speech. The selection will be carried out through the search engines of the newspapers and extracted, organized and analysed through ParseHub, Maxqda and NodeXL.

Specifically, it is expected: (a) to understand what kind of journalistic narratives deal with the links between the pandemic and minority populations and how these narratives influence public opinion and (b) analyze the spaces of commentary as places of interconnectivity of opinions and feelings in order to identify marks and patterns in hate speeches and its variation throughout 2020.

Migrant Women in the Hospital Sector in the South of France during the Covid Pandemic19

Francesca Sirna

CNRS, France

The shortage of health professionals is a global phenomenon (Pang et al. 2002; Chen et al. 2004; Nullis-Kapp 2005). The geographical mobility of doctors, but also of nurses has been the subject of many studies (Gish 1971; Bevan et al. 1979).

An ongoing qualitative survey, based on 30 biographical interviews with health professionals in the South of France, the results of which are presented here and focus on female staff, is providing further insight into the links between migration and professional careers within the hospital. From a theoretical point of view, my approach is based on grounded theory (Glaser & Strauss, 2009). It is an empirical approach that focuses on the point of view and practices of individuals.

The reconstruction of their career paths has highlighted the difficulties that these health professionals, often from Southern countries, may have encountered in the recognition of their qualifications. Frequently faced with disqualification processes, these medical staff are often underemployed (Déplaude 2011; Niamh et al. 2013). Many authors have referred to this as "brain-waste" (Bourgeault 2007), questioning, also from an ethical point of view, the "right" of these highly qualified professionals to migrate (Oberman 2013), to leave their country where the shortage of health care personnel is also faced with risks of large-scale epidemics (Ebola, Zika, AIDS, SARS, malaria, etc.).

The current health crisis has highlighted the precarious and discriminatory working conditions of health professionals with foreign qualifications, who are on the front line in the fight against the Covid-19 virus. In a hospital sector characterized by a global labour shortage, the origin of the diploma remains the key to careers.

1328

The Impact of Migration on the Changes in Dietary Habits and Health of the Population

Gordana Dragomir Vuksanovic

Novi Sad Business School, Serbia

The aim of this paper is to point out the interrelationships in dietary habits between immigrants and local people. The research covered the area of Vojvodina, the northern province of the Republic of Serbia. As Vojvodina is a highly economically developed area, it has always been an immigration destination for people from other parts of Serbia and the region. For example, in the period after World War II, two large waves of immigration from Bosnia and Herzegovina to Vojvodina were recorded. In both cases, the population from Bosnia and Herzegovina migrated into Vojvodina differed significantly from the natives concerning culture. There were also obvious differences in dietary habits.

The diet of the local people in Vojvodina comprised vegetables and fruit, whereas the diet of the immigrants was based on meat and meat products. The interrelation between dietary habits of natives and immigrants were analyzed through:
- the analysis of the population health statistics;
- the analysis of relevant statistics on the dietary habits of the population in Vojvodina;
- biographical interview with two women respondents aged 80 and over, held in 2020; one respondent was a native, and the other one was an immigrant.

The analysis of the mentioned data shows the immigrants tried to preserve traditional dietary patterns, both within the household and as ethno-business by running catering facilities with national food. Catering facilities serving meat and meat products were widely accepted by the native people. Changes in the diet of the natives had a negative impact on their health and coping with the pandemic.

Keywords: migration, diet, population's health, immigrants, natives

Participatory Research on Health Promotion with Refugees: "Layers of Vulnerability" and Strategies of Adjusting to the Covid-19 Pandemic

Anna Huber, Dennis Odukoya, Hella von Unger

Ludwig-Maximilians-University Munich, Germany

Not all people are equally vulnerable to Covid-19. Higher risks of infection are evident in the context of forced migration. For example, in camp facilities where refugees live, keeping distance is difficult as inhabitants share rooms and personal hygiene facilities with other people. Furthermore the social isolation of refugees is amplified and access to information on testing, prevention and health care is limited. Following Judith Butler (Butler 2006), although physical vulnerability is common to all human beings, it is distributed unequally in radically different ways. Based on empirical material from a participatory study with refugees in Germany (EMPOW), this paper aims to show how vulnerability can be acknowledged and made visible in participatory research. The study, funded by the German Research Foundation (2019-2022), is conducted in three German cities (Berlin, Hannover, Munich). The project aims to 1) explore health-related needs and resources of selected refugee groups in a participatory and community-based manner; 2) develop health promotion measures for and with refugees, and 3) develop sociological theory further on how vulnerability, othering/racism and empowerment are experienced by refugees regarding their health. The pandemic affected the research collaboration in multiple ways. It has made participation more difficult, in particular for community partners adversely affected by quarantine measures, limited internet facilities and further restrictions in shared housing facilities. Digital solutions were found to continue the research collaboration and enable group communication. The analysis highlights not only the specific "layers of vulnerability" (Luna 2009) but also the individual and collective strategies developed to counteract the isolation and deprivation and develop health-related information on Covid-19 and related topics (e.g. in short educational videos).

1329

The Least Safe-Most Vulnerable: Migrants and Refugees During the COVID-19 Pandemic in Greece

Theodoros Fouskas[1], George Koulierakis[1], Charalampos Economou[2]

[1]Department of Public Health Policy, University of West Attica, Greece; [2]Department of Sociology, Panteion University, Greece

As the World Health Organization states, asylum seekers, refugees and migrants are exposed to increased risks of contracting diseases, such as COVID-19, as they live mostly in overcrowded facilities and conditions without basic public health provisions as they lack the appropriate means. In Greece, thousands of asylum seekers, refugees, and migrants live under unsafe and degrading conditions at the camps on the Aegean islands and several others on the mainland. Camps are severely overcrowded. The paper analyses the Greek Government's policy responses to the COVID-19 pandemic for migrants and examines the COVID-19 cases of migrants detected and recorded. After 2015, the arrival of refugees, asylum seekers and migrants impacted heavily on the national system revealing its incapacities regarding their reception mechanisms and integration policies on employment, education, health care, social care and housing, and intercultural coexistence and due to these inadequacies, it mobilized a significant number of citizen initiatives, international and non-governmental organizations. At the same time, it is challenging to take the necessary precautionary measures against the pandemic in the Reception and Identification Centers (RICs) and accommodation centers, such as maintaining social/physical distancing between individuals and implementing hygiene rules. Due to their vulnerable situation and poverty, poor housing conditions, overcrowded conditions, and concentration in types of work where physical distancing is mostly impossible, migrants are faced with a higher risk of COVID-19 infection than the rest of the population.

Displacement, Disability and the Pandemic: the Impact of Covid-19 on Internally Displaced Persons with Disabilities in Ukraine.

Kiril Sharapov

Edinburgh Napier University, United Kingdom

The 2020 comprehensive assessment of the impact of COVID-19 on the socio-economic situation in Ukraine confirms the 'devastating impact of COVID-19 in Ukraine' (UN Ukraine 2020), including a disproportionate impact on the conflict-affected population in the east of the country, and those in the situation of protracted internal displacement. Among the 1.5 million IDPs, 51,412 were officially registered as having a disability as of September 2020 (ibid.) and reported to rely on 'stress' and 'crisis' strategies as a means of survival amid the deteriorating socio-economic situation.

This paper will provide an in-depth qualitative assessment of the multifaceted impacts of the coronavirus pandemic on internally displaced persons with disabilities in Ukraine. It will draw on qualitative research conducted in March – August 2021 (funded by UK's GCRF/AHRC) to explore and document these impacts in close partnership with Ukrainian non-governmental organisations working with and led by persons with disabilities. By relying on rhythmanalysis (Lefebvre 1992, Lyon 2020) as both a conceptual framework and a methodological approach, the paper will present rich data drawn from written diaries and video-testimonies self-recorded by people with disabilities affected by internal displacement in Ukraine. In doing so, the paper will relay a mosaic of views and opinions of the most vulnerable individual and communities in Ukraine and those assisting them 'on the ground' to identify existing gaps in the provision of support services within the context of the pandemic, paying attention to its gender dimension.

JR_RN18_23 | Sexuality and Mediatized Societies

Porn-trends: New Freedoms or Old Sexisms? A Research On The Italian Sexual Imaginaries. The Case-Studies of Pornhub and XNXX

Angelica Spampinato, Gaia Peruzzi

Università La Sapienza di Roma

If sexuality is a marginal issue in Italian sociology, pornography is a still unexplored research field. Nevertheless, like all practices not accredited by public discourse and morality, it is an original point of observation for investigating deep social changes affecting cultures and mentalities; in this case, the transformations concerning the perceptions of body, gender relations, public and private boundaries, the limits of decency.

Furthermore, since pornography is a representation of obscene acts, its history proceeds intertwined with that of the media. In our deeply mediatized societies, porn platforms have completely changed access to pornography, making thousands of videos immediately accessible to a potential unlimited audience, where in the past confidentiality and censorship were the watchwords.

In this theoretical frame our proposal intends to discuss the results of a research on the Italian versions of Pornhub and XNXX, two world giants of online pornography. In the absence of data on the phenomenon, the idea is to study the online offer (that we estimate continually recalibrated to the demands of the public) to understand: the evolution of porn, between mainstream and alternative currents; the categories of normal and deviant in the sexual attraction; the roles played by women and men; the redefinition of the terms of consent in the digital world, between amateur films and professional products. The investigation strategy includes four content analysis actions, dedicated to: the interfaces of the sites; the categories into which the offer is divided; the contents of the videos; language on violence and consensus.

Remixing Bodies in Pornographic Deepfake Online Communities

Mia Lunding Christensen

University of Copenhagen, Denmark

In 2018 deepfakes - videos created with AI-tools that swaps faces - gained popularity online. Amateur tech-enthusiasts in online communities started using the tools to forge pornographic videos depicting celebrities in sexual scenes. In 2020 this is the most widespread use of the technology.

Sexualized audience engagement with celebrity is nothing new, as fans have sexualized celebrities in fanfiction and photoshopped photography before. However, deepfaking moved the fantasy into moving pictures offering new, fleshy, and visually believable scenarios of morphed and remixed celebrity and porn performer bodies.

This article contributes the first ethnographically based research into how pornographic deepfakes are created in online communities. Through multi-sited online ethnography, the article investigates pornographic deepfake practices in a decentralized network focusing on the platform MrDeepFakes.com. Here tools, knowhow, and imagery flow between users as they co-create pornographic videos and materialize shared sexual celebrity fantasies.

Through a multiplicity theory framework, the article investigates what deepfaking does to mediated bodies and sexualities when hybrid figures are forged. Furthermore, the article discusses how deepfake technology and communities pose new challenges to concepts of consent and the right to one's own body online on an open internet where everything can be shared and remixed, especially for celebrities who are viewed as shared public goods in the deepfake communities.

Negotiating Sexual Morality Online: A Mixed Methods Analysis Of Sex Related Topics On A Dutch Discussion Forum

Myra Bosman

University of Amsterdam, Netherlands, The

This article examines how sexual morality is negotiated online through everyday talk on sex and sexuality. For our analysis, we selected a well visited public discussion platform that is related to a popular Dutch women's lifestyle magazine. Topic modelling enabled us to identify the twenty most discussed sexual topics, such as infidelity, sexual assault, BDSM play, sex work, watching porn, sexual desire, and erotic preferences. Through a qualitative analysis of over 10.000 messages, we examined how posters established moral boundaries through processes of normalization and contestation. Yet, even though posters shared a great variety of personal experiences and opinions, few morally charged discussions were found. Instead, the platform's use as an online space for advice, confession and information facilitated the normalization of a wide range of sexual topics, aided by a focus on individual experiences rather than collective moral frameworks. We therefore argue that public, mainstream online discussion boards, assisted by moderation and self-regulation, can provide powerful normalizing spaces for otherwise morally contested topics.

Digital Queer Intimacies: Toward a Turkish Queer Digital Embodiment

Rukaya Al Zayani

Örebro Universitet, Sweden

Queer intimacies have fallen outside heteronormative socialities in the analogue world; different scholars have mapped networked technologies that have facilitated queer intimacies in the digital world. The Turkish queer community and how they transcend queer intimacies online are perpetually forming digital networks. Remarkably during the COVID-19 pandemic, the community accelerated transnational queer intimacies transcending spatial and bodily limits. Turkish queers have shifted to online platforms to perform drag, sex work, host queer events, queer activism, film and produce ethical queer pornography. The aim of this paper is to examine the underexplored digital queer intimacies in the Turkish context and how the digital body could become a target in the digital world due to the prevalence of online gendered violence. The other aim is to analyze how queerness, gender, and sexuality between the analogue and the digital world intersect and what kind of local Turkish queer activism arises from such intersectionality. This paper uses ethnographies from queer individuals narrating their experiences of digital embodiment, online queer intimacies, and sexual embodied cyborg becomings. The material is analyzed thematically using grounded theory, the results are discussed in light of queering non-hegemonic and non-Western intimacies and the implications of the heteropatriarchal discourse that enables injustice and gendered violence towards the queer community.

What TV Shows Do Polish Youth Viewers Consume? Exploring (Dis)similarity with Characters, Onscreen Diversity, and the Possibility for Stereotype Change

Bartosz Grzegorz Żerebecki, Suzanna Johanna Opree, Joep Hofhuis, Susanne Janssen

Erasmus Research Centre for Media, Communication and Culture, Erasmus University Rotterdam, Rotterdam, The Netherlands

The support for LGBTQ people and immigrants is a contentious issue in Poland. Young people, who are still in high school, witness a strongly polarized public discourse. The national, pro-government media staunchly oppose pride parades and multiculturalism, while private ones take more liberal stances. For instance, Netflix prides itself on promoting content with diverse casts and characters represented. Often in streamed content, sexual and ethnic minorities play likeable protagonists. Yet, the role of onscreen diversity in the television consumption choices of young Polish audiences remains unclear. Would young audiences in a conservative country be likely to view entertainment programs that feature diverse characters? While echo chamber and identification theories pose that audiences often choose media content that supports their views, mediated contact and social cognitive theories predict that new attitudes can be taught through onscreen

1332

modeling and parasocial contact. Therefore, do the current entertainment television choices of young Polish viewers have the potential to improve their diversity attitudes?

The present research explores the features of the TV shows that matter to the Polish youth in selecting their entertainment. This includes characters' similarity and dissimilarity to the viewers, a representation of diverse opinions, and the potential to change stereotypes about minorities. The study aims to compare viewers' favorite characters and to discuss experiences with television changing diversity attitudes, through 20 semi-structured, online, one-hour-long interviews with adolescents aged 15-18. The faculty's ethical review board approved the design of the study.

Strengthening Discriminatory Position: Same-sex Partnerships in Slovenian Media

Roman Kuhar, Rok Smrdelj

University of Ljubljana, Slovenia

The famous car crash metaphor used by American lawyer and philosopher Kimberlé Crenshaw to illustrate the intersectional inequality of black women in American society has become emblematic of intersectionality theory, which defines discrimination and social exclusion not uniaxially—only from a sexual or only from a racial perspective—but as an interaction of different circumstances. In this paper, we apply the intersectionality framework to the analysis of the media discourse on the same-sex partnerships in Slovenia. Specifically, we consider "intersectionality of representations", which Crenshaw uses to illustrate the dynamics between different discourse forms. She notes that when one type of discourse fails to acknowledge the importance of another, the power relations directed at both are reinforced. Using the example of online media coverage of the Slovenian law legalising same-sex marriage enacted by the Slovenian Parliament in March 2015 and rejected in a public referendum later that year, our analysis demonstrates that the marginalisation and lack of reflection of the intersectional perspective in the dominant media discourse contributed to the weakening of the anti-discrimination position advocating for marriage equality. It has strengthened the heteronormative rhetoric directed against it. Indeed, we argue that the failure to reflect intersectionality in dominant media discourse reinforces contemporary heteronormative narratives that manifest themselves in perfidious, seemingly liberal forms of articulation.

Sexualities And Homosexualities In Media: An Ethnographic Content Analysis

Luca Falzea

University of Turin, Italy

Movies, TV series and TV shows play an important role in defining our experiences in "real life". Throughout our daily lives it is not rare to use expression and metaphors tied to the cinematographic world or to specific movies or series as well. Movies and series do not simply reflect cultural aspects of the societies and times they are produced in but they share moral messages and a particular vision of society. As such, representation of LGBTQIA+ people in these media is a hot topic in the community, as fair representation is considered important to shape people ideas about LGBTQIA+ people. Aims of this paper would be to engage in a theoretical debate starting from different perspectives that I feel can be put in communication between one another: Elias' notion of civilisation and its construction; Puar's notion of homonationalism; Mieli's idea of gay communism. Starting from this rich theoretical background I will try to study representation of sexuality, and homosexuality specifically, in movies and series through conducting an ethnographic content analysis on three case studies: the movie Love, Simon, his spin off series Love, Victor and Netflix series Sex Education. I selected these three because of their shared target audience (teens), their main theme (coming of age and sexuality) and the different platforms they were distributed to the public with and I intend to focus on which kind of moral message these media share to their public, which kinds of sexualities, homosexualities and homosexual relationship specifically, are presented as positive or acceptable and why.

Matchmaking Digitalized: The Contemporary Value of Marriage Through Middle and Upper Classes' Cultural Display on Matrimonial Websites in India

Jeanne Subtil, Mathieu Ferry

OSC - Sciences Po Paris, France

Contrary to most Asian countries, India has not experienced a decline in marriage. It remains a key event in individuals' lives in which families often play an active role by choosing their child's partner through an "arranged marriage." Yet, the rise of modern values tends to promote some degree of individuality in partner selection, especially among the middle/upper classes. In this paper, we study an important tool of the matrimonial market for these class fractions, matrimonial websites. They guarantee socio-religious endogamy while allowing for more agency from the spouse-to-be in both prospect selection and in developing a relationship prior to marriage.

The way in which bachelors (bachelors' relatives or friends) present themselves (the marriageable person) and express preferences in terms of their ideal spouse and relationship, using both closed-ended questions and biodata narratives, enables to unveil the display of cultural markers (e.g. diet, clothes, religious practices), of ascribed positions (as for caste or religion) and of derived cultural markers of achieved class position (e.g. leisure, sports). Other elements (e.g. appearance, personality, expectations from marriage) may also be central in the process of finding a "suitable" partner.

Based on an automatic extraction of more than 150,000 profiles of a widely used matrimonial website among the middle/upper classes in Uttar Pradesh, Northern India, we examine the social and cultural markers by which bachelors present themselves or are presented by their family. We also look at their spouse preferences and their expectations from marital relationships. What does the performance of the search for a "partner for life" say about the contemporary value of marriage in the middle/upper classes through cultural displays?

#ArmieHammerCannibal: How do Twitter Users Negotiate Kink, Abuse, and Memes?

Jaime Garcia Iglesias[1], Neta Yodovich[2]

[1]University of Edinburgh (Centre for Biomedicine, Self and Society), UK; [2]University of Haifa, Israel

In January 2021, alleged messages by actor Armie Hammer—famed for his performance in the 2017 gay popular movie Call Me by Your Name—were leaked online. In these, Hammer describes himself as "100% cannibal" and shares his enjoyment in sexualized violence. The leak generated fiery social media discussions between some who saw the criticism of Hammer's sexual practices as 'kink-shaming', those who saw Hammer as a dangerous sexual predator, and others who sought to make light of the situation by sharing humorous memes about the issue.

Rather than scrutinizing the content of the messages, this paper answers two questions: how did Twitter users delineated the boundary between supporting someone's kinky sexual practices and calling out abuse? And, what role did humor play in these discourses? We remain attentive to the unique characteristics, affordances and limitations, of Twitter and their influence in conversations in line with Paasonen (2018), Gerrard (2018) and Race (2015). We use data scrapping to identify the most relevant conversations on Twitter and thematic analysis to explore the negotiations and meanings mobilized in these.

This paper provides a snapshot of how sexual kink and abuse were negotiated in the long-term wake of #metoo on Twitter.We argue that many users negotiated the issue by referring to previous #metoo learnings in covert ways. Meanwhile, many kink-affirmative users were concerned with how their practices were being portrayed. Finally, humor, in the form of memes, was most frequently used to navigate Hammer's history as a gay/homoerotic star and his current scandal.

Dispositive Ambiguities of Young People's Media Practices After Experiencing Mediatized Sexualized Violence

Frederic Vobbe, Katharina Kärgel

SRH University, Germany

Due to an increasing mediatization of sexualized violence, those affected face the risk of a medial sharing of sexualized image, video and chat recordings beyond control. Be it the non-consensual sharing of sexualized material either produced consensually or under coercion, or a false linking to sexualized material for humiliating purposes, or records of sexualized acts of violence. If the spiral of violence once escalates, young people are subject to revictimization, retraumatization or victim blaming. Also, the mere knowledge of existing but not yet shared sexualized materials is experienced as seriously threatening. Consequently, the feeling of hopelessness and being trapped becomes stronger. That is probably why young people affected by sexualized violence using digital media (SVUDM) usually report about ambivalences and uncertainties in dealing with digital media. Therefore, we investigate the impact of experiencing SVUDM on the media practices of young people. Using interviews with young people affected by SVUDM, we shed light on their media practices, which are experienced as a tension between adaptivity and maladaptivity. What all the elaborated media practices have in common is that they reflect personal strategies for coping with media-related stresses and fears. At the same time, some media practices might adversely affect young people's wellbeing.

Mediated Infidelity: Media Discourses and Understandings and Experiences of Infidelity in Romantic Relationships

Simone Schneider

University of Cambridge, United Kingdom

Infidelity is a widespread phenomenon in romantic relationships, which becomes even more ubiquitous through digital platforms disseminating media representations and enabling virtual forms of infidelity. In this presentation, I examine how understandings and experiences of infidelity in romantic relationships are mediated through discursive frameworks, focusing on media discourses. This analysis is based on empirical research drawing on 20 semi-structured interviews with individuals in the UK who have had personal experiences with infidelity and builds on the literature on the mediation of intimacy.

Dominant media discourses inform initial understandings of infidelity, both regarding conceptualisations and normative ideas of infidelity. However, these understandings are challenged by personal experiences with infidelity, providing new frameworks through which individuals understand infidelity. Experiencing a disconnection between initially acquired media narratives and personal experiences, individuals turn to alternative media discourses to make sense of their experiences. Media discourses continuously inform infidelity, but this media framework comprises different, conflicting discourses, that individuals draw upon. Furthermore, clear-cut boundaries of infidelity, as mediated through dominant media discourses, are further complicated through digitally-mediated practices.

By analysing infidelity through a mediation framework, I illustrate that specific definitions or experiences are not inherent to infidelity in and of itself. Instead, they are informed by the process of individuals drawing on and engaging with discursive frameworks. Consequently, infidelity is an inherently social and relational phenomenon. Ultimately, the findings show how the complexities and ambiguities of infidelity are closely-linked with the mediation of infidelity through various, contradictory discursive frameworks which individuals must navigate and negotiate.

Mediatised Sexuality In Post Modern Society

Elena Savva

Panteion University of social and political sciences, Greece

In postmodern society, a significant part of flirting and sexual expression is exposed through the use of technology (e.g. mobile phones, computers, tablets). Especially in the era of covid19, this situation became almost normality. The aim of this paper is to study the formation of sexuality under these circumstances (technology mediation/internet). How date apps, sex apps, cyber sex, e-pornography, amateur e-pornography, social media e.t.c. have influenced the creation of a new sexual culture. While the technical effects, the filters, the physical distance from the object of interest allow us to build an ideal image of ourselves, at the same time, this fact creates a lot of stress and anxiety in real life (e.g. increase in plastic surgeries, anorexia, drugs for erection). In addition, the effect of hypersexualized pop-culture on the formation of a new sexuality is also studied. New possibilities are recorded, such as access to multiple sexual partners, reduction of time to find a sexual partner, ease of finding sexual partners with the same sexual tastes. But also additional features of an emerging sexual culture appear such as elimination of flirting, emphasis on the image/ physical characteristics and sexual technique, non-essential contact, "sexual subjectification" of women, perception of sex as a sport, impersonal interaction, emergence of post-feminist sexism, objectification and fetishization of sex. The contribution of this papper is to the study of a new mediatised sexuality which is characterized by strong self-focus and non-essential interaction with a sexual partner.

JR_RN11_RN13_RN33 | New Disavowals? The Politics of Emotions and their Separating and Connecting Effects

Trust in the Face of a Pandemic: in Search for Common Ground

Irina Tartakovskaia

Federal Center of Theoretical and Applied Sociology of the Russian Academy of Sciences, Russian Federation

The paper examines the impact of the new coronavirus pandemic on interpersonal trust relationships and trust in government institutions and official sources of information. The empirical base of the study is the "diaries of professionals" - 34 diaries, which were kept by social science experts from March 25 to June 10, 2020 ("first wave"), and then from September 20 to 30, 2020 ("second wave") - sociologists, philosophers, philologists, anthropologists, political scientists, historians, orientalists. Thus, a collection of thick descriptions was collected, representing a mix between a personal diary and research reflective autoethnography. Based on the review of the scientific discussion on the problem of trust, a significant for this study conclusion is made about the contradictions between â€˜trustâ€™ itself, which implies the possibility of choice and pertains mainly to interpersonal relations, and â€˜confidenceâ€™ in social and state institutions, which implies much less agency of the subject of trust. It is concluded that the epidemic has greatly exacerbated the problem of the lack of trust, noted in the context of the spread of "post-truth" and "fake news" at the global level, but especially noticeable in Russia, where this deficit significantly undermines the very possibility of basic solidarity. The authors of the diaries, as researchers, note that â€œcomfortableâ€ forms of a trust prevail in their social milieu, which creates some uncertain illusion of security. People tend to trust those who help maintain their identity and relieve fear, as well as their familiar "trusted" sources. However, many of them feel the low reliability of these "pillars of trust" in a new unpredictable situation.

Costs Of Social Mobility In The Context Of Intimate Partner Relationships – "It Is Really Easy To Be Angry At Someone Who Is Front Of Me And Not At The System, Which Produces The Inequalities Between Us"

Fanni Deos

Hungarian Academy of Sciences Centre of Excellence, Hungary, Centre for Social Sciences, Institute for Minority Studies

Power inequalities originating from capitalist patriarchy are having an impact on and even determining our personal relationships: gender, class and ethnic inequality are consistently present in our intimate ties as well (Ridgeway 2009). For socially mobile individuals from lower classes, one of the main costs of moving between social classes is to exist in the complex conflict that arises from distancing from the social class of origin in order to integrate into new social spaces (Bourdieu 2005; Friedman 2016). These internal conflicts that are caused by broadened social structures are also present not just in the difficulty of finding a desired romantic partner (Durst â€“ FejÅ's - NyÃrÅ' 2014) but in the process of sustaining an intimate relationship with someone from a particular social background as well. Structural inequalities are also determinative factors in partner selection, education homogamy and ethnic homogamy are highly present in society (Kamijn 1993; 1998; 2010; Kang Fu 2001). In my resarch, through analysing narratives of educationally upwardly mobile women in Hungary, regarding intimate partner selection and looking at intimate relationships themselves, I aim to discover how their narratives reflect upon the hidden costs of mobility. I show how gender, education and ethnic inequalities emerge through the personal accounts of their mobility experiences and to what extent these inequalities determine the process of finding a desired partner or sustaining an existing intimate relationship.

Emotional Perception of the President as a Marker of Political Divide (the Case of Ukraine)

Olena Zlobina1, Evgeniya Bliznyuk2 1

Institute of Sociology National Academy of Sciences of Ukraine, Ukraine; 2 Gradus Research Ltd

The case of Ukraine is unique because it makes possible to evaluate a full palette of emotions in relation to a non-systemic politician that became the President. As a popular comedian, the current President was perceived totally positively. Therefore, one could expect rich palette of feelings when perceiving him in a new role. To study, a methodological solution was proposed that made it possible to present Plutchik's wheel of emotions as a system of closed questions in the questionnaire. For each of the basic emotions, presented by the options that differ in the degree of intensity, the respondent could choose one variant, or indicate that he did not feel such emotions toward the President at all. Complex emotions arising from the mix of basic emotions were integrated into one question with compatible alternatives where all suitable states could be selected. 1420 respondents took part in the survey conducted in an on-line panel. Analysis of the data confirmed the split of emotional attitude towards the personality of the current President between those who voted for him and for his opponent. The split is most clearly seen along the "trust versus disgust" axis. 95% of those who did not vote for the President answered that they did not feel any acceptance, trust or pride towards him. At the same time, 88% of them experienced loathing, disgust and rejection.

Racism Unspoken: Race, Discrimination and (white) Privilege in Emotional Narratives of Young Migrants

Magdalena Nowicka1 , Katarzyna Wojnicka2 1

DeZIM Institute, Germany; 2 University of Gothenburg

This paper investigates how young migrants narrate about racism and which role emotions play in these accounts. Emotions are central to the racial edifice of societies (Bonilla-Silva 2019). Past research pointed to emotional responses to racialization. We follow Fanon (1967) and Baldwin (1963) in how we view racism as infused with emotions that precede the cognitive awareness of being a racialized subject. Our interest is twofold: first, we ask which emotions are involved in young migrants' experiences of racism. Second, we explore how different research methods allow for triggering narrations that include racialized emotions at different levels of consciousness. We base our paper on data collected in 2019 among young (16-29) first- and secondgeneration migrants living in Berlin, Germany. While our research focused on gender, family and friendship, the collected narrations included explicit accounts of experienced racism which were stronger the more we encouraged to express nonverbally or offered them a safe space to talk about emotions rather than sharing their thoughts and opinions. Racism remained silent in the in-depth interviews and was even denied if we asked explicitly about it but the focus group interviews and the artbased workshops helped the same participants to express their emotions involved in experiencing racial offences. Racism and racial oppression as a feeling could best be expressed with help of visual elicitation and drawings which we also applied during our research. We draw conclusions from our research for how social sciences could study racism beyond the classical focus on its material foundations.

The Politics of Care-work Regulation in four Countries with Important In-flows of Migrant Careworkers and its Effects on Emotional Scripts

Rossana Trifiletti

University of Florence, Italy

1338

Italy is the second country in the world in the ranking of the aging population and the incidence of dementias in this phase of the life course (Oecd 2019). At the same time, Italy is one of the countries of Europe where the percentage of people dying at home instead of hospitals or hospices is still one of the highest (Barbagli 2018). The main explanation cannot be traced back only to the strenght of traditional family ties, but also to the wide availability of – mainly female – cohabitant migrant careworkers taking care of frail elderly people at affordable prices. And still, this state of affairs has never been sistematically regulated in Italy, like in other countries such as Austria or Canada, at the one end of a scale of integration capacity, or Israel at the opposite end. This opens a wide space for practices in which a quasi-market for a very heavy emotion work developed (Trifiletti 2018) blurring the boundaries between public and private, between love's and market's labour: we demand that the careworkers face up the difculties of a dirty bodywork, of personal mobility limitations and, often, of not so easy relationships with other family members, if not even of socially constructed ethnic markers (Anthias 2008; Marchetti, Scrinzi 2017). In comparison with the other three countries Italy proves to be a very clear case (especially during the Covid-19 pandemic crisis) of how the intersection among the regulation of migration flows, the labor market and the gender order may change its effects to the extent that the care-work lacks the social recognition that feminists have always claimed (Fraser 1989; 2016).

JS_RN20_RN21 | Traces, Footprints and their Significance for Qualitative and Quantitative Social Research

Using the Biogram to Explore Biographical Traces: from the "Empirical Case" to the "Theoretical Case"

Ivana Acocella

University of Florence, Italy

This paper aims to present the "biogram" as a useful tool for synthesizing and analyzing materials produced by biographical approach. The advantage is the possibility of merging different life spheres into a single instrument in order to identify the main biographical steps, safeguarding the temporal depth and multi-dimensional structure of an individual's life story. Indeed, the biogram allows the researcher to consider the chronology and sequence of events listed in the biographical narrative, while simultaneously exploring several "trajectories of life" (school, work, housing career, structure of relationships, institutional life). The "trajectories of life" can be considered either individually or in combination, in order to identify processes of concatenation and mutual influence among biographic events, relevant milestones and turning points of an individual's life story. The aim is to examine how these elements affected the process of identity configuration of the narrator. In this way, the biogram can be useful in elaborating different types of the identity building processes such as analytical syntheses, in order to transform "empirical cases" into "theoretical cases" (referring to the unit of analysis), switching from an individual story to a sociological type into which this biographical story can be inserted. In the paper, an application of the biogram will be reported on biographies collected to explore paths of social exclusion, defining conceptual categories referable to three identity profiles: "the subject at risk of exclusion", "the intermittent" or "the chronic".

Digital Traces and Feminist Data Studies

Chiara livia Bernardi

University of Stirling, United Kingdom

This paper applies gender reflections on benevolent sexism and revisits it to interpret and analyse the Instagram hashtag network #DownSyndrome. Combining propositions of Actor Network Theories applications to mapping controversies online, disability studies and behavioural sciences, the paper discusses the networks of discussions generated online around the hashtag #Down Syndrome.

A data set comprising of over 14,000 images and associated posts is analysed. Text analysis includes Social Network Analysis, topic modelling and time series analysis. Computer vision and time series analysis are undertaken for images. The objective is to identify rhetoric that emerges in the visual and textual user generated content around discussions about Down Syndrome on this specific social media platform.

The paper builds upon research on data sciences, cartography of controversies (Venturini, 2010) and enrich these with a reflection on how to apply them to marginalised voices (Klein and D'Ignazio, 2020). The paper proposes to bridge an important theoretical gap between user generated content, digital traces and computational methods. The results showcase an insistent 'infra-humanisation' of the person with Down Syndrome, both visually and textually.

Ultimately, the paper proposes a novel methodological framework, data studies to bring to light marginalised and invisible voices in our current digital, increasingly computational, culture.

The Future of the Past: What Traces Remain for Historical Demography?

Rebecca Jean Emigh

UCLA, United States of America

Historical accounts, including historical demographic ones, inspire reinterpretations of the past and present. As understandings of the past change, so do current ones. For example, nostalgia for large extended households relies on a historical understanding that they were historically plentiful; population projections rely on historical understanding of how fertility and mortality responded to economic change (two examples of hotly debated topics in historical demography). For the study of all but the recent past (accessible through oral history), historical research relies on documents. However, what remain in the present, available for research, are not the documents themselves, but traces of the documents. Inevitably, much is lost: purposefully, accidentally, or simply to everyday wear and tear. This article considers how these traces change over time with respect to demographic information found on censuses and registrations. Computers and digitization dramatically change the traces of demographic information. Computerization seems to make information ubiquitous and omnipresent, provoking fears over the loss of privacy, yet digital information is very easily lost and irretrievable even after a few years. This article asks then, does the historically variable format (manuscript, typeset, digitized) of demographic information correspond to the content of the traces? This article uses narrative methods to trace this relationship over time. Some important questions to be addressed are: what was originally produced (format, medium), what was the intention with respect to preservation (to preserve or not), what were the plans for preservation (explicit, implicit, none), and are these plans forgotten (followed through or not).

Self-Tracking Cultures and Digital Traces Analysis: Methodological Implications Between Intentionality and Reactivity

Laura Arosio

University of Milano Bicocca-Italy, Italy

In this paper we intend to reflect on the methodological implications of the growing phenomenon of self tracking, which consists in the practice of individuals to collect data about themselves on a regular basis through digital tools and smart technologies about various areas of their lives. On the one hand, this increasingly widespread social phenomenon allows for the collection, storage and analysis of a large amount of data that can be used by researchers to obtain information about our society regarding different topics (such as health, leisure, consumption). On the other hand, these data pose a methodological challenge, as they are considered "digital traces" even if they are often collected intentionally by individuals. For this reason, these data introduce the issue of reactivity in social research and the need to contextualize the material collected. All of the steps through which the data were constructed should be studied and all of the actors and forces involved should be known . The paper ends with the question whether self tracking data, because of their characteristics, should be considered "trace analysis" or "documentary analysis".

JS_RN20_RN29 | Qualitative Methods and Social Theory

Body In Inter-/Action: Exploring The Interrelations Of Video-based Interaction Research And Social Theory

Ajit Singh

TU Berlin, Germany

Video-based interaction research has enjoyed an astonishing boom in recent decades. From linguistics to sociology, there is an impressive body of qualitative studies dedicated to the study of communicative and social phenomena. Video research is conducted in different social fields and on different interactional phenomena. This trend towards audio-visual data is also observable at the variety of methodological considerations, traditions and developments (cf. Knoblauch et al. 2006; Kissmann 2009; Heath et al. 2010, Tuma et al. 2013). Instead of highlighting the visible institutionalization of video-based methods into the canon of qualitative research, the paper sheds the light on the interrelations of qualitative video-interaction analysis and social theory. Firstly, it will be asked, how social theory influence the research process (e.g., research design, adequacy of methods, fieldwork). Secondly, it will be examined what contributions video research makes to social theory. These questions will be discussed using the sociological concept of the body. Although material culture and sociality can hardly be thought of without the body, a reflexive sociological research on and with the body is a relatively young field. In particular video-based research 'registers' the visibility of embodied practices in a way, that has massively changed the analysis of how meaning and social order is produced in interaction (Garfinkel, Goffman). By drawing on examples taken from my own research, I will show that the empirical focus has expanded from language and the sequentiality of conversations to the simultaneously occurring dimensions of embodied and spatial coordination of social interactions.

The Ambiguous and Neglected Link Between Case Study Research and The Chicago School's Social Theory. Reflections on a Missing Discussion

Barbara Sena

Unitelma Sapienza University of Rome, Italy

In the context of sociology and social research methodology, the case study still represents a sort of catchword, a surrogate for undefined qualitative methods or a way to title a research (e.g. "the case of…" or "a case study of…"). The first application in sociology is commonly traced back to the Chicago School, which used this label to name many of its researches deriving from the in-depth analysis of deviant cases from the archives of American social workers in the first half of the twentieth century (Platt, 1992). After the end of the Chicago School, however, sociology's discussion on the "case study method" has been scarce and ambiguous, often merely considering it as the qualitative analysis of a case in the debate between quantitative and qualitative methods (e.g. Feagin, Orum and Sjoberg, 1991; Gomm, Hammersley, Foster, 2000).

Starting from this premise, the paper explores some reasons that have led to this missing consideration of the case study as specific sociological research approach.

Particularly, the paper will highlight how the use of case study made by the Chicago School is linked to the origins of the methodological misunderstanding that has characterized it. At the same time, starting from a review of Chicagoans case study applications to social theory, a viable development path will be proposed which, summarizing the contributions by other disciplines, such as education, evaluation and political science (e.g. Yin, Stake, Gerring, Simons), aims to propose a new more informed research practice for the holistic analysis of complex social phenomena.

1341

Towards A Longitudinal Understanding Of The Future: Exploring Social Change During Pandemic

Arianna Mainardi, Stefania Voli

University of Milano Bicocca, Italy

The longitudinal perspective is enjoying an increasing recognition in analyzing social change over time. Being well-suited to tackle the question of the subject in hir context, the longitudinal approach is now a centerpiece of the debate for understanding current and new challenges in social theory. In the first place, it significantly puts at the core the element of time. Furthermore, it makes clear how to connect micro and macro dimensions that produce individual and institutional milieus, and also to look at their reciprocal influence on each other. Our proposal originates within a qualitative longitudinal research on being young in Italy, an ongoing project of the Department of Sociology of Milan Bicocca. The article focuses on challenges borne out by qualitative longitudinal studies carried out during the pandemic in order to: 1) integrate the longitudinal approach in the studies of social change with regards of the issue of the future 2) perform reflexivity for unpacking methodological challenges brought by pandemic in long term research 3) explore the impact of the fieldwork during this unconventional time with regards to the transformation of the concepts and the sociological knowledge developed in the research. Thus, the article will discuss the above mentioned topics by especially focusing on the relationship between the fieldwork and theorizations about the future, aiming at understanding what the field tells us concerning the theories about the future (and future in times of Covid-19). We will substantiate this reflection by looking at the transition to adulthood and therefore on the idea of the future that young people elaborate during the pandemic, towards a diagnosis of social change that takes into account the participants to the research.

A Dialogue between Social Theory and Qualitative Social Research in the Field of Migration

Helge Schwiertz

University of Hamburg, Germany

The interrelation of theory and empirical research is a constitutive element of sociology. However, its configuration remains a challenge, especially since the awareness of this interrelation has often been lost. The professionalization of sociology established an understanding of theories as mere generalizations of research results, turning away from more comprehensive social theories and theories of society in most subfields. According to Hans Joas and Wolfgang Knöbl (2017), such an understanding of theory has led to an isolation of theoretical and empirical work from each other. This is the point of departure for this paper, which aims to contribute to the debate on the tensions between theoretical and empirical work by relating social theory and qualitative research and by exploring the question of how this relationship can be translated into coherent research designs. First, the paper builds on poststructuralist-informed qualitative methodologies that argue for a decisive and reflexive reference to social theory (Denzin/Lincoln 2011; Winter 2011). Second, it discusses the possibilities of an empirically informed revision and advancement of social theory. Thus, the question is not so much about the theoretical foundations of qualitative research paradigms or the empirical grounding of new theories. Rather, I would like to discuss how social theory and social research can be re-linked and brought into a dialogue, in which the relative autonomy of their logics is respected. I therefore argue for an articulation of theory and empirical research, which is neither subsumptionist nor empiricist curtailed. I will substantiate these considerations by presenting two qualitative case studies on the organizing of migrant youth in Germany and the U.S. and their linkage to post-foundational and radical democratic theory.

1342

JS_RN21_RN31 | Advances and Challenges in Quantitative Measurement of Racism and Antisemitism

Allport Revisited. Assessing Nonlinear Effects Of Interethnic Contacts

Norman FRM Fauster[1], Nico Tackner[2]

[1]The University of Sheffield, United Kingdom; [2]University of Graz, Austria

The well-known contact theory seems to suffer from its own success. Since its popularization by Allport (1954), this idea while being naturalized in the social sciences was also over-simplified (cf. Forbes 1997). For instance, far-right voting in rural areas is commonly explained by lack of contact to migrants. Yet, at the same time larger cities' districts with high shares of migrants also tend to far-right voting, aligning with the idea that contact actually enables the formation of group boundaries (Barth 1969).

After conducting a survey in the city of Graz (Austria), resulting in the same discrepancy between city districts, we have decided to investigate further: Based on data from the European Social Survey waves of 2002 and 2014, a cross-national-cross-temporal analysis on the effects of interethnic contact on the attitudes towards immigration was carried out. Like Allport originally states, prejudices are not diminished by increasing the mere frequency of such contacts. Our results also confirm that the social conditions surrounding interethnic contact (especially gender) play a crucial role for whether it reduces or enhances existing prejudices.

Besides content-related findings, two methodological implications can be taken from our study. First, there is central issue in using the current measures on contact, as they do not specify inter-group-contact. It seems necessary to evaluate out-group-specific contact in order to investigated group-specific prejudices. Second, assumptions of linear dependencies in variable-oriented research contrast the emphasis on conditions (Rokkan 1999; Ragin 1987/2014). This controversy could be overcome by emphasizing conditional marginal means in linear modelling.

Measuring Prejudice About Immigrants' Social Values

Andrey Tibajev[1,2]

[1]Uppsala University, Sweden; [2]Institute for Futures Studies, Sweden

One way in which racist ideas may both be substantiated and manifested is beliefs that immigrants have social values in stark contrast to the majority population. Such beliefs affect both societal discourse and everyday interactions immigrants have with institutions, often with adverse results for immigrants. In this study, we use a novel way to quantitatively study the beliefs about immigrants' values among health care providers within maternal and child health.

Respondents were first asked a series of questions regarding social values within sexual and reproductive health and rights (SRHR), e.g., to what degree homosexuality, abortion or sex before marriage is justifiable, if parents can decide about their children's sexual debut, women's right to contraception etc. Respondents were then asked to estimate what a patient from the Middle East and North Africa would answer on the same questions. We also conducted a survey on newly arrived immigrants, asking them about these issues.

Health care providers are of special significance because they themselves exhibit extremely liberal values regarding SRHR, even for a Swedish context, and are simultaneously in a position where their prejudice about immigrants can have concrete and severe consequences for the latter. At the same time, SRHR is an area that strongly connects to racist discourses. In this study, we show health care providers' beliefs about immigrants' values, how they compare to the sample of immigrants' expressed values, and how the beliefs depend on demography, the respondents' own values, and their knowledge about global issues within SRHR.

Migration, Persecution And Ethnic Segregation Of An Urban Space. The Case Of Lubartów Jews (Poland, 1932-1942)

Adele Sutre[1], Anton Perdoncin[1,2], Claire Zalc[1,2,3]

[1]ERC Lubartworld (EHESS, ENS, CNRS), France; [2]CENS (Nantes University CNRS), France; [3]IHMC (ENS, Paris 1, CNRS), France

The general objective of this presentation is to study the dynamics of ethnic segregation in the urban space of a small town, in a context of radical transformation of social structures and living conditions.

At the turn of the 1930s, Lubartów was a rather ordinary Polish city. Situated in an isolated region, it offers to the socio-historical survey a population with dense and hierarchical networks. This spatial and relational structure was disrupted by the German invasion of 1939, the war, population departures and arrivals, as well as the ghettoization, deportation and extermination of the Jews. In this paper, we study how persecutions rely on and generate specific spatial dynamics. In doing so, we contribute to the analysis of segregation, and to the "spatial turning point" in the history of the Shoah (Cole et al. 2014; Fogu 2016).

We will rely on original historical data, especially from a register of population, kept up to date from 1932 to 1943. A quantitative analysis of this data allows us to spatialize, over a decade, the transformations of the population and to reconstruct the mobility of individuals and families within the city, according to their voluntary or forced movements.

After describing and mapping ethnic segregation in the early 1930s, we will show how these were recomposed over a decade of major disruptions. A central issue will be discussed: how to measure, at what scales, and with what tools the spatial dynamics of ethnic segregation (Johnston et al. 2005; Lloyd et al. 2014)?

Bursting the Bubble: Network Dynamics of a Far-right Counterpublic

Anton Törnberg, Mattias Wahlström, Hans Ekbrand

University of Gothenburg, Sweden

It is a widespread view that political polarization and the growth of the far right is driven by the insulation of online counterpublics, in which participants' views are reinforced in so-called echo chambers. The echo chamber thesis has recently been challenged by research that points to countervailing dynamics (such as the increased online availability also of opposed political content), but the basic mechanism still deserves attention. However, in order to develop a more nuanced understanding of echo chamber dynamics, one needs to depart from the simplified idea of online groups as more or less homogenous entities, and look closer at their internal structure and dynamics. A key question is how to identify subgroups, leader figures, and possible radical flanks.

In this paper, we use the "Stand up for Sweden" Facebook group, which at the time of study had around 170,000 members, as a case of a large and relatively open far-right counterpublic dominated by racist rhetoric. By using social network analysis on likes within the group, combined with statistical analysis of usage activity, we identify three distinct clusters of users. By systematically comparing posts and comments from users in these clusters using Natural Language Processing, we show that the activity in the group is largely driven by a relatively small radical and ideological core of users that frequently post, but engage less in the discussions. The two larger clusters contribute to various social functions, such as upholding group cohesion and in-group solidarity within the group.

Outgroup Mobility Threat and its Variants – Measures and Tests for the New National Discrimination and Racism Monitor (NaDiRa) in Germany

Frank Kalter[1,2], Naika Foroutan[1,3], Steffen Beigang[1]

[1]DeZIM-Institute Berlin, Germany; [2]MZES, University of Mannheim, Germany; [3]BIM, Humboldt University Berlin, Germany

Theories of ethnic competition and the concept of threat have long played a major role in the explanation of hostile attitudes against racial and ethnic minorities. The ideas come in many variants, as, for example, integrated threat theory has worked out. In this paper we try to develop this further by dealing with a specific, potentially increasingly important type of threat: outgroup mobility threat (OMT). This relates to the well-known integration paradox: a majority population might develop negative attitudes towards minority groups exactly because they are becoming 'integrated' better and better, especially in the structural areas.

We expect that different segments of the majority population will feel threatened by different forms of labor market success on the side of different minorities and develop respective hypotheses. In particular, we argue that respondents with lower socio-economic status will in principle perceive (any variant of) outgroup mobility more threatening. However, respondents with higher socio-economic status will nevertheless tend to be more aversive to outgroups entering higher positions and positions that imply more symbolic rather than realistic threat.

We measure OMT and test the hypotheses this with a vignette study that we recently implemented in a submodule of the new National Discrimination and Racism Monitor (NaDiRa) in Germany, conducted by the German Center for Integration and Migration Research (DeZIM-Institute). Next to occupations (high and low, realistic and symbolic threat), the vignettes vary gender and six different minority groups (Asian, Muslim, Black, East-European, Roma, and Jewish people).

"The Church is Against Us!": Apostasy in the Context of Feminist Struggle in Argentina and Spain

Julia Martínez-Ariño

University of Groningen, Netherlands, The

Apostasy has become part of the mobilization repertoire of feminist movements in Argentina and Spain in the last few years. In their struggle for gender equality, the legalization of abortion, the end of patriarchal (sexual) violence and the fight for LGBTQI+ rights, among other issues, feminist movements have found in apostasy a tool to voice their concerns and denounce the role of the Catholic Church therein. For many, the Church represents an obstacle to their fight and see apostasy as a symbolic —not so much an effective— action to show their disaffection and anger. In my presentation, I analyse what are known as "feminist apostasies" ¬—collective performances in local bishoprics where a group of people, mostly women, request to be formally removed from the Church's registers. While the sociology of religion has studied apostasy as an individual process of leaving religion, I analyse it instead as a form of political protest. In this paper I will draw on interviews and ethnographic and visual material collected between 2018 and 2020 and use conceptual tools from social movement studies.

The Old Enemies Become Friends? Convergences in the Arguments and Strategies of Feminist Organizations and the Catholic Church against Gestational Surrogacy

Fabio Bolzonar

Université Libre de Bruxelles, France

Assisted reproductive technologies have opened highly divisive debates at the national level that often overflow in the transnational political arena. The legalization of gestational surrogacy is one of the most controversial issues, which has provoked strong protests by feminist organizations and the Catholic Church. Although these actors have generally contrasted each other in the debates on family- and sexuality-related questions, their mobilizations against surrogacy show a mutual rapprochement. Whereas major feminist organizations have lessened the principle of women's reproductive autonomy, which has characterized contemporary feminism, Catholic authorities have refrained from using religious arguments and have tended to reject surrogacy on the ground of principles 'borrowed' from feminist activists: the opposition to market logic on reproductive matters, the emphasis on the special bond between mother and unborn child, and the concern for the exploitation of surrogate mothers.

This paper compares the arguments of major feminist organizations and the Catholic Church in demanding a transnational ban on surrogacy. Building on different bodies of scholarship and adopting a multi-disciplinary perspective, we describe the arguments supported by feminist organizations and Catholic authorities, illustrate the similarities and differences of the values sustained by these actors, and explain how such values have shaped the discursive framing of the campaigns against surrogacy. This paper aims to explore the cross-fertilization of secular and religious worldviews in the current post-secular age and to understand if the ethical concerns for the dramatic advances in biosciences can become a terrain for a fruitful dialogue between secular and religious actors.

For A Given Period Of Time And Certain Fee: A Study Of Iranian Academics Attitudes Toward Temporary Marriage (Sigheh)

Maryam Ziari

Shahid Beheshti University, Iran, Islamic Republic of

The only legal and religiously permitted form of relationship with the opposite sex in Iran is marriage which exists in permanent and temporary forms. Temporary marriage (Sigheh in Persian) is a form of marriage within Shiite Islam's system of jurisprudence in which a contract is made between a woman and a man for a given time and a dowry of certain value, and upon the expiration of the period of contract, the marriage is automatically pronounced void. Despite the legality of the sigheh practice, it has faced stigma and is considered a social taboo. Sigheh, however, is not only shunned by the rules of custom and the social norms among the ordinary people. In fact, some of the adamant opponents of the sigheh are among the intellectuals, who, using theoretical arguments derived from feminism and human rights are opposed to the idea.

This study works with the cultural elite who often resist the concept of temporary marriage when it is both permitted by religion and encouraged by the law and mentioned as a potential solution to the part of social problems of the Iranian society. The data is collected from twenty-four interviews with Iranian academicians as representatives of the educated people opposing the spread of the temporary marriage, According to the findings, the main reasons of opposing temporary marriage among the educated people are: temporary marriage is a form of prostitution; reinforces patriarchal discourse; threatening the integrity of family; and is divergence from the sexual lifestyle model of the world.

What Kind Of Violence? Framing Sexual Violence In The Catholic Church

Romaine Girod

Université de Lausanne, Switzerland

Everywhere, institutions are called upon to change by survivors of sexual violence. From the Time's Up campaign to the #Metoo movement and its aftermath, survivors and activists are demanding and working toward an alternative and better future. In this call for paper, I would like to share some of the questions I am raising in my PhD research in sociology and gender studies at the University of Lausanne. In the Swiss context, I am looking at the mobilizations of activists and survivors against sexual violence in the Catholic Church in a socio-historical perspective. Based on qualitative methods (interviews and observations with members of survivors' organizations and discourse analysis of Church documents and activists' autobiographies), I am interested in the framings of sexual violence committed by priests and members of the clergy against women and children. How has the problem of sexual violence been constructed by survivors' organizations? Have these mobilizations changed gender relations within the Church? How does the Swiss case fit within transnational debates that have emerged since the 1990s? Both the Catholic Church and the Swiss context have been somewhat overlooked by feminist analyses of gender violence and sexuality, which is what the thesis tries to contribute to. If feminist anti-violence activism has been well documented we know less about how (religious) groups which might have other frames of reference mobilize against sexual violence and whether they situate themselves within the current wave of denunciations of sexual violence in various institutions.

'Harmful to women': The Moral Regulation Mission of the UK Anti-Abortion Movement

Pam Lowe, Sarah-Jane Page

Aston University, United Kingdom

Despite widespread support for abortion in the UK, anti-abortion activism has increased in style and substance in recent years outside abortion clinics and in other public places. Most publicly-engaged British-based anti-abortion activists are Roman Catholic, yet the evidence show the majority of UK Catholics accept abortion unequivocally or conditionally, so those who actively challenge abortion are a minority. Moreover, overt displays of public religiosity are not seen as appropriate; anti-abortion activities, including silent public prayers, are often positioned on a range from inappropriate to a form of religious extremism.

This paper draws on two projects: a longitudinal ethnography of abortion activism in public spaces, and a second project qualitatively investigating the narratives of Catholic priests and parishioners. Taking a feminist approach, this paper will argue that anti-abortion activism needs to be seen as a moral regulation movement which focuses on abortion as a way to undo wider liberalising changes in society. Their underlying objectives remain rooted in the religiously-derived concerns about sexual behaviours, gender roles and normative (hetero)sexuality, so are firmly rooted in the remit of Papal objections to 'gender ideology'. Despite this underlying rationale, their public framing of abortion often deploys claims about 'risk', 'science' and 'human rights' with a view that abortion causes harm to women. This paper will use a lived religion approach to explain how, rather than seeing this alternative framing as a strategic choice to secularize their arguments, the 'secular' arguments are incorporated into their religious beliefs about 'gender ideology'.

Discourse, Dialectic and Communicative Struggle as Ways Of Women's Resistance To Male-Clerical Domination In The Roman Catholic Church In Poland

Katarzyna Leszczynska

AGH University of Science and Technology, Poland

The aim of the paper is to analyse the women's resistance to male-clerical domination in the institution of the Roman Catholic Church in Poland (Further: RCC), undertaken by Catholic women. I am going to report the results of the qualitative research, 48 in-depth interviews conducted between 2019-2020 with religious lay women who are active in the religious groups in RCC.

Although women in Poland are statistically more religious than men, the RCC in Poland understood as an organization is masculinized and clericalized. In recent years, however, women more and more often engage in various activities within the RCC in Poland and as research shows they face numerous challenges, organizational limitations and barriers, which are the result of e.g. male and clerical domination, which manifests itself in the organization of power and the division of labor. Women undertake various strategies of coping with limitations and barriers, and one of the patterns of these strategies are the practices of resistance, defined as ways in which they intentionally attempt to challenge or act against an oppressive force. In the paper, I will show what patterns of resistance women take against male and clerical power. I will consider three main resistance patterns - discursive, dialectical and communicative struggle resistance. What ideas legitimize these various patterns of resistance, how are these ideas rooted in religion, and how do they correspond with other ideas, e.g. in the egalitarian and feminist discourse? Answers to these questions will show not only the diverse patterns of women activities in a RCC, but also how social practices within the institution of religion draw on secular ideas and the axionormative system of late modernity.

The Effect of Religion on Fertility: Turkish Case

Murat Yilmaz

Hitit University, Turkey

In the last three decades, studies on fertility and its relationship with religion have become a hot issue in the academic world. Previous studies demonstrate that Muslims have higher fertility rates in European countries than other religious groups. Moreover, Muslim-majority countries show a higher average of childbearing rates than Western countries. Because Turkey is a rare example in the Muslim world being a democratic and secular state, scholars pay considerable attention nowadays to investigate social issues in Turkey from a Muslim viewpoint. Religion and family constitute two significant social institutions for the continuity, change, and maintenance of the Turkish society. Therefore, this study will provide an empirical analysis of how fertility attitudes and behaviors are influenced by the conflict between religion and modernity over time. The analyses are based on Turkish samples of the last five waves of the World Values Surveys, from 1991 to 2012. The results indicate that religion and socio-economic determinants show significant associations with the fertility of Turkish individuals but in opposing directions.

JS_RN27_RN30 | Refugee Unaccompanied Teenagers in Southern Europe

A Failing Protection. Obstacles and Risks Encountered by Unaccompanied Minors Beneficiaries of International Protection in their Transition to Adulthood

Emanuela Bonini[1], Giulia Mezzetti[2]

[1]ISMU Foundation, Italy; [2]Catolich University of the Sacred Heart

The present paper examines the risks and obstacles that unaccompanied and separated children (UASC) beneficiaries of international protection may encounter in their transition to adulthood in Italy. The paper is based on a study commissioned by UNICEF, UNHCR and IOM conducted in 2019 in Lombardy, Latium and Sicily, where biographical interviews with UASC and former UASC (N=62) were collected through a peer research technique, along with semi-structured interviews with key-informants (N=55). The analysis of UASC and former UASC's biographic trajectories shows how they often experience the paradoxical situation whereby, despite holding a protection status, they might be exposed to serious dangers of exclusion when turning 18: while some may go missing, many become irregular and get exploited in the informal economy. This is due to the great limitations posed by an age-based distinction between "children", who "deserve" to be protected, and "adults": de facto, even if the protection they are entitled lasts beyond their come of age, the system is not able to guarantee such protection. These obstacles prevent UASC from equipping themselves with all the tools and knowledge that would ensure their successful transition to adulthood and from realizing their aspirations. Therefore, the juridical protection they are formally guaranteed fails, on one hand, to recognize their vulnerability and, on the other, to respect their capability to self-determine as bearers of legitimate desires. The obstacles they meet illuminate the implicit moral economy of reception (Watters 2019) where key-categories of international protection, such as "durable solutions" or "long-term wellbeing", lose meaning.

Problematising Migration and Refugee Flows in Greece through the lens of Socio-Spatial Justice

Apostolos G. Papadopoulos[1], Loukia-Maria Fratsea[2]

[1]National Centre for Social Research (EKKE) & Harokopio University, Greece; [2]Harokopio University, Greece

Migration and asylum are considered two facets of the migratory phenomenon which has attracted the attention of politicians and the wider public in recent years. The rising numbers of migrants and asylum seekers, stressed and/or re-iterated by the media in recent years, has been important in formulating public opinion, forcing adjustments to relevant policies implemented at the European and national level. The socioeconomic and political situation in Greece offers a significant context for addressing migration and refugee flows along with asylum and migration policies.

Our aim is to identify and discuss the changing opportunities and challenges presented to and facing the newly arriving populations of migrants and refugees in Greece in the context of the economic recession/ economic development prospect(s). The capacity of the host society to receive and integrate the arriving populations remained limited, not only because of the impact of austerity, but also due to the indigenous population's reluctance to accept the newcomers. The paper is structured into the following sections: The first section outlines the main developments in relation to asylum and migration in Greece in the period from the start of the economic recession to the present. The second presents the empirical findings collected in the period 2018–2020 and centres on the perceptions and narratives of refugees, as well as stakeholders and policymakers who have been involved in the implementation of asylum and migration policy. The concluding section problematises the issues raised in the previous sections through the lens of social and spatial justice.

JS_RN27_RN37 | Urban Homelessness in Southern Europe: New Problems and New Challenges in Times of Covid-19

'A Crisis Within a Greater Crisis': Hidden Vulnerabilities Among People Experiencing Homelessness During the Covid-19 Pandemic in Croatia

Filip Trbojević, Suzana Sakić, Lynette Šikić-Mićanović

Institute of Social Sciences Ivo Pilar, Croatia

Research literature has shown that crises such as pandemics can exacerbate existing vulnerabilities and that it is common for certain social groups to experience crises more severely than others. Challenges specific to the homeless population in the areas of communication, infection control, isolation and quarantine, and resource allocation have been identified (Leung et al., 2008) while a lack of assistance in a pandemic situation or non-compliance may be a threat to public health (Tsai & Wilson, 2020). In light of the current Covid-19 pandemic, instructions such as staying home, physical distancing and frequent handwashing become unmanageable among homeless people, especially if networks that are essential for their survival start to collapse. This paper, which is part of a larger international project on homelessness and pathways to social inclusion (CSRP No. IZHRZO_180631/1), aims to examine the impact of the Covid-19 pandemic on people experiencing homelessness in Zagreb and Split. Based on ethnographic fieldwork, this qualitative study explores the daily life experiences of this socially excluded group as well as their coping strategies during this crisis. Using a holistic perspective, we also analyse institutional and non-institutional forms of support as well as national and local responses to the pandemic. Although new problems and challenges related to service availability/access as well as criminalisation/punishment of life-sustaining and human activities can be identified, this pandemic is 'a crisis within a greater crisis' for many homeless people who belong to one of the most socially marginalised and invisible groups of citizens in Croatia.

Key words: homelessness, crises, vulnerabilities, Croatia

Alone in a Silent City. Homeless Population in Rome During the Covid-19 Emergency

Folco Cimagalli[1], Cristina Sofia[2]

[1]LUMSA, Italy; [2]Sapienza University of Rome

The homeless (OECD 2020) is a singular and controversial figure (Anderson 1923; Bauman, 2005): the scarcity of goods and the absence of a stable shelter is sometimes associated with a spatial mobility that connotes the subject as elusive, unpredictable and alien to the usual social dynamics (Paolantoni & Zuccari 2014; Polin 2017). This singularity - combined with social invisibility and collective de-responsibility (Barnao, 2004; Cesareo &Pavesi 2019) - determines uncertainty and, often, the absence of adequate assistance and care policies (FEANTSA 2019; Farrugia & Gerrard 2016; Schweiger, 2013; Minnery & Greenhalgh 2007).

The paper describes the situation experienced by the homeless living in Rome during the lockdown and in the immediately following phases. The research jointly analyzes the reception system implemented by the formal and informal services and the strategies activated, in the shortage of information and resources, by the homeless themselves.

The study, in addition to considering some institutional statistical data, makes use of semi-structured interviews addressed to the representatives of the territorial organizations, and biographical interviews addressed to homeless people in the city (Meanwell, 2012).

The research depicts a frame of great stress for local welfare - lacking in network planning and coordination - and, at the same time, highlights how the homeless are social actors, still capable of expressing agency and acting strategically.

1351

Providing Support To Homeless: The (De)Cooperation Between Institutions and Squatters Activists During The Sanitary Crisis In Saint-Etienne, France

Lola Vives

Université Jean Monnet, France

The COVABRI project is a collaborative research conducted at Saint-Étienne (France) aiming at investigating and analyzing the diverse adjustments of services towards homeless during the sanitary crisis in French local context. Saint-Étienne is a medium size town, a former industrial town with a higher rate of poverty than the French poverty rate. There is a wide range of services for homelessness : accomodation, shelters, housing supports, food supports, outreach psychiatric team from institutionnal or self-organized organization.

Launched the 1st day of the 1st lockdown in 2020 March 17th, the research starts a second phase of the investigation through thematiques widening and researchers recruitment, a 5 researchers team. From an ethnographic perspective and using interviews, our interest is to document the plurality of viewpoints : institutionnal stakeholders, front-line workers, services providers, homeless themselves and to assess the effects (or not) of the sanitary crise.

In this investigation, I am focusing on food support and self-organized solidarity networks, mostly from « housing » activists, squatters movment. My first assumption is a reconfiguration, that might be contextual and ponctual, of the connection between institutionnal organizations and housing activists. The aim is not to focus on activists as an oppositionnal or critical groupe, but as a complementary support ; people provide actions in parrallel of services providers and they have been cooperating together on occasions.

In this presentation, I intend to discuss empirical data and to emphazise the cooperation and de-cooperation process of involved individuals, institutional, professional or activits, to provide support to homeless persons.

Too Late For Trust: "I Would Rather Sleep On The Streets"

Irina Zamfirescu

University of Bucharest, Romania

In the last ten years little has been made for the urban poor in Bucharest, local authorities deciding on a laissez-fair strategy. The public discourse and the administrative agenda of the local decision makers have been focused on the urban development, with little to no attention paid to the people affected by extreme poverty. Therefore, the social services aimed at homeless people in Bucharest are rather minimal. The ethnographic material I have gathered in my 7 years research into poverty in Bucharest indicates an acute lack of trust between homeless and representatives of the social care departments in Bucharest. Along the years, NGOs compensated for this mistrust between the urban poor and local authorities, providing food, elementary medical care, infrastructure for personal hygiene and shelter. During pandemic, they have continued to provide social services that would not put at risk of infection the urban poor, therefore they could not offer shelter nor the mobile shower service, both essential in pandemic times. This led to homeless people preferring to sleep on the streets than to access public shelters. In order to identify the exact reasons for which this happened, I have conducted several interviews with homeless people and public employees in charge with managing the biggest public shelter in Bucharest. The conclusions of this research consolidate the image of a weaken social system that has failed in its very first responsibility – building trust.

RS01 | After Weber: Making Alternative Ethical Rationalities 'Knowable'

The 'Spirit' of Schooling: Personal Stories of Ciganos Students of Portuguese Secondary Education

Pedro Jorge Caetano[1], Manuela Mendes[2]

[1]Universidade Nova de Lisboa, Portugal; [2]CIES-ISCTE, Portugal

Max Weber deplores the ecological domination of instrumental rationality in The Protestant ethics and in the spirit of capitalism, to the detriment of the rationality of value-oriented action in the social conduct of individuals. Weber puts religion and the values it professes as a driver of individuation, relatively free from the pressure of adapting to the environment. Indeed, the concept of vocation becomes a key to the interpretation of ethical rationalization process.

One can find an illustration of the Weberian ethical rationality among the Portuguese Ciganos/Roma who, despite the increasing economic pressure on their way of life - the traditional fairs -, seek alternative means of subsistence via schooling, without denying the aspects that are core to its identity and tradition.

Ciganos/Roma students are characterized by a high rate of early school leavers in Portugal, with a very low number of students attending secondary education as well a strong ethnic segregation in schools. In this context, an action-research project entitled "The school performance of the Roma students" was launched with the aim of discovering the achievements of Ciganos/Roma in secondary education.

This communication is based on the interviewing of 23 gypsy students from the Metropolitan areas of Lisbon and Porto. Preliminary results suggest that despite the economic problems that affect the continuation of their studies, academic success of young Ciganos/Roma is facilitated by the influence of religion and their respective values. In this way, the concept of vocation becomes relevant to understand their schooling.

The Environment As A Good To Defend And Preserve - Grammars Justifying The Ways Of Involvement And Participation In Environmental Associations

Pedro Francisco Rodrigues Pais Duarte

NOVA University Lisbon, Portugal

The environmental problems with which humanity is generically confronted, allow and invite the most concerned and informed subjects to a committed civic participation, which, in the great majority of times, is framed in institutional contexts specifically constituted for this purpose.

This presentation intends to interpret, according to the analytical framework of Sociology under the Weberian perspective, the forms of involvement and participation of the individuals in the Portuguese environmental movement through the deconstruction of the grammars' justifying action and associated forms of judgment.

In this way, then, the practices of volunteers, their motivations, values and ethics of action will be examined. The results arise from a study carried out in an environmental association (Quercus) and they will allow us to understand and explain the different sorts of associative involvement of the subjects who fight for this cause, which are differentiated according to the judgment made by the actors in context.

Keywords: Political Citizenship; Environmental Mobilization; Associativism; Ways of Action.

1353

Professionalism as An Unfinished Ethics of Global Citizenship: A Weberian Understanding of the Relationship between Modern Profession and World Society

Po-Fang Tsai

Graduate Institute of Humanities in Medicine (GIHM), Taipei Medical University, Taiwan, Taiwan

In the past decades, the ideas of global citizenship and its related ethics, in contrast to the ever mainstream form of citizenship based on nation-state formation, have become a crucial alternative ethos of citizenship practice and education around the world. The idea of global citizen often comes with dual-facet topics, such as GCE (global citizenship education), ESD (education for sustainable development), and SDGs (sustainable development goals). Besides, it not only projects an actor-figure that is named with active, creative, or inclusive citizen, but also requires a serial of capacities such as cross-cultural communication and dialogue, critique with justice, concerns of human happiness, or earth-centered values. Thinking this with a Weberian viewpoint, the ethos of global citizen, however, would not naturally go along with our globalized world, but an alternative ethical rationality to modern society. This research proposes a Weberian analysis of the global-citizen ethos in three aspects: (1) I attempt to revisit Weber's insights on work ethic, both religious and vocational, and extend it to ethics of modern professionals; (2) I try to construct a Weberian 'elective affinity' between the professionalism ethic and the spirit of global citizenship; (3) I deploy a thought experiment to view both professionalism and global-citizen as an unfinished yet becoming ethics in our world society. In summary, the culture of the modern profession generates not only its self-regulation ethic, but also knowledge of the ideal global citizen, basing on the homology of the two projections of human-actors in the future.

"Ethics and Rationality in Social Simultaneity"

Emanuela Ferreri, Ilaria Iannuzzi, Romina Gurashi

Sapienza University of Rome, Italy

The paper aims to revisit some of the key themes of Weberian sociology and offer new insights into issues such as rationalisation and modernisation; control and domination of the world; disenchantment and re-enchantment of the world; social acting and underlying ethics; community relations, war and peace.
The specific focus of the work covers three core areas of reflection:
- Ethos and Spirit of Capitalism. The Weberian conceptual repertoire and its renewed applicability in the sociological investigation of the re-sacralisation of capitalism, which takes on the connotations of a new idolatry.
- The 'alternative' re-enchantment of the world. The critiques to capitalist idolatry materialised in the sixty-eight mass pacifist and nonviolent movements, recovered during the 1970s and 1980s and "disarmed" in the 1990s by the techno-élite of the network society (Duffield 2017), are now dusted off to propose new forms of re-enchantment based on the values of peace and sustainability.
- The cultural transformations of Capitalism. From the individual to the dividual. M. Weber according to A. Appadurai (2013; 2016). The case of derivatives in the financialisation of the economy.
Key words: Capitalism and social change; Cultural dimensions and economies; Peace research and no violence experiences.

From online activism to anti-racist protest. The political engagement of Portuguese Roma

Ana Rita Costa

ISCTE - University Institute of Lisbon

The growing use of digital technologies and social media in different contexts makes its transdisciplinary analysis important for understanding contemporary social phenomena and their multiple perspectives. One of ethnography's contributions has been to demonstrate that what people do with and within the digital world can differ radically, is deeply interconnected to everyday life and social realities, is not constant over time and, sometimes, can lead to social changes. Its impacts on

1354

social movements, in the mobilization, engagement and approximation of different struggles around common causes are known. The protests that broke out around 2011, the Arab Spring, the 15M-Indignados, and the subsequent Occupy, or later the #MeToo demonstrated the potential of online activism and social media in building the protest and "the power of real-time, open collaborations amongst like-minded citizens" (Postill 2014).

For weber, what is most important for understanding and interpreting social phenomena is social action, i.e., the individual's behaviours endowed with intentionality and that take account of the behaviours of others. This intentionality comes from their values, that are also shared. The particular point of view that the actor brings is what social scientists should try to understand. Digital technologies and social media are linked to the political emergence and engagement of Portuguese Roma. Proprietary platforms such as YouTube and Facebook, perceived as public venues, became central tools for the dissemination and creation of spaces for participation on their own terms. Based on an ethnographic study approaching the technological appropriations and the engagement of Portuguese Roma on social media, we intend to analyse how Portuguese Roma are disputing new imaginaries and power relations, considering their own (shared) values and motives.

Reflexive Analysis On The Limits and the Operability Of The Concept of Ethnic Goup Apllied to Roma

author

Maria Manuela Mendes[1,2], Olga Magano[1,3]

[1]CIES-ISCTE-IUL; [2]FAUL, Universidade de Lisboa, Portugal; [3]Universidade Aberta, Portugal

Max Weber was one of the most innovative sociologists of his time, among the vast and diverse contributions of his extensive work, in this communication we highlight his interesting importance and pioneering spirit in the analysis of ethnic and racial relations. Based on the fact that Romani people are the most numerous minority in Europe (10-12 million), in this presentation we aim to discuss the relevance of some forms of categorization of Roma/ Ciganos, namely those based on racial and ethnic belonging, revisiting Max Weber's writings. Having as background some qualitative studies carried out by the authors on Portuguese Ciganos/Roma in which in-depth interview techniques, observation and focus groups were mobilized, we intend to produce a reflective and critical analysis based on contemporary social theory about the limits and potential of interpreting Roma / Ciganos as an ethnic (and racial) group in the Weberanian perspective and the importance of these concepts in the construction

of a public representation of Roma as a target of public policies and as a form of self -representation as a crucial stage in a process of emancipation, empowerment and self-knowledge.

Social Prestige In Emigration Contexts. Returnees' Positions In A Romanian Multi-ethnic Context

Remus Gabriel Anghel
Romanian Institute for Research on National Minorities, Romania

In the past years there is a growing interest in analyzing processes return migration. The literature largely discusses return motivations, patterns of return and how returnees readapt to societies of origin. In this paper we interrogate on the role of social prestige in structuring social contexts of origin and returnees' positions upon return. In this respect, we build on the notion of prestige that was formulated by Weber, as a principle organizing social order and social hierarchies. The paper draws on a research in the city of Sebeș, Romania, wherefrom returnees belonging to different ethnic groups, Romanians, Roma, and Germans, renegotiate and assume different positions of status and prestige. This understanding of prestige provides an understanding on the role of prestige that structures local contexts in terms other than socio-economic positions. Besides, social prestige can also provide a unique angle to unfold local relations of inequality in migration.

The Multidimensionality of Deservingness and Social Closure – The (Un)Making of Ethnic Communities

Stefania Toma[1,2]

[1]Romanian Institute for Research on National Minorities, Romania; [2]University of Trento

It is doubtless that Max Weber had the greatest contribution to social theory and through this contribution he deserves to be placed in the pantheon of the history of sociological thinking. But his contributions and approaches are so vivid – despite its limitations, true, from our present perspectives - that he must be taken out from this (quasi)closed cabinet of great thinkers.

In my presentation I would like to address the already strategically exposed Weber-inspired concepts of deservingness and social closure through some ethnographic data collected in multiethnic communities in Transylvania. Different levels of social solidarity

characterize these communities. Ethnic Hungarians, Romanians and Roma are in constant negotiation of their identity and their status in the local society, adopting different kind of strategies to define who is the (un)deserving or to challenge their own outsider or poor status. In these contexts the structure and the agency are strongly connected, one of Weber's great contributions.

Acknowledging The Plural Weberian Rationalities In Clinical Embryology: When Moral Values And Affection Prevail Beyond Efficiency

Catarina Delaunay

CICS.NOVA - Centro Interdisciplinar de Ciências Sociais da Universidade Nova de Lisboa, Portugal

This paper addresses the plural forms of reasoning used by clinical embryologists when deciding the fate of the human embryos they create and manipulate in the laboratory setting through the application of assisted reproductive technologies (ART). Decisions include to transfer to the woman' uterus, to cryopreserve, or to discard. Our analysis is based on qualitative data from an ongoing research project, namely in-depth interviews with 18 clinical embryologists working at private and public fertility centres in Portugal. Embryologists display multiple perspectives on the criteria they use to evaluate and classify the quality, potential and viability of the embryos produced in vitro. Taxonomies and international guidelines, as well as statistical data (e.g. success rates) are largely used to qualify the embryos, showing that especially the youngest embryologists base their action on an instrumental rationality (efficient means and calculated ends recognized inductively). Beyond scientific and technological facts and theories as intellectual tools for action, some of them also mobilize alternative ethical rationalities. Moral valuations and legitimate rules/ends that are felt deductively play concomitantly an important role, in what can be seen as a value-rational action (especially when the embryo is perceived as potential life besides a cluster of cells). Moreover, affectual rationality governed by emotions, affects and feeling states (such as empathy with the beneficiaries), and traditional rationality based on habits and routines ("the embryologist's feelings" gained by experience) intervene too. Weber's distinctive concepts and theoretical contributions are relevant for rethinking professional practices within ART, and clinical embryology in particular.

Re-enchanting The World: Buen Vivir In Front Of Western Bureaucratic Rationality.

Rubén Darío Castellano Durán

Territorial Polytechnic University of Mérida, Venezuela, Bolivarian Republic of

The Andean Buen Vivir (Living Well) notion, a cluster of indigenous conceptions on human and nature relationship has been acknowledged as an alternative to Western development models and neo-liberal policies in some Latin American countries, although the implementation results are far to be substantive.

Besides social and political issues suffered in those countries during the last decade, the translation of Buen Vivir conceptualizations to policies has been mediated by the State, this imposing its structure, discourses, and practices on the indigenous Andean knowledge, practices, and rationalities and thus taming its original transformational potential.

In this regard, two questions will be posed. First, how the State copes with other rationalities challenging its discourse and practices; and second, the conditions of possibility of other rationalities could be locally incorporated in the State, transforming its ethical practices beyond instrumental rationality, assessing other forms of action and sociality.

A core premise is considering Latin America as constituted by the modern ethos despite the extant traditional societies in the continent; thus positing Modernity not as an exclusive Western European historical process but as a project with manifold possibilities to its implementation.

From this reflection, a prospect would arise: to situate our modern rationality in front of other human realizations, other rationalities and practices, in a required search of alternatives to deal with global issues menacing us all, from environmental concerns to social inequality.

The Ethical Dimension of Critique in Academia: Contesting Ethical Rationalities?

Francisco Durán del Fierro

UCL Institute of Education, United Kingdom

It has been argued that the gist of academic life across disciplines and universities is an endless critical activity (experience of critique) intended to 'the search of the truth' (Boltanski, 2011; Felski, 2015; Weber, 2004). This practice involves the compliance of a set of formal rules and procedures along with the persistent attachment to normative principles (Kim, 2020; Weber, 2004). In this paper, I propose – based on my ongoing doctoral thesis - a theoretical framework for the study of academic's everyday practices within universities in times of neoliberalism (Ball, 2015; Ball & Olmedo, 2013). Drawing on Foucault's distinction between 'philosophy' and 'spirituality' laid out in his latest lectures at the College de France (Foucault, 1997, 2006), I will distinguish between the 'epistemological form' and 'the ethical form of critique'. The former relates to how individuals exercise their 'faculty of reason' to contest prevailing modes of social life, whilst the latter stresses a certain form of critique that, without sticking to values, gives rise to new forms of one's behaviour and social life. For instance, the traditional values of academia (autonomy and objectivity) seem to be a hindrance rather than a way of thinking and acting differently. This distinction is relevant as it helps us to discuss the way in which rationalization, values and ethical practices are interwoven. Thus, I argue that it is not possible to rests upon values or normative principles to counter the hegemony of instrumental rationality within academia.

The Less Agreeable Side of Charisma: Incredulous Onlooking and Anti-structural Power

Paul Joosse

University of Hong Kong, Hong Kong S.A.R. (China)

Charisma is often theorized as a form of cultic insularity consisting of "bonds" between leaders and followers. Its world-historical significance, however, stems not from this inward-intimacy, but rather from an aggressive outward posture which occasionally radiates through traditional and/or rational-legal social orders, destabilizing and overturning them. This article focalizes charisma's consumptive leading edge by distinguishing and describing the 'incredulous onlooker'—a type of non-believing institutional elite who exists at the interface between the charismatic community and wider society. Incredulous onlookers intend to quash charismatic movements, but their interventions counterintuitively (to them) work to augment charismatic potency and proliferate charismatic rupture. They do this in two ways. First, their affective signals of shock, exasperation, and moral outrage lend a sense of gleeful wonder (even "miraculousness") to the incipient leader's early successes, even if such successes are initially relatively minor. Second, as institutional-organizational mouthpieces, incredulous onlookers widen the aperture for extraordinary expression within the institutional spheres they represent, bringing their full interlocutory capacity within reach of the charismatic leader. Together, these factors account for charisma's revolutionary potential. Observational and interview data reveal that incredulous onlookers played a key role in buoying and propelling the "Trump phenomenon."

RS02 | A New Normality For a New Europe? - ¿Una nueva normalidad para una nueva Europa?

Happiness and Love During the Covid-19 Crisis: a Relational View

José Antonio Rodríguez Díaz, Aitor Domínguez Aguayo

University of Barcelona, Spain

During the long and ongoing COVID-19 pandemic most of the countries have acted in a very similar way, trying, with different luck, to stop its spread by closing borders, confining their populations and applying strict social distancing measures.

In order to begin to analyze the social impact of these measures, we

focus on some aspects of daily life and study changes in actions and activities that people do in order to feel good, and in moods and feeling of happiness before, during, and after the lockdown. We also look into values and orientation towards others during this period of time as proxies of love.

We use data from our online survey "Social relations and daily life during the COVID-19 crisis" launched on April 11, 2020 (2,652 responses obtained by May 12, 2020 in the Spanish version of the survey). To compare the experiences through the pandemic we will use data from the second wave of the Spanish version of the online survey (currently open).

Along standard statistic procedures we will use Social Network Analysis approaches and visualization techniques to map the system of relationships between actions, moods, feelings and love towards others previous to the crisis and during and after confinement in order to assess the main changes in their interconnection and inter-embeddedness.

The response to the COVID-19 has been a social "experiment" of a global and massive social lockdown affecting the dominant system of relations and contacts resulting in changes in ways to see and live life and in ways to value others and the social.

New Normality and New Behaviours Towards Hooking up Among Young Girls?

Guiomar Merodio[1], Garazi López de Aguileta[2]

[1]Universidad Nacional de Educación a Distancia (UNED);
[2]University of Wisconsin-Madison

The COVID-19 pandemic is deeply influencing changes in society and among individuals. A new sphere of analysis related to how the pandemic is influencing behavioural changes in sexual-affective relationships emerges. Recent studies are studying changes in the habits of stable couples (Yuksel & Ozgor, 2020). However, fewer studies have focused on changes among sporadic relationships, particularly on the potential influence of the awareness regarding the risk of becoming infected on changing habits and behaviours towards casual sexual relationships among youth in the new normality. To fill this gap, an exploratory study based on pre-test and post-test questionnaires was conducted. This study has been carried out following a qualitative method with a communicative approach (Gómez, 2019) with twenty young women in Spain during the spring of 2020. The study focused on analysing changes related to tongue-kissing ("morreo" in Spanish) in hook-ups. Findings provide evidence that suggests how the new normality might contribute to changing memories, perceptions, and intentions of participating young women towards tongue-kissing hook-ups from the past and in the future. These findings have potential implications not only in what could become a decrease in the contagion of COVID-19 or other infectious diseases; it can also have implications for the future sexual-affective relationships of many youths, providing greater freedom to break free from coerced preferences (Ruiz-Eugenio et al., 2020) and engage in quality, egalitarian relationships.

Close Normalities of Fourth Kind

Sowelu Avanzo, Vincenzo Giorgino

University of Torino, Italy

Covid-19 pandemic is showing a societal crisis which engendered critical attitudes towards the limits of our current social contract, and the functioning of our institutions.

This has been particularly evident as regards the formulation and implementation of public protection policies.

Covid-19 has also catalyzed new forms of social interactions based on digital technologies, and fostered technological innovation.

This trend will potentially strengthen the monopolistic turn of platform companies, supported by the alliance between a welfare state based on new forms of control, and restriction of personal freedom.

By contrast, in the meanwhile, initiatives related to self-organization of communities and co-provisioning partnerships between governments and citizens based on DLTs (Distributed Ledger Technologies) are being developed.

Our presentation is based on the framework of pandemic work, that is the relational work performed by agents, whether part of a network or not, in dealing with the pandemic and its effects. In this light, we will discuss the experience of the use of "Beckman Echo 305". This is a case study showing how the existential risks and transformation of biopolitics led to the adoption of approaches based on Citizen Science, co-production in applied science and biotechnology.

Our presentation also addresses the forthcoming action-research aiming to drive the valorization of data as a citizens' ownership. This initiative is important to oppose the current trend leading to centralized data-silos.

Moreover, ongoing social experimentations aiming to empower communities through tokenization will be considered. In this respect, DLTs enable disintermediation of social and economic processes, hence facilitating commoning practices.

Postmodern Attitudes to Health and Vaccination Hesitancy in Croatia: A Focus-Group Study

Anita Dremel

University of Osijek, Croatia, Croatia

The aim of this study is to discuss postmodern attitudes to health in relation to vaccination hesitancy in Croatia based on focus group discussions, conducted asynchronously with 40 Croatian citizens in October 2020. The data were coded and analysed with the help of NVivo software. The study is part of the wider research project funded by the Croatian Science Foundation. Our data suggest that vaccination attitudes should be seen as a continuum ranging from ardent advocacy of mandatory vaccination to a complete refusal of any vaccine, whereby the term vaccine hesitant is reserved for a heterogenous group (where people can refuse only some vaccines, delay vaccine schedule, refuse non-obligatory vaccines etc.). The results of iterative thematic analysis reveal risk perception, distrust in the healthcare system and lifestyle factors as relevant determinants of vaccine hesitancy. As the attitudes connected with vaccine hesitancy are, among other factors, under the influence of wider socio-cultural context, in this paper the focus is put on examining our results in the broader context of postmodern health beliefs, which include but are not limited to the advocacy of a holistic approach and unobtrusive treatments, patient participation, harmony of body, mind and spirit etc.

Motivations of volunteers to join the European Solidarity Corps Projects in Wroclaw

Azad Heydarov

University of Wroclaw, Poland

This article explores the social motivations that bring young people to join the European Solidarity Corps projects in Wroclaw during Post-Pandemic. The study aims to present the manifested and underlying causes for the participants joining the program and discuss how their motivations evolved during mid and long-term volunteering.

Young participants from different organizations in Wroclaw, Poland, were interviewed. Ten semi-structured interviews provided primary data for the qualitative data analysis. Volunteering alongside respondents and memos from everyday activities provided an in-depth view of the subject.

Conducting volunteer activities for international organizations in foreign countries has been a relatively new approach for young people to cope with life uncertainties. Participants engage in volunteer activities with mixed motivations regarding their circumstances - e.g., negotiating a better life strategy, maintaining upward mobility while increasing social and cultural capital. Socio-economic background, family, country of origin, skills, and education were the primary categories that distinguished volunteers' motivations.

Believing in European values and proudly volunteering in their dissemination was explicitly manifested in every respondent's interview. Involvement in at European Union-wide project encouraged them to raise a critical voice on social matters and – especially those organizations misusing the European Commission's resources, and eventually treat the volunteers as a source of cheap labor.

The research findings may be useful for future participants of the program, current volunteers to reflect on their experiences because none of the respondents were prepared for the challenges and often mentioned in the interviews the feeling of self-lost.

A systematic review about European Mountain Tourism Regeneration in the Covid-19 Era

Blanca Vidao Teruel

University of Zaragoza, Spain

In this called European "new normality", could covid-19 facilitate an accelerated shift towards a more sustainable kind of tourism, favouring already existing related trends? What kind of opportunities of tourism regeneration will come to fruition after the covid-19 pandemic?

Mountain tourism is rising in popularity year after year, in detriment of typical beach destinations. The benefits of nature for human well-being are traditionally well-known. Mountain areas possess all necessary natural resources which attracted visitors in this "post-confinement" period. Nevertheless, tourism as a whole, and specially mountain tourism from the Pyrenees, currently face a double crisis, sanitary and climatic. The present, practically total stop of societies due to lockdown and mobility restrictions, has generated serious economic consequences. However, it has also lead to new hopes for environmental renewal.

This study conducts a methodologically systematic review of scientific literature on the above matter. To this purpose, a total of 24 specific articles have been analysed, within the three platforms selected according to their impact in the scientific community (Scopus, WoS and Dialnet Plus).

This literature review highlights the present state of tourism regeneration and the transformation within the sector, demonstrating its remarkable capacity for reinvention and resilience as well as the ability of promote innovative, sustainable experiences.

In the present uncertain "covid" and "post-covid" context, this study suggests future lines of work aimed at the diversification of activities adapted to a sustainable mountain tourism and new travel habits. Finally, it also pinpoints opportunities for international cooperation towards the development of cross-border territories.

Covid-19: Un Tsunami Que Rompe La Cohesión Social

David Pac Salas[1], Jaime Minguijón Pablo[2]

[1]Universidad de Zaragoza, Spain; [2]Universidad de Zaragoza, Spain

La ponencia que presentamos se ha construido a partir de una lectura conjunta del libro que hemos coordinado "Incertidumbres en tiempos de pandemia: una mirada hacia el futuro". Se han identificando las grandes brechas que la COVID-19 ha abierto o agrandado en diversas dimensiones básicas para la integración y cohesión social: salud, empleo, educación, servicios sociales, relaciones de género, servicios sociales, etc. Más allá de los efectos iniciales, el análisis pondrá el punto de mira en las consecuencias a futuro sobre los peligros de ruptura de la cohesión social, dibujando una sociedad a dos velocidades, en la que un volumen importante de ciudadanos y ciudadanas se pueden quedar descolgados del progreso y del bienestar.

Igualmente, en la ponencia abordaremos las ventanas de oportunidad que se abren ante las instituciones y la sociedad civil, como posibles vías alternativas para reconducir o, al menos, paliar, ese proceso de deterioro y suturar las brechas que ha producido el tsunami de la COVID-19 en España.

El Impacto de la Pandemia y el Confinamiento en Nuestras Vidas

Victor Sanz, Gema Alises, Angela Sánchez, Rubén Martín, Paola Cauja, Adela Palazuelos, Marta Sancho, Adrían Corona, María Gómez-Carrillo

ISCSP, Universidade de Lisboa, Spain

La pandemia y el confinamiento han afectado profundamente la vida social y económica en España. Colectivos como las personas con discapacidad y sus residencias se convirtieron en un foco de atención sanitaria y mediática, por el riesgo añadido de contagio y vulnerabilidad de sus residentes. Sin embargo, sus experiencias de la pandemia y el confinamiento no han sido tenidas en cuenta. Además, han puesto de manifiesto que, muchas de las cosas que no se creían posibles, como la conexión remota a reuniones virtuales y el manejo de ordenadores, han funcionado, cerrando en parte la brecha digital existente.

Este paper presenta los resultados de un proyecto de investigación participativo co-liderado por investigadores con discapacidad intelectual (5 mujeres y 3 hombres) en el que se exploró los efectos del covid-19 y del confinamiento en la vida de las personas con discapacidad intelectual. Este proyecto ha sido realizado en colaboración con una investigadora de doctorado de la Universidad de Lisboa en el marco de un proyecto europeo (Disability Advocacy Research in Europe).

Para ello, se llevó a cabo una metodología mixta vía remota y se utilizó una encuesta y grupos focales para explorar cómo habían vivido las personas con discapacidad intelectual el confinamiento, si tuvieron acceso a información en un formato accesible, cómo han gestionado las respuestas emocionales a los cambios y cómo se han adaptado a las restricciones en la vida cotidiana y en sus centros de referencia.

Identidades y Practicas Sociopolíticas Desde el Confinamiento Social, Narrativas Juveniles de Colombianos en España.

Henry Steven Rebolledo Cortes

Universitat de Valencia, España

Las identidades y practicas socioculturales y politicas de jóvenes migrantes son diversas y divergentes. Llegan y reconstruyen procesos de adscripción identitaria de acuerdo con el entorno conservando vinculaciones de acuerdo con su condicion juvenil, de genero, comunidad o etnia. Pero las identidades culturales, políticas, los vínculos de cohesión social que se reconstruyen, son producto de un proceso de construcción social demasiado hibrido y cambiante, es generado desde los contextos de origen por las condiciones sociopolíticas, por los sistemas culturales, pero tambien desde el entorno de llegada. Ahora basado en las condiciones recientes de confinamiento social, de limitacion del trabajo, de la movilidad, muchos de estos jóvenes viven condiciones precarias y que tendra que repensarse en el corto plazo. Los jovenes con adscripciones identitarias, vínculos de descendencia, originarios de territorios, comunidades y familias étnicas, afrodecendientes o en situacion de pobreza, en cuyo caso la condición afecta o incide de manera significativa y diferente en la dinámica de migración nacional y trasnacional, marcándose en las relaciones, discursos y prácticas que guarda con la sociedad de acogida, generan acciones políticas de organizacion y movilización interesante por advertir. Se presenta el avance de una investigacion doctoral que se pregunta y cuestiona la manera como se reconstruyen las identidades culturales, políticas y los vínculos de cohesión social de jóvenes colombianos inmigrantes en España, clasificados por sus condiciones como la clase social, la adscripción o descendencia étnica, racializadas, que por sus condiciones de encierro y limitacion por pandemia se vinculan a organizaciones, movimientos, acciones en el pais. Parte del uso de las narrativas comouna estrategia para recueperar desde los lenguajes, las expresiones y vivencias, la vida misma de los sujetos en una clave hermeneutica.

El Covid-19 como Agente de la Metamorfosis del Mundo

Jordi Lopez Ortega

Universidad Politecnica de Catalunya, Spain

Ulrich Beck retoma la expresión de Herbert Marcuse para apuntar hacia un catastrofismo emancipador. Del mismo modo que el riesgo climático global es el preludio de nuevas normas, una nueva normalidad, el Covid-19 tiene consecuencias secundarias: provoca una conmoción antropológica, política y social. La metamorfosis del "mal" primario en "bien" secundario usa el Fausto maniqueísta. No vamos a la antigua normalidad sino una nueva. Richard Horton, director de The Lancet, plantea que no estamos ante una pandemia sino una sindemia. Recuerda el debate, hace un siglo, entre la "enfermedad por gérmenes" de Robert Koch frente y el "terreno biológico" de Claude Bernard -la medicina experimental y fisiología quedaron eclipsadas. En el siglo XXI nos enfrentamos a una pandemia intentando controlar el patógeno, las líneas de transmisión, etc., como se hacía con la peste medieval. La naturaleza sindemica, argumenta Richard Horton, exige una aproximación más matizada que la que guía la "ciencia" a los gobiernos. Por un lado, tenemos una desigualdad socioeconómica, esto es, una enfermedad no transmisible (ENT) que interactúa con el síndrome respiratorio agudo severo (SARS-CoV-2); por otro lado, se correlación entre el virus y el deterioro de los ecosistemas, desforestación, etc. Nos lleva a abordar el Covid-19, o desde pretexto son desde un contexto más amplio, esto es, tanto desde una crisis de civilización hasta cuestionar el paradigma epidemiológico centrado patógenos externos. La metamorfosis es un término adecuado, pues no es una revolución, ni reforma, ni algo ideológicamente orientado, es una catarsis social que derrumba los muros mentales.

La Brecha Digital Del Alumnado (y Sus Familias) y Del Profesorado en la Enseñanza Primaria en España. Impacto Del Cierre Escolar Para el Aprendizaje y la Igualdad de Oportunidades.

Leopoldo Cabrera, Gabriela Sicilia, Gustavo Marrero, Carmen Pérez, Carlos Bethencourt

Universidad de La Laguna, ULL, Spain

Los centros educativos en España permanecieron cerrados de marzo a junio de 2020 por el coronavirus. La enseñanza telemática sustituyó a la presencial y la tenencia de ordenadores y el dominio de competencias digitales se hicieron imprescindibles en el proceso formativo en todos los niveles educativos, pero más en la enseñanza primaria donde aún no se han desarrollado plenamente las competencias digitales del alumnado. Esta comunicación estudia la brecha digital en la enseñanza primaria y muestra sus efectos negativos genéricos sobre el aprendizaje, más aún en el alumnado de familias con bajos niveles educativos, bajas rentas y en las formadas por un solo progenitor (madre, casi siempre), que escolarizan más a sus hijos-as en la enseñanza pública, agrandando la desigualdad de oportunidades educativas de los centros escolares abiertos.

Tecnocuidados En Los Hogares. Cualificaciones, Estrategias y Desafíos Ante Los Requerimientos Tecnologícos en Contexto de Pandemia SARS-CoV-2

MaríaTeresa Martín-Palomo[1], Carmuca Gómez Bueno[2]

[1]UNIVERSIDAD DE ALMERÍA, Spain; [2]Universidad de Granada, Spain

En esta comunicación se analiza el papel de las tecnologías en el trabajo de cuidados desempeñado por las trabajadoras del Servicio de Ayuda a Domicilio (SAD) en el contexto de la pandemia ocasionada por el SARS-CoV-2. Se presentarán los primeros resultados de un proyecto de transferencia Sostenibilidad de la atención a las personas en situación de dependencia: experiencias y dilemas en el diseño de tecnocuidados (PT18-2624; PAIDI2020), sobre la percepción de las tecnologías, potencialidades, limitaciones y resistencias como herramientas profesionales para dicho colectivo. Mediante un abordaje cualitativo, se analizan tanto las cualificaciones requeridas, las que se activan al incorporar las tecnologías al trabajo cotidiano de las auxiliares, así como los desafíos que encuentran en el contexto de la pandemia, las estrategias que despliegan, sus adaptaciones y resistencias a los nuevos requerimientos.

Impacto Del Cierre de Escuelas Por el Covid-19 en el Derecho a la Educación

Luca Chao

A Coruña University, Spain

Como era de esperar, ni el sistema educativo español, ni el sistema educativo gallego en el que centramos nuestro estudio de caso, estaban suficientemente preparados para afrontar el reto que supuso y sigue suponiendo la pandemia provocada por el SARS- CoV-2 en la enseñanza. La suspensión de las aulas presenciales por más de tres meses, nos situó en cabeza de los países de la OCDE que más tiempo cerraron los centros de enseñanza. Esto hizo que docentes, equipos directivos, familias y alumnado se enfrentaran a un sistema educativo en línea claramente insuficiente.

El objetivo principal de este trabajo es analizar el impacto de la pandemia de la covid19 en el desempeño educativo.

En este sentido, las preguntas fundamentales que trato de responder son: ¿cómo impactó la covid19 en el desempeño educativo? ¿Cómo valoran los docentes este impacto? ¿Y el alumnado? ¿Estábamos preparados para una enseñanza de calidad a distancia?

Para tratar de responder estas cuestiones realizamos un estudio de caso en un centro educativo de secundaria de Santiago de Compostela combinando el uso de una encuesta con un trabajo cualitativo centrado en grupos de discusión.

Un estudio que esperamos sirva de análisis sobre el desempeño educativo del curso pasado y ayude a abrir necesarias reflexiones para el futuro

Edadismo Laboral Y De Género En Tiempos De Covid-19: Medidas Necesarias

Mª José Torres Haro

Universidad de Almería, Spain

La edad en su dimensión social, como relación de poder y concepto construido social y culturalmente, actúa como una potente barrera de acceso al mercado laboral y es además un motivo de expulsión del mismo. Este criterio de discriminación afecta indistintamente a hombres y a mujeres; pero son ellas las que lo sufren en mayor medida. Las consecuencias sociales son muy graves: pobreza, precariedad laboral, economía sumergida y exclusión social.

Esta preocupante realidad se desprende tanto del análisis de los datos publicados por el Instituto Nacional de Estadística, los Servicios Públicos de Empleo y Servicios Sociales así como de las entrevistas realizadas a personas desempleadas de larga duración mayores de cincuenta años e informantes claves pertenecientes al ámbito de la intermediación laboral. No por predecibles los datos dejan de resultar alarmantes. Cada vez más personas desempleadas se encuentran en la díficil tesitura de ser consideradas demasiado jóvenes para jubilarse y demasiado mayores para trabajar. Esta situación se ha visto aún más agravada durante la pandemia del Covid-19.

Es necesario identificar los mecanismos de discriminación para poder combatirlos eficazmente. La presente investigación, se realiza bajo el paradigma feminista y desde una perspectiva interseccional; al analizar la importancia del edadismo y sexismo como discriminaciones laborales que intervienen significativamente en el desempleo de larga duración y que a su vez interactúan con otras variables discriminatorias como la etnia, el origen o la nacionalidad.

Palabras Clave: Edadismo, Mujeres, Desempleo, Interseccionalidad.

'Failed Architecture'? Visions, Images and Social Realities of Large-Scale Housing Architecture

Eveline Althaus[1], Marilena Prisco[2], Tino Schlinzig[1]

[1]ETH Zurich, ETH Wohnforum – ETH CASE, Switzerland; [2]Università degli Studi di Napoli Federico II, Dipartimento di Architettura, Italy

Similar to a burning glass, architecture allows the study of logics, intentions and codings inscribed in the built environment as a structure in constant interplay with the social. As a materialized texture it may provide trajectories for understanding how practices and knowledge of different actors – institutions, inhabitants, technicians, etc. – are embedded in the built form. Our contribution first aims to reconstruct the initial visions and discourses on postwar industrialized large-scale architecture by drawing on research on Swiss system buildings of the 1950s – 1970s. It asks for architects' concepts on society and the role of technology expressed in specific design principles and ideas of living and dwelling materialized in built structures. We reflect on todays' socio-material realities on site through in-depth case studies of two housing estates in Italy (Lotto O, Naples)* and Switzerland (Tscharnergut, Bern)* from our ongoing research. In doing so, we direct attention to the physical conditions of the built environment and the wider urban context, formal policies and informal norms as well as the social practices of inhabiting, maintenance, community initiatives, exclusion and inclusion. These ethnographic insights reveal that ongoing stigmatization processes are powerful in both cases – also if the settings are very different – and that the residents' inside perspectives considerably vary from the clichéd outside image of the estates. This paper questions normative concepts such as 'failed architecture' to enhance our understanding of the complex interrelationships of the built environment and the social in large-scale housing architecture.

Behind the Closed Doors of Yugoslav Modernism: the Practice of Everyday Life and Social Reality of a Glazed Balcony

Sonja Lakić

Independent Researcher / The School of Buying Time, Bosnia and Herzegovina

This study (re)visits the actual (conduct) of life within what remains from the former Yugoslav modernist collective housing stock through self-developed mixed-method micro-level research approach of "Apartment Biographies" (Lakić, 2018), using architecture as an excuse and a tool, portraying the contemporary practice of the post-Yugoslav everyday life. The research, based on specific kinds of ethnographic encounters behind closed doors of domestic interiors, visits the lives of rebellious non-expert residents, who, relying on the help of their families and friends, contested original architectural design, modifying their apartments in a mostly illegal manner. Inspired by the "House-Biographies", which employs the smallest urban scale of all hence uses an individual apartment as "a starting point for higher-level thoughts and actions" (Althaus and Glaser, 2013), the study narrates the post-socialist transition-induced behavioral shift of the masses, ethics and new cultural values, through the eyes of privatised dwellings. Taking off from the phenomenon of illegally glazed balconies, the research collects different residing experiences and dwelling histories doing the storytelling through autobiographical narratives, drawings, photographs, discussing DIY-transformations of personal domestic space as both a visual hence physical alteration of the built environment, simultaneously contemplating them as a testimonial on how the transition is understood, experienced, interpreted and lived. Adding more of an understanding on the interrelation between architectural and social change in the particular geo-political context by observing the dynamic relationship between material and societal dimensions, the research blurs boundaries between disciplines, questions architectural promises and programs, authorship and architect-prescribed use of space, individual freedom, and citizenship, portraying a perplex love-affair of people and their homes.

Flexibility as a Form of Work – Sociological Reflections on an Architectural Dream

Kerstin Sailer[1], Adam Wood[2]

[1]University College London - Bartlett School of Architecture, United Kingdom; [2]University College London - Institute of Education, United Kingdom

The architectural historian Adrian Forty explained mid-century modernists' interest in flexibility as a receptacle of hope, a way to combat determinism by introducing the possibility of change through users' active involvement in defining function. Flexibility continues to be repurposed, sustaining architectural dreams from permanent user-consumer adaptability to environmental drivers, defeating the common 'demolition and rebuild' approach.

In this paper we offer a way of thinking sociologically about architectural expressions of flexibility and flexible space by building on Merton's unintended consequences and applying it to two case studies in education settings. The first presents data from a 2-year ethnographic investigation in a northern English school to show how teachers struggled to make their so-named flexible learning spaces, genuinely flexible-in-use. The second case study draws on a longitudinal observation of continuous changes to a higher education building to accommodate different requirements throughout the academic year, highlighting usage conflicts.

We argue that flexibility, rather than a spatial attribute, is more usefully approached as an achievement and form of work requiring people to have and use resources (designed space, clearly, but also time and often additional materials), motivation and effort. This more situated account of flexibility now clarifies for whom flexibility is important and why, and thus points to the unintended consequences of design-for-flexibility. Reflecting on our findings, we close with observations on how an architectural sociology of this kind can provide deeper understandings of societal issues than each discipline alone.

Eat, Drink, Work, Dwell: Investigations in the Materiality of Social Practices

Julia von Mende

Bauhaus-Universität Weimar, Germany

Eating and food preparation are in the focus of the media and public discourse. In contrast, cooking at home in the everyday lives of urban dwellers in German metropolises became increasingly uncommon over the last decades, while the food-delivery industry has seen enormous growth. This paradox raises questions about the role of the kitchen in the domestic sphere and about dwelling practices in the urban context more generally. Eating and dwelling have often been subject to studies in social sciences. However, little is known about the role of material space (in the focus of architecture) inherent to social practices of eating, food preparation and dwelling, widely explored in cultural studies and sociology.

Hence, this contribution based on the author's dissertation thesis (2020) and further studies, seeks to bridge this gap, exploring phenomena of spatialization of everyday social practices. Using a practice theory perspective, it empirically explores private households in Germany and related places out of home (like office kitchenettes, gastronomic venues, rental kitchens or traffic junctions) The research object's complexity is met by a methodological approach combining interviews with analytical architectural drawings.

Phenomena of blurring boundaries between the private household and its urban context, inversions of Erving Goffman's (1959) backstage and frontstage on the one hand, and persistent adherence to existing physical-material structures, on the other hand, are being identified. Through the lens of Hartmut Rosa's theory of "social acceleration" (2005) the contribution expands the perspective from the spatialization of everyday practice to its underlying social determinants.

Aesthetic Work in the Service of Capital – Promotional Online Staging of Investment-driven Housing Production in Vienna

Anita Aigner

TU Wien, Austria

Relatively unaffected by the Corona pandemic, business in the real estate industry is flourishing and the financialization of housing continues to advance. This is despite the fact that investing in 'concrete gold' has negative effects on the community, making housing increasingly expensive, even unaffordable, for many people. If we want to understand why housing is increasingly becoming a global investment product, we must also look at the advertising infrastructures and image products that have been profoundly reshaped by new digital technologies. Two studies are presented that address the online staging of investment apartments for small private investors in Vienna. Using the example of websites (of investment-driven new construction projects as well as of spezialized brokers), on the one hand, it is shown how housing is discursively transformed into an investment product for private small investors. On the other hand, websites and their elaborate image products (such as renderings, image films, virtual tours etc.) are examined in terms of how they entangle users emotionally and temporally. It is argued that the 'invisible' digital mediating structures that have become so commonplace in everyday life also help shape housing markets and our consumer behaviour. Instead of seeing the impressively realistic images merely as representations, they are conceptualised as 'market devices'. As such, they serve not simply to better imagine something that has not yet been built, but to sell apartments more quickly, i.e. to accelerate the capital turnover. What a sociological analysis of today's real estate marketing practices has to offer: a 'counter-knowledge' to the essentialist and normative 'investment knowledge' that also raises the question of alternative, more sustainable investment practices.

Homes In Mardin: Women's Reproduction Of Daily Life In Pandemic Times

Zemzem Taşgüzen

Mardin Artuklu University, Turkey

"The home is not the one tame place in a world of adventure; it is the one wild place in a world of rules and set tasks." G. K. Chesterton.
Pandemic has transformed our daily lives and domestic practices and has redefined the gender roles within those practices drastically. While it remains uncertain how long it will last, how this transformation takes hold in different contexts and how permanent these will be remains as important questions. Taking the historical city of Mardin as the case, this study aims to understand how women experience the home during the pandemic times and discuss the ways in which they reproduce the daily life in different housing typologies. Along with its unique topography, coexistence of different ethnicities and religions in the region for centuries affected Mardin's urban development and social and spatial character. Today, Mardin has an urban landscape consisting of various housing typologies where traditional and modern ways of domesticity coexist: traditional stone house, country house, apartments and gated communities. In-depth interviews will be conducted with women living in these four housing typologies, coming from different marital and employment status to understand new practices and how they transform the home, and how old/routine domestic practices have transformed over time and through the pandemic. Everyday narratives of individuals will be discussed through Lefebvre's concepts of production, praxis and rhythm. In every city, the daily production of women has a vital place in the context of social production, and this study aims to offer an insight into how the pandemic has affected this, drawing parallels between subjective and local and universal conditions impacting them.

The lived House and the dreamed House: Values, Spaces and Relationships

Rosantonietta Scramaglia[1], Ariela Mortara[2]

[1]IULM University of Milan, Italy; [2]IULM University of Milan, Italy

Never as in the past months, because of the pandemic outbreak, the house has been experienced as a single space in which to carry out the most diverse activities.

The home has turned out to be a school space, a working space, and a space for leisure time. Today, scholars, administrators and architects are re-thinking houses functions, forms, and internal/external relations.

The paper presents the first preliminary results of a research project carried out in Italy, titled "The lived house and the dreamed house: values, spaces and relationships". The research project involves two parts: a qualitative one encompassing documentary analysis, ethnographic observation inside the houses and interviews with their inhabitants and a quantitative one carried out through an online questionnaire proposed to a large sample. So far, we have collected around 19,600 questionnaires and the ethnographic observation of around 400 houses.

Specifically, we have investigated the internal arrangement and use of the house; the need for outdoor spaces; the need for separate spaces to allow the privacy of each family member (vs open space); the need of new spaces, furniture, and technical installations allowing to combine home life, working life, school life, and entertainment; the change of house and/or preferred location; new relationships with the neighborhood and the city.

Make the Walls Speak, Architectural Drawing as an Ethnography Method

Fiona Del Puppo[1], Paule Perron[2]

[1]EPFL, Switzerland; [2]HEAD Geneva

Ethnographic methods inside the house have prooved effective in highlighting domestic dynamics and interactions, but studying the home itself and letting its walls speak, by mobilising the descriptive and subjective qualities of architectural drawing, could provide precious insight in exposing social practices in relation with the materiality of the private domestic space. Therefore, how does the architectural graphic language can enrich the methods of qualitative ethnography and analysis ? Could

the interpretative dimension of any drawing expression represent an asset to the scientific sociology research ?

The presentation will put forward a research production corpus based on two semi-directive interviews with family members at their respective houses. The representations and graphic analysis attempt to make the walls speak by adopting the usual metric referential along with innovative, perceptive referentials such as time, tension, mouvements, interactions. It will highlight and question the potential and pertinence of architectural drawing in exposing the invisible social practices at stake within those walls. This graphic and architectural method will also question the researcher's own subjectivity and gendered experience of domestic life as part of the scientific approach, thus resonating with the standpoint theory. This interdisciplinary innovative research method based on architectural drawing is all the more interesting when applied to the private domestic space as it aims to study interactions, social practices and inequalities made invisible by both the traditional scientific approaches and the material limits of the house.

Examining Architectural Change, identifying Social Change. Studying Architecture to Study Digitalisation.

Alina Wandelt

University of Leipzig, Germany

Positing that architecture is a vital part of society (Delitz, 2010, p. 317), sociologists have made many efforts to make architecture a central object of sociology. Applying discourse analysis (Grubbauer 2011), sociology of knowledge (Steets 2015), grounded theory (Glauser 2018), working with group discussions (Leuenberger 2018), ethnographic fieldwork (Neubert 2018) or photographs (Egger 2019), the diversity of studies shows that there is not 'the method', but a whole range of methods available to study architecture.

My paper makes the case for an analysis of architecture as a way to study social change. Drawing on my research on library architecture, I argue that it is neither necessary nor desirable to reduce sociological research on architecture to one particular methodology and method. Instead, the paper demonstrates how well established methods of qualitative research can be adapted and applied to study architecture. Combining discourse analysis, objective hermeneutics, as well as participant observations with grounded theory, the paper discusses methodological and methodical challenges in analysing architecture.

I conclude that the sociology of architecture – contrary to what is often suggested – does not need entirely new

1367

methods, but should direct its efforts towards adapting existing methods of qualitative social research. Related to this is a plea for a stronger integration between the sociology of space and the sociology of architecture that can benefit both disciplines. In this way, I contend, the sociology of architecture can perhaps succeed in emerging from the niche it still conjures up.

Praise for Everyday Life in Teaching Architecture

Paola Briata, Gennaro Postiglione

DASTU, Politecnico di Milano, Italy

The paper stems from some reflections on a 4-year cooperation between an architect interested in 'the art of inhabitation' and an expert of urban ethnography, in the context of a number of Design Studios at the Bachelor and Master Degree in Architecture at Politecnico di Milano. These courses are offered in English and attract students from all over the world.

Some starting points were: (a) finding ways to stimulate students to give value to direct observation of everyday life and spatial practices related to the places where they are called to make any kind of design intervention - this positioning was not obvious, as students in architecture are often asked to design in places where they have never been, or where just one field visit guided by the professors is a common practice; (b) considering the diverse biographies and backgrounds of the students as a strength, by giving value to different cultures (related both to daily lives and architectural skills developed in different countries), ways of living the space and seeing architecture.

The paper will be organized in two main sections: a theoretical part, where all the still few explored potentialities of developing an ethnographical design approach based on a specific spatial sensitivity (e.g. analysing the relations between people, spaces and their uses) will be unpacked; a part related to one of our teaching experiences, where students were asked to use ethnographical/biographical approaches to identify contemporary 'non-conventional' ways of living in very traditional dwellings, and consequently re-design some existing buildings and flats in Milan.

How can we Build a Bridge between Architecture and Sociology? Dialogy in design

Josep Muntañola, Magda Saura, Sara Morarinho, Nathan Martinez, Julia Beltran, Yuraima Martin

Polytechnic University of Catalonia, Spain;

The need for a bridge between architecture and sociology started long ago However, the bridge has been harder to build than was forecasted. The paper will implement new recent theoretical frameworks about it.These theoretical frameworks can be summarized as follows. Architects and designers need to forecast the fabrication and the use of their products .The way they prefigurate these products needs some kind of specific reflexive social interactive knowledge at the crossing point between science ,art and social cognition . In relation to it, the works by Mikhail Bakhtin, Bill Hillier,Rainer E Zimmermann,Paul Ricoeur,Richard Sennett, Karl Friston David Seamon,David Kirsh, Kevin Lynch,Jan Gehl and others, have been paving the way, but new strategic methodologies need to be developed .We will explain how these new interdisciplinary dialogical frameworks can be implemented in design education and in professional works. We will synthetize PhD studies that experiment with digital and artistic design tools, in order to uncover the knowledge used by designers in an implicit intuitive way, "before" and meanwhile the objects are designed. The process should be made explicit and reflexive "after" architecture is built and used. So the bridge we are looking for is a bridge between architecture and sociology, but also a bridge between the "before and after" of the creative power of the designer. Finally, a correlation between reality and virtual spatial simulations, either in art, science or politics.

Between Stability and Flux: The Everyday Work with a Building under Heritage

Sabine Hansmann

Technische Universität Braunschweig, Germany

Based on a qualitative case study that focuses on the Sainsbury Centre for Visual Arts (1978) by Foster Associates, this presentation investigates the everyday life of the building in use with the help of actor-network-theory (ANT). The Sainsbury Centre is a museum and educational building that since 2012 has been listed as a heritage site.

While it is common to deal with the physical world and its temporal layers in a linear and abstract manner, ANT, a methodology rooted in science and technology studies, makes it possible to explore buildings from a complex experiential perspective. Here we can unravel the entanglements of humans and nonhumans and take both, actors being present and actors being absent, into account. Entering the world of the Sainsbury Centre and following the people who work with the building, it becomes apparent that a building is not a singular, static object, but a network of countless actors—each having their timings and spacings. By tracing the full complexity of the doing together of people and the material world we can follow the countless negotiations as much as the constant work that is necessary to maintain the stability of what is actually on the move. This presentation shows how ANT can provide a detailed and nuanced view on a building under preservation, which often is interpreted in terms of static solid artefact. Circumventing the traditional divide between material and immaterial heritage it thus offers a unique understanding of "doing heritage".

Towards A Theory Of Shelter

Simon Guentner

Technische Universität Wien, Austria

From Lesbos to Lipa, horrifying stories about conditions in refugee camps and shelters reach us every day. They speak about a contradiction that is hard to grasp: Infrastructures of aid that are meant to protect people have an adversary effect and only add additional harm to what already are desperate and destitute circumstances. This contradiction has accompanied the provision of shelter ever since. Reports about bad conditions date back to medieval times and have led to reforms and improvements over time, but seemingly to limited effect. This contribution tries to shed light on the mechanisms that produce this contradiction. In a first step it elaborates on the shelter as an infrastructure, reflecting on variations in form and materiality. Secondly, and turning to the social life of these infrastructures, it portrays the shelter as an institution. Focusing on structures for persons who are either deprived of their home or who are seeking asylum, it will look at the rationality of provision, eligibility and access. Thirdly, it will discuss the impact of the infrastructure on those who (have to) use it to get by. Criticism of negative effects, referred to as "shelterization", has led to campaigns against shelter and concepts such as "housing first". From such critique, and as the demand for shelter has risen dramatically on a global scale, an urgent question is about alternative forms of institutionalization and design that can turn shelters into what they could be expected to do: sites of protection for the most vulnerable groups.

Heritage of Humanity? On the Destruction of Architecture and the Production of Meaning

Susanne Krasmann

Universität Hamburg, Germany

It is in the event of destruction that the societal relevance of architecture becomes particularly palpable. We might even say that the meaning of architecture is collectively produced in the first place: in the moment of possible loss when people begin to realize how they feel attached to a particular building and when communities deliberate about whether and how to reconstruct that building. They envision their own future of how they want to be and live together with their fellow-beings.

Architecture itself, first results of my own research suggest, can be conceived of as a fellow-being. Drawing on a variety of heterogeneous examples such as the Notre-Dame de Paris fire of 2019 and a landmark decision of the International Criminal Court on the destruction of architectural heritage in Mali, the paper explores how societies negotiate about "their" architecture and thus constitute themselves as a collectivity.

Concern for architectural heritage on a global scale has gained momentum at a time when the world order, as we know it, has come under scrutiny. If historic buildings in the past, especially due to their monumentality, have been criticized for their being expressions of power and sovereignty, and related heritage politics for their colonial bias, today a novel sensitivity seems to arise towards societal vulnerability and the fragility of what culture and civilization and in particular the heritage of humanity could mean.

The Construction of City, or a Conversation Between Latour and Luhmann About Architecture.

Krzysztof Janas

University of Warsaw, Poland

Although architecture has been experiencing a renaissance in scientific discourse since at least the 1970s, the problem of the duality of material and social worlds remains valid. The vast majority of publications on architecture continue to focus on analyzing the relationship between buildings and their aesthetics on the one hand, and society or culture on the other. Objects and their designs, architects and their work become understandable only when we place them in various types of frames – contexts, structures or conditions. All that remains is to uncover the invisible and explain what buildings mean and how they represent social processes. In my lecture I would like to propose a different optics. The starting point for my considerations will be an attempt to apply together the theory of Niklas Luhmann's social systems and the actor-network theory (ANT), which not only can provide a novel approach to the study of the built and social worlds, but also new narrative means to intertwine them. Following Luhmann, I treat architecture as an autopoietic system which, separating itself from the craft, science, art and technology, creates a separate system in which objects, knowledge and ideas are produced within the framework of intra-systemic processes, activities and acts of communication. The use of ANT allows, in turn, to extend Luhmann's concept to include the spatial aspect of the social and to appreciate the material world on the one hand – things, buildings, tools and technology, and non-human actors on the other – enterprises, law, trees, birds or biological processes.

RS04 | Institutional Ethnography

Exploring Early Intervention And Integration As Categorization Work

Ann Christin Nilsen, Eric Kimathi

University of Agder, Norway

'Early intervention' and 'integration' are ideals that are held high in the Norwegian welfare state. In practical work, these ideals are translated into different models and social technologies to which street level bureaucrats, such as kindergarten teachers, are held accountable. In this article we explore the work of doing early intervention and integration in Norwegian kindergartens. Building on two institutional ethnographies we address how kindergarten teachers relate to models and social technology in their everyday work. While Nilsen's research focus on how children with some sort of deviance are sorted into manageable categories, Kimathi's research focus on how a specific category is invoked to attribute specific needs and abilities to people whom the category is assigned, thus rendering the categorized people 'manageable'. The work of 'doing' early intervention and 'doing' integration is, in other words, all about managing categories, whether making categories fitting for people or making people fitting the categories.

Grades Or Wellbeing? Translating Policy On Inclusive Education In Sweden

Karin Larsson Hult

Mid Sweden University, Sweden

The concept of inclusive education has increasingly become an important issue on a global level. Inclusive education is often taken to mean including all children in the regular education system and adapting teaching to accommodate to students' different needs. However, the concept is interpreted differently by various actors in various contexts. This means there is considerable variability in how inclusive education is practiced within different schools, and across countries. Thus, the policy on inclusive education is translated (Czarniawska & Joerges, 1996) differently by different educational actors. Adapting schools in order to become more inclusive can mean changing the educational practice. One way of changing such practice is through projects. The focus of this study is a project for inclusive education carried out at a secondary school in Sweden. In the study I examine the policy translation of inclusive education through the project format. Based on this I critically discuss the possibilities for schools in Sweden to be inclusive, in an educational system influenced by neoliberal steering policies as well as welfare state policies of equality and fairness.

Understanding Barriers In The ECEC Teacher-Immigrant Parent Partnerships

Josefine Jahreie

Oslo metropolitan University, Norway

A large body of research has explored social class variations in the cultural logics of child-rearing, and the relationship between parents and the school system. Previous research focuses primarily on different relationships between working-class and middle-class parents from the majority population and the school system, or between parents from different ethnic backgrounds. However, only a handful of studies have addressed the relationship between immigrant parents and Early Childhood Education and Care (ECEC) teachers, and the interrelationship between immigrant status and status specifically on teacher-parent collaboration. Reflecting on interviews with 11 Danish and 11 Norwegian ECEC teachers working in high minority areas in Copenhagen and Oslo, this paper investigates the relationship between ECEC-teachers and parents with low socioeconomic status and immigrant background. I use methodological tools from Institutional ethnography and the Bourdieu inspired conceptual framework of Lareau and Reay on parent-school relationship to investigating ECEC teachers' everyday work of preparing minority language children for school. I find that both Danish and Norwegian ECEC-teachers actively urge minority and or/migrant parents with low socioeconomic status to initiate "educational play" through "concerted cultivation" at home with their children, and thus adopt parenting styles usually associated with middle-class parenting, to promote "lingual readiness" prior to school transition. Thus, the idealization of "the standard Nordic middle-class parent" in ECEC creates friction in the relationship between ECEC teachers and immigrant parents.

Children's Everyday Practices of Shared Physical Custody in Italy: An Institutional Ethnography of the School System and the Neighborhood

Sarah Murru

UCLouvain, Belgium

This paper presents new material about my current research project exploring the social organization of Italian children's experience of living in shared physical custody after parental separation – and from their own standpoint. This IE (part of the ERC Starting Grant project MobileKids: Children in Multi-Local, Post-Separation Families – supervision: Prof. Merla) was conducted over the past 4 years, and through two fieldworks in the Piedmont Region, (one year-long field work in 2018-2019 and a longitudinal follow-up in 2020), with 22 children (aged 10 to 16) and their families. Through the use of creative and participative methods, I consciously mapped children's work practices inside their everyday lives in-between two homes, as well as the coordination of this work with that of their parents and other actors.

My results discover that children's experience of shared physical custody is organized by two intersecting institutions: the School System, and the Italian urban planning of neighborhoods.

In particular, this is explained by the appropriation of the neighborhood as a "home" and, in this frame, of the appropriation of one of the parent's home (in majority the mother's) as, what I call, the "homework-home". Moreover, since the second follow-up fieldwork happened during the first Covid-19 Spring Lockdown, where schools were entirely closed, paradoxically, the organizing power of the institution of Italian School System was made even more visible through its absence: as children's experience of shared custody completely changed with the school out of the picture.

Doing Institutional Ethnography in International Contexts: Reflections on a Research Study in Four European Countries

Morena Tartari

University of Antwerp, Belgium

This paper is based on a two-year Institutional Ethnography (Smith, 1987, 1990, 2005, 2006) in four European countries: Belgium, Italy, Spain, and the UK. The STRESS-Mums research study (Tartari, 2019) concerns the legal transition from double to single parenting. Through in-depth interviews, the research investigates from the standpoint of lone mothers how legal institutions and professionals shape the mothers' phase of transition from double to single parenting. Then, through interviews to the double, the research involves legal professionals and gender activists and asks them for explaining how they read and interpret the legal texts translating them into a language that fits the needs of the mothers. This IE allows illustrating how texts' interpretations, translations, and discourses (Manicom and Campbell 1995) shape the everyday life of lone mothers during and after that legal transition.

Conducting an IE in different countries presents many challenges and opportunities to develop new reflections on how IE as a theory and as a method can be utilized in international comparative research studies focusing, at the same time, on the local and translocal dimensions. How to select countries, how to select, contact and interview participants, how to manage and consider the culture and language differences, how to interpret and compare mothers' experiences analyzing texts, processes, and discourses in different countries are some of the challenges that this paper discusses.

1372

Doing An Institutional Ethnography From The Standpoint Of Children.

Kira Saabye Christensen

University College Copenhagen, Denmark.

In the presentation I will unfold my experiences doing an Institutional Ethnography from the standpoint of children. Not many have done an institutional ethnography from the standpoint of children. Therefore, I will unfold some of the possibilities and difficulties working with the standpoint of children. In the presentation, I will draw on my ph.d.-thesis: 'Difficult transitions. An institutional ethnography about children's movement from kindergarten to school' (Saabye Christensen 2020) in which I have explored the everyday life of 20 children as they move from kindergarten to school. The thesis is based on an ethnographic fieldwork during 8 month using participatory observations and interviews. By taking the standpoint of children, I have gained knowledge about how children do the transition from kindergarten to school, what kind of strategies they use, what kind of things they value and care about, and what kind of institutional understandings and organizations they have to handle to be interpreted as appropriate children. But how to keep the institution in mind and how to grasp the ruling relations, when you as a researcher - to explore the children's doings and perspectives - are following the children's play and interactions on the playground, in the bushes and at the table in the back of the classroom? How to understand the translocal relations, when children mostly talk about friends and swings and how to make a reliable analysis from the standpoint of children in kindergarten and school, without at the same time representing the professionals here as 'thin figures' or as professionals, who do not understand children and their perspectives? These challenges - among others- will be discussed in the presentation.

Research on Family Practices Goes Materialist: the Contemporary Relevance of Dorothy Smith's Thought

Chiara Bertone

University of Eastern Piedmont, Italy

The perspective of family practices, as developed by Morgan, has been able to assemble tendencies in family studies that, in the UK and beyond, were distancing themselves from essentialist, positivist and categorizing approaches, and moving towards attention to relational connections, the actors' perspectives and the researcher's reflexivity. In this move, marxist perspectives were also put aside. Tendencies towards looking at sexuality in anti-essentialist and anti-individualist terms as a social practice have some resonance with this move, while preserving, as in Jackson's works, an anchor in historical materialism.

The paper analyses the relations of these tendencies with Dorothy Smith's thought, whose influence is in several cases outspokenly recognised, interrogating the heuristic possibilities that these relations open today, with a focus on the Italian context. It is intended as a contribution to building a meeting ground in the understanding of families and sexuality, between research inspired by practice approaches and the perspectives emerging in the last years from transfeminist and queer movements, that are rediscovering Italian and French materialist feminism to make sense of the increasing precarity of lives, and to outline transformative practices.

The paper argues for the specific relevance of Dorothy Smith's epistemology for research on family and sexual practices, in a context of strong political conflict revolving around the definition of family, its functions and its boundaries. Finally, the paper discusses the methodological implications of taking this direction, on the basis of an ongoing project on practices of support and care by middle-aged women living outside the couple.

1373

The Livelihoods of Postgrowth Workers

Eeva Houtbeckers

Aalto University, Finland

It is argued that the current socio-ecological crisis is connected to the dominant paradigm of continuous economic growth. Many critical thinkers acknowledge a need for a transformation to postgrowth societies. However, the notion of work in postgrowth societies remains elusive. How do people in postgrowth society gain a living? Whose work is considered valuable in a world with socio-ecological crisis? This study explores activities related to gaining a livelihood when aiming for an ecologically and socially just world.

My ongoing ethnographic work in Finland confirms that there are many things to do in order to challenge contemporary relations and enable sustainability transformations locally, but there are less possibilities to sustain oneself when doing that. Thus, many end up dividing their time (1) among earning a living and (2) running or taking part in initiatives that they consider game-changing. While their projects may seem vital for reimagining ways of living in the ruins of capitalism, their existence may not be supported by the contemporary taken-for-granted institutions, such as human-nature relations or the understanding of work as a means for capital accumulation. As a result, their position seems precarious.

For this presentation I analyse recorded interviews with people (a) who run or take part in initiatives that aim at sustainability transformation but (b) whose livelihood (mostly) stems elsewhere. As one result of this analysis I present a constructed standpoint of "postgrowth workers", which I aim to develop further later on with the participants of my study.

Producing Job Centres: Institution From the Standpoint of the Unemployed

Alicja Palęcka

University of Warsaw, Poland

Job Centres (JC) in Poland are state institutions which provide counselling and job training to the unemployed, while also adhering to disciplining practices towards claimants. In accordance with the dominant workfare approach, the unemployed should demonstrate their ability and readiness to work in order to remain registered and have access to health insurance offered by the JC. By doing so they also produce the institution from the bottom-up with their interactions with bureaucrats, the practices of form-filling, signature-putting and workshop-attending.

In the paper I will analyse JC from the standpoint of the unemployed. I am interested in people's experience of job centres: how ruling relations and the macro level of state become present in their lives through their interaction with local JC? How various documents and JC procedures structure and condition their everyday life? In engaging the unemployed in various activities, JC confirm its raison d'être. Therefore, what are the practices in which the unemployed actively produce the institution with their actions?

The paper will be based on the analysis of app. 45 in-depth interviews with unemployed persons in four locations in Poland, as well as observations in JC and auxiliary material, such as interviews with JC personnel, legal acts and other documents. The research is funded by National Science Centre, Poland, grant no: 2016/23/B/HS5/00889 and 2018/31/N/HS6/01964.

Spain's First Independent Feminist Union - Charismatic Rule among Migrant Houseworkers and Caregivers

Alesandra Tatic

EHESS, France

My Ph.D. research is based on working with and for unionized houseworkers and caregivers in Sindihogar, Barcelona. Members of the union - the Sindis - are women of diverse origins and ages. Most of them live from domestic and care work, while others depend on a range of activities. The union´s lines of work join under housework and care-giving as overarching systems of oppression for women. Sindihogar is a community of diverse women who are not all like-minded. Sindis have fought military regimes, confronted the Sharia, have been prominent members of the Trotskyist movement in South America, and walked across deserts. Their experiences have reached a point where mutual support among women is welcome and necessary as most still struggle to regularize their stay as migrants.

By adopting an activist role within Sindihogar, my fieldwork has been strongly grounded in the multiple ways the institution articulates external effects on their quotidian existence. Through IE I explore the union's transition from a charismatic grassroots community to a bureaucratized institution. As COVID-19 served as a growth catalyst, the need for being capable of meeting the union member's needs kept rising. Yet, Sindihogar continued its efforts to function without charging membership fees. The socio-economic model the union has been building in its 10 years of existence relies on a circular and feminist economy, now submerged by the sanitary crisis. Consequently, power relations with the State and its majority unions are also transforming. In fact, Sindihogar´s changing identity relies mainly on their independence and novelty as an exclusively female labor union in Spain.

Managing Partial Flexibility; An Exploration Of Employment Specialists' Work Narratives In labour Market Inclusion Services.

Suzan Mbatudde Skjold

Western Norway University of Applied Sciences, Norway
Key words: Work-knowledge, flexibility, discourse

This paper explores employment specialists' work knowledge and how this intersects with flexibility as institutional discourse in labour market services. Basing on team observations and individual in-depth-interviews with employment specialists implementing a back to work programme for long-term unemployed in southern Norway, I explore understandings of role flexibility as it is implicated in the institution of labour market inclusion that organises the work of employment specialists. From the standpoint of employment specialists, I explore their various work tasks, and how these are enacted in daily work routines. Consequently, I problematise flexibility as an internalised institutional discourse which, when confronted by the actual daily work of employment specialists, raises a problematic that confronts employment specialist's work as it embeds, masters, and organises the actualities of employment specialists' lives. Indeed, flexibility expectations often need to be coordinated with demands of strict documentation regimes, curtailing the much-touted room for manoeuvre that employment specialists need to connect long-term unemployed to lasting employment relations. I therefore question established understanding of the employment specialist role that subsumes their experiential knowledge, articulating it into the politics of welfare and the way results-based systems work in practice. From the preliminary findings, I raise an argument about how welfare institutions, while trying to create the 'perfect' bureau-entrepreneur, may place potential agents of transformation in unresolvable dilemmas that have implications for frontline work.

Negotiating Academic Audit Processes: An Institutional Ethnography of UK Universities

Órla Meadhbh Murray

Imperial College London, United Kingdom

This paper explores how to analyse texts and discourses using Institutional Ethnography (IE), based on a five year study into UK university audit processes. I focus on how academics negotiate audit processes in UK universities, specifically how they read, write, and speak about three key regulatory texts: the National Student Survey, Economic and Social Research Council funding applications, and the Research Excellence Framework. I explore these through a three-part IE text analysis approach which sits on a spectrum of closeness to the text(s) under analysis: (i) text - close analysis of one text or a small array of texts; (ii) process – mapping across a textually-mediated process; and, (iii) discourse – identifying a textually-mediated discourse. Additionally, I make three analytic points about how texts organise: the importance of reader interpretation (researchers and users of texts); the strategic multi-layered translation work done by readers to fit into institutions and anticipate readerships; and, the importance of non-readers who can make mythologised understandings of texts material through writing future texts.

Manufacturing Difference: Double Standard in Swiss Institutional Responses to Intimate Partner Violence

Faten Khazaei

Goldsmiths University of London, UK

Through an ethnographic exploration of three public institutions, a women's shelter, a public hospital and a police emergency unit in French-speaking Switzerland, which support victims of Intimate Partner Violence (IPV), this paper investigates how racialization of sexism have entered institutional interpretative repertoires of the studied institutions, resulting in identifying, naming and addressing IPV differently in relation to Swiss citizens and migrants. Field observations and uncountable informal interviews, supported by 56 expert interviews with agents from these institutions, were conducted over 18 months from 2014 to 2016.

A close study of public action against intimate partner violence shows, first, that the general framing of such violence, when it comes to Swiss/European cases, is gender-blind, revealing a politics of silence surrounding unequal gender power relations in the intimate sphere. Intimate partner violence is alternatively framed psychologically, and individually as isolated instances of deviant behaviour caused by alcohol, drug consumption, or psychological problems. Second, however, when the targets of intimate partner violence include migrants from the Global South, the incidents are associated with a racialized conception of culture in which unequal gender relations disadvantage women and trivialize male control and abuse. This double standard through a visibilization of gendered power relations in specific cases, and their occultation in others, leads to perceptions of ethnic and racialized differences that are subsequently equated with moral differences between 'them' and the 'civilized us'. Last, the practices of institutions are critically examined to document some of the concrete consequences of these manufactured differences in recognition and naming.

1376

Impact Of Institutional Culture On The Experience Of Students With Disabilities In Nigeria: An Institutional Ethnography

Abass Bolaji Isiaka

University of East Anglia, United Kingdom

Nigeria is a signatory to the United Nations Convention on the Rights of People with Disabilities (UNCRPD) in 2007 and its Optional Protocol in 2010. In 2009, the National Assembly passed the Discrimination Against Persons with Disabilities (Prohibition) Bill and was signed into law in January 2019 after several civil calls for the ratification. Beyond the decade of negligence that the Bill has faced, inaccessibility and unattainability of higher education by students with disabilities (SWDs) remain the same. This study, therefore, seeks to explicate the impacts of ruling relations of institutional culture in mediating the experience of students with disabilities in attaining higher education in Nigeria. Within a neoliberal context of the global knowledge economy, it takes a decolonial approach to unravel how the intersectionality of disability is being exacerbated by the equity discourse in the postcolonial higher education system in Nigeria. An institutional ethnographic case study would be employed as a method of inquiry to engage students with disabilities, disability unit (DU) staff, and academics of a Nigerian university by employing data gathering methods like observation, document analysis, and in-depth interview. In this study, the principal goal is to uncover how the work involved in the inclusion and participation of SWDs in Nigerian HE is being coordinated via texts and discourses. This study aims to provide a knowledge base in which policymakers and practitioners could draw effective and inclusive intervention to advance the country's phase of educational development and inclusion and participation of people with disabilities.

What's So Feminist About Institutional Ethnography? Re-centring the 'feminist' in feminist IE

Elizabeth Ablett

University College Dublin, United Kingdom

In October 2020, I co-organised a postgraduate workshop on Institutional Ethnography (IE). Participants came from a diverse range of disciplinary backgrounds and were investigating a broad array of social problems. The disciplinary diversity reflects the broad appeal of IE, where IE is used primarily as a methodological frame.

Yet IE originates from the fundamentally feminist ideas of Dorothy Smith, who developed the approach not only as a methodology, but as part of her wider theorisations of gendered power, the coordination of everyday life and an ontology of the social (Smith, 1987, 2005). The popularity of IE as primarily a methodological approach is now ripe for interrogation, in terms of its relation to its feminist origins and the centrality of power within IE analyses. In this paper, I show how in recent years there has been an attempt by some IE researchers to re-centre the 'feminist' within IE. I consider the circulation of IE among disparate disciplines and the subsequent epistemological effects of this circulation, before turning to more recent attempts to underscore the 'feminist' within feminist IE. I situate my discussion within the context of feminist scholars of epistemology who interrogate 'citation patterns, discursive framings and some of their textual, theoretical and political effects' (Hemmings, 2005, p. 115).

I draw on my own IE of local English politics, along with other examples from a burgeoning new generation of feminist IE scholars in Europe. I consider this work of re-centring of the 'feminist' in IE in terms of wider scholarly debates about what it means to have dominant stories that academics tell about the 'progression' of feminist ideas through the academy (Hemmings, 2005; Pereira, 2012, 2017).

Chinese View of Ocean: A Historical Analysis

Seung Kuk Kim[1], Se-hyun Cho[2]

[1]Pusan National University, South Korea; [2]Pukyong National University, South Korea

This study aims to explain the historical change of Chinese view of ocean. Before the mid-19th century, ocean of the world (Tianxia, 天下) in association with Sinocentrism had been a key notion to Chinese. Ocean(海洋, inner sea plus outer sea) as an extension of sea in Chinese terminology was wider and much outer than sea(海), and constituted a core part of Tianxia. This premodern period of ocean was relatively free and exploratory. In fact China was once a very powerful ocean country, However, together with the consolidation of Confucianism as governing ideology, ocean during Ming and Qing dynasty became a forbidden area by the ban(海禁) policy as well as military defense system(海防). China as a closed and self-fulfilling county was unable to recognize the power of ocean indispensable to successful modernization. After the humiliating defeat of Opium War in 1840's China had been aware of the importance of ocean such as territorial sea(領海), sovereignty, and maritime disputes. Thus ocean has become a space of the state, not of Tianxia as China lost its pride of Sinocentrism. Very interestingly, the recent rise of China as a great ocean state(海洋屈起) manifested clearly in its global project of Ocean Silk Road in One Belt One Road (一帶一路) reminds that China tries to recover the glorious vision of ocean of Tianxia. Remember China was the core builder of both overland and ocean silk roads. Shall we have globally an ocean community or a Sinocentric hierarchy?

Farming rice at the margins in West Africa

Joana Vaz Sousa

Centro de Estudos Sociais, Univ Coimbra, Portugal

The production of West African rice requires specialised techniques that transform the inland side of mangroves into agricultural fields. Dykes prevent seawater flooding into the cultivated land during high tides while drainage ditches, culverts, and swing check valves allow for rainwater management.

In southern Guinea-Bissau, limitations put on forest land access in the context of nature conservation, cane rat damage to upland rice, and the economic instability of cash-crops have all contributed to a return to farming by the sea. However, increasingly unpredictable rainfall and salinization risks – consequences of global warming – have necessitated stronger dykes and more efficient drainage. These structures depend on expert knowledge and are labour intensive, challenging the social and agrarian arrangements required for the reproduction of mangrove rice farming.

This long-term ethnographic study in Tombali region identifies small villages where mangrove rice production decreased or ended during the independence war (1963-1974) and where efforts for mangrove rice rehabilitation began in 2010s. This rehabilitation is strengthening the circulation of knowledge, technology and capital, revitalising social bonds between villages and reinforcing mangrove rice networks while cutting across rice centres and rice peripheries. Within this matrix of people, crops and climate, the sea appears as a multidimensional actor that fertilises the mangroves with essential nutrients for rice growing and provides means of transportation for rice experts to move between rice producing villages while, at the same time, it is central actor in climate injustice, as the "stronger sea," as the farmers say, poses a threat to coastal livelihoods.

1378

Implementing SDG 14: Why Is It Such A Difficult Problem?

Ulrike Kronfeld-Goharani

Kiel University, Germany

The ocean provides humanity with food, fresh water, oxygen and raw materials and regulates climate, emission absorption and shoreline protection. It supports hundreds of millions of jobs through the extraction of living and non-living resources, serves as a transport medium and supplies us with energy. However, the ongoing human activities (emissions, pollutions and overuse of resources) have changed the biophysical properties of the ocean and reduced its ability to support essential ecosystem services. A global unsustainable way of life and economy has decreased ocean health with consequences that now already affect the well-being of many people.

To counteract these and other negative developments worldwide in 2015 the international community adopted the Agenda 2030 with its 17 UN Sustainability Development Goals (SDGs), of which SDG 14 "Below Water" is dedicated to the protection of the ocean. Although it was agreed to achieve the targets in a relatively short period of time by 2020, it remains vague how this is to be done in concrete terms, given the great challenge that the implementation involves a profound transformation of the existing economic, political and social structures in the world.

On the basis of selected examples – marine protected areas (MPAs) as instruments of marine conservation, the globalisation of seafood markets and the development of maritime ecotourism – the paper discusses main difficulties of implementing SDG 14 that are closely linked to other SDGs. Finally, an outlook is given on how these problems could be addressed.

Maritime Co-Management Board for Public Awareness and Effective Territorial Preservation

Carolina Martí Llambrich[1], Bernat Hereu Fina[2]

[1]University of Girona, Spain; [2]University of Barcelona, Spain

The Maritime Co-Management Board of the Baix Empordà Coast (TCMLBE) is an ambitious pilot project created in 2017 to solve problems of coexistence of the diverse stakeholders and the sustainable exploitation of resources through a bottom-up process in the Costa Brava centre (NE Spain), protected by the Natura 2000 enforcement. The TCMLBE is a permanent space for participation to discuss and specify proposals for the planning and management, with the aim to reconcile the uses and socio-economic activities that take place in this area, including the conservation and improvement of its natural, cultural and landscape heritage.

On this board, decision-making is always done by the cooperation and consensus of its participants, which are aggregate in four main sectors: public administration, scientific community, civil society entities, and blue economy and activities at sea, with more than 80 entities. Each sector establishes an annual action plan to be developed based on an agreed and prioritized work strategy among all members.

The scientific sector every year defines a series of actions aimed to improve the species and ecosystems knowledge and promote the balance between the conservation and functionality of natural ecosystems, and its uses and resources exploitation. Priority is given to zoning activities, quantifying pressures, identifying conflicts between uses and activities, and the impacts they generate on marine ecosystems. To develop them, it relies on the co-creation of knowledge and environmental awareness. Beyond mere citizen participation, the help and knowledge of all the agents involved is demanded to build citizen science, and to promote the involvement and awareness of the participants.

Building Resilience: Antecedents of Perceived Social Support Among Crew Members on International Commercial Vessels

Birgit Pauksztat[1], Michelle Grech[2]

[1]Uppsala University, Sweden; [2]University of Queensland, Australia

Previous studies suggest that social support from fellow crew members on board can play an important role in mitigating fatigue and mental health problems. In this way, it may be a key resource of resilience when crews are faced with challenging situations such as the ongoing COVID-19 pandemic. Although the importance of social support is well-known, the factors that allow crews to build and maintain social support are not equally well understood. Combining insights from qualitative studies on crew members' informal interactions on board and from research on social support in other contexts, we develop and test hypotheses comparing the effects of three types of antecedents: homophily (here: crew composition with regard to national diversity); opportunities to develop informal relations over time (here: organizational level and ship-level turnover); and the current situation on board (here: workload and joint leisure activities). Hypotheses are tested using data from an online survey among seafarers on international commercial vessels, collected in summer 2020. Initial findings suggest that opportunities to develop informal relations over time, as well as the opportunity to engage in joint leisure activities during the current tour have a significant positive association with perceived social support. By contrast, there was only limited support for a homophily-based mechanism. We conclude by discussing practical implications of our findings.

Gender Dynamics at the Mediterranean Sea – The (Re-)Production of Gender Orders during Refugee Smuggling and Sea Rescue

Matthias Schneider

Goethe University Frankfurt, Germany

In recent years heated debates erupted in the European Union around the smuggling and sea rescue of refugees in the Mediterranean Sea. While debates centered around border security, safe entry routes and the dangerous of crossing, not much attention was focused on how the organization of smuggling, the experiences of refugees and the processes of sea rescue are deeply entrenched in gender orders. With the help of biographical interviews with Eritrean refugees conducted between 2017 and 2020 in Germany will be shown, how gender plays a decisive role to understand dynamics in the Mediterranean Sea. Especially along the life history of one refugeed man, John, will be exemplified how the perception of women as vulnerable and men as strong guides the loading of the refugee vessels. Thereby will also be revealed, how the social relations below deck for men can be structured by a hierarchy of dominance and the use of physical violence. Furthermore, will be shown, how the sea rescue in part counteracts such a hierarchy, but at the same time establish new divisions along the lines of gender, mobility, and age. With the results a first step will be taken for a more comprehensive understanding of how gender orders effect the processes and lives of people on the sea.

Maritime Identity and Memory of the Place

Urszula Kozłowska, Karolina Izdebska

University of Szczecin, Poland

Abstract The presentation aims to determine the specificity of maritime culture on the example of the port city of Szczecin, by presenting its monuments and site-specific actions in public spaces, here described as anti-monuments as main manifestations of this culture. We presents only a narrow selection here and concentrated on those objects and actions that are a significant part of the city's social memory connected with the sea, those that emphasize its maritime identity, and those that can be considered a material symbol of commemorating the past.
The analyzed works referred to different categories of seafarers, including sailors, fishermen, port workers, shipbuilders, and dockers. They commemorate important events, people, places and are important for the micro-community. The share a strong sense of local uniqueness and strong connection with the city, its history, and identity. If moved to another place they would lose their original meaning. When analyzed from up-close they seem to be one of the most important artefacts in the maritime cultural landscape of the city, shaping the identity and memory of the place.

Seafarers' Perception of Time

Agnieszka Kolodziej-Durnas, Arkadiusz Kolodziej

University of Szczecin, Poland

Labour millieu and life styles of seafarers are exceptional. They live in different time shift than people working in land. In the vessel they spend both their time of work and time of rest (sleep, entertainment and other non-professional activities). Social space at sea is special as thare are no or very few women on board. This made us put forward a hypothesis that seafarers may perceive time differently to office workers employed in land. We discuss the organization of labour time, as well as the phenomenon of time as a subject of interest in different disciplines. Finally we present the research project and its results. The research project comprised qualitative interviews and survey by questionnaire of time metaphor (KMC by Malgorzata Sobol-Kwapinska). This tool explores e.g. scales called friendly and hostile time, quick flow of time and the value of a moment, temporal chaos and temporal emptiness).

`Boats Don´t Fish, People Do` – A Sociological Contribution Towards A Holistic Fisheries Bycatch Management

Fanny Barz, Josefa Eckardt, Steffi Meyer, Sarah B.M. Kraak, Harry V. Strehlow

Johann Heinrich von Thuenen Institute of Baltic Sea Fisheries, Germany

Bycatch of seabirds and marine mammals in gillnet fisheries is a major hazard for conservation globally. Measures on bycatch mitigation in fisheries management mostly base on technological and ecological findings and they generally assume fishers as a homogenous group that is supposed to apply new technology or act according to the latest ecological insights. There is often a lack of knowledge about the heterogeneity of fishers´ actions and drivers and the organisational structures they navigate in, despite its importance for effective fisheries management. For the specific case of the German gillnet fleet in the Baltic Sea a qualitative social-science research approach was chosen to generate an ontological understanding of fishers social practises that can inform management. With a praxeological view and in applying the concept of agency, three types of fishers´ actions are distinguished: projective (future-oriented), evaluative (present-oriented) and iterational (past-oriented). Fishers´ attitude towards incidental bycatch differed between viewing bycatch as a normal part of the daily routine (`normalizing` - relating to seabirds) or as a disturbing event (`non-normalizing` - relating to marine mammals). These findings are discussed in the context of an expert workshop that was conducted to identify possible management measures for mitigation. It is concluded that considering fishers´ agency and different discourses on bycatch may be an important contribution to design effective management instruments to mitigate bycatch of seabirds and marine mammals in gillnet fisheries.

'Paprykarz' as Non-Human Agent. Fish Food and Translations of Local Maritime Culture.

Robert Bartłomiejski, Maciej Kowalewski

University of Szczecin, Institute of Sociology, Poland

At the centre of our research is the 'Paprykarz' (fish and rice sandwich pate), local fish food which is an example of the relations and networks in a field of maritime culture. These relations address both the question of the social memory of national fishing industry and a regional identity. The theoretical framework of our research is inspired by Bruno Latour's Actor-Network theory, referring to Callon's (1984) classic work on scallops, and the work of food anthropologists using the ANT perspective (Hegnes 2007, Abbots 2017).

'Paprykarz' is associated with Szczecin, recognised nationally, embedded in pop culture, a brand referring to the region's fish menu. It exceeds the boundaries of localness, although it has the adjective 'szczeciński' in its name. Sold throughout Poland, the product carries images of the city's maritime character and the heritage of Polish fisheries. 'Paprykarz' was an export hit in the 1980s, and its international references are important for our analysis: the recipe was transferred from one of the African countries (known as 'chop-chop') and ingredients from different world regions were used in production.

In our presentation we show how a popular food product concentrates the leading themes of maritime sociology, and how this pate becomes a metonymy for the complexity of meanings associated with the sea. In the 'Paprykarz' tin we discover set of the translations between actors, including nostalgia for the 'glory days' of the port city and the deep-sea fishing industry. We argue that it is not just a fish food product or cultural artefact, but that it is itself an actor-network around which nets of embodied action and communication in different spheres are activated.

Artisanal Fishermen Within MPAs: Guardians Of Biodiversity Or Guardian Of Sea Borders? (San Andrés, Colombia)

Justine Berthod

Sorbonne Nouvelle, France; CREDA/IHEAL

Key words: artisanal fishermen; MPA; maritime border dispute; maritime sociology

The ocean is frequently described as the "last frontier" of our planet. It is subject to both logics of "commoning" and "ocean grabbing" (Le Meur et al, 2018). This paper will employ maritime sociology to examine how, in the small Caribbean island of San Andrés, artisanal fishermen are propelled to the forefront of this conflict. This Colombian island, surrounded by a large-scale marine protected area (the Seaflower Biosphere Reserve), is at the center of a maritime border dispute between Nicaragua and Colombia, since the Decision of the International Court of Justice of 2012.

This communication will thus examine the positioning of artisanal fishermen of San Andrés island as new "guardians of the sea", by crossing several scales of analysis. This analysis is built on six months of ethnographic inquiry in fishing cooperatives of San Andres in 2018.

The communication will first consider how, within the context of competing access to sea resources, some fishermen within the MPA build a role of "sea guardian" as symbolic forms of localized appropriation of fishing territories. It then points out the contradictory dimension of the fishermen's role of "sea guardians" at regional and sub-regional scales. In a context of regional border dispute and competitive access to oil exploration between Nicaragua and Colombia, the role assigned to fishermen by national institutions is one of guardians of national maritime borders rather than guardians of the biodiversity, making the Biosphere Reserve fulfill above all a geopolitical function.

1382

Associationism and struggle of the fisherwomen of Oaxaca, Mexico: "Mujeres Pecadoras del Manglar"

Nuria Jiménez García

-, Mexico

This presentation is based on my postdoctoral research (2018-20) that was carried out at the Rural Development Postgraduate Program of the Autonomous Metropolitan University, Xochimilco Unit, Mexico City.
I analyse the strategies carried out by fisherwomen,from the "Mujeres pescadoras del Manglar" cooperative in their struggle to conceptualizethe importance of their work in fishing activities, and in the rescue and care of the coastal lagoon ecosystem where they live and upon which their subsistence and that of their families depend. I aim to identify the difficulties, barriers and various forms of violence (family, community and institutional) that these women have suffered when transgressing a space and a productive activity traditionally/predominantly monopolized by men, Next, describe and reflect on the experience of these women and their families in a more generalised context of invisibility, discrimination and inequality towards women who participate and dedicate themselves to fishing or related activities. I am also interested in making visible and clarifying whether, from the transgression of traditional spaces, there is an improvement in the conditions of family life and a greater participation in community decision-making and in the political sphere. Finally, I explore the consequences that participation in the fisherwomen collective has had on womwn's daily lives and wellbeing, and if this has been a tool of personal empowerment for them and of the legal acceptability of their fishing activity.

Forced Labour in the International Merchant Marine Sector in the 21st Century: Forms, Estimates, Comparison with Forced Labour on Land

Valter Zanin

University of Padova, Italy

The paper discusses the forms of forced labour in the international merchant marine in the 21st century, estimating the numbers and nationalities of the seafarers subjected to these forms of coercion. The distinctive features of seafaring are contrary to the characteristics of the largest part of forced labour on land: in fact, maritime labour is strategic, productive, highly regulated by States and International Organizations, has very high capital intensity, high salaries and a skilled and internationalised workforce - so much so that ILO has never mentioned seafarers in its estimates on forced labour and until now only one monograph, published in 2007 by the author of this paper, discusses the matter systematically and draws up estimates. This paper updates and specifies the estimates presented in 2007. Among other sources, the author analyses the annual reports (from 1932 to 2019) of ILO's Committee of Experts on Application of Conventions and Recommendations (CEACR), which monitors the compliance of signatory States' shipping laws with ILO's Conventions on forced labour. Since the ILO has never even considered the cases reported by CEACR in its estimates of forced labour, the paper, which recommends that the methods developed for monitoring work at sea be made more general and applied to work on land, advances criticisms and revisions of the estimates of forced labour in the world produced by ILO. The concluding part of the paper focuses on an analysis of changes in disciplinary and coercive labour regulations in the maritime sector during the period from 1990 to 2015, which find their place in a more than 50-year long process of modifications in the apparatus (re)producing forced labour in the maritime sector.

1383

South African Shipping And Seafarers From 1970: Implications For Economic And Industrial Sociology

Shaun Denvor Ruggunan

University of KwaZulu-Natal, South Africa

This paper argues that one way to reinvigorate industrial and economic sociology is for it to consider the maritime social world not as a peripheral area of interest but one that can enhance the sub-discipline of industrial sociology and sociology in general. I argue that the case of seafaring labour markets in the merchant marine is one such case. The reconfiguration of the global labour market from seafarers from the 1970s remains the largest labour market restructuring event since the industrial revolution. Yet it is largely invisible as an empirical and theoretical case in sociology. Through an empirical case of the South African merchant marine since 1970, I show that this restructuring allows us to theorize in new ways, the agency of labour, the agency of nation states, the trajectories of globalization, the intersection of technology and capitalism, and the ways in which nationality, ethnicity and 'race' intersect to shape labour markets. This allows us to make comparisons with other middle income countries globally as well as countries in Europe to see which trajectories are similar and different, and make conjectures as to why this may be.

The Contribution of the Blue Economy to Social Cohesion and Sustainable Development in Greece. The Case of Greek Island Regions.

Ioannis Katsounis, Maria Lekakou, Ioannis Spilanis

University of the Aegean, Greece

Greece is a state with inseparable ties with the sea. According to the Blue Economy Report (European Commission, 2020), the Blue Economy contributes 14.2% of all national jobs, the highest share in the EU and in terms of GVA, Greece ranks fourth with the Blue Economy contributing 5.2%. For the last ten years, Greece has been facing the consequences of an unprecedented economic crisis. The situation worsened with the outbreak of the COVID-19 pandemic which negatively affected the blue activities. This study is based on the following assumption: Greece is called upon to adopt a new productive and development model that will contribute to both the strengthening of social cohesion and achievement of sustainable development after the end of the health crisis, and the question arises whether the Blue Economy is capable of playing this role. The aim of the study is to capture the development inequalities and the contribution of the Blue Economy to the sustainable development of the Greek island regions through the Sustainability Impact Assessment (SIA) approach. In addition, the degree of acceptance of blue activities by local communities is examined through conducting quantitative research on the attitudes and perceptions of stakeholders concerning which established and emerging blue sectors can create the conditions for the strengthening of social cohesion, the recovery of the Greek economy and the achievement of the Sustainable Development Goals.

RS06 | Politics of Engagement

Battle Between Interventions and Markets. Worths Behind the Finnish Housing Policy Practices.

Jutta Elisabet Juvenius

University of Helsinki, Finland

Finnish society has faced a notable number changes during the recent decades: Socioeconomic differences have turned into the new growth and Finland has joined into international migration. Both these phenomena have had an effect on Finnish cities as the spatial segregation has deepened during the last decades. Finnish cities have implemented interventions to tackle such development since the post-war decades as part of the Nordic Welfare State ethos. Nevertheless, these interventions have faced a number of critique during last years when the public discussion has claimed a shift towards more market-oriented housing policies. This moment can be seen as a watershed of Finnish housing policies. Housing has served as one of the key elements of Finnish Welfare State policies, but only under favourable conditions. In my article I explore how the experts working with the housing issues in the biggest cities of Finland see this development and its effect to their work. In my analysis that is based on the expert interviews and which draws on the sociology of engagement by Boltanski and Thévenot, I observe how the housing experts see the recent development and the challenges the societal changes may cause. Focal question are, what kind of development they are willing to tackle and how the chosen courses of action in housing policies are justified. Analysis open up chances to discuss on the future of the Welfare State and connection between values and concrete practices.

Planning For a Job: The Trying Experience of Unemployment During the Covid-19 Crisis in Denmark

Magnus Paulsen Hansen, Sabina Pultz

Roskilde University, Denmark

The Covid-19 crisis has resulted in elevated unemployment rates. In a Danish context unemployed people have been governed through activation policies for decades, however, during corona these were temporarily suspended. What happens when part of the system is put on hold? How is the unemployment experience changed? Do unemployed people engage more with family or friends? Explore alternative lifestyles? Based on in-depth interviews with 25 unemployed people, we apply the theoretical framework of regimes of engagement developed by Laurent Thévenot as we explore how unemployed people engage in various regimes while being unemployed during the corona crisis. In doing so, we carve out a tension between the plan of the system and a plan of the unemployed person. Unsurprisingly, we conclude that the system almost exclusively relies on the regime of the plan based on activation policies. The unemployed people similarly primarily invest in the plan, however, also in the regime of familiarity as well as the explorative regime. Engaging in the familiarity and explorative regime is not necessarily detached from the plan, as engagement in other regimes is sometimes used instrumentally for optimizing human capital. The corona crisis has offered a new opportunity for unemployed to 'open their eyes' - both in relation to critically reflect on the system and activation policies as well as their own situation with implications for how we understand the link between politics and psychology.

1385

Young People's Activism – Themes, Motivations and Structures of Youth Civic and Political Participation in the UK

Silvia Behrens

University of Strathclyde, United Kingdom

How and why do young people organise themselves to strive for political or social change? This project is investigating which issues young people in the UK are caused to become politically active for, with focus on the impact of self-perception of agency for participating in activism. Activism is conceptualised using Pickard's concept of 'Do-It-Ourselves' politics (DIO politics). This approach to specifically young people's political participation picks up on recent young adulthood literature and emphasises agency as being central to participatory behaviour.

The theoretical assumption is that partaking in activism is an individualised choice. Such individual choice is hypothesised to be impacted by the perception of agency, i.e. to whom an individual attributes responsibility to act. While classic research on the perception of efficacy, is also recognised, this research looks specifically at the perception of personal agency and collective agency. Corresponding to the individual and collective dimensions of DIO politics and taking up the importance of agency as part of becoming a young adult, these are explored as decisive factors for not simply engaging cognitively with 'the political' but for taking the extra step, and thus effort, to become politically active.

Data collection includes an online survey with a sample of people aged 16-34, with residence in the UK, and subsequent focus group discussions with young activists. While the survey's findings examine if, and if so, what the effect the perception of agency has on the likelihood of participating in political activism, the group discussions enable a deepened qualitative perspective into youth activism. The results contribute to research on social-psychological factors for participation and activism and indicate potential connections to already researched predictors and influential factors.

Politicizing environmental emergency: The Fridays for Future movement in Russia

Svetlana Erpyleva

Public Sociology Laboratory, Center for Independent Social Research, Russian Federation

The crises of the environment are at the heart of material, social, and cultural concerns everywhere. People justify, protest, reason and negotiate. They post pictures on the social media, they rally, write petitions, and demonstrate. They also worry, morn, panic, and rage about the catastrophes in their local environments and on the global scale. These actions and affects are fuel for politics, and they portray many different ways people engage in situations of conflict around the environmental crisis. Politicizing environmental emergency is an especially tricky issue in Russia where activists present environmental crisis as a political problem (e.g., systemic and caused by people's actions, requiring collective action to solve) but at the same time try to avoid its "politicization" in order not to be associated with risky "political protests" against Putin's regime. Using the Russian branch of the "Fridays for Future movement" as a case, I show how Russian environmental activists navigate between different meanings of the "political" in their collective actions. Although the presentation is focused on Russia, comparative data from the FFF in Finland is used in order to demonstrate how the political climate and national activist political cultures influence the ways activists politicize the environment.

Overlapping Aversion: Grievances In The Narratives of Grassroots Twitter Activists Within the Populist Right in the US and Sweden

Markus Holdo[1], Johanna Söderström[2]

[1]Lund University, Sweden; [2]Uppsala University, Sweden

The question of what drives people to support and contribute to the discourses of the populist right continues to generate debate among scholars. In this paper, we consider how common explanations help interpret life history interviews with online activists. Previous research suggests, e.g., that people who engage in these discourses share a sense of injustice inflicted on the white working class, that they are primarily motivated by a perceived need to defend white supremacy, or that they wish to punish increasingly detached political elites. Our sample of interviewees consists of central grassroots twitter activists that helped spread messages from the Donald Trump campaign in the 2020 US election as well as from the right-wing populist Sweden Democrats. We find that each of the dominant interpretations provide partial ad-hoc explanations. We also identify additional explanations that are similarly of limited scope. Right-wing populist discourse, we argue, builds not on one particular grievance but, on the contrary, on an "overlapping aversion" that is conveniently porous and open to a multitude of specific motivations. Activists' motivations range from white supremacy to a sense of defending a particular way of life and feelings of non-recognition. We discuss how these different kinds of grievances are connected and translated into a broader narrative of resentment.

Selfies as Engagements – Conceptualizing the Selfie-practices of Marginalized Youth

Taina Meriluoto

University of Helsinki, Finland

This paper suggests an approach to conceptualizing selfies as societal action. As selfies – self-images shared on social media platforms – have become ubiquitous, their significance for societal participation has also become apparent (Tiidenberg 2018; Kuntsman 2017). Prior research has recognized their societal meaning when the self-image is coupled with a written political message (Ferreday 2017), or when they represent marginalized positions and bodies (Asenbaum 2019; Nikunen 2019). However, the majority of selfies are often overlooked as meaningless (Abidin 2016), and hence disregarded from analysis of societal action.
This paper aims to broaden our understanding of selfies as societal action by conceptualizing selfies as engagements (Thévenot 2007). By analysing ethnographic data on the selfie practices of marginalized youth in Finland, the paper shows different ways in which selfies can hold societal meaning for their takers. The threefold scheme of engagements allows us to perceive of selfies as actions, and as different ways of creating the common world and of positioning oneself in it (Thévenot 2015).
The paper shows how selfies in the regime of familiar engagements are vehicles to share emotions and create a sense of commonness. In engagement in a plan, selfies are tools of self-development to monitors one's "progress" in life, often with the use of image pairs. In the regime of public action, selfies serve as political arguments in debates on recognition and representation. This threefold scheme, the paper argues, can prove useful when analyzing the societal meaning of selfies also beyond the context of marginalized youth.

Acting Underneath Conventions – Extensions To Familiar Engagements In The World Of Assisted Reproductive Technology

Luís Gouveia

CICS.NOVA - Centro Interdisciplinar de Ciências Sociais da Universidade Nova de Lisboa, Portugal

In the context of Assisted Reproductive Technology (ART), the conduct and interaction between beneficiaries and professionals are intermediated by different devices to support the coordination of the action having the therapeutic 'efficacy' as the main normative reference. However, in the context of these acting logics based on devices predominantly from the 'industrial' world, extensions to other cognitive and evaluative formats of smaller scope are likely to be integrated into actors' discourses and acting logics. Namely, the engagement dynamics of professionals – especially doctors and embryologists – can also extend to other evaluative formats beyond conventional grammars that serve to support the coordination of action in different situations in the clinical context. This is the case of the relationship with the beneficiaries, displaying plural compositions between different engagement formats, but also in their relationship with the different objects in their environment that support their scientific and technical decisions (as is the case of 'standards' for the evaluation of embryo's potential for transfer or to support decisions about clinical cases to be accepted or not for new treatment cycles), exhibiting evaluative frameworks that are also anchored in dynamics of familiarization with the surrounding environment. That is the case of judgments where criteria such as 'hospitality' and 'solicitude' can also arise.

Through empirical data collected from a currently ongoing research project, involving interviews with both professionals and beneficiaries from the ART sector, the aim is to analyse some of the tensions, dilemmas and compositions between different 'regimes of engagement' and 'grammars of commonality' that are likely to take place in different situations concerning the relationship with the governing conventions in the clinical space.

Digital Good: A Descriptive And Normative Application Of The Orders Of Worth Framework To The "Googlization of Health"

Tamar Sharon[1], Andrew Hofman[1], Marjolein Lanzing[2], Lotje Siffels[1], Marthe Stevens[1]

[1]Radboud University, Netherlands, The; [2]University of Amsterdam

The digitalization of health and medicine has engendered a proliferation of new collaborations between public health institutions and data corporations, such as Google, Apple, Microsoft and Amazon. Drawing on Boltanski and Thévenot's framework of orders of worth, the Digital Good project explores how this "Googlization of health" is justified in line with a plurality of common goods – thereby problematizing the critical framing of the Googlization of health as an instance of (solely) market transgressions by tech giants into the sphere of health and medicine. Further, drawing on Michael Walzer's theory of justice, the project seeks to identify what risks are involved in this phenomenon, both in terms of reshaping the sector of health and medicine (inter¬-sectorial risks), and in terms of an accumulation of political power by Big Tech through society (cross-sectorial risks). The project thus also engages with the affordances and challenges of shifting from 'descriptive' to 'normative' registers vis-à-vis the orders of worth framework. In this presentation, we discuss findings from the first two years of the project, pertaining to different Cases studies within the Googlization of health. These include: 1) the Personalized Parkinson's Project, a collaboration between Verily and a Dutch university medical center; 2) the Apple/Google API that was developed for digital contact tracing apps at the start of the Covid-19 pandemic; and 3) collaborations between Apple and university medical centers using the Apple ResearchKit software in the United States.

Playing with the Social Contract: Exploring Ideology and Political Socialization on Government Simulation Videogames

Carlos Moreno Azqueta[1,2]

[1]Universidad de Castilla La Mancha, Spain; [2]Universidad Complutense de Madrid, Spain

More than 20 years since the emergence of game studies, videogames have become a central sociological issue, partly due to its believed capacity to shape our beliefs about the world that surrounds us. In particular, the subgenre of government simulators, in which the players embody a state and manages different types of political communities, has received academic attention, usually through critical content analysis of popular franchises like Civilization or Tropico.

Each government simulator presents a singular view about how a political community should organize, and what objectives to pursue. Depending on its openness to players agency, it also gives them the opportunity to take part in this debate. Hence, government simulators are both agents of political socialization and citizenship schools, defined by rules, agency, and representations. I believe many fundamental debates about our societies are being discussed thought these games, urging for a better understanding of their ideological content and the political imagination possibilities they offer.

For that, I have selected more than 50 government simulators released between 1990 and 2020, attending to the criteria of popularity, release data and innovative mechanics. I perform a content analysis with a mixed quantitative-qualitative methodology, including both 24 operationalized variables and open commentaries, focusing on aspects related to the political organization of the community (for example the presence of democratic institutions) and the objectives set by the game. The evolution of the games through time or the impact of the setting (sci fi, fantasy, realistic…) on its ideological configuration are also explored.

Making Claims for Belonging Through Arts and Culture

Ivana Rapoš Božič

Masaryk University, Czechia

Recent years have seen a rise in artistic and cultural initiatives that aim to foster intercultural dialogue in ethnically diversifying societies and help migrants publicly articulate their claims for belonging. In many such initiatives, arts and culture have been turned into tools that are used to communicate specific social and political messages. The prevalent model of minorities' claim-making in democratic societies—the minority advocacy—has been traditionally based on argumentation that takes place in the language of human rights and requires detachment from personal concerns. On the other hand, the novel art- and culture-based forms of claim-making are also welcoming to other forms of communication that do not require argumentative format and are open to the expression of migrants' personal interests or familiarity. My contribution aims to fill the gap in the knowledge of the models of migrants' claim-making, which, together with their social and political implications, still remain largely unexplored. Based on ethnographic research of civically-engaged cultural festivals concerned with the issue of ethnic diversity in Central Europe, I identify three grammars of claim-making that are commonly used to communicate migrants' belonging through artistic and cultural initiatives. Drawing on the theoretical perspective of the French pragmatic sociology—and particularly the concept the grammar of commonality in the plural—I will also discuss political implications of each of the grammars. The results of my research will have an impact on the understanding of the role of arts and culture in fostering more inclusive urban environments.

1389

Commonality Through Plural Attachments to Common Places : the Case of the Yellow Vests

Karine Clément

CRESPPA/CNRS, ERC "ImagiDem"

We will use the case of the Yellow vests in France to study the problematic communalization of familiar or close engagement with the world, which is a format weakly prepared for communalization. Theoretically we will build on Laurent Thévenot's exploration of close politics, while relying on our empirical materials (ethnographic observation on three roundabouts in Lorraine) from the yellow vests movement in France which is a good example of a movement rooted in familiar and close environments.

We argue that the yellow vests show a path through which close and personal attachments to some common places can build a common which goes beyond individual intimate relation to the world and maintains the possibility of differences and disagreement. This study will focus on the yellow vest as a familiar object which has been emotionally invested by people on the street and become a sign, a symbol, and part of the body (the personal body and the people's body). If we have time, we can also study the roundabout which is an occupied and plurally inhabited familiar place to whom usually nobody is attached.

We will show, however, that the building of commonality through close attachments meet obstacles: the use of common places as cliche, the instrumentalization of common places by demagogical leaders and the disavowal of commonality through familiar attachments by critics speaking from the standpoints of the liberal grammar (or the grammar of individual interests) or the grammar of public justification which deny to close attachments any political meaning.

How Should We Talk About This? Metadiscursive Ideals In A French Populist Municipality

Noemi Casati[1,2]

[1]EHESS, France; [2]IC Migrations, France

Recent scholarship in critical discourse analysis has been underscoring a rise in "covert" forms of racism. In a similar way, actors on the ground also mobilise their critical capacities to evaluate fellow townspeople's utterances. Building on pragmatic sociology and figurational theory, this paper follows both ordinary actors and professionals of public speech in their metadiscursive analyses and, more specifically, their formulation of metadiscursive ideologies. Data were collected over 9 months of fieldwork in Béziers, an impoverished town in southern France whose local administration is supported by the extreme-right populist party Rassemblement National. Here, ordinary actors regularly evaluated critically each other's speech practices. This happened most notably when issues of cultural and/or religious differences were on the table. Tensions cristallised around two main poles: those arguing that "we should be able to talk freely about problems" and those considering that "we should put limits on expression." Through an analysis of specific local-scale controversies, the paper explores how ordinary actors questioned current discursive norms (sometimes for opposing reasons) and collectively negotiated how to foster a "better" discursive environment. Only seemingly trivial, these everyday assessments constituted important forms of engagement in communal life that led to concrete choices – especially for professionals such as journalists, political representatives and teachers. Ultimately, the paper shows how ideals are not illusions, but social products – each social group producing (and acting on) a distinct ideal version of what future society as a whole should look like.

1390

New Social Pragmatism

Veikko Eranti, Eeva Luhtakallio

UNIVERSITY OF HELSINKI, Finland

In this paper, we take steps toward a new understanding/interpretation of pragmatist sociology we tentatively call new social pragmatism. Our approach is built on two elements. The first element is what is often called new French pragmatism based on the works of Luc Boltanski and especially Laurent Thévenot, providing an understanding of conflict, critique, and the cultural repertoires of valuation used in conflict situations, and, furthermore, an account of the different "grammars" humans deploy in order to build common ground in situationally appropriate ways. The second element is built on American cultural sociological tradition, emerging from interactionist roots to Swidler and to Eliasoph and Lichterman, and providing a definition of culture embedded in action. We argue that used together, these traditions provide a grounding for a research programme that is nuanced, reflexive of the role of situations and culture, but robust in ways that purely contextual programmes can never be – a new social pragmatism.

Commonality as Self-evidence: the Effect of Major Events on Argumentation in Online Petitions

Andrey Indukaev

University of Helsinki, Finland

The question of commonality arises for every social actor seeking public's support for advancing a cause. A major vehicle for building commonality is the operation of rise in generality, when a particular issue is shown to be related to the common good. This idea is central for the Boltanski and Thévenot (1991) theory of justification, in which they describe the reference to the shared logics of morality and common good as a pathway for rising in generality. Recent research suggests that commonality building could be done without mobilizing these "orders of worth", but trough claiming a legitimacy of one's individual interests (Eranti 2018) or by referring to a shared "common-place" experience (Ylä-Anttila 2017).

In a search for yet another registers of commonality building, this research joins William Sewell's (1996) perspective on events as cultural transformations, and scrutinizes how events affect an important element of political culture - the discursive practices of commonality building. Examining a large-scale dataset of petitions from change.org platform, I show that large-scale events,

creating a presumption of common ground between a large enough community, enable a new way for discursively constructing commonality – through reasoning with an assumption that the importance of some issue or cause is self-evident.

The Sociology of Engagement and the Relational Turn

Laura Centemeri[1], Mischa Gabowitsch[2], Andrew S. Hoffman[3], Luca Pattaroni[4]

[1]Centre National de la Recherche Scientifique / French National Centre for Scientific Research, CEMS-IMM (Centre d'Etudes des Mouvements Sociaux - Institut Marcel Mauss); [2]Einstein Forum, Potsdam, Germany; [3]Radboud University, Interdisciplinary Hub for Security, Privacy and Data Governance; [4]École polytechnique fédérale de Lausanne, Urban Sociology Lab

A result of conversations in and around the Politics of Engagement sessions at the ESA 2019 conference in Manchester, this paper is an attempt to provide a general introduction to the sociology of regimes of engagements for an English-language audience unfamiliar with this approach by placing it in the context of the relational turn.

Parallel and in some ways anticipating the emergence of relational sociology in North America, the social sciences in France have seen their own relational turn over the last few decades. The resulting theoretical innovations have only had a very selective impact on English-language theorizing. In this article we seek to close this gap by discussing, from a relational perspective, Laurent Thévenot's sociology of engagements. We contend in this article that Laurent Thévenot's engagement sociology can contribute in an original way to enriching the debate on some of the contentious issues that are currently discussed in relational sociology, particularly the role of the material environment and non-human actants in explaining social action; a relational understanding of power; oppression and exploitation in an increasingly interdependent world; and the need for a public sociology that would equally take into account the interpretive, critical, and reconstructive dimensions of the sociological endeavor.

An added advantage of the sociology of regimes of engagement is that it integrates theoretical traditions often excluded from relational sociology by pointing out their affinity with specific regimes of engagement that can be observed empirically, such as the rational-choice approach which can be shown to correspond to a strategic-individual regime of planned action. It also takes the logic of relationalism further by extending the notion of coordination to the personal level without psychologizing.

Values and Political Attitudes of Local Refugee Aid

Verena Schmid

Heidelberg University, Germany

This paper examines the question which values, and political attitudes are negotiated and im-plemented in the civic engagement for refugees during the so-called refugee crisis in Germany.

The research is based on three elements. First, local refugee aid is considered as a strategic field of action and the refugee crisis is seen as an exogenous shock that brought the field into turmoil. Second, special attention is paid to civil engagement in its plurality, relationality, and historicity. Third, the specificity of the local level will be addressed.

The results base on ethnographical field work in two German cities for five years since 2016. The data includes observation protocols, qualitative interviews, and internal and external doc-uments regarding the observed organizations. This material got analyzed according to the con-structivist grounded theory methodology (Charmaz). The study shows a politicization of the field with different intentions and orientations. While in the beginning most of the tasks of basic care were still uncontroversial and much could be achieved locally by using pragmatism, this path became increasingly difficult. Other fields influenced the local field and national developments arrived on the ground. As the tasks be-came more complex and the integration of the refugees increased, the common ground of wanting to help and the values associated with it needed to be defined.

With my results I focus on the basic and long-term developments of the field of engagement and how different influences affect attitudes of local engagement.

New Communities Made of New People. The Integration Process in Lower Silesia in 1960s and Today

Jacek Kubera

Adam Mickiewicz University, Poland

The process of building commonality may take several or even several dozen years. The creation of new local communities was a significant social and political challenge after the Second World War in the pre-war German areas that became part of Poland due to border changes. A few years after 1945, immigrants belonging to various cultural groups settled cities, towns, and villages of this part of the country. In Lower Silesia, they were former inhabitants of today's central Poland, Belarus, Ukraine, Russia, Romania, Bosnia, France, Greece, etc. Many of them were displaced people and almost all identified strongly with their places of origin. They differed in many ways and tended to stay in their groups, but at the same time – by acting together – they gradually began to identify with new places of life. The paper presents the perception of this process in Lower Silesia by its participants in two moments: in the 1950s/1960s (based on autobiographical narratives) and today (based on in-depth interviews). First, it will explain how a sense of belonging to new places and people was created in everyday situations. Second, the paper will show the importance of past regional and ethnic identities during the integration process and today.

1392

The Worth Of Solidarity. An Application Of the Sociology Of Conventions To Refugee Social Work Organizations.

Michael Corsten, Patrick Kahle

University of Hildesheim, Germany

The increased refugee migration since 2014 demanded the worth (grandeur) of solidarity. In Germany, the integration of refugees is a matter for several types of organizations – governmental organizations (GO, offices for migration and integration), social welfare organizations (SWOs) and Organizations of Civic Society (CSO). By defining organizations primarily by decision-making (Luhmann 2000), we can ask how these different organizations, based on multiple modes of valuation, make decisions under a social demand for solidarity. In analyzing the organizations their compromises between regimes of engagement (Thévenot 2007) and orders of worth (Boltanski and Thévenot 1991) are shown.

Following convention-theory-driven research on organization (Knoll 2015, 2019; Eymard-Duvernay 2011) and hospitality (Felder et al. 2020) we will discuss the case of SWOs as organizational type in the field of social work with refugees. GOs are clear compromises between the civic world and the industrial world. CSOs transform from a compromise of the regime of familiar engagement (Thévenot 2007) and domestic world to project-oriented Cité (Boltanski and Chiapello 2005). SWOs are a much more complex case.

SWOs have based their humane mission on their ideological origins and serve the common good by representing the interests of the excluded. The critical reality test of SWOs is to mobilize power as a 'governance reserve fund of social change', i.e. to generate services precisely in such constellations in which state and market fail (Merchel 2011; Zimmer 1999). Consequently, it seems promising to examine whether SWOs are complex compromises or a world of their own, of 'organized solidarity'.

Imagining Nature(s) in Pandemic Times: How Scandinavians Deploy Visual Frames of 'Climate' and 'Covid-19' on Instagram

Anna Helene Kvist Møller, Anders Blok

Copenhagen, Denmark

1393

Images and visual representations are widely seen as integral to contemporary forms of everyday and affective public engagement, as mediated by image-sharing social media platforms such as Instagram. In this paper, we analyze large-scale image datasets from Danish, Norwegian, and Swedish Instagram publics during the 2020 coronavirus pandemic, focusing on how collective visual frames link up to meaning-making practices (i.e., hashtags) related to the global risks of climate change and covid-19, respectively. The pandemic, we argue, represents a situation of inter-risk framing contests, in which actors vie for public attention to competing and overlapping global risks (Beck), including via acts of visual framing and keying (Goffman) on Instagram. In methodological terms, we combine computational techniques –i.e., supervised machine learning in the shape of convolutional neural networks – with qualitative coding to understand aggregate patterns of visual framing across the two risk domains (climate, covid-19) in the three cultural-political Instagram settings (Denmark, Norway, Sweden). In particular, we attend to patterns of meaning-making around 'nature(s)', a visual theme that emerges strongly across risk domains and national settings, yet with significant variations and comparative differences, as expressed in different landscape styles (rural, urban) as well as human-, plant-, and animal-oriented visual registers. Qualitative follow-up coding, we show, allows for finer-grained interpretations of visual patterns of public engagement, relative to a purely computational approach. Analytically, we end by suggesting linkages between our Goffman-inspired frame analysis and the notion of familiar engagement found in French pragmatic sociology – as one way of interpreting contemporary everyday visual politics.

New Forms Of Valuing Spiritual Engagement With Environment In India?

Audrey Richard-Ferroudji

Independent sociologist, France

There is an increasing call for the spiritual dimension to be included in environmental policies. This contribution analyzes 3 settings that proposed original assemblages and valuing of spirituality in India: the valedictory session of the Delhi Sustainable Developments Submit (DSDS) in 2015 which brought together religious leaders, the Pondicherry water festival in 2016 and the "water ceremony" organized for the Auroville's fiftieth anniversary in 2018. The analyses has an autoethnographical dimension while the author was participant and one of the organizers of the water festival. These celebrations were opened to plurality while leading to a dilution of the differences with the ambiguous definition of the world as "one family"/"Vasudhaiva Kutumbakam" in Sanskrit. The expression that was used in these 3 meetings is also promoted by Hindu nationalists to build communality. Following a pragmatic stance, the communication will rely on Laurent Thévenot's sociology of engagement to question inclusion of spiritual attachments with the environment and how it contributes to changes in environmental policies. How commonality is built while claiming to "live in harmony" with the environment ? Finally, we will question the relevance of distinguishing a spiritual engagement with the environment or resonance (Centemeri and Renou, 2014) and its extensions.

Understanding Visual Political Engagements Online and Offline. Practices of Visual Participation in Extinction Rebellion: A Look at Finland and Germany

Jenni Maria Kettunen

University of Helsinki, Finland

The worldwide mobilisation of the environmental movement has been hard to miss. One example of this includes Extinction Rebellion (XR), an environmental movement established in the UK in 2018, and nowadays active in 45 countries. XR offers a topical and versatile example of doing visual politics due to their action's strong visual impact and performative element. This mobilisation is closely linked to social media channels, which, in turn, make increasing use of visual practices. Because the public sphere of today's youth is increasingly dominated by visual content, it becomes vital to investigate how it shapes political action and imaginaries of the youth. This presentation introduces my ongoing doctoral research, which takes the idea of connection between the online and offline spheres of public action and the increasing significance of the visual content in the lives of young people as a starting point to study visual participation among XR in a comparative research setting in Finland and Germany.

What are the practices of visual participation unfolding in between online and offline spheres? The research is based on the pragmatist idea of looking at what political actors actually do when they engage in political action. I approach the practices of visual participation with the notion of engagement (Thévenot 2007) and the idea of cultural toolkits (Swidler 1986). However, grasping the action and habits that form political engagement through visual dimensions of the toolkits is still uncharted. To understand visual engagements online and offline, the research makes use of ethnographic research methods, most importantly snap-along ethnography and interviews.

1394

Visual Modes Of Engagement? The Role of Images In Motivating And Sustaining Climate Activism

Carla Malafaia

University of Porto, Portugal

Climate crisis is a defining topic for the younger generations which, born and raised in a warming world, strive to influence how climate futures will play out. 'Climate emergency', 2019's word of the year for Oxford Dictionaries, now shapes public debates. Activists worldwide play a major role in this process, not only through actions and words, but also through images. Theoretically inspired by pragmatic sociology and empirically grounded on an ethnography with school strikers and civil disobedient groups in Portugal, this presentation addresses the role of visual imagery in motivating and sustaining engagement. Emotion-eliciting images were identified by the young participants as triggers for their activism, and this emotional dimension now guides their practices of producing and using images. The use of images as modes of raising emotions while striving for the common good has actually led to considering the role of emotions in practices of justification (Silber, 2011): (civic) anger towards political leaders, (ecological) grief regarding the destruction of nature, and (domestic) fear of not securing a livable legacy to younger relatives seem to host discursive formations related to regimes of public justification (Bolstanki & Thévenot, 1991). Additionally, everyday situations of coordination with other (institutionalized) groups lead to 'visual compromises' in which civic worth (climate-justice arguments) is articulated with the worth of expertise to contest a system driven by market-worth. Lastly, the private (inward collective) circulation of images portraying moments of 'doing things together' emerges as a mode of engagement in familiarity, instrumental in preventing withdrawal and sustaining engagement.

Mechanisms To Turn Social Infrastructure Into Empowerment Spaces

Marina Pera

Universitat Autònoma de Barcelona, Spain

The common ground of contemporary society has been affected by the rise of individualism and the precariousness of the labour market and, more recently, the coronavirus pandemic has increased citizens' isolation. Social infrastructures at the neighbourhood level have the potential to become significant places for the creation of mutual understandings and for building commonalities (Klinenberg, 2016). Moreover, social infrastructures can also promote the creation of bridging social capital (Putnam, 2000) and civic capacity (Shin, 1999) to respond to collective challenges in the neighbourhood. However, this potential of social infrastructure to promote social cohesion is not a given since the present power relations in society are simply reproduced in such community centres, unless mechanisms to counteract it are enhanced (Deleixhe, 2018). Processes for raising awareness of social inequalities and strategies to empower vulnerable collectives are needed, otherwise citizens' capacities to participate will be influenced by the intersectionality of gender, racial and class discrimination. Through the mainly qualitative analysis of 50 civically managed centres in the city of Barcelona (1.636.762 inhabitants), which are centres managed directly by neighbours with economic and legal support from the city council, this paper contributes to the discussion of which mechanisms are needed to turn social infrastructure into spaces of civic capacity building. The results show that some of the influential factors include strategies to adapt opportunities of participation to the availability and skills of different citizens, the openness of participative bodies and horizontal organization.

RS07 | Precariousness in a Post-Covid-19 World: Labour, Daily Life and Subjectivities

Between Invisibility and Over-Visibility: Exploring Sex Workers' Vulnerabilities in the Context of Covid-19 Pandemic

Agata Dziuban[1,2], Anna Ratecka[1,2]

[1]Jagiellonian University, Poland; [2]Sex Work Polska

Our paper explores how the emergence of the COVID-19 and state responses to the pandemic impacted lived realities and everyday practices of sex workers in Poland. Different governance interventions, including the 'anti-crisis shield', were undertaken to tackle and counter both immediate and anticipated consequences of the outbreak for the labour market(s), general population, and individuals and groups adversely affected by the epidemic. The eligibility to acquire help provided by the state institutions and the capacity to access it were, however, unevenly distributed: it was based on one's employment and citizenship status, positionality in relation to policies, and crime control measures. Due to repressive sex work policy framework, which criminalises sex work labour relations and workplaces and does not grant sex workers recognition as workers, sex workers have been invisibilised in policy responses: they were not entitled to help, or were subjected to punitive rather than humanitarian and rescue interventions. In result, the COVID-19 crisis itself and crisis-related governance strategies (re)produced the increased vulnerability and precarity of sex worker community in Poland. As sex work researchers, sex workers and members of a sex workers' rights collective, Sex Work Polska, we have been directly involved in providing emergency and community-led support to sex workers in Poland. Drawing on the collaborative autoethnography method, our presentation we show how COVID-19 pandemic exposed the pre-existing vulnerabilities of sex workers, their invisibility as a community in crisis, and their over-visibility as subjects of punitive measures. In the Manuscript, we also discuss how the COVID-19 crisis evoked solidarity, the conditionality of institutionalised support and our resistance to it.

Digital Labour Platforms: Mechanisms of Neoliberal Governmentality? the Case of Household Service Workers in Turkey

Kadir Uysal

Higher School of Economics, Moscow

Recent studies on digital labour platforms are mostly focusing on the neoliberal elements within platforms or working conditions of workers within platform economy or the regulation debate surrounding platforms. Governmentality perspective is important in the study of platforms to understand what changes platforms bring around work in the era of informatization. Also, studies are mostly undertaken in developed economies especially when they focus on physical labour. With platform work is growing around the world, there is apparent need for the study of labour platforms in developing economies and on less known local platforms where the number of workers engaged in platforms can be very high. The research is focusing on the case of Armut platform in Turkey from the point of view of neoliberal governmentality.

The purpose of the research is to explore the effects of recently emerged digital labour platforms on workers' experience and meaning attributed to work, as well as on the mechanisms of managerial control of employers. What are the effects of digital labour platforms in promoting entrepreneurial outlook attached to labour? Do the technologies deployed in platform economy change the nature of control exerted by the management on the workers? Are these platforms constitute a new phase in the prevalence of entrepreneurial culture and managerial control? How did COVID-19 affected workers' experience of work through platforms?

The research is based on a qualitative study of service workers case in Turkey, through in-depth interviews undertaken with platform workers of Armut, the largest household service work platform in Turkey, specialized in services delivered at the service requester's residence.

1396

Women's Everyday Experiences in Modernised China-One Country, Multiple Stories

Yunyan Li

University of Bristol, United Kingdom

This paper investigates the recalibration of the economic reform and the gendered welfare system in contemporary China, under the interaction between modernisation processes and transforming Confucianism. There are dual national security systems and unbalanced social and economic development across rural and urban China, which brings the different gendered impact of the economic reform on women's lived experiences and the daily practices of gender justice. By drawing on 40 semi-structured interviews of women with children, this paper explores the tension, opportunities, and contradiction that challenge and support women's real-life experiences and the practices of gender justice.

This paper develops a holistic 'human dignity' framework focusing on the challenges and opportunities of the fulfillment in women's autonomy and mutuality at home, workplace, and in a wider social context. This research found that intergenerational co-residence and family relations become more pragmatic based on the needs of physical childcare and financial support, rather than merely focusing on the hierarchical and patriarchal family relations and expectation. Under Communist governance, the Chinese welfare system with selective coverage of national security insurance, also continuously produces the divide of labour market in the public and private sectors, which generated a more complex and unequal practice in driving gender equality not only between men and women but also between women and women in different sector and industries. These findings portray the variations of the experiences of gender justice across space and time and highlight the disjuncture between transitional gender policy paradigms and everyday practices in contemporary China.

Experiences of Tattooing from the Perspective of Tattoo Artists in Croatia: Gender-Based Differences

Ema Bašić[1,2]

[1]Institute of Social Sciences Ivo Pilar; [2]University of Zadar

Tattooing has a long and rich history as one of the oldest ways of body art. Therefore it can be viewed as an occupation and art. The aim of this research was to find out more about experiences of tattoo artists in Croatia at work and how they use personal social and cultural capital in their career development. For the purposes of the research, semi-structured interviews were conducted with eight female and seven male tattoo artists. Due to the common characteristics (precarious work-life balance, working on projects etc.) tattooing has been compared with creative industries. Theoretical background also consisted of social and cultural capital (represented by leading theorists like Mark Granovetter, Robert D. Putnam, Pierre Bourdieu) and current researches in the same field. Qualitative analysis yielded few topics, where gender-based differences were found. Both male and female tattoo artists claim they are burned out but satisfied with their life and work overall. The experience of tattoo artists shows the importance of strong ties in the form of support from family, partners and friends. That was especially the case with female tattoo artists, who entered tattoo industry through their partners and who felt safer when they have male colleagues by their side. Analysing cultural capital, differences were mostly found in way how they refer to tattooing as an art. This research revealed gender inequalities that were seen as discrimination against female tattoo artists from clients and tattooed women because of large, visible - "unfeminine" tattoos.

"Analyzing the COVID-19 Effects on Local Labor Markets: Precarity Trends for NEETs Across the Mediterranean European Economic Area"

Stelios Gialis[1], George Sykas[1], Akis Kanelleas[2], Nikos Kapitsinis[3], Anna Saroukou[4]

[1]University of the Aegean; [2]COVID-19_Regional_Labour Team; [3]Cardiff University, Business School, UK; [4]Panteion University, Greece

The COVID-19 pandemic, the health emergency and the subsequent economic crisis have strongly affected socio-economic life across the globe. However, these effects have been socially stratified and geographically differentiated. Some sectors, such as hospitality and tourism, have been hit much worse than have others, leading to significant economic disruption for those places with high concentrations of workers employed in such sectors. Likewise, those regions and countries that were most affected by the 2008 global economic crisis and that were still recovering when the pandemic broke have tended to experience worse economic outcomes.

The paper in hand assesses the impact of the COVID-19 pandemic upon youth Not in Employment, Education or Training (NEETs) across the Mediterranean European Economic Area regions. Young people are most likely to be subject to escalating precariousness and flexibility at work, whilst facing difficulties in obtaining or sustaining employment, thus increasing youth unemployment, vulnerability and marginalization. The paper contributes to the socio-economic academic and policy discourse in two distinct ways focusing on a sector of the labor force (NEETs) being at particular risk of further insecurity in post-COVID. It analyzes the interrelationship between contemporary flexibilization/precarization and NEETs, critically discussing the effectiveness of mainstream policies and their true impact upon youth unemployment. It also uses figures from the 'COVID-19_Regional_Labour' dashboard, funded by the YOUTHShare project, and scrutinizes recent figures of NEETs rates, against the ongoing COVID-19 pandemic, shedding light the effects of lockdown restrictions on labor markets and examining the level of NEETs precarity in post-COVID.

Keywords: labor precarity, labor flexibilization, NEETs, COVID-19, Cultural political economy

Youth Labour Landcapes in Turkey: Precarity and Precariousness in Uncertain Times

Hilal Kara

Queen's University, Canada

Situating itself within the context of the COVID-19 outbreak that crystallizes the blurring separation between productive and reproductive spaces, this paper explores how young people navigate uncertainty in the face of the shifting the meaning of work and education, increasing precarity and the rise of mental health issues associated with the loss of safety nets and the prolonged exposure to social and physical isolation. Drawing on 62 in-depth interviews with urban young people that was conducted during the pandemic (May-December 2020), I seek to understand the strategies young people are engaging as they respond to the emerging spaces of waithood, which is a period characterized by labour market precarity, as well as more generalized forms of vulnerability, disenfranchisement, or precariousness. In the Turkish context, young people have long been exposed to the spaces of waithood where the state's patriarchal and authoritarian governing technologies attributed to gender regimes are being made and legitimized, and there is no economic security enabling them mobility and start-up an independent life. The pandemic-mandated lockdowns pushed young people to more prolonged exposure to the spaces of waithood. Young people, however, transform the spaces of waithood into the sites of social and spatial (im)mobility, through which they navigate the systemic exclusions as their strategies and attributions to work falsifies what conventional temporal and spatial boundaries of work and non-work are and reshapes the boundaries that defined young people's duties, responsibilities and relationships with home, family, and the state.

(Post-)pandemic Crisis and the Normalisation of Precarity

Adam Mrozowicki[1], Jan Czarzasty[2]

[1]University of Wroclaw, Poland; [2]Warsaw School of Economics, Poland

The unfolding post-pandemic crisis is already leaving mark on labour markets and work and employment relations, and amplifies the levels of socio-economic insecurity experienced by economically active part of population worldwide. Adopting the thesis that COVID-19 outbreak and its aftermath are accelerators of social, economic and technological trends that originated prior to the pandemics rather than factors opening new paths of, supposedly radical, social change, we aim to focus on anticipated consequences of post-pandemic crises on precarity. The paper is intended to serve as a bridge between the recently completed PREWORK project – on young precarious workers in Poland and Germany - and newly started COV-WORK project. The later focuses on extent the socio-economic crisis has been reflected in changes in work organisation, collective labour relations and discourse about work as well as the socio-economic consciousness of working Poles and their individual and collective life strategies. We assume the social consequences of the post-pandemic crisis will further contribute to precarization of work. Simultaneously, workers' life strategies are most likely to exhibit significant resilience to the crisis due to continuous relevance of various biographical and social resources (e.g. social networks, cultural capital, earlier experiences of coping with crises). In the paper, we will try to develop some initial hypotheses about the conditions in which the 'normalisation' of precarity can be questioned following the (post)pandemic crisis based on the results of biographical research carried out in the PREWORK project and preliminary observations from pilot interviews in the COV-WORK project.

Lived Experiences of Covid-19 Crisis: The meaning making of a pandemic.

Athanasia Chalari[1], Efsevia Koutantou[2]

[1]University of Northampton, United Kingdom; [2]University of Essex, United Kingdom

This article utilises relevant sociological literature on the concept of crisis, in order to provide a description, understanding, and explanation of the ways meaning making is ascribed to covid-19, through lived experiences of the pandemic, during the April 2020 lockdowns. The underlying purpose would be to reveal how lived experiences may determine the meaning making of covid-19. For this endeavour to be accomplished, 46 in-depth interviews have been conducted with Greek participants residing in 14 different countries. Participants' lived experiences of covid-19 have been analysed within two different and rather opposing frameworks of crisis: 1) negative and fearful and 2) positive and optimistic. This article concludes by proposing that lived experiences of covid-19 are shaped through collective meaning making of fear and unsettlement as well as hope and adaptation. The determinant factor that may explain why different people experience covid-19 in such district manners may be that of reflexivity as allowing and enabling the emergence of resilience and adaptation as coping strategies during such challenging and adverse circumstances.

The Construction of Network Social Capital in the Local Employment Services in a Context of Employment Scarcity

Joan Miquel Verd, Joan Rodriguez-Soler

Universitat Autònoma of Barcelona, Spain

The worldwide emergence of the Covid-19 pandemic has only worsened the risk of employment exclusion that young people suffered as a result of the Great Recession. In this context, the measures aimed at generating social capital that are developed or could be developed within the framework of active labour market policies take great relevance. It should be remembered that the use of personal networks, also known as network social capital, are the main means of job searching and finding for young people; and that in times of job scarcity this use increases even more. However, young people with precarious labour market trajectories mainly use bonding-type contacts, obtained in close spheres, which contribute little to job finding in contexts of high unemployment. This communication studies, using a qualitative approach, the degree and way in which the different measures that are part of the active employment policies developed at the local level in Catalonia may contribute to developing bridging and linking contacts, which are much more effective for the job search of young people. The results obtained in the research show that the indicated policies generate, indeed, useful social capital for labour market insertion. This generation of social capital occurs, firstly, through the creation of contacts as an indirect outcome of training actions and work placements, and secondly, through informal mentoring developed by the workers of local employment services. This finding suggests that deliberate and comprehensive social capital building actions could be even more profitable for the group of young people studied.

Labor Market and Social Protection: Representations and Expectations of Vulnerable Workers in Portugal

Rodrigo Vieira de Assis, Renato Miguel do Carmo

ISCTE - University Institute of Lisbon, CIES-Iscte, Portugal

Which conceptions, expectations and perspectives can socially vulnerable workers express when they reflect on social protection system and labor market? From a series of 53 in-depth interviews, we will try to identify how precarious workers realize these systems in the Portuguese contemporary context, accented by the cumulative effects of two critical moments: the 2008 financial crisis and, recently, the Great Confinement resulting from the COVID-19 pandemic. Under the ART63 research project, funded by the Portuguese Foundation for Science and Technology (PTDC/DIR-OUT/32096/2017), the empirical material analysed is composed by first-person narratives provided by individuals who have held positions in different fields of activity, as in cleaning and food services, construction, contact centers and digital platforms. The meanings that these workers attribute to the labour market and Social Security will also be discussed, their expectations of being entitled to a reform and their evaluation regarding services and public support of which they have already been beneficiaries. In this sense, this proposal focuses on social protection and labor market social meanings between workers, subjected to different work regimes, in which distinct forms of precarity and relations with social security mechanisms are verified. The results revealed that these workers design the future as an increasingly uncertain and vulnerable horizon, expressing beliefs that possible solutions are of State responsibility, often understood as an institution opposed to the market.

Thinking about the Management of the Covid-19 Pandemic with Castel: The Welfare State or the Social State?

Mustafa Gültekin[1,2]

[1]University of Bordeaux (Centre Emile Durkheim), France;
[2]University of Pamukkale, Department of Sociology, Turkey

The Covid-19 pandemic, which showed its effect on a global scale, reminded all countries with experience immense anguish that the "social state" performs a vital function. One of the "social security techniques" applied to reduce the spread of the epidemic in working life was "short-time working allowance". In addition, the efforts were put into effect to prevent employees from dismissing for whatever reason in many countries. However, the concept of "welfare state", which is often used instead of the social state during the pandemic process- essentially different from the "social state" as sociologist Robert Castel once stated; "The welfare state which was the enemy of state intervention, was a religious metaphor that suggests that the state would act like a kind of father Christmas who would distribute benefits to all". The global pandemic came about in a milieu where the "mass unemployment" and "precariousness" of the working conditions have been continuing particularly in European countries since the mid-1970s. Problematizing the concept of social state under Covid-19 conditions; In the precarious and vulnerable times when the working did not provide almost everyone the opportunity to have "decent" living conditions, it may offer everyone an occasion to rethink the aim of the social state and reconsider a more universal model such as the "unconditional basic income" that benefits whether they work or not.

Key words: Covid-19 Pandemic, The Social State, Precariousness, Mass Unemployment, Robert Castel, Unconditional Basic Income.

Human Giving In A Crisis

Liz Jane McDonnell

University of Sussex, United Kingdom

COVID-19 entered the UK at a historical moment defined by a decade of radical economic and political austerity measures that have shrunk the welfare and social states as well as our health system. This has meant that the pandemic, with its attendant creation and intensification of psychological, social and physical vulnerabilities, has exacerbated social inequalities and related precariousness in everyday lives. The UK also has one of the highest total death rates from COVID in the world. Human giving or generosity is a potential response to crisis situations where people as individuals or collectively (including by way of the state), give to others any number of things including money, aid, time, attention or consolation. The significant giving of others has become widely apparent in recent times whether the extraordinary contributions and sacrifices of National Health Service (NHS) staff and other key workers, NHS voluntary responders, and Mutual Aid Organisations and multiple acts of individual giving. As sociologists, we see generosity as a socio-relational practice of giving, occurring between people, within systems of social and economic resources. This paper will explore human giving during the pandemic using in-depth interview data collected in early 2021 with participants with professional and/or personal interests in this topic. The paper will discuss experiences of giving and receiving, intersections with concepts such as care, empathy and kindness, as well as the potential role of giving in a post COVID (crisis) society.

"I Could Almost Just Disappear, And Would Anyone Really Notice?" Precariousness And Precarity When Living With A Life-Limiting Or Life-Threatening Condition During The Coronavirus (COVID-19) Pandemic In The UK

Sarah Earle[1], Maddie Blackburn[1], Liz Chambers[2], Julia Downing[3], Kate Flemming[4], Jamie Hale[5], Hannah Marston[1], Lindsay O'Dell[1], Valerie Sinason[6], Lucy Watts[5], Sally Whitney[5]

[1]The Open University, United Kingdom; [2]Together for Short Lives, UK; [3]International Children's Palliative Care Network, UK/South Africa; [4]Hospice UK, London UK; [5]Independent lived experience researcher, UK; [6]Independent researcher, UK

Living with a life-limiting or life-threatening condition (LLTC) is a precarious embodied state. Not only do individuals need to constantly adjust to the challenges of living with complex, often progressive, chronic illness but they also contend with a lack of diagnostic certainty. Living with a prognosis of comparatively premature death is a constant existential and material threat to human existence, highlighting what Butler (2004) describes as the 'corporeal vulnerability' of (all) human life: a fundamental form of precariousness.

As disability scholars have previously highlighted (for example, Knight, 2014), precariousness is not equally distributed; the coronavirus pandemic is deadly, but not uniformly so (Abrams and Abbott, 2020). In the UK people with 'pre-existing' or 'underlying health conditions' have been casually and repeatedly referred to as those most at risk of dying from COVID-19 in attempts to reassure the wider population that they are unlikely to die. This othering has served to render the precarity of those with living with LLTCs simultaneously visible and invisible.

This paper draws on an inclusive qualitative research study based on in-depth interviews with 26 young adults (aged 18-40) with LLTCs living in the UK. Using a constructivist grounded theory approach, we explore the experiences of 'shielding' and 'lockdown' during the first wave of the COVID-19 pandemic. In particular we examine the context of participants' embodied precariousness and precarity in relation to the rationing of limited healthcare resources, an increased reliance on private domestic care and intensified social isolation finally reflecting on their imagined post-COVID future.

Resources and Status Inconsistency. Class Differences in the Effect of Perceived Job Insecurity on Health.

Nils Teichler

Institute for Employment Research (IAB), Germany

This study investigates occupational class differences in the effect of perceived job insecurity on health. While there is burgeoning research on the general negative health effect of job insecurity, studies on a class-based heterogeneity show mixed results and go back many years. Ongoing discussions about the fear of downward mobility of the middle classes re-raise the question in which occupational classes job insecurity might cause higher stress and thus stronger negative health effects. This research project employs the Erikson-Goldthorpe-Portocarero (EGP) class scheme addressing the following research questions: Are there occupational class differences in the effect of perceived job insecurity on health? Can class differences be explained by class-varying sets of material resources and employability? I apply linear fixed effect regressions based on the German Panel Study Labour Market and Social Security (PASS). Results show strong negative effects of perceived job insecurity on two health outcomes, general subjective health and numbers of visits at the doctor, only for routine non-manual workers. These effects are significantly stronger than the effects for skilled and unskilled workers. The class differences cannot be explained by different sets of material resources and employability. Job insecurity and unemployment might more often hit lower social classes, yet the negative health shock of perceived job insecurity is strongest for the middle classes. The results support the idea that job insecurity evokes a fear of social downward mobility among the middle classes.

The Impact of the COVID-19 Pandemic on Precarious Workers' Health and Wellbeing: the Case of Catalonia within the International 'Precarious Work Research' Project

Mireia Bolibar[1], Mireia Julià[2], Eva Padrosa[2], Astrid Escrig[3], PWR Consortium[4]

1University of Barcelona, Spain; [2]Pompeu Fabra University, Spain; 3Escola Superior d'Infermeria del Mar, Spain; 4Karolinska Institute, Sweden

The COVID-19 pandemic is having striking socioeconomic consequences, particularly among workers in flexible, non-standard, and unprotected forms of employment. In this study, we aim to analyze how the pandemic affected the employment situation and its impact on the well-being and health status of non-standard workers in Catalonia, according to the level of precarity in their employment conditions. We hypothesize that workers in precarious employment will be exposed to serious stressors and dramatic life changes that may lead to a rise in diseases of despair.

The study is part of the 'Precarious Work Research' international comparative mixed-methods research. In Catalonia, in a first phase, an online survey was conducted to a sample of 1,174 non-standard employees aged 25-55. In a second phase, we selected a sub-sample of participants based on their level of precarity, gender, and age (n=40) to conduct semi-structured interviews.

Preliminary survey results show that almost half of the respondents had seen their monthly income reduced, compared to before the COVID-19 outbreak; one third reported issues of depression and/or anxiety; and more than 70% of those exposed to crowds or infected people in their workplaces identified deficiencies in the protective measures provided to them. The qualitative data are expected to delve into how and why precarious employment sets a condition of vulnerability to the contingencies derived from the COVID-19 health, social, and economic crises, leading to issues of physical and mental ill-health.

We expect that the results of this study will contribute to raising awareness about the necessary political interventions to increase precarious workers' protection.

The Vulnerability Of The Care Workers Of The Older People Residences in Castilla-La Mancha: Revealing The Hidden Part Of The Iceberg In Thimes of Pandemic

Paloma Candela Soto, Sandra López Fernández

UNIVERSIDAD DE CASTILLA-LA MANCHA, España

The severe health crisis we have experienced in Spain since March 2020 has placed older people residences or nursing homes as one of the most vulnerable sectors. During the confinement of the first wave of Covid, the neglect of care in this professional sector (Moré, 2021) in regions such as Madrid or Castilla-la-Mancha, showed us an unworthy reality in a democratic society. To date we accumulate in our country, Spain, more than 31,800 persons died with COVID-19 or compatible symptoms in residential centers. In Castilla La Mancha the figures total 3,209 deaths in Residences, 57.3% of the total deaths since the first wave.

The Public Network of Senior Residences of Castilla-La Mancha is composed of 11,445 places of which 4,736 are located in their own residences, 4,528 places in concerted external private residences and 2,181 places more in residences agreed with private non-profit entities or with local corporations. Only 20% of these places belong to Public Regional Ownership Centers, the rest is in the hands of the concerted external management.

The pandemic has highlighted the situation of job precariousness carried out by external workers of older people in residences. The well-known feminization of the sector, the implications of a false professionalization of workers through public programs such as ACREDITA (recruitment of young people without social health experience), as well as the conditions of intense precariousness and physical and mental overload that workers suffer in the current situation (intensification of work, absence of security protocols, volatile contracts, work shifts, etc.) are some of the most relevant aspects of the research results that we deal of in this presentation.

1403

Examining the Relationship between Precarity, Migration and Transnational Family Life: The Case of Mexican Women in Seasonal Agriculture in Canada

Astrid Escrig Piñol[1,2]

1ESIMar, Universitat Pompeu Fabra, Spain; 2GREDS-EMCONET, Universitat Pompeu Fabra, Spain

This focused critical ethnography examines the impacts of participation in a low-wage international labour migration (ILM) program for five Mexican families, with a focus on the impacts of precarity on their relationships. The sample includes women working in seasonal agriculture and an average of five of their non-migrating kin (n=29). The study took place in Canada and Mexico using a combination of four methods: participant observation, a visual elicitation strategy, semi-structured interviews, and a socio-demographic questionnaire.

A multidimensional approach to precarity revealed how study participants' family relationships were impacted by employment, living, migration, and social conditions. There were six structural constraints identified as particularly affecting family relationships: Limited decision-making power and uncertainty over contract length and dates; Wage insecurity; Lack of control over employer, geographical location, and type of job; Long, strenuous workdays; Travel restrictions to workers and relatives; and Family separation.

The study showed that the ILM program's conditions of precarity influenced family relationships, not only for workers but for non-migrating extended family members. It illustrated how the impact that conditions of precarity have extend beyond the workers' rights and health, to those related to the social domain of families, friendships, and intimate and affective relationships. Conditions in this program can be interpreted as having a precarisation effect on family relationships.

These results suggest that workers and their families would benefit from being able to exercise their agency and manage the terms of participation in this program to better fit their changing needs over the years and to organize care accordingly.

'How Can I plan My Future?': Self-employed Job Insecurity In The Post-Covid-19 Era

Concetta Russo

University of Milan-Bicocca, Italy

The aim of this paper is to investigate, through a qualitative study, the impact of the Covid-19 health, social and economic crisis on a group of self-employed workers, focusing on their job insecurity, family planning and daily life organization.

Self-employed workers are formally free from any relationship of subordination, but are made subordinate through the condition of precariousness and existential risk and, according to the data of the Italian National Institute of Statistics (Istat), represented the workforce most affected by the socio-economic consequences of the current pandemic. Indeed, their household budgets has recorded, between April and May 2020 , a decrease in incomes of approximately 79%, against the average of 50.8% for the rest of the workforce.

By analyzing twenty-five in depth web-based interviews of self-employed workers who exercise their professional activities mainly in the metropolitan city of Milan, and by using narrative methods to produce a comprehensive case study material, this paper investigates to what extend the pandemic has worsened the participants' condition of precariousness. Precariousness should be intended here as not limited to the work realm, but also as a broader existential experience which overflows in the life spheres other than work.

Preliminary results suggest that the high uncertainty and instability caused by the pandemic together with the poor (if not non-existent) social protection ascribed in their specific employment conditions, are strictly connected to the interviewees difficulty to plan for their future. This difficulty reflects directly on family planning and, for those who already have children, on the possibility of achieving a good work-life balance.

1404

Recognition and Precarious Working and Living Condition Before and During the COVID-Pandemic

Mona Motakef[1], Christine Wimbauer[2]

[1]TU Dortmund, Germany; [2]HU Berlin, Germany

Precarity and precarious work are widely debated concepts, though a lack of clarity remains about its definition, dimensions and application. Recognition appears to be an illuminating concept for a deeper understanding of work and employment in times of precarity and its further effects on gendered inequalities, but has yet to be considered. In our presentation we present a multifaceted understanding of precarity and it's gendered dimension for empirical research. Hence, precarity of life arrangement is introduced as a heuristic, though it is developed further on the grounds of theories of recognition (Honneth and Butler). To demonstrate the concept`s potential, we present empirical cases of individuals and couples in precarious working and living conditions in Germany. The empirical foundation is provided by narrative individual and couple interviews with 24 precarious workers which we have evaluated in a case-reconstructive manner, based on the hermeneutic sociology of knowledge. Income and employment are important dimensions within the concept but are embedded in gendered life arrangement and hence intertwined with rights, love, participation, care, health and housing. The enlarged perspective stresses not only how precarity cumulates in gendered unequal life arrangement, but also gives insights into how precarity is mitigated and strengthened within the reciprocal relations of life dimensions and due to recognition (deficits). This allows to understand the gendered contexts, relations and interconnections of different precarity dimensions. Our research heuristics can therefore also inspire further research that is focused on the multidimensionality and complexity of insecure living conditions. Transferring our results to the present, we argue that gendered inequalities that were already known before the COVID-pandemic are currently intensifying and new ones are emerging.

Different Systems, But Similar Forms Of Organising. Emerging Freelancer Cooperatives in Europe

Mathilde Mondon-Navazo, Annalisa Murgia, Andrea Bottalico

University of Milan, Italy

In the current debate, self-employed workers are associated with different forms of employment, ranging from independent entrepreneurship to precarious work. In the European context, this heterogeneity can also be observed in labour law systems. In some countries, such as the Netherlands and some CEE countries, the boundaries between self-employed and small entrepreneurs are blurred, whereas other countries, such as Italy, have long had hybrid statuses of self-employment, which have exposed workers to greater risks of vulnerability. This heterogeneity also affects industrial relations systems and forms of collective representation. Indeed, in a number of European countries, alongside the traditional collective actors, i.e. trade unions and employer organizations, new associations have emerged, with the aim to represent the 'new' solo self-employed workers.

This paper aims to provide an in-depth analysis of how solo self-employed workers are able to develop new forms of collective representation across different national contexts, in a historical era marked by the Covid-19 health emergency. Using the most different system design, we compared two associations based in the Netherlands and in Italy, two countries where self-employment is differently regulated by national labour laws and welfare systems. In both cases, the associations studied – Werkvereniging and ACTA – do not belong to either trade unions or employer organizations. In 2018-2019, through a twelve-month cross-national ethnography, our research explored their forms and strategies of collective representation. Therefore, this paper provides comparative evidence of how similar forms of representation can be developed, despite the different institutional contexts.

From Bad to Worse: Knowledge-Worker Precarity in Times of Covid-19 Pandemic

Rabia Burcu Uluyurt, Evren Hoşgör Çimen

İstanbul Bilgi University, Turkey

Recent decades have witnessed a profound transformation of the institutional setting that sustains and reproduces the capitalist mode of production characterized (among others) by flexibilization of labour markets and changing employment standards. A phenomenon once confined to low- and mid-skilled work, the non-standard employment (NSE) sphere rapidly expanded to devour the high-skilled workers previously considered immune to insecurity. Accordingly, the (so-called) knowledge-workers (KW) in flexible arrangements in online labour markets (OLM) burgeoned in number across the globe. While initially legitimized with a narrative of an entrepreneurial and self-managerial individual fulfilling her need for flexibility and autonomy, NSE is increasingly identified with precarity, insecurity and in-work poverty for both low- and high-skilled workforce suffering invariably from a vacuum of institutional protection. It is in this void of protection and state of vulnerability, the KWs of the OLM encountered the disruptive impact of the Covid-19 pandemic.

As part of a larger research project, this study aims to identify the impact of the Covid-19 crisis on KWs in precarious arrangements in the context of the late-developing Turkish economy. Combining market-level, interview and participant-observation data, our preliminary findings suggest that the Covid-19 pandemic further deepened the precarity experience of these individuals, who, on the one hand, are precluded from mitigatory actions of the government, and on the other, are encountering increasing competition in the OLM where a surge of supply is experienced despite decreasing demand.

Precarious Work and Intermittent Life Trajectories in a Platform Economy

Isabel Roque1, Jorge Caleiras2

1Centre For Social Studies, University of Coimbra, Portugal; 2Center for Research and Sociology Studies, ISCTE - Institute University of Lisbon, Portugal

This communication aims to present the results of an ongoing investigation under the EmployALL Project, funded by the Foundation for Science and Technology (PTDC/SOC-SOC/30543/2017). Industry 4.0 has brought dramatic changes into the labor market, regarding new precarious, intermittent, and informal work, dictated by the algorithm. Digital platforms enabled work to be done remotely, without any space and time constraints. Tourism and the service sector not only brought new professions, new labour characters, but also created new urban scenarios with precarious labor forms. Airbnb, couriers, Uber and Tuk Tuk drivers, are the 21st century professions which employ the majority of workers who once integrated the precarious reserve army, increased by the Troika crisis. Nevertheless, not having fully recovered from it, Portuguese workers face a new pandemic COVID-19 crisis, which has brought new forms of exploitation, vulnerability, and social exclusion. This can lead to intermittent, precarious, and unstable labour trajectories within the labour market, resulting from the frequent lockdowns which endanger not only companies, but also workers, who are faced with massive dismissals and layoff situations. Between 2019 and 2020, fifty-three in-depth interviews were conducted with several workers, aged between 24 and 66 years old, comprising the regions of Coimbra, Lisbon, and neighbouring areas, to carry out a qualitative analysis regarding their life and professional paths. In some cases, follow up methodology was also applied. These were reports of workers obtained in the first person, reflecting logics of struggle and survival, translated into regimes of pluriactivity, but also unprotected, informal and illegal work.

Keywords: Vulnerabilities, Digital Labor, COVID-19, Precarity, Life trajectories.

The Intersectional Precarity Of Gig Workers. The Case Of Food Couriers

Cosmin Popan1, Esther Anaya2

1Manchester Metropolitan University, United Kingdom; 2Imperial College London

In less than a decade, the global emergence of online food delivery services such as Deliveroo, Uber Eats or Gloovo has highlighted the tremendous power of the increasingly prevalent gig economy to reshape the nature of work under platform and surveillance capitalism (Srnicek 2016; Zuboff 2019). In their quest to hoard venture capital, innovate and disrupt markets, these companies and others in the gig ecosystem have, at the same time, further entrenched the insecurity and precarity amongst an already vulnerable and pauperised workforce. Such food delivery start-ups enrol an increasingly diverse and precarious population as self-employed contractors to whom they grant little social protection. For food couriers, an often precarious entitlement to the road space, which makes them constantly vulnerable to bodily harm, is compounded by a broader ontological precarity. Their insecurity at work results from being engaged in an unregulated gig economy where job and income instability are amplified by issues of gender, race and capabilities, which further add to their precarious livelihoods. In this presentation, we draw on case studies from the UK, Spain and South America to account for how this amplified precarity is, on the one hand, enabled by the political landscape of neoliberalism of the last three decades, while at the same time contested through various strategies of individual and collective resistance.

Precarious Employment, Precarious Life? A Qualitative Study Exploring the Perspective of Temporary Agency Workers and Their Households.

Kim Bosmans

Vrije Universiteit Brussel, Belgium

This study explores the broader impact of precarious employment on the life course, family and social life of households. A multi-actor perspective is adopted, considering the perspectives of different household members. For this aim, in-depth (household) interviews are used among temporary agency workers in Belgium. The results reveal that precarious employment influences the life course and family and social life in three ways: (1) by hindering or facilitating life course events and transitions of household members, (2) by influencing the daily life and planning in the household, and (3) by influencing the mood of household members. To conclude, the consequences of precarious employment reach further than the work environment; they impact the life course, and social and family life of workers. Moreover, precarious employment does not only influence the workers themselves, but also their household members, which is often forgotten in studies. Therefore, policy makers should consider the far-reaching consequences of precarious employment when developing (flexible) labour market policies.

RS08 | Researching Social Futures

Sustainability In Times Of Uncertainty: Future Engagement In Practices Of Food Entrepreneurship

Koen van der Gaast, Sigrid Wertheim-Heck

Wageningen University and Research, Netherlands, The

The global food system contributes about a third of global greenhouse gas emissions (Poore and Nemecek 2018), which necessitates a transition towards a more sustainable system. The recent covid-19 outbreak interferes with this. On the one hand, uncertainty can obstruct the transition towards more sustainability in the food sector when delaying new investments and inhibiting growth of promising sustainable initiatives. On the other hand, it might lead to new opportunities for entrepreneurship, which is associated with exploiting ambiguities that are associated with uncertainty (Dimov 2018; Gross and Geiger 2017) and sustainability (Johannisson 2018). Furthermore, after disruptions entrepreneurship can incite a process of recovery and transformation. However, this depends on how the adversity is construed, and what responses are enacted as a response to this (Powell and Baker 2014; Korber and McNaughton 2018; Sonnino and Griggs-Trevarthen 2013). In other words, the engagement with the uncertain future plays a large role in how entrepreneurship in and after a crisis situation develops. In this paper we explore in what ways future engagement shapes practices of sustainable food entrepreneurship in the context of the covid-19 crisis and the uncertainties it causes. We conducted a quantitative survey (n=30), and qualitative in depth interviews (n=10) with practitioners of sustainable food entrepreneurship in the Dutch province of Flevoland in respectively the first and second lock down. Flevoland has a history of both entrepreneurship and agricultural production (van der Gaast et al. 2020). The findings show that future engagement shapes practices in two ways. First, it shapes how practices are de- and re-routinized in the break with everyday routines. Second, it shapes the 'new normal' and the normative dimension of sustainable food systems.

Governing Algorithmic Futures: Social Research Methods For Algorithm Audit

Biagio Aragona

University of Naples Federico II, Italy

The expanding use of algorithms in society has called for the emergence of 'critical algorithm studies' (Seaver, 2013; Gillispie, 2014) across several fields, Critical algorithm studies pay particular attention to the social and political consequences of algorithms on the future of society, such as how the algorithmic circulation of contents affects cultural consumption (Beer, 2013), how the massive use of algorithms has effects in markets and finance (Mackenzie, 2019), or how automated decision systems centred on algorithms may reinforce inequalities and embed cultural biases (Noble, 2018; Espeland & Yung, 2019; Aragona, 2020).

As reported by the Panel for the Future of Science and Technology of the European Parliament in 2019 (STOA, 2019), there is growing concern that unless appropriate governance frameworks are put in place, the opacity of algorithmic systems could lead to situations where individuals are negatively impacted because 'the computer says NO'.

As sociologists we therefore ask for more transparent algorithmic systems because they are becoming so central to our lives and economies. We want imagine in 10/20 years a future where algorithms are receiving a colour according to their level of fairness, similar to how it happens on the new nutritional labels for food. To achieve this, the very first step is to gather and disseminate much evidence about algorithms and their functioning.

The presentation will give some examples of how through social research methods is possible to gain knowledge about algorithms and promote transparency and accountability of automated system. The objective of the presentation is to raise awareness about algorithmic governance and to address the future of data intensive societies through the reconstruction of the actual practices of algorithmic governance.

Marriage and Cohabitation under Uncertainty: The Role of Narratives of the Future during the COVID-19 Pandemic

Raffaele Guetto, Daniele Vignoli, Giacomo Bazzani

University of Florence, Italy

This paper addresses the impact of COVID-19-induced uncertainty on union formation practices in Italy. Prior research generally supports the view that poor economic prospects for men and women are associated with a delay in marriage in favour of cohabitation. In light of this empirical evidence, one might hypothesise that the uncertainty induced by the COVID-19 pandemic would be negatively associated with marriage and positively associated with cohabitation decisions. In testing empirically this hypothesis, we acknowledge that decisions made in uncertain conditions rely on personal narratives of the future, that is socially-constructed contingent plans for achieving a personal imaginary. The data come from an on-line survey experiment carried out during the final week of lockdown in Italy in spring 2020. We presented the respondents with a mock news bulletin – based on the work of a task force made up of leading coronavirus experts – concerning the expected end of the pandemic emergency in Italy. Our findings suggest that narratives of the future have a causal effect on marriage intentions: expectations of a long wait before the return to pre-pandemic conditions negatively influence marriage intentions, especially among less-educated women. On the other hand, cohabitation seems more compatible with the uncertainties of today's world, a result consistent with the Pattern of Disadvantage perspective. The present study gives a prominent role to the future in family formation practices, net of more 'traditional' factors that have been considered in the literature.

Personas, Practices and Energy-sufficiency Futures: Conceptual and Methodological Deliberations

Marlyne Sahakian, Orlane Moynat

University of Geneva, Switzerland

This contribution will expose the conceptual and methodological work undertaken for an ongoing project on co-designing 'energy sufficiency' futures, leading to participatory workshops scheduled for 2022 where citizens will engage with personas from the future in order to navigate tradeoffs related to sustainability and wellbeing in the year 2050. The idea that citizens can be engaged in prospective processes is not a new one, towards better situating the future in everyday lives, in order to make decisions today that are future oriented (Berger 1957). While a bourgeoning literature exists on persona development, our approach is to engage with social practices in developing personas that are embedded in socio-material arrangements of the future. We relate these personas to 'energy sufficiency' scenarios and related pathways, which are often difficult for citizens to interpret in relation to their everyday lives and that do not account for human wellbeing. We see several challenges with this approach: how to situate energy use in everyday practices of the future, currently lacking in most national energy scenarios (Dahlgren, Strengers, Pink et al. 2020); how to make future practices tangible and relatable through personas (Vallet et al 2020); how to account for the positioning of future-oriented agency (Welch et al 2020), where tradeoffs might exist between environmental sustainability and human flourishing, and between collective action and more individualized lifestyles; and how to present futures that are neither utopic nor dystopic, and that invite participants to 'stay with the trouble' and challenge dominant understandings of society-nature interactions (Haraway 2016).

1409

Can We Imagine A Post-Growth Future?

Aurianne Stroude

National University of Ireland, Galway, Ireland

Degrowth and post-growth theories have been gaining popularity in academia and are becoming more concrete in their suggestions (Parrique, 2019; Jackson, 2009). The topic of well-being and "Good life" is also explored by a growing number of researchers and sometimes linked with a post-growth perspective (Rosa & Henning, 2017; Muraca, 2012) or with sustainable consumption (Syse & Mueller, 2015). Nevertheless, the link with the imagination of the future at an individual and collective level is not often addressed directly in these different theoretical inputs.

My contribution to this conference will try to address this topic. I will draw on the qualitative data of my previous research on sustainable lifestyle transition (Stroude, 2019 ; book under press) and my current research focusing on sustainable practices and the experience of resonance (Rosa, 2016). I will in a first part present the methodological development of my research : starting with a standard semi-directed interviews and ethnography research design in which social futures imagination was not planned as a topic but appeared in the data, to a specific research methodology using journaling (Kenten, 2010) and visualisation exercises inspired by research on design (Burnett & Evans, 2016) addressing imagination of the future as an important topic. In a second part, I will present the first results of this current research, focusing on the imaginaries of the future that arise from my fieldwork data and in what extend they can be related to the theories on post-growth and the Good Life.

Engagement of Sociology with Imaginaries of Technological Change – The Case of Automation

Lilla Vicsek

Corvinus University of Budapest, Hungary

There are pressures on sociologists to say something about how technologies are going to affect societies. The contribution addresses two strategies that sociologists can take when faced with these demands, and argues for their usefulness, by taking the debate on automation and future of work as a case example. Firstly, a strategy of analyzing the role of projections in the present is suggested building on sociology of technological expectations (STE). It is shown how assumptions in the ideal typical circulating visions in the future of work debate make certain conversations possible, while hindering others. It is argued that these projections are technologically deterministic, give agency to technology and the future. By focusing on the issue of how automation impacts the future of work, prominent circulating visions leave other questions in the background, such as problems with current social and business arrangements in the development of artificial intelligence, and how society and technology co-shape each other, more importantly how technology may be shaped to achieve certain social goals, or even what would be desirable social goals with respect to AI. As a second strategy that sociologists can adopt, integrating sociological approaches together with foresight methods is discussed. Looking at perspectives that are currently left out of the dominant rhetoric in the future of work debate can provide useful insight, and scenario building and backcasting can help in devising these alternative futures. Results of combining STE with these methods, raise important issues and can enhance both techniques as well as sociological and interdisciplinary thinking which can subsequently lead to better practical uses in policy development. The research was funded by the NRDI Office in Hungary.

Visions And Imaginaries In Sustainability Transitions And Niches: Methods, Concepts And Examples

Jaco Quist

TU Delft, Netherlands, The

Visions and imaginaries and expectations are important concepts in sustainability transitions and emerging niches evolving around sustainable innovations and sustainable (consumption) practices formation. It is not only important to work on opening up visioning methods so that alternative and marginal perspectives can be articulated and enrich more dominant visions and imaginaries, but also to evaluate vision development and visioning processes and how inclusive these have been. In addition, visions and imaginaries are in need of conceptualization enabling comparative analysis of their role and how these are interpreted and used by actors. This allows to study visions and imaginaries after visioning processes have been completed, in long-term transition processes and how these are generated and evolve in emerging niches.

To address the points above, this paper will do three things. First, it will provide an overview of visioning methods applied in action research by the author, providing a critical discussion how these methods can be applied so that marginal and alternative can be better included, for instance from a de-growth or sufficiency perspective. Second, it will use concepts and frameworks on visions and imaginaries from the STS literature, including Leitbilder, actor worlds, socio-technical imaginaries and promises and expectations to generate a framework to evaluate roles and effects of visions in (1) vision development processes and how these evolve, (2) emerging niches surrounding sustainable innovations and alternative sustainable practices, and (3) long-term transitions. This will be illustrated with examples from renewable energy and circular economy.

Un-cancelling the Future at Walking Pace: Utopian Transformation of Public Services Explored Through Walking Interviews

Martin John Greenwood

University of Manchester, United Kingdom

In this paper I highlight the implicit, yet under-emphasised place public services occupy in the notion that a postcapitalist future has become difficult to imagine. The UK's slow cancellation of the public future of its public services, can be viewed as the ongoing subtraction from the routine experience of millions of people, of non-market/consumer-oriented values operating with social power and implicit hegemonic blessing. These values – such as the idea of collective contribution to a 'public good' - have increasingly come to be encountered only ever in a context of significant duress. This, I argue, could contribute significantly to the unimaginability of a postcapitalist future: values associated with making such a future come into being seem, when they are routinely encountered, to be facing evident doom. I suggest this likely diminishes social capacity to muster the organised collective effort necessary to meet the challenge of justly navigating the Capitalocene. Given this, I argue that there's value in examining whether these institutions could yet contribute to a restored faith in socialised improvement of society and in exploring what changes they might need to undergo in order for this to occur. To investigate these ideas empirically, I've employed a utopian-ethnographic approach - including walking interviews with participants, who are encouraged to think expansively about ways in which their communities might be positively transformed and potential roles transformed public services might play in such change. I'll conclude by setting out some initial findings from these interviews, and offering some reflections on this utopian-ethnographic method.

Shaping the Future – Utopian Imaginations Empowering Agency in Contemporary Land Conflicts in Argentina

Anja Julia Habersang[1,2]

1Ruhr-University Bochum, Germany; 2Fulda University of Applied Sciences

In order to analyse what empowers social actors to build alternative futures, this contribution links prefiguration, or realising change, with utopianism – the hopes and desires related to a fairer, freer, and more sustainably balanced world. My approach in researching this intersection is the analysis of how prefigurative practices translate utopian imaginations into action and transformative change. An in-depth case study of the 'Indigenous Women's Movement for Buen Vivir' in Argentina will reveal how these actors' shape alternatives, while taking into account how everyday life influences their approaches to the future. Empirical data collected in 2019 shows that the actors critique the present day as a crises-ridden dystopian age. In turn, they aim to make the future possible by (re)constructing a reciprocity with nature as well as one between humans and other-than-human beings, in short, Buen Vivir. To unravel how prefigurative practices translate utopian imaginations into action and transformative change, I focus on how Buen Vivir is experienced in the movement. The related ancestral practices are reconstructed in the present, 'so that there is a future', reflecting a cyclical temporality that inspires the processual, non-linear view of social change that accompanies the women's agency in contemporary land conflicts. Thus, the linking of prefiguration with utopianism helps us in grasping the role of imagination, hopes, and visions for future transformations in the process of building alternatives.

Practicing Fair Futures: Social, Material and Affective Dimensions of Urban Food Sharing Futures

Louise Michelle Fitzgerald, Anna R. Davies

SHARECITY, Trinity College Dublin, Ireland

In the face of growing environmental and social justice challenges in relation to unsustainable food systems there is increasing attention to, and need for, fair futuring; that is a considered process for thinking about, and planning for, the future in an inclusive manner. However, there are concerns that dominant approaches to futuring risk compounding existing social and environmental injustices given their basis in "smart" techno-growth optimism or narrow conceptions of green growth that are predominantly designed in isolation from city inhabitants' needs and experiences. Practice theory offers insights to the material, ontological and social relations arising if such futures are enacted upon, marginalising other ways of knowing and being within future cities. Reacting to these concerns, and to explore what widening the scope of voices in futuring reveals, this paper outlines the development of urban food future scenarios designed explicitly to respond to the experiences of grassroots urban food sharing activities. Here food sharing includes collaborative acts around growing, cooking, eating and redistributing surplus food and related materials as an example of pre-figurative politics and already existing practices of alternative futures. Drawing on empirical research conducted with 56 food sharing initiatives across eight cities, a novel process was developed to create and visualise three different scenarios for urban food futures and explore their reception amongst different stakeholder groups. The process sought to: 1. Elevate the marginalised perspectives of food sharing initiatives in practices of futuring; and 2. Explore how the visualisation of these future scenarios affected different audiences with respect to realising more just and sustainable futures.

Using Utopian Methods to Think Critically About Intergenerational Futures

Melanie Lovatt, Valerie Wright

University of Stirling, United Kingdom

Future time is meaningful to us because our identities are in part shaped by a forward-oriented perspective of what we want to do in our lives, what we look forward to, what we fear and what we expect to happen. However, there are differences and inequalities in the socially-constructed relationships between different social groups and the future, with some groups being included in, or excluded from, narratives of the future. This has been highlighted during the Covid-19 pandemic, which has amplified views that the future 'does not matter as much to older people as it does to younger people'. In this paper we present initial findings from a series of intergenerational reading groups that were designed to reimagine a future in which everyone's lives and futures are valued, regardless of age. Participants used fictional narratives in novels of different genres to reflect on what social conditions, relationships and policies might be required to realise a future in which intergenerational solidarity could flourish. Drawing on Levitas' concept of 'utopia as method' (Levitas 2013) we consider the ability of fiction to not only critique current hegemonic, exclusionary narratives of time and age, but to unlock emancipatory narratives of the future and future societies.

Exploring Youth Futurity Through Visual Narratives

Giuliana Mandich, Caterina Satta, Valentina Cuzzocrea

University of Cagliari, Italy

Today, the development of future-orientated research does not merely mark the opening of a new field of inquiry but rather goes along with the need to redefine both sociological theory (Mische, 2009) and methodology (Coleman and Tutton, 2017). What kind of methodologies can provide the means for social scientists to address interrogations concerning futurity? This question is crucial when "youth futures" are analyzed as today more than ever they at the same time loaded with societal expectations of success and framed by affective atmospheres of fear and anxiety. In view of this, the need is to reflect on multiple modes of projectivity, both representational and non-representational.

In this presentation, we reflect on 40 interviews conducted with mobile young people aged 25-34 for the

'Mapping youth futures' project to specifically discuss the use of images (photos, paintings, portraits, and self-portraits) selected by the participants to elicit narratives. We aim to understand how these images act as an imaginative device facilitating 'future-telling', allowing the emergence of multiple dimensions of futurity.

Young People, Pandemic And Emotions In Sicily

Alessandra Polidori1,3, Adrian Scribano2

1Università di Perugia; 2Universidad de Buenos Aires; 3EHESS

The Covid19 pandemic has meant very rapid and intense changes in social interaction with political, economic and cultural impacts that we still need to reflect on. This proposal contains the first results of an investigation into the emotional situation of young people in Sicily during the confinement caused by the pandemic. The main objective is to preliminary map the emotions experienced by young people in Sicily during the confinement. The pandemic has thrown the world into uncertainty, this has particularly impacted young people as it has blocked their natural predisposition to the future. The Sicilian context emphasized some of the characteristics of the youth condition in Italy, such as the difficulty in finding a job, the impossibility of acquiring autonomy from one's own family and planning a stable biographical trajectory. We therefore understand the importance of analyzing what impact the pandemic may have had on young people and what their responses to the pandemic are. The first preliminary investigations show a series of strategies implemented by young people to overcome the crisis, in line with some sociological studies that show how young people react creatively and strategically to the uncertainty that characterizes the present and the future. We therefore propose to report in this intervention the results of the interviews conducted in April 2020 and some previews of a second round of interviews that will take place in February 2021. To achieve this objective, the following strategy is followed: a) the social situation in Sicily is contextualized, b) a look at the sociology of bodies/emotions is outlined, c) some partial results obtained are presented and d) some preliminary conclusions are drawn.

1413

The Technologies of the Self to Address the Future

Sandra Vatrella, Roberto Serpieri

Department of Social Sciences, University of Naples "Federico II", Italy

This contribute is an attempt to show how the technologies of the self (Foucault 1984; 1988; 2012) constitute a powerful conceptual tool useful to address the future as analytical object.
To this aim, first we move the Foucault's latest reflections into the field of futures studies that we approach from a critical point of view (Inayatullah 2002; 2013). In particular, we grasp the prospective and preparatory exercise, in which the technologies actually consist, in the tension between spaces of experience and horizons of expectation. Between a present past of events that merge and re-emerge in the prefiguration of "what is not yet" and a presentified future which is part of the now that steers us (Jedlowski 2017). Second, we put the technologies into practice by empirically testing them. In particular, we pursue a methodological strategy where, by means of the qualitative interview, which combines the biographical (Bertaux 2016) and post-structural approach, we solicits a narrative where the memory retrieves itself and show itself in the "effort to constitute a kind of operational scheme for the future" (Foucault 2014, p. 246). So, by showing the heuristic prolificacy of the Foucauldian categories, we:
1) Identify the technologies to which young people resort in order to both construct and transform themselves in view of the future and how they take shape;
2) Understand the mechanisms through which the technologies can finally become a sort of tool for emancipation. That means, in what terms do practices perform an auto-poietic, and of ethical self-governing function.

Young People And Representations Of The Future In The Aftermath Of L'Aquila Earthquake (Italy, 2009).

Marianna Musmeci, Carmen Leccardi

Università degli studi di Milano-Bicocca, Italy

Traditional forms of mid-to-long term life planning are becoming increasingly obsolete due to the incumbent climate of uncertainty and the acceleration of social rhythms. In the specific case of young people's orientations towards the future, there is a tendency to rely on forms of biographical construction that take the present as the privileged temporal reference. In fact, rather than renouncing the project tout court, young people tend to adopt new strategies of relating to the future centered on the short term. The risk of the shortening of time horizons appears particularly high in contexts afflicted by disasters. In fact, in such situations, it is not only the dimension of the future, but also that of the present, that gets thrown into crisis.
The paper is based on a qualitative study carried out between 2016 and 2017 with young people who experienced the destructive earthquake in the Italian city of L'Aquila, in 2009. The contribution aims to shed light on the ways their relationship with the future has been redefined, starting from the methods adopted to cope with the discontinuities in daily life generated by the earthquake (both at a personal and socio-relational level). Devoting attention to gender differences, the study highlights the emergence of specific strategies for facing the uncertainty of the future. Participation in civic and political activities oriented towards community re-building, for example, appear to be of crucial importance in positively redefining the relationship with both the present and the future.

1414

Sustainability In Times Of Uncertainty: Future Engagement In Practices Of Food Entrepreneurship

Koen van der Gaast, Sigrid Wertheim-Heck

Wageningen University and Research, Netherlands, The

The global food system contributes about a third of global greenhouse gas emissions (Poore and Nemecek 2018), which necessitates a transition towards a more sustainable system. The recent covid-19 outbreak interferes with this. On the one hand, uncertainty can obstruct the transition towards more sustainability in the food sector when delaying new investments and inhibiting growth of promising sustainable initiatives. On the other hand, it might lead to new opportunities for entrepreneurship, which is associated with exploiting ambiguities that are associated with uncertainty (Dimov 2018; Gross and Geiger 2017) and sustainability (Johannisson 2018). Furthermore, after disruptions entrepreneurship can incite a process of recovery and transformation. However, this depends on how the adversity is construed, and what responses are enacted as a response to this (Powell and Baker 2014; Korber and McNaughton 2018; Sonnino and Griggs-Trevarthen 2013). In other words, the engagement with the uncertain future plays a large role in how entrepreneurship in and after a crisis situation develops. In this paper we explore in what ways future engagement shapes practices of sustainable food entrepreneurship in the context of the covid-19 crisis and the uncertainties it causes. We conducted a quantitative survey (n=30), and qualitative in depth interviews (n=10) with practitioners of sustainable food entrepreneurship in the Dutch province of Flevoland in respectively the first and second lock down. Flevoland has a history of both entrepreneurship and agricultural production (van der Gaast et al. 2020). The findings show that future engagement shapes practices in two ways. First, it shapes how practices are de- and re-routinized in the break with everyday routines. Second, it shapes the 'new normal' and the normative dimension of sustainable food systems.

Sustainably Part of Society - The Question about the Future Professionals

Susanna Marja Ågren

Tampere University, Finland

Bronwyn Elisabeth Wood (2017) has noteworthy argued that young people's transitions (e.g. to adulthood or to working life) should be examined in relation to their sense of belonging and to societal change. The current situation with the Covid-19 pandemic has made evident the need for critical discussion about young people's actual possibilities to find their place in society and to feel themselves as meaningful parts of it. The findings of the ALL-YOUTH research project (www.allyouthstn.fi) indicate that young people perceive paid work as an important guarantee for opportunities for independence and societal belonging. At the same time, many scholars have noted that the working life insecurities tend to accumulate especially to young people. This presentation concentrates on two questions: 1) how vocational education students see their possibilities for societal belonging after graduation and 2) how vocational education graduates position themselves in relation to labour market and to society in general. I examine these questions empirically by using data from group interviews among vocational students, and from individual interviews with vocational education graduates. The presentation analyses the meanings of labour market involvement for these young people as an enabler of their societal participation and belonging. Thus, and following Ian Gough's (2017) argumentation, this presentation argues that to guarantee sustainable belonging and wellbeing for young people we must discuss critically both society's possibilities and responsibilities to maintain a system that guarantees such sense of meaningfulness.

Futures Images for Constructing Sustainable Cruise Ships

Leena Jokinen1, Marileena Mäkelä2

1University of Turku, Finland; 2University of Jyväskylä, Finland

The presentation discusses future-focused human agency for collaborative sustainability enhancement in a cruise shipbuilding network. The analytical term 'futures images' refers to alternative future states based on current knowledge, understandings, perceptions, beliefs and values. The study aims to describe a variety of futures images and to analyse social construction of the images. The study focuses on one shipyard and its supplier network. The shipyard manufactures cruise ships, which are complex and tailored products, requiring intensive physical work and a wide range of cutting-edge technological machines.The results are based on a business- academia joint project where sustainability enhancement and transparency of actions were the main objectives. The primary research data were collected through interviews (40) and workshops (2).

The four resulting futures images were 1) 'Money rules'; 2) 'The most sustainable cruise ships in the world'; 3) 'Employees as the key' and 4) 'The customer is always right'. The methodological findings on social construction of the futures images supported relational approach fruitfulness in exploring collaborative informal foresight actions. The workshop method proved to be a valid communicative setting for data gathering on social construction of futures images.

The study contributes to analytical means to examine futures images constructed in collective, dialogic setting and elaborated through interaction and talk with others. An analytical frame used in the study captured dimensions of the collaborative talk and interaction in construction of futures images. Further research on practical perspective to inter-organisational foresight will benefit from exploring how actors produce futures insights.

Indigenous Knowledge and Sustainable Development

Tania Sen

Indian Institute of Technology Guwahati, India

Traditional Ecological Knowledge (TEK) has been defined as "a cumulative body of knowledge, belief, and practice, evolving by adaptive processes and handed down through generations through traditional songs, stories, and beliefs…it is concerned with the relationship of living beings (including human) with their traditional groups and with their environment" (Ferkes, 1993). These are indigenous knowledge systems which pre-modern or tribal communities used to sustain both themselves as well as their natural habitat. Such knowledge is helpful when it comes to the conservation of the ecology and is of immense importance in the face of present environmental threats that we face today.

However, modernisation and entry of the "scientific" knowledge system have pushed back TEK and brought it to the edge of extinction. How can communities maintain their indigenous habitat amidst competition for 'development'? Can we think of ways to progress without causing the loss of indigenous knowledge and cultures?

Questioning the future of culture and society, this paper is trying to understand the environmental changes that the Apatani tribe of India underwent due to modernisation and the entry of modern western education. The paper also looks into the politics of knowledge formation and is largely based on ethnographic data collected over nine months undertaken for my doctorate degree. The indigenous knowledge systems are crucial in the present context of climate change and stakeholders are to realise the useful bank of ideas and methods that they offer, which can help in the sustainability of the entire world ecosystem.

1416

Non-teleological futures

Clare Margaret Holdsworth

Keele University, United Kingdom

The covid-19 pandemic has radically altered future orientations. The pandemic does not make the future more uncertain as some commentators might suggest, but it has altered how we plan future goals and a normalisation that plans are always subject to change. Living through a pandemic modifies the synthesis of past, present and future. In this paper I consider how we can use these experiences to rethink a non-teleological orientation to the future. Non-teleology is rooted in the pragmatic philosophy of writers such as John Dewey to emphasise the importance of intention over the teleological realisation of goals. Drawing on Kantian

deontological ethics, a non-teleological approach priorities agency over final outcomes; it is what we do rather than what we accomplish that matters. In this paper I develop a conceptualisation of non-teleological futures using analysis of 'planner' videos. These are Youtube videos in which planner enthusiasts describe how they use their planners to organise everyday life and move towards future ambition. My analysis considers how planners differentiate between intentions and goals and what this infers for a non-teleological orientation to the future.

Agency in the Future-Related Discourse of Business Schools

Zsuzsanna Géring1, Réka Tamássy1,2, Gábor Király1, Márton Rakovics1,3

1Budapest Business School, Future of Higher Education Research Centre, Hungary; 2Doctoral School of Sociology, Corvinus University of Budapest, Hungary; 3Eötvös Loránd University, Budapest, Hungary

All social organisations have implicitly or explicitly stated reasons about why they exist and why do they operate in a certain manner. Finding the 'right' reasons and publicly stating them can be understood as the process of claiming organisational legitimacy. As for higher education institutions, it can be said that the reasons of their existence are no longer beyond doubt. This legitimacy crisis particularly affects business schools since they are often invoked as the very actors who train students for effectively participating and maintaining managerial capitalism. These raise the question of responsibility in relation to post-crisis business education.

In line with this, we analysed how business schools refer to the expression 'future' in their external communications. We claim that through utilising future in their organisational discourse, they seek legitimation for their existence and operation. Consequently, a key part of our analysis is examining what frames of action do the investigated business schools use in their discourses. That is, we investigate questions such as how these organisations create agency, how they construct personal, organisational, and social responsibility towards the future, and how they understand their role in shaping or adapting to a perceived future.

We examined business schools' external online communication based on the top 100 universities from the THE World University Ranking 2019 Business and Economics list. To capture the diverse agency patterns in the future-related communication of business schools we identified 6 frames in the corpus: preparing, shaping, adjusting, exploring, personal future, (social) responsibility. The composition and distribution of these frames outline patterns in the construction of future-related legitimacy claims.

Where Has The Future Gone? From Eschatology To Presentism – What Next?

Jiri Subrt

Charles University, Faculty of Arts, Czech Republic

Consciousness of the future is not something common to all people in the same way. The perspective of historical sociology shows that the dimension of the future had to be discovered during the development of human knowledge, and that it has gradually changed over the centuries since. In Europe, medieval eschatological ideas were replaced by philosophies of history and theories of progress; the idea of history with a closed end (a historic finale) was later replaced by history with an open end. While historicism, which dominated in the late 19th century, created considerable expectations in relation to modernization, at the turn of the 20th and 21st centuries faith in a better future is gradually disappearing. The idea of progress is reduced to science, technology, and medicine, but even this has been weakened by the COVID-19 pandemic. From the perspectives outlined above, it is desirable to make the future the subject of empirical sociological research. The fundamental question should be what seriousness and importance is ascribed to the future by the people of today. There follow from this a number of related research questions, such as: a) to what extent is the connection between the past, present and future perceived and reflected? b) with what breadth, depth and specificity can people - both laymen and professionals - create ideas about the future? c) with what symbolical universe are these ideas connected (religion, ideology, philosophy, science, art)? d) to what extent are these ideas oriented individually, microsocially or, conversely, macrosocially, or globally?

1417

The Multitemporality of Future

Letteria Fassari1, Massimo Blandini2

1Sapienza University of Rome, Italy; 2freelance

The research is the first step of a path that will take a broader and more complete form within the 2017 PRIN (Project of Relevant National Interest) entitled "Mapping of the future of young people: forms of anticipation and youth agency". Its purpose is to identify the new figures of the future that marks the life horizon of the new generations. Taking up the challenge of Carabelli & Lyon (2016) and Andersen, Ravn & Thomson (2020) we have identified the emerging futures by monitoring their evolutions and their flight lines. Based on 20 interviews with young people involved in the construction of start-ups geographically located in Southern Italy, we have detected a temporal dislocation of the future consisting of at least three different dimensions: the past of the future, the present of the future, the future of the future. In particular,

1) The past of the future represents the roots, its anchor point, and answers the question: where does the future originate from?

2) The present of the future represents action, the point of contact, and answers the question: what is the future in the present time?

3) The future of the future represents the imagination and answers the question: what transformative force does the imaginary future bring?

The plurality and complexity of the visions expressed and the forms assumed by the future are proposed for the methodological discussion with particular reference to a sort of 'light ontology' of the idea of subject (Rebughini 2018).

Eventfulness and Reflexivity – Conceptual Thoughts for a Sociological Macro-Phenomenology

Manuel Schulz

University of Jena, Germany

In order to develop an adequate theoretical approach to analyze the contemporary collective time-apperception, this presentation aims to refine the New Phenomenology towards a macro-level perspective. Accordingly, I will start from the observation that societies, due to the recent crisis of COVID, have been involuntarily exposed to a repressed form of vulnerability, namely the idiosyncrasy of temporality. The suddenness of the pandemic revealed the eventfulness of temporality as something which is hardly controllable and thus fundamentally offended the self-conception of modern society.

While societies in 2020 initially were overwhelmed by the sudden occurrence of the virus, the process of balancing and reflecting the measures which had been taken in the heat of affectedness set in subsequently. It is precisely this time-theoretical tension between the involuntary eventfulness and the reflexive arrangement of what is happening that could be itemized with the neo-phenomenological differentiation of modal-time and positional-time. As bodily existing entities, the latter approach argues, we are exposed to the eventfulness of modal-time. However, the particularity of human beings is that we are able to (partially) emancipate ourselves from this eventful sphere. By means of reflexivity we can arrange the occurring on a positional scale of temporal relations (earlier than, simultaneous with and later than) which leads to the dimension of future-related planning and acting. Thus, human beings are able to (re)construct futurities and act reasonably instead of being victims of completely uncontrollable circumstances.

As the recent crisis revealed, this time-theoretical perspective seems to be fruitfully transferable to the macro-level in order to refine the analytical tools for investigating current social realities in the light of insecure and at least partially uncontrollable futurities.

Proof Of Life. Towards An Enactive Model Of Discernment And Understanding Of Existential Threats.

Vincenzo Mario Giorgino

University of Torino, Italy

The attention catalyzed by the current pandemic makes it easier to remove the veil from existential risk and the need for conscious adaptation, beyond sustainability goals. The social sciences are still too affected by the pressure to return to normality, due to a prevalence of biomedical and economic reductionist views of the situation.

Life Politics define clearly the landscape, but the attention to pandemic work is still too small and marginal. Re-addressing the understanding of the situation to it, including not only the experience of citizens' daily life but also of scientific work, we can enable our knowledge to be more effective in reshaping the provisioning system and its protection policies. The anticipatory mode must be substantiated by a wise attention to the present.

The enactive approach can be of help to articulate a transdisciplinary toolkit, beyond the mainstream sociological knowledge, in order to be able to deal with the existential threat posed by other future emergencies too.

Human Agency Theories could be revised under a contemplative perspective in favour of a set of methodological tools enabling to overcome determinism such as distinction between individuals and context/structure or micro-macro perspectives still dominant in our discipline.

I will finally make a reference to an ongoing case study on adaptation of a biomedical technology for handling reagents for SARS CoV-2.

"Normality Under Uncertainty. Praxeological Approach in Research on the (Re)production of a 'Normal' Everyday Life in the City."

Marta Smagacz-Poziemska

Jagiellonian University, Poland

I just want things to be back to normal again" – these are the words spoken by individuals at the end of 2020. What is this future normality? What will it be for the people in the cities, who likely will end up tired and sore – socially, psychologically, economically - from pandemic experience? What is their imaginary normal future and how is it being done in practice? To what extend will normality be a correction of the pre-pandemic practices of work, parental involvement, leisure, consumption, and mobility, shaped by our previous routines? Or, alternatively, to what extend will normality mean a turn of urban everyday life? What possible trajectories of the future urban communities - diversified in terms of class, ethnicity, gender, and age – will be set through evolving practices? What are the likely consequences of everyday "doings and sayings" for individuals and communities, for the local development and environment?

In my presentation I am going to present the results of my exploratory project I am carrying out [spring 2021] in two urban neighbourhoods. Using the tools of the praxeological approach (Schatzki 2002) I am exploring the 'normalisation" of everyday life of urban communities and transformative nature of urban social practices in an environment of uncertainty.

Speculative Societies – Towards A Praxeology Of Speculation

Manuel Reinhard

Helmut Schmidt University Hamburg, Germany

Western societies at the beginning of the 21st century are speculative societies. What remains after two decades full of various crises has destroyed faith in the last remaining political eschatology of occidental societies, in the idea of progress, are societies in search of their lost future, of their lost orientation in time. Against this backdrop, the notion of speculation becomes increasingly important for contemporary social philosophical, social theoretical, and sociological research.

This paper is, consequently, a sociological sketch. What follows are a series of theoretical and methodological thoughts about the history and prospects of speculative research in the field of Social Theory and Sociology. The

1419

main purposes of this paper, therefore, are 1.) philosophical section: to present a conceptual analysis of the concept of speculation oriented towards the challenge of coping with present day societies, their new dynamism, and their various efforts to construct new futures, 2.) social theoretical section: to give an overview of future-oriented research in the field of contemporary Social Theory and Sociology, and finally, 3.) sociological section: to outline – based on the analysis of the concept of speculation and its relation to the current state of future-oriented research – the research agenda „Praxeology of Speculation". The paper emanates from an extensive discourse analysis of philosophical, social theoretical, and sociological texts that builds the first part of the author's postdoc project on predicitive governance.

Sociology cannot change the passage of time, but it can – with recourse to the concept of speculation, as this paper suggests – give its time a language that makes it possible to hint at the "specularization" of social worlds at the beginning of the 21st century.

Democratizing the Future:
From Theory to Practice
Roberto Paura1, Vincenza Pellegrino2, Rocco Scolozzi3, Alberto Robiati4

1Italian Institute for the Future, Italy; 2Università degli Studi di Parma, Italy; 3Università degli Studi di Trento, Italy; 4ForwardTO, Italy

The future is not an "empty space" and can be "colonized". There is an increasing need to democratize futures. The "future images" of individuals as well as of communities or organizations condition and inspire today's actions, but also values, expectations and even perceptions of the present. This issue is the subject of a variety of studies in different disciplines and from different perspectives, from cognitive science, social psychology, political science to futures studies. This latter field explore how the definition and use of futures condition the present and, in a "feedback forward", the very development of possible futures. In anticipatory systems one distinguishes between "feedback" and "feedforward". The activation of a proactive attitude in/with citizenship is essential to keep open the futures and possibilities of the public good. It is a matter of democratizing the futures and not only the present society.

The purpose of this session is to present a series of practical experiences carried out in the last two years in Italy by several organizations and research institutions on futures studies with the aim of increasing the engagement of citizenship addressed to democratization of the future. These experiences concern the Future Labs carried out at the University of Parma with disadvantaged

groups (unemployed, prisoners, etc..), the Future-Labs in the Classrooms carried out by the University of Trento with school students, the applications of the Three Horizons method by ForwardTO with the citizenship of several municipalities in Piedmont, the Erasmus+ project TAKE PART coordinated by the Italian Institute for the Future with young Italians and Albanians on the future of participatory democracy.

Creating The Same Old Futures: Conflicting Subjects In Eco-Political Documentaries
Mareike Zobel

University of Cambridge, UK

Since Al Gore's success with An Inconvenient Truth in 2006, eco-political documentary films have become influential voices in discourses on climate futures, environmental action and sustainable lifestyles. With global environmental movements and digital streaming services on the rise, 'eco-docs' have established themselves as popular how-to guides for becoming 'fit for the future' on a personal level. Feature films as production sites of discursive knowledge are only just starting to gain sociological attention. Yet to understand the social dynamics by which futures are imagined and created, we must recognise how popular media discursively devise possible and desirable futures. For while explicitly calling for fundamental change, most eco-documentaries in fact promote a self-understanding and positioning of (human) subjects that rather reinforces present-day orders of knowledge and power. A reconstructive sociology of knowledge analysis, based on a data corpus of 20 feature-length documentaries (2006-present), traces how many of them portray the path to alternative futures as the processes of subjectivation of the films' protagonists. The subject figure of the 'informed self' serves as an example for how they advertise technologies of personal development and self-affirmation, neglecting the social conditions and epistemological premises on which futures are made. This paper suggests that by postulating enhanced versions of present-day, neoliberal subjects as pioneering the future, documentaries undermine their interpellative potential to spark radical change. It asks how the genre could use its affective and aesthetic possibilities to design alternative futures, addresses the role of subject templates for social futures, and invites a discussion on the broader dilemma of creating futures from present-day orders of knowledge.

1420

Looking for Futures Between Individual Attitudes and Collective Actions

Antonio Sama, Carlo De Rose, Francesca Falcone

Universita' della Calabria, Italy

The increasing fast pace of change in social and ecological environments and systems brings to the fore the notion of uncertainty and the role it plays in the perception of the future and in the projections toward the future. This paper focuses on the answers to uncertainty provided by individual leanings and behaviours as well as by contemporary approaches in social planning. The aim is to highlight some similarities that may suggest further work on theory and research.

On the individual level it seems that uncertainty is addressed though adopting an attitude towards the future based on the awareness that life choices have a degree of temporariness. This tendency is based on the pragmatic inclination to situate life choices within the here and now where projections are realistically delimited to short term future.

The horizon of individual choice has been very often interpreted as a sign of a latent precarity, linked to new generations when compared to times the norm was the stability and certainty of life trajectories.

However, from a different perspective such transformation has fostered the emerging of attitudes that decisively show a positive implication in terms of agency and resilience, e.g., the ability to adapt one own's biography to the (uncertain) situations, the acceptance of changes as opportunities, the open-mindedness towards diversity.

Similarly, these attitudes are found in the debate on social planning, e.g., the transition from rational-linear approaches to emerging and participative approaches. This paper will explore this transition using Italian cases of social innovations.

What Makes Social Futures Robust? Towards a Processual View of How Social Actors Jointly 'Organize Uncertainty'

Timo Walter

Université de Lausanne, Switzerland

How do social actors create joint grounds for 'acting in an uncertain world'. Sociology has commonly approached this as a problem of overcoming the (fundamental) openness of the future. In this logic, the reflexivity of the future is backstopped, and uncertainty overcome, by rendering the future 'legible' or 'calculable', in order to allow "social actors to create and maintain stable social worlds" (Fligstein 1997, 398) allowing them to align their individual conduct to these jointly « imagined futures » (Beckert).

At the same time, this line of argument provides little analytic leverage for understanding the conditions under which such joint(ly imagined) futures remain performatively stable and can be effectively enacted – while at other times, they turn « counterperformative » and break down, often quite suddenly. Indeed, the idea of anchoring social action in joint meanings or projects of the future is based on an inherently semanticist conception of meaning and social action, making it difficult to discuss how these meanings are processualy coping with changes in their environment or 'target domain'.

To begin addressing this problem, I take the processual conception of rational conduct proposed by pragmatic sociology (Beckert, Stark) as a starting point. I then draw on insights from ethnomethodology, cognitive science, semiotics and linguistics to begin developing an analytic framework that allows for understanding how semantic certainty (intensional coherence of joint meaning-worlds) is interdependent with the 'syntactic' coherence of joint social practices through which these meanings relate to the world. I suggest to conceive of the robustness of futures in terms of whether they allow or reflexive re-organization of their socio-technical syntax in response to the emergence of semantic anomalies, or not.

RS09 | "Second-Generation" Youth: Acts and Lived Experiences of Citizenship

Between Dreams and Memories: Understanding of Homeland Across Generations

Gül Ince Beqo

University of Bari, Italy

Unlike the other western European countries where immigration from Turkey was induced through bilateral agreements from the 1960s onwards, Italy mainly welcomed asylum applications only towards the end of the 1980s. Consequently, while descendants of immigrants form a large diaspora especially in Germany, the first generation of Turkish and Kurdish immigrants is still middle aged, and their children are relatively young in Italy. This research examines, through an ethnographic case study, how these young people conceptualize their "homeland" and sense of belonging to parental home country in comparison to their parents' experience.

The participants of this research grew up in families where the main desire was not to stay in Italy but to arrive in Germany. The second generations also want to build their life in Germany but unlike their parents, they consider Germany not as another gurbet* experience that would permit accumulating enough money for a glorious return to the country of origin, rather a functional homeland: A place one feels at home in the heart of Europe to which to refer and within which to plan weddings, a professional future, or an active involvement in economic and political life, without renouncing either belonging to parental home country thanks to diasporas firmly rooted or to continue to live in Europe.

*Gurbet means to be far away from homeland and is closely linked to the experience of guest workers in Germany.

The Tunisian Second-generation In Italy: A Case Of Transnational Lived Citizenship?

Andrea Calabretta

Università degli Studi di Padova, Italy

Over recent years, the merging of the lived citizenship approach (Kallio, Wood, & Häkli, 2020) with the transnational perspective has permitted to shed light upon the spatiality of everyday citizenship practices (Martin & Paasi, 2016), helping to overcome the methodological nationalism (Wimmer & Glick Schiller, 2003) in citizenship's studies.

Starting from this potentiality, the contribution applies the transnational lived citizenship framework (Kallio & Mitchell, 2016) to the case of the Tunisian second-generation in Italy, aiming at delving into the interplay between transnational ways of belonging (Levitt & Glick Schiller, 2004) and citizenship's practices. The Tunisian community is an interesting field of study due to the growth of a significant second-generation and due to the 2011 revolution, which reshaped the civic and political bond between the community and Tunisia (Hagi, 2015).

The study answers to the following questions: (how) do the transnational attachments translate into citizenship practices within the second-generation? What are the sites (Staeheli, 2010) of lived citizenship for young Tunisians in Italy? What are the practices through which citizenship is lived?

The study draws on 12 in-depths interviews with Tunisian second-generation members (20-30) living in the area of Modena (Northern Italy). The interviews have been collected in the autumn of 2020 and thematically analyzed with the support of Atlas.ti.

The study offers fresh insights on how the transnational attachments shape the geographies and the contents of second-generation's practices of citizenship, ranging from dissenting forms (Maira, 2004) to real acts of citizenship (Isin, 2008). Moreover, the transnational lived citizenship framework proves its validity also for addressing the question of the transnational engagement within the second-generation.

(Post-)Migrant Youth Organizations And Their (Under)Representation In Youth Policy

Ana-Maria Nikolas, Sabrina Zajak

Deutsches Zentrum für Integrations- und Migrationsforschung (DeZIM), Germany

Second-generation youth - very often born and raised in Germany - are politically engaged, not only by expressing their political ideas in rather volatile and spontaneous mobilizations. They also organize themselves in associations and found and even lead their own migrant youth organizations in order to influence politics like other civil society organizations. However, migrant youth organizations or migrant youth self-organizations (MJSOs) are little researched - often their existence is not even known, let alone their political influence, or if visible, it is often under the heading of preventing radicalization of migrant youth. This paper discusses the political participation and (under)representation of migrant youth organizations in the field of youth policy. To this end, we examine the network structures of migrant youth organizations in the context of the so-called youth rings at federal, state and city level. Youth rings are one of the biggest associations and youth representation in politics of youth in Germany (Peucker et. al. 2019). With the help of network analysis, we show patterns of exclusion and inclusion. While hardly any direct membership relationships are found between MJSOs and the youth rings, we see connections between MJSOs as well as some crucial brokers that can bridge structural gaps and disadvantages in terms of cooperation partners and resource distribution. In summary, migrant youth are still underrepresented (for various reasons), but we also see a new dynamic in the form of emerging post-migrant organizations and youth networks with strong claims of belonging.

Claiming Rights. The Mobilization of Youth of Migrant Descent over Access to Citizenship Rights in Italy

Chiara Milan

Scuola Normale Superiore, Italy

The political activism of youth of migrant descent in Italy has been so far almost absent from most socio-political accounts, and rarely analysed from a social movement perspective. To that end, this article investigates the political activism of the so-called "new Italians", youth of second and third generation mobilizing over access to citizenship rights in Italy. Specifically, it analyses the political campaign they conducted in 2017 to reform the Italian citizenship law, which does not acknowledge their full membership into the state. Whereas previous attempts to amend the law had been conducted mostly by political parties in alliance with trade unions, in 2017 it was the youth umbrella organization "Italians without citizenship" that lead the coalition advocating for the reform, gathering together several individuals and associations of youth of migrant descent all over Italy. Throughout the grassroots campaign, the "new Italians" expressed their political agency, so far neglected.By means of participant observation and in-depth interviews with representatives of the main groups involved in the campaign, this article focuses on the mobilizing and discursive strategies that youth of migrant descent employed to bring support to their cause. The study shows that the "new Italians" claimed recognition and inclusion into the nation by relying on the idiom of legal rights and by using a language that rested upon the notion of deservingness and exceptionality. It reveals also that, by means of the campaign, the youth constituted themselves as political actors. They performed acts of citizenship through which they enacted their right to citizenship even in absence of formal legal recognition.

5 Ws+H: A Two-step Methodological Framework to Analyze Second-Generation Migrant Protests

Liana Maria Daher, Davide Nicolosi

University of Catania, Italy

The paper aims at exploring innovative methodological paths that can be used in social movement research, borrowing techniques from other practices that aim at describing events and behaviour, such as journalism.

The processes and narratives of social movements need to be carefully outlined through a two-step procedure that takes into account both the event process and the narratives of participants. The following tried-and-tested framework supports a solid analysis of the collective events and could be the proper solution to obtain a complete description, along with personal narrations and interpretations, of the whole event process.

The 5Ws+H (who, what, where, when, why + how) strategy seems to be useful to achieve the above goal, as this paper aims at demonstrating. In particular, applying this formula in the content analysis of second-generation migrant protests online (websites and forums) and through street mobilizations, such as the #italianisenzacittadinanza movement, helps to give a broad outline of the actions of the associations/movements of second-generation migrants in Italy and the reasons for their protests; it also aims at understanding their real social status in society and the sources of their choices of mobilization as social movement. The framework can be also used as a layout to employ in qualitative interview settings with movement activists in order to obtain further information about their personal experiences of "active citizenship from below", and their influences on social policies.

By implementing this two-step approach and following triangulation, therefore mixing data and results coming from the two-step analysis, we aim to offer a potentially complete overview of the acts and personal experiences of young second-generation migrants involved in the protests against the Italian citizenship law.

Second-Generation Perceptions of Integration Through the Lens of Positioning Theory and an Ethnic Boundary Making Approach.

Wendy Altınörs

Leeds Beckett University, United Kingdom

Turks came to Germany as gastarbeiter in the early 1960s. With a population of around three million and being a well-studied group, what more can be learnt about integration from the Turkish case across the generations? Using a family case study and applying positioning theory as an analytical lens combined with an ethnic boundary making approach (Wimmer, 2013); how has integration been perceived across the generations? The multi-level nature of positioning theory effectively links the complex levels of macro, meso and micro that shape integration experiences. Findings reveal second generation distancing, in this case, from others of a Turkish migration background. Storylines are dominated by attempts to disentangle self from Turkish politics; formation of an 'Other' in an 'Other' as well as 'reactive secularism', or 'reactive de-ethnicity' through dissociation; unacknowledged and even denied marginalisation and individual boundary crossing strategies.

Positioning theory has been used in a wide range of contexts from conflict resolution (Moghaddam, Harré and Lee, 2008) to examining identity and self-other relations (Andreouli, 2010). However, it has not been applied to better understand the concept of integration through lived experiences of the second generation. The multi-level nature of positioning theory effectively links the complex levels of analysis to reveal 'de-ethnicity' and ethnic dissociation for some as a means of expressing second generation lived experiences of integration.

1424

Inclusive Settings and School Culture for Children of Immigrants: Multicultural Childcare and Education in Japan

Yuki Nagae

The University of Tokyo, Japan

This study aims to describe inclusive settings and school culture for children of immigrants through ethnographic research at a daycare center, which has historically been a base of a social movement for multicultural coexistence in Japan. At daycare and education sites, the cultural differences of children of immigrants tend to be highlighted as deviation and consequently exclude them from the majority. However, the result indicates that the environment of the subject center which offers a child-centered curriculum and multi-aged activities were set up to free individuals from collective action and norms and let people recognize the cultural differences of the minority children equal with the other majority. This environment facilitated the immigrant children to gain a holistic understanding and support from teachers. Besides, it enabled the teachers to identify their potential needs by carefully considering their socio-cultural backgrounds. The main contribution of this study is that it provided insights to promote practices of multicultural childcare and education in the context of Japan.

Belonging Through Performances of Whiteness?: The Case of the Second-Generation Immigrants from Turkey in France

Ceren Şengül

Centre Maurice Halbwachs (Ecole Normale Supérieure), France

In France, race is officially invisible within the Republican discourse of 'liberté, égalité, fraternité', and everyone can become French as long as they adhere to the civic values of the French nation (Escafré-Dublet 2019). Whiteness, however, is still the default (Ndiaye 2008), and immigrants are acknowledged as temporary residents but not as potential members of the nation-state (Beaman 2019). How do the second-generation immigrants who are citizens of France manifest their feelings of belonging through acts of citizenship? This paper aims to analyse feelings of belonging amongst second-generation immigrants in France through the concept of whiteness by taking the second-generation immigrants from Turkey as its case study. Drawing on ethnographic data (in-depth interviews and participant observation) and on document research (the official diaspora policies of Justice and Development Party, AKP), this paper distinguishes two different layers of whiteness experienced and performed by the second-generation immigrants from Turkey: a) their everyday experiences of whiteness in their interactions with local whites (external whiteness), and b) (re-)construction of whiteness through everyday interactions within themselves (Turks vis-à-vis Kurds, Turks vis-à-vis Alewis, Kurds vis-à-vis Alewis) (internal whiteness). Through these two different processes of whiteness, this paper illustrates that a) these two processes are not mutually exclusive, and b) the dynamics of internal whiteness cannot be processed without taking into consideration the historical Republican and the current AKP discourse within Turkey. Thus, this paper contributes to the discussion on belonging and whiteness by focusing on both immigrants vs. whites and immigrants vs. immigrants axis.

Claiming Danishness – arguing for hybridity. The contested citizenship of second generation Minority Danes.

Laura Gilliam

Aarhus University, Denmark

Studies of second generation minority Danish children suggest that they tend to regard the Danish identity as a nominal identity, that they are excluded from due to their parents' ethnic and religious background. Yet, in my fieldwork and interviews with second generation young adults, most of the participants describe that growing up they had come to identify as Danish in a substantial way. To them being Danish refers to everyday experiences of affinity, belonging and sharing "Danish" ways and values, which they combine with their "Turkishness", "Moroccanness" or "Muslimness". This points to shifts in experiences of and understandings of citizenship through adolescence and young adulthood, which should be explored further. The young adults themselves explain these shifts with defining experiences of otherness when visiting their parents' country of origin as well as an increasing realization that they have been 'shaped' by Danish society through their upbringing and schooling. Yet, they also express that their Danish identity is precarious and continuously fought for and defended, as it is often met by ridicule and strong held ideas about Danish nationality contingent on kin, whiteness and Christianity by both minority and majority Danes.

1425

To help articulate and theorize this insistence on a hybrid form of Danishness, I will argue for a revitalization of the often discarded concept of hybridity. Not a 'happy hybridity' (Lo 2000) of multicultural bliss, but hybridity as a complicated entanglement that characterizes all identities and, following Ien Ang, in this case involves a disarticulation of exclusionary conceptions of Danishness, as essentially "white" and "Christian" and insinuate "the "other" (…) into the very fabric of the dominant" (2003:150).

Everyday Citizenship Among Italian Children of Immigrants: Internalizing Exclusion, Responding to Stigmatization

Giulia Marroccoli1, Giulia Mezzetti2

1Università di Torino - Université Lumière Lyon 2, Italy; 2Università Cattolica del Sacro Cuore, Milano

The present paper investigates how an ethnic and racialized understanding of citizenship shapes the everyday experience of citizenship of youths with a migratory background in Italy. On the basis of a qualitative study - 50 in-depth interviews and observation conducted with second-generation youths aged 18-34 in Milan and Turin, between 2018 and 2020 - the paper sheds light on the ways the narratives surrounding the identity of the Italian society affects these youths' sense of belonging and participation in society. A great deal feels compelled to show "gratefulness" to the country where they have grown up, "understanding" natives who hold prejudices regarding foreigners. By justifying natives' distrust towards them, these youths appear to somehow accept that the "burden of proof" to demonstrate their Italiannes lies on their shoulders. While it is easier to prove such Italianness for those whose phenotype is similar to that of the Italian mainstream, such mimetic strategy ends up internalizing the very exclusionary rhetoric that targets these youths. However, many of them may also adopt coping strategies and manage margins of manoeuvre to counter negative perceptions: some can "play" with labels and ascribed identities through micro-level everyday enactments of citizenship; others, especially those involved in associations, show forms of resistance to adaptation and advance novel (intersectional) claims. While this everyday tactical agency illuminates the existence of spaces of negotiations where these youths can claim "to belong", it also demonstrates that traditional identities can still be problematized only to a very limited extent in the Italian context.

Italian citizens, South Tyrolean identity, translocal connections? Second Generation Youth and the complexities of becoming and being citizens in South Tyrol, Northern Italy

Johanna Mitterhofer

Eurac Research, Italy

This paper explores citizenship beyond its formal legal status, presenting it as contextual to a place's local culture and history, and an individual's lived experience (Isin & Nielsen 2008; Jašina-Schäfer & Cheskin 2020; Kallio et al. 2020). It investigates everyday negotiations of citizenship by second generation youth in South Tyrol, Italy. By exploring alternative meanings and practices of citizenship within a single local context at the margins of a state, by a group often considered to be at the margins of a society, the paper moves toward an understanding of citizenship that is 'historically grounded and geographically responsive' (Isin 2008). Since South Tyrol became part of Italy in 1920 – and its inhabitants Italian citizens – categories of citizenship and identity have been politically charged. For many South Tyroleans, Italian citizenship is a mere legal formality without a connected sense of national identity. Calls for dual Italian-Austrian citizenship are periodically voiced. People with migrant background also experience this particular local context, which shapes the meaning of citizenship and belonging in this autonomous province. Drawing on 23 semi-structured interviews with young people aged 16-30 whose parents arrived from various non-EU countries, this paper explores how they experience the complex and complicated local discourses surrounding Italian citizenship and South Tyrolean identity, while simultaneously negotiating the complicated path toward the acquisition of Italian citizenship. How do they contribute to local discourses and practices on citizenship? By answering these questions, the paper explores the complex negotiations that go into these young people's attempts to find their place as a minority within a minority, and as Italian citizens within the Italian state.

RS10 | Sociology of Celebration

A Lisbon street party: Cultural heritage in practice

Ana Gonçalves1,2

1Universidade de Lisboa, ICS, Portugal; 2ISCTE-Instituto Universitário de Lisboa, CRIA, Portugal

This presentation focuses on the role of celebratory social occasions (Goffman, 1983) in shaping subjectivities, identities, and relationalities. The central argument is that festive events are key settings that might contribute to producing ties and memories that enhance a sense of belonging to particular social contexts.

Based on long-term fieldwork conducted in the Portuguese capital of Lisbon, we sought to grasp the meanings of the experiences lived by different participants in a local community party. The interest of this cyclical celebration lies in the fact that it is interrelated with a specific music circle in a certain way. More precisely, that of the Fado, a musical genre linked to Lisbon for around the last two centuries, which has been much publicised after its consecration as World Intangible Heritage by UNESCO in 2011. Bearing this in mind, we intend to explore how such events provide occasions for local residents, musicians, and other guests to meet up, jointly appreciate or perform music that they value, and engage beginners in musical pathways. In this way, the present proposal stresses the living aspects of cultural heritage.

New rituals out of an old one: The Slava among Serbian immigrants in Sweden

Sabina Hadzibulic1, Mikko Lagerspetz2

1Stockholm University, Sweden; 2Åbo Academy University, Finland

Slava or Krsna slava is the Serbian Orthodox celebration of a family's patron saint on a given day of the year. During the decades of Socialist Yugoslavia (1943–1992), it was confined to the private sphere only. Since the 1960s, there is a sizeable group of Yugoslav or Serbian immigrants in Sweden, and the Serbian Orthodox Church in Sweden claims 40,000 members. The article is based on eleven semi-structured interviews with immigrants who have started celebrating the Slava in Sweden. We identified four frames of interpretation used in order to provide the ritual with meaning: Orthodoxy, family, ethnicity, and the local community. A closer discussion of three cases illustrates different ways of finding a balance between Slava's possible meanings. The ways of celebrating display individual variation and the varying influence of the culture and values of the host society.

Ceremonies of Vaccination: An Exemplary Life History of a Roma Probationer in the Frame of Health & Social Mobility Study

Marian Badea, Cătălin Ionete

Romanian National Probation Directorate

It is a fact, reintegration rituals are less visible than punishment rituals when we talk about prison. But, what happens in the case of community measures and sanctions, in the case of probation? The probation system in Romania is a 20-year institution in which 600 probation counselors work annually with 90,000 probationers, using support and control-oriented means. In the current context, marked by fears and uncertainties, remote surveillance is more widely used by the institution of probation, but we can probably also talk about more fluid ceremonies of reintegration. IL, a young Roma, was placed on probation for several months in 2018. Then, in response to one of the obligations under the non-custodial educational measure, he became involved in a pro-vaccination campaign carried out by a team of specialists in his local community, made up of Roma people, predominantly. Now, we aim to follow his life

1427

story beyond probation, to discover in particular the consequences of all ceremonies of vaccinations, how he and the members of his community relate to the current vaccination campaign in Romania. This study is funded by the project "Improving the Correctional Services in Romania by Implementing the Normality Principle - 4NORM (-ality)" within the "Norwegian Financial Mechanism, 2014-2021".

Parties or Ceremonies? Contemporary Toraja under Normal Circumstances and in Times of Crisis

Anna Marta Mackowiak

Jagiellonian University in Krakow, Poland

The Toraja people have one of the most advertised ethnic cultures in Indonesia. It is famous for extravagant death feasts (Rambu Solo'). During my fieldwork, I attended 10 funerals and conducted in-depth interviews with 57 social actors of Rambu Solo': officials, organizers, family members and visitors.

I examined the touristic image that presents Toraja funerals as 'more joyous than somber' and 'part of a religion that the Toraja have developed over many centuries' (Meyer and Meyer 1972). These two statements have dominated the popular discourse on Toraja. Firstly, Rambu Solo' rites might seem more happy than sorrowful because they usually serve as social events for relatives, friends and neighbors. Often celebrated months or years after death, these lengthy funerals are family reunions and occasions for migrants to visit their homeland. Secondly, the Toraja funeral tradition has originated from the indigenous religions, but today most ceremonies are Christianized. The tourism industry tends to conceal the influence of new religions and portrays Rambu Solo' in a timeless authenticity bubble.

Dutch colonization, Christianization and the promotion focused on folkloristic visions of ethnicities contributed to describing Rambu Solo' as cultural rather than religious. Consequently, many Torajas began to call to their funerals not only 'ceremonies/rituals' (upacara) but also 'feasts/parties' (pesta). If words matter, which one is accurate here: 'ceremony', 'party' or 'tourist attraction'? How have these large gatherings changed during the Covid-19 pandemic and restrictions? Can the ritual cycle of Toraja funerals be stopped in a time of crisis?

Between Observing Tradition and Obeying to the Lockdown Rules. A Qualitative Study of the Celebration of Romanian Easter 2020 Through Solicited Diaries.

Ozana Cucu-Oancea

Institute of Sociology, Romania

Celebrations are social constructions consonant with the cultural and political values that exist in a certain society at a given time. As it is known, years ago, people in the Eastern bloc countries were forced by the communist regime to adapt their traditions to serve ideological purposes. At present, Coronavirus is proving to have a power even greater than that of politics, as long as ignoring the rules imposed by the pandemic can suddenly endanger the health and even the life of ourselves or one's loved ones. Romania is standing out nowadays as one of the most religious countries in Europe, Easter being the most important religious holiday for Romanian people. In 2020, Orthodox Easter has been under total lockdown restrictions, which generated an impediment to following Easter traditions, especially from a religious point of view. This paper is based on the results of a qualitative research conducted on a purposive sample of 73 participants aged 16-80 years, from various areas of Romania, which aimed to capture the impact of the Coronavirus pandemic on celebrating Easter 2020. The data have been collected through solicited diary methods, covering the most important three days of the Orthodox Easter period: Good Friday, Holy Saturday and Easter Sunday. The paper explores the diarists' attitudes towards this unique situation in which faith and tradition interfere with fear and lockdown rules, a typology of coping strategies being highlighted in this regard.

1428

Celebration Despite It All: Reinventions of Tradition in Time of the Pandemic

Jack Santino

Bowling Green State University (Retired), United States of America

It has become clear during the pandemic how important traditional rituals and celebrations are to people, as Americans and Europeans refused to abandon annual and personal celebrations in the face of confinement. The enforced lack of social interaction led to the re-invention and adaptation of traditional activities during anomalous circumstances.The confinement has made it impossible to carry out direct field research concerning specific instances of adaptation and re-invention or of the creation of new performances. Therefore, in this paper I can only share preliminary observations.

Ironically, while ritual and festival events are routinely described as "times out of time," as liminal, the period of the coronavirus is itself an anomalous period in which everyday structures and social rules have been suspended. Thus we are examining the enactments of regularly occurring periods of liminality during an unforeseen period of time out of ordinary time. In this paper, I will look at adaptations made to facilitate celebrations such as Halloween in the US and Mardi Gras in New Orleans; adaptations and accommodations made to celebrate rites of passage such as graduations; and the creation of new traditions such as daily bell-ringing, daily applauding, singing and dancing from balconies, and so on. I will suggest ways in which many of the new performance traditions draw on the particular cultures in which they are found, how they use the built environment, and the important role of electronic media.

Love in the Time of the Coronavirus: Sociopolitical Constraints and Individual Strategies on Getting Married in Hungary

Judit Balatonyi

University of Pecs, Faculty of Humanities and Social Sciences, Hungary

During the COVID-19 pandemic getting married has changed considerably all over the world, including Hungary. During the lockdown periods numerous wedding receptions and wedding ceremonies were postponed, rearranged, or cancelled. In other cases, for a variety of reasons, couples got married at city hall or in a church ceremony in front of two witnesses or their immediate families, without a wedding reception, without wedding providers and services. The weddings then continued with just the couple or with an intimate circle of family, or friends. The phenomenon has attracted lively media attention from the very beginning. These reports showed news of smaller, more puritanic, and more personal, new kind of weddings, and spoke of their otherness, characterizing them as "quarantine weddings" and "micro-weddings". What are the reasons for the otherness of the weddings planned and replanned or held during the COVID-19? How can we explain the popularity of micro-weddings? Were individual decisions shaped by changing political and social rules and contexts or did individual decisions become normative and shaped structural constraints and along with them weddings? Based on my qualitative and quantitative research (digital anthropology, nethnography, online surveys, and in-depth interviews), starting from the beginning of the pandemic, this paper will examine the individual wedding-planning and celebrating processes during the time of COVID-19 in Hungary. The paper raises questions about the extent to which these choices and decisions were individual and reflexive, how they were influenced, restricted by the old-new social, economic, cultural, legal structures and contexts.

1429

Pandemic Exposures of Vitality of Celebration for Individuals and Communities

Ismo Juhani Kantola

University of Turku, Finland

The Covid-19 Pandemic has brought restrictions and lockdowns for activities not regarded vital, practically in all countries of the world. The purpose of this presentation is to assess the impacts of those restriction on all kinds of celebration and celebrative activities. Short term impacts consist of deprivation in socialising while longer term effects may be for example a shared experience capable of constituting a specific generation. Worst deprived groups of population seem to be youth, students and singles. Secondary or indirect impacts of lockdowns and restrictions are probably felt most heavily among entrepreneurs and employees providing restaurant and pub services, as well as within the so called creative arts. So, what are the impacts? First and foremost suffering and corrosion of mental health, increase in frequency of suicides; loss of income, unemployment etc. Positive impacts, if there are any, can be innovations in the field of distant sociative togetherness as well as the shared experience of perils and excitement of illegal (or otherwise objectionable) partying and clubbing.

RS12 | Sociology of Law: Law in Action in the Covid-19 Crisis

Remote Hearings In Family: Justice Or Good Enough Justice?

Mavis Maclean

Oxford University, United Kingdom

During the covid emergency family cases involving child protection or domestic abuse have been heard using online process to comply with lockdown restrictions. This paper reports data from a study carried out May-September 2020 comprising phone interviews with a sample of 30 family judges and lawyers about their personal experience and asks what we now mean by "access to justice" ? Does the absence of face to face communication affect outcomes ? What is the importance of assuring comparable IT facilities for parties and decision makers?Are we moving away from access to justice to access to good enough justice ?

Pandemics, courts and the law In Poland

Małgorzata Barbara Fuszara

University of Warsaw, Poland

Pandemics demands the extra-ordinary regulations encroaching several rights that are in everyday circumstances considered inviolable as right to economic activity or human rights such as freedom of assembly. Polish Constitution of 1997 provides for introducing such extra-ordinary states – including „the state of natural disaster" - that would allow the said limitations. The government had not introduced yet such extra-ordinary states most likely fearing the costs of compensations that would follow. Instead the limitations are introduced through the detailed regulations that are legally challenged both by citizens and by the courts. This results in the quasi-duality of the legal system. The penalties are issued against the tresspassing of the governmental rules (lack of mask on face, quarantine isolatiopn, walking in a park, opening the barbershop, etc.) but later annulled by the courts. Until February 2021 more than 200 cases had been thus brought before the administrative courts and

majority was successful.The courts verdicts point to the lack of statutory base for limitation of human rights and/or to the lack of the extra-ordinary state declaration as required by the Constitution. As result some regulations such as a curfew though advertised by government had not been introduced. The paper deal with cases that had been decided by the courts and illustrate best the said duality of law in Poland during the recent pandemics.

Alternative Dispute Resolution And Covid-19 :The Case Of Mediation Ingreece

Ioanna Pazarzi1, Ino Pazarzi2

1Athens Law Bar Association, Greece; 2Athens Law Bar Association, National Bank of Greece

Our paper will present and discuss the implications of COVID-19 in the Greek Judicial System and mainly in the Institution of Mediation, an institution developed during the last decade in Greece, which is of increasing importance nowadays because of the various developments that require alternative ways to resolve problems. Various definitions of the concept of ADR have been presented in the existing literature and legislation. The basic elements for all types of ADR systems are: the parties' agreement to participate, the neutral third party helping to reach an agreement and the parties' decision on the outcome. The impact of the Covid19 Pandemic has led to many changes in the lives and activities of people. Studies and researches on this theme show that many countries all over the world adopted new legislation in the various aspects for the regulation of economic and social life This had also an impact on the judicial system and in the implementation of the alternative dispute resolution techniques.
Our main concern will be the analysis of some laws passed from the Greek Parliament concerning with the confrontation of the pandemic crisis and then we will present the impact of them to the implementation of both civil and family Mediation in Greece. We will also refer to the implications of the Covid 19 to the regulation of issues and disputes that were not encountered in many other countries.

1431

Justice in the Time of Covid-19 Turning Point or Parenthesis?

Benoit Bastard1, Christian Mouhanna2, Frédéric Schoenaers3

1CNRS, ISP, Ecole normale supérieure Paris-Saclay; 2CNRS, CESDIP, Université de Verdailles; 3CRIS, Université de Liège

In this contribution, we try and outline some of the foreseeable consequences of the current sanitary and social crisis on the judicial system. More specifically, we look at the temporal dimension in order to analyse the changes that have affected the legal professionals and conversely the habits that still exist in the courts.
Using previous researches on these issues and new data collected on purpose, we can reformulate the questions relating to the temporal dimension of the functioning of justice in the context of the pandemic.
- The health crisis came at a time when managerial policies were already facing contradictions. It was able to make more visible critical situations that had already been known for a long time. It forced judicial authorities to look for operational solutions.
- Likewise, the question of "urgency" in the justice system could be revised in light of the health crisis. Many actors had already realized the excesses of a global policy of urgency in which any solicitation made to the justice system had to obtain a rapid solution. Then, the new constraints of health prevention forced the judicial authorities to a more systematic sorting of cases that had to be dealt with immediately.
- Of course, the crisis has also imposed a different relationship to the new technologies, especially communication technologies, with the search for a balance between equity - from the legal point of view - and efficiency.

The Italian Surveillance Judiciary During the Pandemic

Giovanna Truda

University of Salerno, Italy

In the Italian judicial system, the surveillance judiciary identifies a part of the judiciary system which oversees the surveillance of the execution of the sentence (right of criminal execution). It was born with the Reform Law of the Penitentiary System, Law 26 July 1975 n. 354, implementing article 27 of the Constitution. Its role is extended not only to matters relating to the rights of prisoners during the time that they serve their sentence, but also to the granting and management of alternative sentences to detention, both for the final part of the sentence and before they are imprisoned. Unlike other systems, Italy considers that the execution of the sentence, even in prison, is not simply administrative in nature but is judicial. The surveillance judiciary is a collegial and specialised body, composed of a judging panel of four members, half ordinary magistrates who are directed to exclusively fulfil these functions, and half of non-professional experts, such as psychology, social services, pedagogy, psychiatry and criminology, and scholars of criminal sciences. Given the corona virus pandemic, the activities of this court have changed, using totally novel methods, including the use of online hearings and meetings with magistrates. What effects did these modalities have in the short term on complex social interactions, and which ones are still in progress? How has the court, through its organs, followed the detainee's "deviant career"? It is also unclear how the panel have guided and accompanied the individuals' judiciary paths.

Divided Legal Consciousness. Looking on the Bright Side of Crisis-driven Society

Marcin Michal Wrobel

Institute of Sociology, Jagiellonian University, Poland

1432

Legal consciousness is often described in simplified categories – different types of it are created in theories while people sometimes tend to function differently than scholars predicted: without deep knowledge they seem to navigate good enough in the everyday legal activities. Simultaneously they behave (or declare to behave) differently in various areas of life (regulated by various laws).
Presentation aims in presenting outline of how members of polish society find themselves in social life regulated by law and how their competences, attitudes and declarations vary depending on what issues are discussed.
Presentation will be focused on issues related to private law. One of the most interesting traits that can be found in this branch of law is mix of informal and formal strategies of legal actions – respondents preferred individual, personal contact with another party as a first step of conflict resolution but in case of lack of success they turned out quickly towards formalized was of resolving their conflicts.
Research explored declaration of activity, competences (not knowledge) in various areas of legal regulations, opinions about certain legal regulations and willingness to usage different types of social norms in different social (legally relevant) situations. Results show complexity of how individuals feel, think and (declare to) act in legal realm – with no place for simplified typologies or explicit types of legal consciousness.

Noteworthy: current crisis of democracy, constitutionalism and trust towards state seems to affect only certain aspects of legal consciousness, therefore creating even more complex image of people's attitudes and opinions.

When Automatic Justice is Just? Evidence from Moscow COVID-19 Isolation Enforcement

Olga Shepeleva1, Ekaterina Khodzhaeva2, Dmitriy Serebrennikov2

1Center for Advanced Governance, Russian Federation; 2Institute for the Rule of Law at the European University at Saint-Petersburg

In Spring 2020, Moscow authorities introduced the "Social Monitoring" mobile application to enforce isolation requirements. Application collects and automatically process geolocation and other personal data, and each time when data analysis reveals breach of isolation, isolated person is fined. Installation and use of the application are mandatory for Moscow resident who were tested Covid-19 positive, or contacted Covid-19 positive individuals, or must be isolated after returning from abroad.

"Social monitoring" is the first large-scale law enforcement tool in Russia, which applies totally automitisized algorithms in absence of human decision-maker. Developed and implemented urgently in face of epidemic this tool was a raw product, which predictably sparked severe critics. Users' comments in social networks shows, that apart purely technical problems with the application, people were strongly disturbed by excessive intrusion in their privacy and by unfairness in imposition of fines. Moscow authorities responded by modifying "Social monitoring" what resulting in decrease of negative scores for application and fewer users' comments loaded with negative emotions.

Interviewing bureaucrats implementing "Social monitoring" and its users, examining users' posts in social networks we will analyze views on the proper balance between privacy and public good with regard to automatized law enforcement tools. Using the concept of justification, based on the work of L. Boltanski and L. Tevino, we want to show difference and changes in public officials' and citizens' views on justice of automatic law enforcement and find the points where they converge.

The Right To Protection Of Vulnerability

Deborah De Felice

University of Catania, Italy

This work aims to reconceptualise the notion of child trafficking by seeking to understand child vulnerability and agency. The research approach focuses on some Italians criminal sentences and assessing how institutional interpretations support perceptions of vulnerability or agency that are often promoted or defined by criminal law perspectives. The attempt is to investigate human trafficking both as a multifaceted phenomenon and as a process, to tie together the functioning of elements of Human Trafficking (HT) system and assumes different shapes in growing complexity.

The Covid-19 pandemic has exposed the multifaceted and complex nature of the phenomenon even more, increasing the response strategies' difficulty. For children, the danger of falling into the traffickers' clutches has substantially increased. "Job" offers through various digital channels, both formal and informal, appear to be the main recruitment approach. The Covid-19 pandemic has had significant repercussions: the criminal networks that manage the trafficking of human beings have readjusted their business models and girls have been increasingly pushed to a step towards invisibility. With COVID-19 pandemic, victims are being subjected to increased pressure and violence from their controllers. The girls have often felt forced to accept lower prices from customers and received incorrect information about the face masks' use (Save the Children, 2020). So, any analysis or purpose on the protection of victims' rights must be paid particular attention to measures taken to address the vulnerability of children to trafficking.

1433

Smart working, smart law. Trust, Nudge Theory and Light Standards to Reshape Working Relationships in the Post Covid-19 Restart

Enrico Raimondi, Simone D'Alessandro
Università D'Annunzio di Chieti - Pescara, Italy

The pandemic prompted the Italian government to create regulations to facilitate 'agile working', introduced by Law No 81 of 2017. This typology, also commonly referred to as 'smart working', is characterised by a particular 'mode of performance' of salaried work. The agility that characterises this form of work does not constitute a simple evolution of teleworking.

In fact, 'agile working' changes the relationship between employers and employees, modifies family relationships and overturns traditional social constructions of space, time and place.

9% of Italians went into smart working during the pandemic, but 56% of Italians would like to choose this mode of working after the end of the emergency, even for one day a week (Nomisma, 2020). Like all phenomena that bring about social, economic and cultural change, agile work also has ambiguous and paradoxical characteristics. It can improve the quality of life or increase the workload and anxiety. It can resolve or exacerbate family conflicts. It can have a positive or negative impact on productivity. In this research paper we will examine the advantages, disadvantages, undesirable and perverse effects of smart working, emphasising that any solution designed to solve certain problems creates other unexpected ones. The analysis of existing data, acquired through empirical research, allows us to understand the effects that smart working has on workers and their relationships. This analysis, moreover, allows us to assess whether a new trust pact between employers and employees can be generated.

Covid- 19 As A Deviant Risk for The Electoral Process.

Yordanka Tsvjatkova Gancheva

Institute for the State and the Law - Bulgarian Academy of Sciences, Bulgaria

The report considers COVID 19 in the context of the electoral process. The impact of the infection on the electoral process in the conduct of elections both in the world and in the author's country is analyzed. Specific examples of elections held by different countries and the Republic of Bulgaria since the beginning of the pandemic are presented. The pandemic is considered a deviant risk for the electoral process, in the view of the reactions of the participants, the introduced special rules, the measures and the restrictions in the conduct of elections under the impact of COVID 19.

The First Individual Reactions to the COVID-19 Regulations in Poland

Marta Magdalena Karkowska
Polish Academy of Sciences, Poland
This paper attempts to reconstruct and discuss the first individual reactions on the legal acts contained the spread of the COVID-19 which has been adopted in the first months of the pandemic in Poland. The presented analysis focus on the perception, interpretation and implementation of legal acts recommendations, bans,

orders and restrictions introduced by the Polish authorities, mainly in the public sphere like keeping social distance, use of cloth face coverings, but also ban of movement if it's not necessary. It allows to present ways in which regulations that had never been introduced on a state scale were received and adopted by representatives of Polish society.

The analysis based on (apart from the documents themselves and related information available in the public sphere) 150 qualitative interviews conducted between April and June 2020 as a part of the research project deals with changes in social attitudes and lifestyles during the COVID-19 pandemic in Poland. Interviews were conducted via remote communication tools with people from selected regions of Poland, of different age, professional situation and life.

COVID-19 in the US: Leadership, Federalism and Law in Action

Barry Sullivan

Loyola University Chicago, United States of America

1434

President Trump consistently downplayed the significance of the pandemic or simply ignored its existence. In early 2020, he repeatedly proclaimed that the virus was no more serious than the flu. After he contracted the virus in October, and was treated for it, he pronounced again that the virus was not serious. From election day until he left office ten weeks later, the President never mentioned the pandemic in public, even as an additional 170,000 people died during that time, in what was the deadliest phase of the pandemic.

President Trump set an example for his followers by refusing to wear a mask or take other precautions. In the US, primary legal responsibility for maintaining public health rests with the states, but he repeatedly urged citizens not to cooperate with state officials. The federal government plays an advisory and supportive role to the states, including the formulation of recommendations and best practices. The President reported the recommendations of federal health officials, but he said that he would not personally follow them. The President presumably engaged in these activities because he thought that they would inure to his political benefit, and they played well with his base. At the same time, the President massively invested in vaccine development – for something no more serious than the flu – and his base did not object.

Apart from the vaccine, the response to the pandemic was disastrous. The legal framework for a successful response was in place, but it failed. This paper will examine some of the reasons.

National Bioethics Committees in the E.U. and the Pandemic Political Dilemmas: Balancing Health Public Interests and Individual Rights

Helen Rethymiotaki

NATIONAL AND KAPODISTRIAN ATHENS UNIVERSITY, Greece

During the last year all European Governments have declared the coronavirus Covid-19 to be a serious threat to public health and have undertaken measures restricting (more or less) seriously individual rights in the name of its protection. National Bioethics Committees in all European countries issued a series of opinions regarding the management of the pandemic crisis. Many of them try to strike a normative balance between legitimating the individual compliance to restrictive measures and questioning or delimitating them by evoking bioethical principles. It seems that the effort to face the pandemic has triggered a process of re-politicizing many questions and debates about biomedical science and health policies so far considered as strictly ethical. Some examples are the following: a) Can all individual rights be restricted, to what extend and under what conditions in order to protect public health? b) Are ethical preconditions of clinical research valid in urgent situations? c) Should vaccination become obligatory?, d) Do some lives matter more than others when there are not enough resources to cover the therapeutic needs? and e) Should digital technology be used to trace the contacts of the diagnosed cases and with what legal guaranties? The paper will try to disclose the reasoning between ethics, politics and law by analyzing and comparing the answers given from different National Bioethics Committees in E.U. countries.

Legal Nihilism and a "Thin Constitutional Legality"? Lessons from Poland

Grazyna Skapska

Jagiellonian University, Poland

This paper debates the government led systematic rule of law destruction, the results of national survey on legal consciousness conducted in Poland in 2020, and the recents activities of Poles aimed at the protection of rights and the rule of law. The survey revealed the sharp dicrepancies between "legal nihilism" of the actual government, and the popular opinions on the importance of law and the constitution.
Considering a still rather high popular support of the actual government responsible for the rule of law destruction, the survey leads to two contrasting hypothetical explanations of those dicrepancies. First of them is a hypotheis on a "thin constitutional legality" characteristic of the legal consciousness of Poles. The second one is a hypothesis on cognitive and axiological maturation of the society which undergoes a rather dramatic deprivation of rights, and experiences a blatant violation of the rule of law.
The second hypothetical explanation is supported by the recent social activities in Poland.
The question emerges on the role of Covid 19 crisis as an important factor/driver in the process of legal consciousness awakening, at least on the active part of the society.

1435

Legal Consciousness Formation During the Time of Crisis: the Case of Poland

Ewa Radomska, Ewa Kryglon

Jagiellonian University

Although studies on legal consciousness have a long tradition in Polish sociology of law, most of the research was conducted before political transformation in the 90s. Since then, Poles' attitudes on the law have changed enormously. Also the importance of law in everyday life of Polish citizens, as well as the sources of knowledge of law used by them have undergone far-reaching transformations.
The legal consciousness of Poles has become essential during the Polish democratic crisis. The fact that the Polish government does not comply with constitution and treats the law as a tool to expand the scope of its power has influenced the Poles' attitudes towards current regulations. In particular, it entails negative

attitudes towards legal regulations aimed at fighting the Covid-19 crisis.

The results of nationwide survey conducted during the pandemic have shown that, despite the crisis, the law is still an important element of life for Polish citizens. For example, according to the findings, sources of knowledge of law used by Poles and their relations with the applied law are important factors determining legal consciousness.

The proposed paper presents the results of analysis of the relationship between Poles' experiences with law (including their strategies for searching for knowledge of law and solving specific legal problems) and particular types of legal consciousness.

Democracy Quarantined? Pandemic Politics and Human Rights.

Ioannis Flytzanis

National and Kapodistrian University of Athens, Greece

The current presentation focuses on the ongoing health crisis and it attempts to highlight its critical socio-political dimensions using for reflection the tools of social theories for the human rights. It starts presenting the condition of the violent overthrow of our daily biorhythm: the state imposes a series of draconian provisions in order to prevent the spread of the epidemic. It develops an extraordinary regulatory framework which consists mainly of movement restrictions and economic activities disruptions. The measures are so hard that citizens are allowed to walk outdoors only for exclusive reasons, people every so often must be driven out of the public spaces which are guarded by the police, whole sectors of the economy are ordered periodically to cease their function or they are obliged to provide their services digitally. The question that we will attempt to pose is if pandemic politics are part of a wider paradigmatic shift in the way we perceive human rights, an end of the human rights era, or if they are restricted temporally in order to guarantee public health. We will argue that the virus management is not a state of exception, but it underlines the devaluing by the worldwide community of nation-states of policies based on social justice, human rights and democratic relations (public health-care facilities, universal access to vaccines, patent free medication). Therefore, the present crisis finds public health structures underfunded and under-functioning, with shortages of staff and resources, while we face an authoritarian drift on "Surveillance and Punishment" which is doomed to deepen furthermore inequalities and social conflicts.

Pandemics as Testing Challenge for Socio-legal Theories

Jacek Maria Kurczewski

University of Warsaw, Poland

Basic socio-legal theories have been chosen to study of contribution to understanding the functioning of law in pandemics. First, the ability of pandemics to assist in testing the theories is discussed. Then four theories representing different types of perspective on law are applied. Theories dealing with law as elements of political jurisdiction are compared with theories taking state law as a sub-class of the 'legal'; theories that deal with the contents of the law are compared with those that focus on law as a form of action. Thus, one may take (i) The Legal System theory approach that would face the pandemics as an external problem to be integrated into the law on condition that it is successfully reinterpreted as 'legal'; (ii) instrumentalist Marxist search for class interests behind the 'public policy' regulations; (iii)Bourdieu's theory would focus on competition between politicians and professionals over the ascription of pandemics to the legal, medical or administrative field; (iv)Black's behavioral theory would locate pandemics as the external stimuli to which the governmental control reacts by increasing production, implementation and adjudication; (v) Petrażycki's approach would lead towards unravelling the emerging juridical official and unofficial relations based upon intuitive as well as positive normative grounds, while (vi) Latour's ethnography might focus on the links between a new constellation of actors – viruses and medical laboratories as well as medical experts and administrative regulators – leading to the 'binding' pronouncements of pandemics policy. Finally the performance of these theories in comprehending the law of pandemics is assessed and compared.

1436

Global Threat at Local Level: Use of Law in Local-level Pandemia Management in Poland (a Case Study)

Maria Halamska, Arkadiusz Ptak

Polish Academy of Sciences, IRWiR, Poland

The personal experience of one of the authors and general research by the other are combined in this attempt to document and interpret the handling of Covid-19 at local level in the Polish countryside. The diary of a city mayor and his remniscences are complemeted by other documents and the relevant research. The stress is on particular elements in local powers and duties that are undergoing transformation since the 13th March 2020 when the crisis was officially declared by the country's PM and its links with the law at national level. The unprecedented problems like f.i. waste disposal at quarantined sites, or the coordination of actions between the until then unrelated agencies of local and national government are described, as well as the solutions that are being institutionalised over time. The picture that emerges is that of the flexibility of the actors combined with the sudden disruption of the apparent inclusiveness and consistency of the official law. The routine way of using law in local government gives way to the new improvised practices that are summarised as the ab-normal state, in contrast to the extra-ordinary state as envisaged in the specific chapter of Polish Constitution which the national government declined to invole in order to escape the additional economic (and political) costs.

Local Injustice Decisions in the Covid-19 Crisis

Rosalba Altopiedi1, Valeria Ferraris2

1University of Eastern Piedmont, Italy; 2University of Turin Italy

Covid-19 pandemia is one of the biggest challenges that welfare systems had to face. The short-term socio-economic impacts were huge. The sudden lack of income for several families has increased social inequalities and forced the national governments to enact emergency measures to support the most vulnerable citizens.
In Italy, among other measures, so-called Bonus Spesa were issued. It is economic support directed to the families and citizens who have difficulties providing for their essential needs. It is a measure that contributes to the Right to Adequate Standard of Living (article 25 Un Human rights Declaration).

The key legal act was an ordinance of the Emergency Management Agency (EMA), which demands the municipalities (i.e. 7093 different entities) to decide criteria and modalities to distribute the bonus within a one-sentence instruction made included in the EMA act. The obvious result was highly discretionary decisions taken by the local authorities with severe consequences in defining who can have the right to an adequate standard of living.
Within the theoretical framework of Local Justice (Elster, 1993) and a pragmatic approach to the questions of justice, the paper reflects on the:
1) production of law in an emergency as a feature which is not new but it is a confirmation of an already established trend;
2) legitimacy of delegating a choice of such importance to the local government's discretion, creating a fragmentation of decisions and a risk of multiplication of injustice and inequalities.

Mongolia's Early Response To Covid-19: Experiences And Challenges Of A Developing Country

Sodgerel Byambadorj

University of Warsaw, Poland

The reaction to COVID-19 pandemic in Mongolia had been assessed as „a timely and apparently effective response of a large lower-middle-income country neighbouring China" (THE LANCET.GLOBAL HEALTH 01-09-20) despite the limited number of health care equipments and health care officials, low-budget economy, and the geographical position of Mongolia. The purpose of this study is to investigate the link between the extreme regulations that were passed and the number of COVID-19 cases in Mongolia. A study published in July 2020 found that nearly half of the adult population in Mongolia is under high risk for the COVID-19, however the highest daily caseload of COVID-19 in Mongolia only reached 58 persons for about 3 and half million population. Using a correlational method, as well as semi-structured interviews, the paper will analyse the statistics of COVID-19 from March 2020 till March 2021 and the regulations that were passed for the duration. The implementation of the official regulations under the overall public health authority is presented with help of the several interviews with people from various ecological (urban-countryside) contexts. The content and the procedure of regulating acts will be analysed as it developed in time on basis of the 2017 law on public health disasters.
The paper will conclude by attempting to answer questions regarding the correlation between tight

regulations and the low incidence of the pandemic in Mongolia as well as to characterise the style and performance of the Mongolian state as the official regulator.

Pioneer legislation on Second Order Violence. Socio-legal innovation contributing to overcome sexual violence.

Lídia Puigvert1, Ana Vidu2

1Universidad de Barcelona, Spain; 2Universidad de Deusto, Spain

Gender-based violence and sexual harassment still constitute great challenges in our society. Understanding sexual violence broadly involves analyzing the reality of Second Order of Sexual Harassment (SOSH) and its socio-legal implications. Scientific studies reveal that breaking the silence on sexual violence implies re-victimization, not only for survivors but also for those who support them. This paper pretends to deepen on the approval of the new legislation, Law 17/2020, of December 22, modifying Law 5/2008, on the right of women to eradicate sexist violence, which includes the novel incorporation, among the expressions of violence that may occur in the social sphere, of the SOSH reality, incorporated as "Second Order Violence". This type of violence is defined as physical or psychological violence, reprisals, humiliations and persecution exercised against people who support victims of sexist violence. Acts that obstruct prevention, detection, care and recovery of women in situations of sexist violence are included. This paper will provide insights into the trajectory of the reality of second order of sexual harassment, up to the present moment of becoming law for the first time ever. There is a general consensus that bystander intervention constitutes one of the most efficient mechanisms of sexual harassment prevention and response. However, bystanders' protection has to be legally addressed. The impact of it is specified in raising awareness about this reality, empowering survivors and involving everyone, who would know they will be protected if acting. In addition, more victims will report and more people will dare to support them

Corona Impacts On Individual Routines And Mobility In Hamburg – Implications For The Ecological Transformation

Fabian Zimmer, Katharina Manderscheid

Universität Hamburg, Germany

The ongoing SARS-CoV-19 pandemic has significant impact on peoples' everyday lives and in consequence on the individual mobility. Due to a broad range of public measures, several reasons for travel are not possible or necessary any more. Additionally, first findings suggest also changes in the modal split (e.g. Robert Koch Institut & HU-Berlin 2020, Zehl & Weber 2020).

Meanwhile, qualitative insights into the changed patterns and geographies of everyday lives, individual coping strategies and new routines are still lacking. Yet, the pandemic represents a critical incident in people's lives and a possible window of opportunity for the transformation of mobility routines. By this token, a focus on the micro-level allows to study in a nutshell the formation and breaking of travel routines and corresponding path dependencies.

Our contribution will present preliminary results from an ongoing real-world-laboratory project in the urban neighborhood Lokstedt/Hamburg. In response to the pandemic context, we expanded the original data collection by two waves of semi-structured interviews with residents on their everyday travel and transport patterns. The current first round focuses on the changes in comparison to the pre-pandemic time and the situation during the lockdown. In a second wave after an easing of the pandemic situation, we will ask whether pandemic-driven changes in everyday travel are likely to be maintained or dropped and how this is being rationalized. Drawing also on the literature, we will then discuss the transferability and policy impacts of these results for an ecological transformation of the transport sector and travel behavior.

Citizenship and Mobile Family Life During the Pandemic

Ida Tolgensbakk1, Anne Balke Staver2, Justyna Bell1

1NOVA, Oslo Metropolitan University, Norway; 2NIBR, Oslo Metropolitan University, Norway

Norwegian society includes non-citizens of various legal statuses, and Norwegian citizens with family ties crossing national borders in complex ways. One of the most immediate consequences of the COVID-19 pandemic was travel restrictions and the effect it had on global mobility. This affected the national economy and individual livelihoods, but it also had unprecedented effects on individual family lives. This new immobility made people who were previously mobile stuck between their residency, their individual and their families' citizenships. When borders closed, rhythms of travel previously taken more or less for granted where disturbed.

Our paper will discuss how individuals tried to maintain cross-border and mixed-status family lives during the first year of the pandemic, how they reacted to borders closing, and how they protested travel restrictions arguing with their rights as citizens to family life.

Our project is based on online ethnography, simple content analysis of media articles and qualitative interviews, complemented by policy analysis of the series of changes to border rules, and our paper will problematise the issue of citizenship through the eyes of those that live on the border between multiple statuses. We will discuss the interplay between residency, citizenship, and sense of belonging across borders. During a global crisis: who has the right to access, and whose family life is prioritised?

Governing Mobilities: Managing the (Im-)Mobility of Skilled Workers With Fractural Knowledge

Johannes de Kam

The University of Warwick, United Kingdom

By March 30th 2020, 142 countries had either applied variable measure of travel restrictions on in and/or outbound travel in moves to curb the spread of Covid-19 (Connor, 2020). The changing and uncertain nature of restrictions around the world left Global Mobility professionals to scramble for fleeting information to mitigate impact on both the business they are employed by and the mobile individuals they support. This paper concerns the governance of the spatial mobility of skilled migrants during the early stages of the Covid-19 pandemic. The presentation introduces a global perspective on how Global Mobility professionals within multinational organisations interacted with emerging, uncertain, fragmented and opaque knowledge and information to make sense of restrictions around the world that were impacting globally mobile workforces. Whereas much mobilities research focuses on the (im-)mobile practices of the mobile subject, less emphasis is brought to the actors that condition such mobility. Drawing on an emergency mobilities perspective (Adey, 2016), this paper analyses in-depth interviews with 27 Global Mobility professionals across the world as to the knowledge these professionals were drawing on that governed the spatial mobility of a privileged group of mobile individuals and the forms this took. First the paper will lay out a typology of the types of knowledge Global Mobility professionals were engaged in and forms this took. Subsequently the paper will draw on emergency mobilities to consider how mobility is conditioned in a transboundary crisis.

Gender Justice And The Immobilities Of Gender Based Violence In The Covid 19 Crisis

Lesley Murray

University of Brighton, United Kingdom

In 'Mobility justice: The Politics of Movement in an Age of Extremes', Sheller (2018: 17) argues that we need to move beyond existing theories of transport justice to consider 'all forms of movement' and 'the wide-ranging techniques for the management of different kinds of im/mobilities and mobility infrastructures'. 'Mobility' as justice is about embodied relations of gender, racialization, age, disability, sexuality etc., as situated in historical contexts of colonialism; 'rights to the city'; movement across borders - including violence against women; and the politics of the circulation of goods, resources, pollution and waste. This paper analyses this proposition from a gendered perspective, calling upon feminist approaches to justice, space and im/mobility (Murray and Khan 2019) in understanding gender-based violence during the Covid 19 crisis. It draws from a research project: 'The immobilities of GBV in the Covid 19 pandemic' (funded by the Arts and Humanities Research Council (AHRC) as part of UKRI's Covid-19 funding), which investigates the relationship between spatial mobilities and GBV in the UK during the two Covid 19 lockdowns. Understanding GBV within this frame allows us to look across the multiple sites at the full range of GBV experiences. This research does so through the analysis of told and untold stories of GBV in relation to the complex interdependencies of immobilities. The project investigates how im/mobilities precipitate gendered violence, both felt and experienced and how embodied experiences become situated in mobile spaces - inside, outside and online - in the context of the Covid-19 pandemic.

Spatial Mobilities and Academic Careers: Precariousness and the Beneficial Influence of COVID-19

Kamil Luczaj[1,2]

1University of Cambridge, Faculty of Education, UK; 2University of Information Technology and Management, Poland

Securing a job in the USA and UK is often seen as a step forward in an academic career due to various pull factors such as competitive salaries, research excellence, favorable organizational culture, or institutional reputation. Nevertheless, such a career plan has unavoidable negative consequences. Based on 36 interviews with Polish-born academics employees in the USA and UK, I analyze how spatial mobility may lead to academic precariousness. The paper reveals that sub-standard accommodation, lack of social bonds, and the need for long-distance commuting are the most common reasons making the lives of mobile academics precarious. The sudden outbreak of the COVID-19 pandemic has an impact on all of these instances, but – quite surprisingly – many interviewees pointed to the positive side of the changes triggered by the pandemic on their careers. Usually, it meant that their professional life is now easier than ever before because COVID eliminated lengthy commutes – both within the country and across national borders. The paper concludes with a summary of what we can learn from the pandemic to cut some of the social costs of academic spatial mobilities.

Everyday Walking in a Pandemic City: Affordances of Public Space in Lockdown Helsinki

Annaliina Matilda Niitamo

University of Helsinki, Finland

This paper explores young adults' given meanings to walking in eastern downtown Helsinki, a semi-lockdown city amidst the first wave of the COVID-19 pandemic in spring 2020. Mobility in the city is seen as an inherent characteristic of liberty and freedom of the modern citizen who is granted the right to move at will in the bounds of the nation-state. However, in spring 2020 across the world the COVID-19 pandemic introduced a sudden reorganizing of the way in which public space can be used in a safe way. Municipalities have reacted in

differing ways depending on their levels of virus spread and governance styles.

Although Helsinki has not introduced sanctionable restrictions concerning mobility within the city, social norms and official recommendations have dictated and created patterns concerning walking. Temporary expanded walking routes, which were barely introduced in Helsinki in spring 2020, presented as a highly politicized topic in local municipal politics.

I use the concept of affordances (Gibson 1979) as an analytical tool to explore what material and social opportunities urban public space provides pedestrian mobility and regulation of everyday life. By exploring affordances, I attempt at operationalizing the concept of everyday life (Lefebvre 1947, 1961, 1981; de Certeau 1980) by looking at pedestrians' political agency in their perceived chances to shape environmental affordances of walking. The concept of participation is an underlying theme which I wish to develop in relation to pedestrian mobility. Data consists of survey responses, discussion in a formed group chat and walk-along interviews with residents and urban planners in Helsinki, Finland. Data is analysed using thematic analysis. In this paper presentation I will discuss initial research findings.

Marketplace Ambiences Under Covid-19: A Case Of Selective Immobility Among Hyper Mobile Traders

Maria Lindmäe

Pompeu Fabra, Spain

Weekly markets of Spain met important restrictions during the first weeks of lockdown in Spring 2020 and have met further restrictive measures during the second and third wave of the virus. Not only have mobility restrictions between neighbouring regions affected traders' income, but they have also curtailed the role of markets as inclusive public spaces. In this paper, we first introduce the notion of mobile ambiances to argue that marketplaces are coproduced by the often imperceptible and undermined mobilities of traders who produce the marketplace through their mobile practices in and between different places. Secondly, we argue that because of the immobility that has been selectively imposed by the local authorities on some of the traders, markets as public spaces have become less equal and less inclusive because of the exclusion of a certain category of traders who now face the risk of downward social mobility. This confirms the early estimations of Honey Rosés et al (2020), who predicted that the pandemic might limit the role of public space in triggering spontaneous interactions and new relationships, especially with strangers. Drawing on our ethnographic

1441

fieldwork in a Spanish marketplace, we contend that public space is constituted by numerous "fleeting moments of encounter" (Amin & Thrift, 2002) that give meaning to it. We hence disagree with the common perceptions that see mobility as counterproductive to the creation of "thick" places (Casey, 2001) and conclude by saying that limiting access to markets and other public spaces may have long-term consequences on the dynamism, diversity and inclusiveness of these places.

Media Consumption and Tourism

Claire Wallace, Stephanie Garrison

University of Aberdeen, United Kingdom

The paper focuses upon the role of popular media consumption in promoting travel to destinations in Scotland. Popular media such as Harry Potter and Outlander encourage a range of followers and fans who create a view of "place" linked to the media in question. These imaginary places map onto real places and become in turn tourist destinations. The online activities of fan groups, followers, bloggers and vloggers help to create a virtual representation of real places in Scotland. The explosion of online activities and social media in recent years has helped to create virtual followers and has made an impact upon the way in which people perceive Scotland. The research is part of an EU Horizon 2020 project and focuses upon three case study areas in rural Scotland: Abbotsford House, the home of Sir Walter Scott; Doune Castle setting for Outlander and Glenfinnan Viaduct, destination for Harry Potter fans.

Provincializing Motility: A Conceptual Revision

Daniela Atanasova, Jana Donat

University of Vienna, Austria

Within the interdisciplinary field of mobility studies, both inequalities in spatial mobilities and the complex interrelationships of spatial and social mobility have been recognised and discussed. The concept of motility has been advanced by Kaufmann and colleagues to raise attention to the unequal distribution of the capacity to be mobile in socio-spatial regards. They have proposed that motility could be regarded as a form of capital in the sense of Bourdieu's economic, social and cultural capital. This paper interrogates and critiques this premise by conceptually revising motility, based on a review of the literature on motility, the authors' own theoretical reflections and examples from studies on mobility from the Global South. Our aim is to "provincialize" the concept in its current shape and suggest ways in which it

could become more open and sensitive to Global South experiences and realities. We argue that the elements of motility should not come in a finite, closed list, but should be generated empirically in each context, with due recognition of their dynamic nature and intricate interdependencies. Next, we point to the potential of aspiring (instead of aspirations) to enhance the concept's promise to illuminate the entangled relations encompassing social and spatial (im)mobilities by investigating actors' relations to motility. Finally, we consider that rather than as a form of capital, it could be more fruitful to start by regarding motility as a heuristic device and a relational dynamic where other forms of inequalities and capital converge, intersect, are activated or constituted.

Socialisation and 'Mobility Links' Effects in International Holiday Travel: an Intergenerational Study

Giulio Mattioli, Joachim Scheiner, Christian Holz-Rau

TU Dortmund University, Germany

1442

International tourism was rapidly growing until the COVID19 crisis and was widely expected to continue on such a trajectory for decades. This development is driven by macro-trends such as globalisation and transnationalisation, while also being a driver for it. This would suggest that young adults today had earlier and more frequent experience of cross-border tourism than previous generations, with possible knock-on effects in terms of socialisation to increased international mobility. Previous research has also suggested the existence of self-reinforcing dynamics in international mobility over individual life courses and across family generations. Frändberg's concept of "mobility links" points to such effects, whereby e.g. international migration is associated with frequent holiday trips to the country of origin later in life and/or among the subsequent generation. Robust quantitative evidence of such trends and associations, however, has remained elusive due to the lack of adequate data. We use unique data from Dortmund (Germany) which includes detailed retrospective information on holiday travel, full residential biographies, and other life course events for a large sample of students, their parents, and grandparents. Our results show: i) trends in international holiday travel behaviour (trips frequency and age at first trip) across three generations; ii) from a life course perspective, associations between international holiday frequency and destination and factors such as age at first holiday abroad, migration background and experience of residence abroad; iii) from an intergenerational

perspective, associations between the holiday practices of parents and their children.

Home, Spatial Familiarity And Routines In Mobility Behaviours

Marc-Edouard Schultheiss

Ecole Polytechnique Fédérale de Lausanne, Switzerland

This research explores the unreasoned influences of locational behaviour – i.e. locational habits – in Activity-Travel-Behaviour (ATB). In particular, the interrelations between Activity Space characteristics and mobility patterns. In a wider research effort, behavioural (in)variability of space are investigated along biographies and inter-personal constraints, to propose bottom-up strategies for a human-centric transition towards sustainable urban territories, and greener modal choices. Even though the reasoned influences of locational behaviours have been largely theorised and experimented (e.g. effects of urban forms, space representation or mental maps on travels), the unreasoned influence of habits and familiarity remains scattered in the literature. Yet, we believe that time-space-activity habits (invariability, periodicity) hold a significant role in daily mobility behaviours and drive most of everyday-life organisation. Building on the approaches of modality style, action space, and mobility motifs, the contribution of this research lies in a multivariate analysis of (1) multi-day ATB motifs (or invariants) and (2) activity space characteristics and topological properties. Analyses are based on an eight-week georeferenced travel-diary collected in Switzerland in 2019. Contextual open data is also leveraged, including a territorial typology, the OpenStreetMap street-network and the General Transit Feed Specification data.

Early results tend to validate a causal relationship between the action space geometries and ATB motifs. Home-attachment regimes seem to have an important role in the activity space forms. From a purely scheduling and space consumption perspective, results suggest that exclusive drivers do not necessarily have the more complex spatial-diaries, even in areas of high spatial capital.

Migration, Daily Commuting or Second Residence? New Insights into Mobility Decisions Based on Longitudinal Survey Data

Thomas Skora1, Heiko Rüger1, Knut Petzold2

1Federal Institute for Population Research Germany (BiB), Germany; 2Zittau-Görlitz University of Applied Sciences, Germany

If a new job is not in the immediate vicinity of the place of residence, mobility decisions have to be made: Individuals or households have the choice of either moving or foregoing a move and commuting between place of work and place of residence. A sound knowledge of mobility decision-making is of high relevance for regional policy and planning, since different types of mobility have different consequences in terms of the regional distribution of the population. However, only a few studies have empirically investigated the different mobility alternatives comparatively and in their interdependence. Moreover, very few studies have distinguished between daily commuting and weekend commuting (i.e. staying overnight at a second residence near the workplace during the workweek). This study aims to fill this research gap by analysing the determinants of these mobility decisions of individuals who take up a distant job (i.e. a distance of 50 km or more) by focusing on the interplay between migration costs associated with different sources of location-specific capital and commuting costs. Based on longitudinal data from the German Socio-economic Panel (2001–2017) we estimate probit regression models with Heckman correction to account for sample selection. Results suggest that weekend commuting is a reasonable alternative, especially when both migration costs and daily commuting costs are very high. However, weekend commuting does not emerge as a particularly viable solution for parents of school-aged children. Rather, parents tend to commute daily, even when the distance is very long, probably because the cost of being away from the family during the week is considered even higher.

On Staying Local: Work, Place and Mobility in a Small Town

Hanna Uddbäck

University of Gothenburg, Sweden

The aim of this paper is to contribute to a deeper understanding on the relationship between spatial and social (im)mobility. This is explored through a study of how young adults in an industrial small town in Sweden perceive and negotiate their work opportunities and their position in the local labour market. The study is theoretically informed by a relational understanding of place, mobility and immobility in addition to concepts such as capital, habitus and field. Empirically drawing on qualitative interviews with young adults, as well as local actors, the study makes visible the different negotiations and tensions dealing with a changing labour market and dominant notions and norms on mobility. The main findings suggest that dominant notions and norms on mobility are challenged by local values such as place-loyalty and work-ethics. The young adults find themselves in-between value systems where mobility, place and work have different meanings causing them to reflexively relate to sometimes contradictory norms and values. The study makes visible the local structural conditions in terms of access to labour market and housing that make it more beneficial and desirable for some young adults to stay locally, rather than to move to bigger cities. However, this is not an advantage that is equally accessible to all. Through the theoretical frames of the study, the analysis contributes to a complex understanding of labour market negotiations among young adults and how these negotiations are shaped by access to different resources and the local structural conditions in the industrial small town.

The Use Of Visual Methods To Explore Multi-local Lifestyles

Lisa Garde1, Lena Greinke2

1ILS – Research Institute for Regional and Urban Development, Germany; 2Leibniz University Hannover, Germany

Work-related mobility is increasing due to the flexibilisation of labour markets. Therefore, many employees decide to live multi-local, which means living in more than one place at the same time. While existing studies use several quantitative and qualitative methods for studying these lifestyles, this paper presents complementary visual methods, e.g. reflexive photography and biographical mapping, used in semi-structured in-depth interviews with multi-local employees. The methods were applied in two German case studies, the city of Stuttgart in Baden-Wuerttemberg and the rural district Diepholz in Lower Saxony.

Using the biographical mapping method showed that specific employment and residential biographies can influence the decision to start and maintain multi-local lifestyles. Furthermore, through the photos, the researchers thus gain insight into the social and personal context of the persons and have the opportunity to directly recognize their spatial perception. Moreover, both methods indicated that using visual methods during interviews give narrative impulses and ease the interview situation: the roles of the interviewees and the scientific observers are reversed, thus, the interviewees act as experts.

The first aim of the paper is to explore multi-local lifestyles and furthermore to show to what extent these methods can be used to develop results regarding multi-local living over the life course, the organisation of everyday life and communication between household members and acquaintances. The second aim is to explain spatial (im)mobilities and the decision making (not) to give up one of the residents and thus the multi-local life.

1444

The Reaction on Small-scale Contextual Changes as Catalyst of Regional Inequality: Qualification-specific Evidence on Regional Job Mobility

Kerstin Ostermann1,2, Martin Abraham2

1Institute for Employment Research (IAB), Germany; 2Friedrich-August University Erlangen-Nuremberg

Prior literature has shown that regional job mobility is selective and exacerbates regional inequality on the aggregate. This paper investigates two channels on how short-term aggregate context changes selectively influence the individual probability of leaving a local labor market (LLM). Theoretically, we disentangle economic and social context effects for different qualification types in relying on the general job search, the network and the homophily theory. Empirically, we use German process data on job vacancies for the economic context and small-scale administrative data on neighborhood unemployment for the social context. In using georeferenced data, we capture ego-centered and occupation-specific LLM opportunities and regional job mobility realizations irrespective to the size or shape of administrative regions.

The first difference models show significant effects for both context dimensions. For the economic context, we find that improving LLM opportunities have a small and negative effect, which holds even if we control for other regional trends. If the LLM offers no suitable vacancies for the individual, the probability of regional job mobility increases significantly – especially for high-qualified and unskilled individuals. For the social context, we find that rising neighborhood unemployment affects the regional job mobility probability positively and to a larger extend than changes in the individual LLM opportunities. The subgroup analyses show that high-qualified individuals are more likely to leave the LLM when the unemployment in the neighborhood rises. Preliminary results indicate that homophily preferences partly explain this qualification-specific neighborhood effect. The paper highlights the potentials of georeferenced data for sociology.

Division Of Paid Work Among Couples Living In Switzerland: The Importance Of Residential Mobility And The Residential Environment

Gil Viry1, Jacques-Antoine Gauthier2, Guillaume Drevon3, Vincent Kaufmann4, Florian Masse4

1University of Edinburgh, United Kingdom; 2Université de Lausanne, Switzerland; 3Luxembourg Institute of Socio-Economic Research; 4Laboratory of urban sociology (LaSUR) - EPFL, Switzerland

Migration can significantly impact couples' labour market participation, especially young mothers who are often expected to organise childcare in the place of destination. Evidence shows that women's employment suffers from family migration driven by the man's job. Most research has traditionally focused on the distance moved and has largely ignored the distance from both partners' places of origin, although we know that some couples stay or move closer to grandparents for helping them balance work and family. Rather than comparing migrant couples with non-migrants, this paper examines variation in the division of paid work (DPW) according to where the couple resides in relation to both partners' place of birth and the place where they lived when the couple relationship started. It also considers the moderating effect of the residential environment, parental status and relative resources of partners. Using a nationally representative sample of 1452 adults in heterosexual relationships living in Switzerland, the analysis shows that DPW is more traditional among couples living in suburbs compared to those living in city centres or rural areas. But no residential mobility patterns are associated with a traditional DPW. On the contrary, DPW is more egalitarian among couples where both partners were mobile prior to and after starting the relationship. Couples in which one partner migrated or those who migrated together only after the couple was formed do not significantly differ from immobile couples. This suggests that future research should consider migration patterns over the lifecourse and their long-term effects on labour market outcomes.

1445

How a Lack of Green in the Residential Environment Lowers the Life Satisfaction of City Dwellers and Increases Their Willingness to Relocate

Tetiana Dovbishchuk, Stefanie Kley

Universität Hamburg, Germany

This paper investigates whether various forms of green spaces in the residential environment are associated with life satisfaction of city dwellers and their willingness to relocate. The state of research shows that having natural elements in the window view, having a garden, or doing exercise in a green environment improves physical and mental health, whereas health is connected to well-being. However, there is scarce research on the role of green spaces in the residential environment as a direct source of well-being, and we know little about whether it affects the decision to relocate significantly. We address this topic with a two-equation model that estimates respondent's plans to relocate while accounting for the endogenous satisfaction with one's residential area. With this strategy, we are able to test which residential features regarding greenery (e.g. window view, garden, balcony, green environment) are associated with one or both outcomes, controlling for life-course events and demographic characteristics. The data comes from a primary survey conducted in two large German cities, Hamburg and Cologne, in 2020/21 (N=1,800). The results suggest that experiencing a lack of green in the immediate vicinity decreases the satisfaction with one's residential area, and thus is significantly correlated with plans to move. Having a green yard and – exclusively for parents – having an own garden does deter city dwellers from moving. We consider these findings substantial, as they were obtained under control of relevant life-course events, subjective health, and household characteristics.

Moving Or Staying? Comparing People's Residential Location Decisions By Analysing Self-Reported Reasons

Cornelia Tippel1, Frank Osterhage1, Annett Steinführer2

1ILS - Research Institute for Regional and Urban Development, Germany; 2Thünen Institute of Rural Studies, Germany

Understanding spatial (im)mobilities is an increasingly important objective in the social sciences (Urry 2000). However, studies have widely focussed on mobility while largely overlooking immobility. Specifically, the motivations for residential mobility have been extensively analysed (e.g. Coulter/Scott 2015), yet they have been widely reduced to 'rational' triggers such as life course events or job opportunities. In contrast, staying has either been largely neglected or even seen as "failure" to move away (Looker/Naylor 2009). Against this backdrop, the proposed contribution focusses on residential (im)mobility by conceptualising both as active decisions embedded in complex sets of motives and biographical contexts (Hanson 2005, Halfacree/Rivera 2012) instead of taking them either as a result of restriction or constraint or of rational considerations.

The contribution is based on findings from a large research project investigating residential location decisions in urban and rural areas in Germany. In particular, it builds on a large population survey (n=3,600) conducted in 2020 that involved both movers and stayers. Besides classical item batteries, respondents have been asked to answer openly to questions about reasons for moving, impeded moving, staying and moving aspirations. These answers have been recorded, transcribed and coded. This allows us to compare in-depth the underlying motives and perspectives both on residential mobility and immobility. By analysing self-reported reasons for moving, impeded moving, staying and moving aspirations, we can reveal the underlying meanings and ascriptions connected with these different manifestations of spatial (im)mobilities. Additionally, our material allows identifying reasons related to the Corona pandemic and related restrictions.

1446

To the Periphery and Beyond. Residential Mobility and Inequality in Madrid (2013-2018).

José Ariza, Daniel Sorando

Universidad Complutense de Madrid, Spain

After the bursting of the real estate bubble, a new bullish real estate cycle has transformed the patterns of residential mobility in Madrid. In this research, the arrival and departure rates of the neighborhoods of the city of Madrid are analyzed, in order to understand if residential mobility is defining a new process of suburbanization of poverty, as well as what factors are promoting it. For this, both the Residential Variation Statistics (INE) at the infra-municipal level as well as different databases to define the neighborhoods of Madrid are used. These neighborhoods have been classified using multivariate techniques to then define the main flows of residential movements between types of neighborhoods according to the social position of those who change residence. Likewise, a geographically weighted regression analysis has been applied to define which characteristics of the neighborhoods promote the different flows of residential mobility. The results show a recurrent departure of impoverished social positions from the central neighborhoods towards the poorer peripheries, at the same time that these central spaces attract the most advantaged social positions. These neighborhoods are characterized by a residential stock that facilitates residential rotation in a context of financialization of housing. These results confirm Madrid's participation in the international dynamics of poverty suburbanization linked to the extension of gentrification processes in its central neighborhoods.

The Impacts of the Digitalization of the Labour Market on Commuting Behaviour in Switzerland: Evidence from the Swiss Mobility and Transport Microcensus

Fabienne Wöhner

University of Bern, Switzerland

Switzerland has committed itself to the Paris Climate Agreement, which aims to reduce global greenhouse gas (GHG) emissions. Since individual transport is a substantial source of GHG, this study investigates whether the digitalization of the labour market contributes to reductions in traffic. Digitalization allows increasingly flexible working time and home office-based work. Hence, more and more employees are able to reduce commuting to the workplace, or can manage avoiding rush hours, which relieves traffic congestions at peak times. To assess the digitalization's potential to reduce and redistribute traffic, the two newest available Swiss Mobility and Transport Microcensuses (MTMC) from 2010 and 2015 are analysed. The data contains detailed information about respondents' mobility behaviour and their use of flexible working time and home-based work. The MTMC allows investigating who performs home-office, provides insights into whether individuals working flexible use different modes of transportations and answers the question of whether home-based work is associated with a reduction of individuals' mobility behaviour in Switzerland.

The Relationship Between Commuting Willingness And Behavior: Evidence From Longitudinal European Data

Heiko Rüger1, Nico Stawarz1, Thomas Skora1, Brenton M. Wiernik2

1Federal Institute for Population Research, Germany; 2University of South Florida, Tampa, FL

Findings from cross-sectional studies point to a positive correlation between commuting willingness and commuting behavior. Individuals who currently commute long distances to work express a greater willingness to do so in the future. In policy and planning, the willingness to commute long distances is often regarded as an important indicator of a population's potential future commuting behavior. However, given the emphasis on cross-sectional studies in the existing literature, it is unclear whether a high willingness to commute actually has an influence on the decision to engage in commuting (selection hypothesis), or whether participating in long-distance commuting determines willingness to commute (adaptation hypothesis). We use unique longitudinal data from four European countries – Germany, France, Spain, and Switzerland – to examine the relationship between individual level willingness to commute long distances (i.e. at least 60 minutes one-way) and actual commuting behavior. Results show that there is considerable within-person variance in commuting willingness over time. We find novel evidence that is in line with the adaptation hypothesis, meaning that starting a long-distance commuting episode is associated with an increase in commuting willingness. There is also some evidence for a selection effect, yet this effect appears to be considerably weaker. Therefore, this study provides more support for adaptation theories of commuting suggesting that commuting willingness can be understood as an evaluative outcome capturing people's attitudes toward their current commuting arrangements. Future commuting research should incorporate such possibilities into their conceptualizations of the commuting willingness construct and explanatory models for commuting behavior and outcomes.

Work-related Internal Migration And Mental And Physical Health Trajectories

Nico Stawarz1, Oliver Arránz Becker2, Heiko Rüger1

1Federal Institute for Population Research (BiB), Germany; 2Martin-Luther-Universität Halle-Wittenberg, Germany

Work-related internal migration can be associated with various burdens, but also benefits. For example, it is often associated with improved career and income opportunities. Another benefit is, for example, relief from time-consuming commuting. However, the benefits can be offset by specific burdens, which in turn can be associated with adverse health effects. These include, for example, difficulties in maintaining social relationships, homesickness or feelings of displacement. Possible negative consequences also include occupational disadvantages for accompanying partners, which can lead to conflicts and a reduction in partnership quality. However, with regard to the migration–health relationship, few studies are available to date and there is a particular lack of longitudinal studies. Existing evidence suggests the importance of distinguishing between physical and mental health. From human capital theory, it can be inferred that those who migrate are generally positively selected. To take into account possible selection, anticipation and adaptation processes, we apply fixed effects panel regressions to representative data of the German Socio-Economic Panel (SOEP). We use the SF-12 Health Survey items to capture the subjectively assessed overall mental and physical well-being. Preliminary results show slight decreases in mental health one to two years before and short-term increases in mental health one year after the move. Moreover, those who move generally have better physical health, which additionally increases slightly with the move. In further analyses, we examine how these effects differ by relevant moderators such as gender, distance of the move, moving alone or with a partner, or rural-to-urban vs. urban-to-rural moves.

Telecommuting amidst Covid-19: The Governmobility of Working-from-home Employees in Hong Kong

Grace Hiu-Ling Yeung

Hong Kong Baptist University, Hong Kong S.A.R. (China)

Covid-19 is ravaging the world. In order to cut off the chain of virus transmission between people, various types of mobility restrictions have been initiated around the world. Under this circumstance, working is also restricted to maintain social distancing. In the blink of an eye, the world has become a 'work from home laboratory'. Through the rapid circulations of information on the Internet, teleworking effectively eliminates daily commuting and allows people to work remotely from home. Considering Dorow, Roseman and Cresswell's (2017) call for 're-working mobilities', the author finds that extant literature lacks a thorough investigation into the politics of mobility embedded in teleworking. In particular, how the ever-changing power relations of teleworking produces or shapes various forms of (im)mobilities, and what opportunities and constraints virtual mobility brings to spatial mobility (or conversely). From the perspective of the politics of mobility, teleworking can be considered as a new form of society-making involving sociality, sociation and network capital intertwined with (im)mobility. Teleworking enables the ruling of information flows and circulations work through (self-)governed workers and their complex relational networks. Compared with before Covid-19, intricate and complex workplace relations have been stretched out in time and space. Workers are subject to self-governance and governance-at-a distance. Hence, this research adopts the notion of governmobility proposed by Bærenholdt (2013) as a theoretical main axis, and supplemented by Cresswell's (2010) interpretation of mobility (i.e. the physical movement, representation of (im)mobility and experienced practices of (im)mobility) to investigate how teleworking arrangements influences the (im)mobile experiences and practices of workers.
Keywords: mobilities; the politics of mobility; governmobility; teleworking; telecommuting

What Role Do Physical and Virtual Mobility Play for Academic Career Success? Evidence from an Experiment with University Professors

Nicolai Netz1, Knut Petzold2

1German Centre for Research on Higher Education and Science Studies (DZHW), Germany; 2Zittau/Görlitz - University of Applied Sciences, Germany

Due to its importance for knowledge production and transfer, physical international mobility (the movement of individuals across national borders) has a long tradition in the academic system. During the Covid 19 pandemic, however, the possibilities of substituting physical mobility by virtual mobility (the exchange of ideas through information and communication technologies) have become ever more apparent. Nowadays, both physical international mobility and virtual international mobility are considered to be crucial for career success in academia. Therefore, the academic system constitutes a particularly interesting test case to study the relative importance of physical and virtual mobility for career progress. We elucidate this issue by analysing data from a factorial survey experiment with professors of sociology, political science, geography, German philology, and chemistry at German universities. In this experiment, we asked professors to evaluate vignette profiles of fictitious scientists regarding their suitability for a tenured professorship. In the presented vignettes, we randomly varied scientists' characteristics, such as their gender and qualifications. Moreover, we varied the candidates' experience with physical international mobility during different career stages (studies, doctorate, and postdoc) and measures of virtual international mobility (amount of international publications and citations). On these grounds, we determine whether different types of physical and virtual mobility have independent influences on the suitability for a tenured professorship. Moreover, we examine the extent to which academics can substitute physical international mobility by virtual international mobility. Finally, we show that the assessment of both physical and virtual mobility depends on professors' own experiences and characteristics.

Displaced Academics as Mobile Academic Persons: A Question of Normativity or Anomaly?

Ahmad Akkad

Warwick University, United Kingdom

The mobility of international academics literature tends to celebrate the internationalisation of higher education, globalisation and transnationalism. Academic mobility is often conceptualised within neoliberal, market-oriented and human capital terminology (Kim, 2009) which acclaims academic mobility as a universal advantage. Academics' decisions for mobility have largely been understood through the push-pull paradigm that constructs people as making career-related choices for career advancement and international reputation. Despite the usefulness of these discussions, considering displaced academics (DAs) as mobile persons and their choices to move to a destination country calls into question the normative assumptions about academic mobility as a universal benefit. Such assumptions may not adequately acknowledge ontologically and epistemologically the mobility 'choices' of DAs in terms of i) the heterogeneous or multi-directional nature of mobility trajectories of some DAs as displaced people; ii) their mixed motivations for mobility; and iii) their varying experiences in their host societies. Therefore, this paper seeks to offer a nuanced understanding of international academic mobility through an in-depth examination of three contrasting cases of displaced Syrian academics in terms of their 'choices' within a situation of 'forced' mobility. It utilises in-depth narrative interviews which are specifically analysed for this presentation based on the discursive construction of choice and/or lack of choice in participants' mobility decisions. The study sheds light on DAs as an underrepresented group in research, and it contributes to the wider literature and theoretical discussions on academic mobility as a lens in testing the choice-making boundaries of DAs for moving across time and space.

Mobilities and Immobilities Among Skilled Workers in the Gig Economy

Alisa Petroff

Universitat Oberta de Catalunya, Spain

Although the digital economy and the crowdsourcing phenomenon have been the subject of extensive research, in terms of motivations, working conditions and regulatory issues, to date no studies have addressed its implications in terms of mobility. This paper aims to establish a dialogue between the literature on crowd work and the main approaches on high skilled migration to identify the potential of the crowd platforms, in terms of enhancing new forms of mobility and immobility. First, I argue that the crowdsourcing platforms may represent a window of opportunity to avoid brain waste, at least during the transition into the traditional labor market. Asylum seekers are not entitled to work until they achieve refugee status, a process that, depending on the country, can take several years. These profiles, among others, are particularly suited to benefiting from the regulatory lacunas of digital platforms, avoiding de-skilling processes. Second, crowd work can mitigate the brain drain, especially in the Global South. The "hybrid geographies" shaped by crowdsourcing platforms, where humanity and technology become inseparable, are the perfect scenario for the virtual mobility where people can feel more "in charge" of their immobility and not trapped by it. Third, the circularity paradigm reveals the hypermobility of the digital nomads who build privileged circulatory territories, marked by pendular and onward movements. While digital nomads appear to embody the freedom to circulate, the cultural glamorization of their hypermobility may hide a darker side marked by a fragile legal status and limited access to social protection schemes.

Why Do Women More Often Intend To Study Abroad Than Men?

Fine Cordua, Nicolai Netz

German Centre for Higher Education Research and Science Studies (DZHW), Germany

In many Western countries, women are more likely to study abroad than men. At present, there is a lack of theory-guided empirical studies searching explanations for this pattern. We address this research gap by examining gender differences in study abroad intent among first-semester students in Germany. To derive a comprehensive theoretical framework, we draw on social role theory of sex differences, cognitive developmental theory, new home economics, and statistical discrimination theory. Using data from the nationally representative 2010 DZHW School Leavers Survey, we test our hypotheses by estimating logistic regressions and non-linear effect decompositions. We find that women more often intend to study abroad primarily because of the gender-specific interest profiles they develop throughout their life course: Related to their subject choice at school, women tend to acquire competences that ease later stays abroad. To some extent, women's better educational performance during school also explains their better chances to study abroad. Once in higher education, women tend to choose fields of study in which studying abroad is considered more valuable for competence acquisition. Losing time due to studying abroad is less of an obstacle for women but – against expectations – not because of a lower labour market orientation. Finally, the expectation to interrupt the professional career for taking care of the family deters women – especially those from a low social background – from studying abroad, but not men. We do not find evidence that women understand studying abroad as a strategy to counteract this anticipated discrimination.

Mapping The Contours Of Doctoral Subjectivity And Mobility In Changing Times And Places

Bing Lu

University of Warwick, United Kingdom

Studies on education and migration often examine how migration decisions interact with education decisions, and view international education as an investment in human capital (Dustman & Giltz, 2011). Among all forms of tertiary education, PhD degrees represent a strong pull factor in boosting higher education markets and accelerating transnational mobility across national borders (OECD, 2016). Therefore, different patterns and motivations of moving for foreign doctorates are often discussed in the context of neoliberal university marketization and international collaboration. Applying concepts from Judith Butler's Psychic Life of Power(1997), this paper elaborates the psychic life of doctoral mobility, namely how international doctoral subjects' subjectivity is formed through conforming to norms and seeking for visibility in professional areas. The paper goes beyond claims about how doctoral subjects pursue cultural adaptation out of migration considerations in the host country, and highlights that the formation of doctoral subject is a process of cross-border moves and a primary attachment to academic career which had been early rooted before the migration moves. This argument draws upon the 23 narrative interview accounts with Chinese doctoral supervisors currently employed in 13 Chinese research universities who obtained social science doctorates in 10 countries from 1980s to 2010s. The empirical study shows that doctoral subjectivities were regulated by changing social and political norms in different countries, but the mobile subjects also intentionally cultivate themselves as intellectuals in the discourse of knowledge. This paper underscores the limitations of socio-cultural and economic explanations of educational mobility and advocates a discursive approach to understanding the making of doctorates in changing times across national borders.

Becoming Adults Elsewhere: The Recent Migration Of Young Italians To Australia.

Giulia Marchetti

University of Western Australia

My contribution explores Italian youth migration to and from Australia (immigrants in Western Australia and returnees in Italy) and the ways in which transnational mobility intersects with young movers' transitions to adulthood (study paths, economic independence, independent living, coupling, becoming a parent). Based on the findings of my UWA PhD research, I adopt the mobile transitions approach (Robertson, Harris and Baldassar 2018) to explain the many influences of mobility on the coming of age process. In my study, qualitative and visual research methods are applied, such as ethnographic (video-recorded) interviews, photo elicitation, analysis of tattoos. More or less consciously, the desire to become adult "for real" may be one of the reasons to become mobile for many young Italians who, despite different educational and professional backgrounds and reasons for spatial mobility, come from the same Italian "long family". Later on, during the migration and settlement processes in the host country, the various transitions in which this desire is realized take new shapes, as the several life courses towards adulthood can be altered, anticipated, delayed and also put temporarily on stand-by. Upon return, those who return to Italy bring with them a new sense of adulthood, independently from the reasons of return. The 2008 global economic recession and the rise of new intergenerational inequalities have meant that Italy has become (again) a country of emigration, especially for its youth. A solely economic explanation overshadows other important factors that are central to my analysis including the existence of a global youth culture, the changing perception of space and boundaries created by new media, and new types of mobility experienced by younger movers.

RS14 | Sociology of the Commons: Refiguring Social Life Through Education

Care Communities and Commoning Education in Spain

Raquel Martínez-Buján
University of A Coruña, Spain

The purpose of this paper is twofold: first, to analyze early childhood care practices organized by the parents themselves ('grupos de crianza compartida' in Spanish) which represent an alternative that transcend the public and private options offered in the local area. Second, to link these cooperative care experiences with the recent demands for an alternative education that breaks with the values of discipline and authority advocated in traditional pedagogical models. The local area of study is the city of A Coruña (Spain) where in-depth interviews and participatory workshops were conducted with groups that manage care initiatives based on principles of reciprocity and mutual support. The selected experiences emphasize acting together as the main element for their future, being this community the one that generates meaning, values, affections and rules that, in short, the connections in some way in a 'care community' sheltered from individual benefit. The cases examined in this paper have been created as alternative learning spaces, initially aimed at parenting, but later giving rise to alternative pedagogical practices guided by the idea that education is a common good that should be managed collectively according to the principles of equality, freedom and participation. This commitment to commoning education has been reflected through various methods such as the creation of alternative schools, the implementation of homeschooling and unschooling, or an adaptation to the public school but carried aout activities and initiatives that promote values centered on the autonomy of minors and their civic participation. Theoretically, the analysis is framed within the 'paradigm of the commons' and feminist contributions on the politicization of social reproduction.

Educational Practices In Housing Commons

Zacharias Valiantzas, Paschalis Arvanitidis
University of Thessaly, Greece

This paper aims to explore the emergence of self-organised educational practices in the context of housing commons. In the broad galaxy of social innovations, housing commons emerge bringing up new possibilities in terms of habituating, living, learning and creating, all imbued by the values of commoning, which resist commodification and support solidarity, reciprocity and autonomy. On these grounds, housing commons as an institution and practice concern the provision and governance of a number of "goods", that are not confined to collective housing but extent to other aspects of life that take place within the commons' environment. Of particular importance for the current work are the practices of collective education and shared knowledge that emerge in the commoners' communities. These include modes of informal, tacit, knowledge sharing, mutual-help childcare facilities, self-organised structures of education, and self-organised playgrounds, which are present in various cases of housing commons throughout the globe.

The paper looks into the variety of housing commons initiatives around the globe, in order to identify these self-organized educational practices and structures. It then moves to outline and evaluate their commonalities and differences, attempting also an initial classification on the basis of their correspondence to the basic principles of housing commons (de-commodification, solidarity, self-organisation). The paper concludes that those practices emerge and expand in various way in an almost organic-natural manner supporting the community and reinforcing the values that make this community a commons.

Keywords: housing commons, self-organised education, educational commons, expanding communing

Self-help / Mutual Aid Groups in the Light of Commons: Peer Education Based on Self-organized Procedures and Mutual Aid

Sotiris Lainas, Kiki Dimitriadou

Aristotle University of Thessaloniki/ Self-help Promotion Program, Greece

Self-help / mutual aid groups for health issues are a significant manifestation of the peer groups' dynamic in dealing with various life problems. Commons could provide a useful interpretive frame for understanding their dynamic and operation. Self-help / mutual aid groups constitute peer communities that produce significant amounts of experiential knowledge, a different kind of knowledge that contributes to the overall understanding and overcoming of various health problems. Solidarity and mutual aid that are the key features of these groups, act as catalysts for the employment of experiential knowledge. Self-help/mutual aid groups are an eminent domain for the application of informal education processes between peers. People with various health issues or psychosocial problems are entering these groups and gaining precious knowledge and skills in order to overcome their problems through their systematic participation in the group. In this presentation, we will attempt to present the rising issues concerning the processes and learning conditions in the context of commons, such as the context of a self-help/mutual aid group. More specifically, we will present the issues concerning the experiential knowledge gained by peers in order to overcome their problems, as well as how peers learn to operate within a collective context and how they learn to put in practice principles of peer governance. Dealing with these issues may contribute to the wider conversation over informal learning processes in contexts of commons, especially if we take into account that self-help/mutual aid groups are integrated and entrenched paradigms of peers' self-organized actions.

Where is 'Childhood' in the Commons? Children in Commons-based Education

Yannis Pechtelidis

University of Thessaly, Greece

It is noteworthy that 'childhood' and 'children' are absent from the theory of the commons. In other words, childhood and children are invisible in this theoretical field, which aims at progressive, democratic, social reconfiguration. The various forms of commoning social, cultural, economic, and political life affect the lives of people, and of course children. In this sense, the theoretical and empirical exploration of the commons implies that we should try to understand what the prospects of children are in a world organized on the basis of the logic of the commons, the views of the children themselves on their experience in one or more commons, the strategies for managing the problematic situations they face every day in a common, etc. Moreover, the answer to the question of what is the image you have of childhood is linked to the question of what is the image you have of education. Therefore, the role of commons-based peer education in shaping an alternative discourse about childhood is of equal importance. Research findings from several educational communities of the commons will be discussed confirming the theoretical assumptions that children are social actors and can act as commoners in the here and the now, and that their development is not only determined by biological and psychological processes, but also by collective meaning-making processes.

1454

Towards Democratic Common Schools: First Ideas on Democratic Schools Through Commoning Practices

Mar Beneyto, Jordi Collet, Marta Garcia

University of Vic - Central of Catalonia, Spain

In Todorov's words, we are living a fight between neoliberalism and democracy all over the world. In front of that conflict that is undermining the formal democracy pillars, the communication wants to present, in an exploratory way, first ideas on what could be a democratic common school. To do so, we connect with the trend of thought that, from Dewey, have been emphasising the necessity that schools educate in, for and about democracy. Today, the social need for democratic schools is stronger than ever and, related to this, the main goal of the paper is the proposal to do it through commoning practices. Precisely, Bollier (2014, 2020) and Laval and Dardot (2015) proposed to shift "common" from an adjective (the common goods) to a verb: commoning. The contribution explores, from the analytical model of Michel Foucault (knowledge, power and subjectivity), what could be a democratic school based on common(ing) practices. Moreover, its relation to what a school (not) should be (Truth); how (not) should be governed (government); and what kind of identity it (not) should produce (subjectivity). With this proposal of the democratic common(ing) schools, we would like to open up new ways to build up education spaces that transform knowledge, power relations and identities from the common good perspective. In order to contribute to new social life truths, ways of government, identities and experiences more according to a shared democratic and inclusive society.

Secondary School Leaders' View on the Role of Schools: in Alignment with the Commons?

Juno Tourne, Lieve Bradt, Rudi Roose, Jochen Devlieghere

Ghent University, Belgium

Despite economically advanced countries having well-resourced and high-quality education systems, the educational reality is that strong social inequalities persist. Several international studies show that young people's SES remains the most powerful factor influencing their performance in education.

We have argued the importance of navigational agency in order for all youngsters to enjoy meaningful education, meaning students should have space to freely navigate education through opportunities for exit and voice (Claassen, 2018). Previous research, however, shows that young people's navigational agency is limited in the current educational landscape, as the focus is mainly on accountability, competition, and standardization, resulting in strong education (Biesta, 2014). This is attributed to the growing penetration of neoliberal ideology in education and it is argued that a new perspective to adequately address educational shortcomings is necessary.

The commons are proposed as an alternative value and action system to help re-imagine schooling and help realise the potential of education in addressing inequalities and promoting well-being for all. Seeing as school leaders occupy a pivotal position in schools and their vision is crucial in inspiring teachers and students, this study uses semi-structured interviews to identify secondary school leaders' views on 'the school' and in which way they align with neoliberal trends and/or the commons. Answering the question: How do school leaders perceive the role of a school? And who plays a part in shaping a school?

Enriching Alternative Prevention Approaches For Addiction And Psychosocial Problems With The Concept Of Educational Commons

Evgenia Adamopoulou

University of Thessaly, Greece

This paper will discuss a future research about the relationship between educational commons and prevention of addiction and other psychosocial problems. The main purpose of this research is to explore if the implementation of educational commons in a school setting can contribute to the prevention of psychosocial problems. The principles and values of Action Research are a key element of this research. Educational commons are an alternative value and action system which is collectively governed by school community based on the principles of equality, collaboration, caring and sharing, experimentalism, active and creative participation. According to the theoretical background of Self-help Promotion Program, prevention interventions should have similar goals and values in order to be effective. Therefore, the interventions organized by Self-help Promotion Program take place in a collective and cooperative spirit with equal participation of students, teachers and parents. Their aim is to promote community's well – being, strengthen the social fabric, cultivate respect, establish interpersonal relationships and boost creativity. Examples from Self-Help Promotion Program past interventions which are based on the ideas of Action Research will be briefly presented.

Peer to Peer Education in the Digital Era

Alekos Pantazis

Tallinn University of Technology, Estonia

Learning faces major challenges and transformations, with educators and academics in need of new forms of teaching able to engage participants while adapting to rapidly changing societies. Meanwhile, numerous communities have created complex artifacts based on Peer to Peer (P2P) horizontal human relational dynamics (Bauwens et al. 2019) and on treating knowledge, code, and design as a commons (Tomašević et al., 2018). Those communities demarcate the production process termed Commons-Based Peer Production (CBPP) (Benkler, 2016; Kostakis & Bauwens, 2021), which celebrate the inclusive elements of human nature creating for example Wikipedia encyclopedia and Linux operating system.

This presentation utilizes the experience of CBPP communities for the benefit of educational commons and learning. Using case studies and participatory action research, I investigate the implementation of CBPP communities' governance and functional characteristics in learning processes towards what I call Commons-Based P2P Learning. Such learning processes were tested in universities, NGOs, high-schools, eco-festivals, makerspaces, and social centers, reaching a broad spectrum of participants. The Commons-Based P2P Learning scenarios that were created and implemented, concern training about open-source technologies, collaborative design and construction of agricultural tools, and experiential learning on the notions of the commons. In all contexts, I observed empowerment of the process towards both learning per se, as well as towards enhancing the emancipatory and democratic characteristics of learning. Hence, today's educational commons can be greatly benefited by looking into the characteristics of CBPP initiatives and by systematizing and applying their processes into Commons-Based P2P Learning.

Ingame: Enacting Youth Citizenry Through Serious Gaming

1456

Maria Patsarika, Maria Kyriakidou

The American College of Thessaloniki, Greece

INGAME is an online serious game addressed to young people aged 18-35, and developed by the homonymous Erasmus+ informal learning project. (See https://grial.usal.es/ingame.) The aim is to create an open, lifelong learning digital space that promotes youth engagement in civic problem solving and reflection on contemporary sociocultural issues, such as education, gender equality and social inclusion. Methodologically, INGAME brings together the pedagogical potential of digitally-mediated social environments and theories of social learning and intercultural communication. Our foundational aspiration has been that INGAME grows into an open and shared digital resource for educational, youth policy, governmental and non-governmental organizations, who will be encouraged to upscale and amplify the project outcomes. At the same time, however, and since its inception, it has been envisaged as a system of commons throughout its three-year implementation. In this context, we will present the establishment of a youth advisory board for INGAME and our young advisors' active involvement in the process of pedagogical, storyline and narrative design for the game. The acknowledgment of youth expertise and techne, key driver behind this initiative, goes hand in hand with the

principles underlying their involvement, namely the practice of reflexivity and that of asking critical questions that problematize civic action. Our discussion is thus inspired by Giroux's (1997) call for a 'critically engaged citizenry', which we argue is a stepping stone, if not a definition, of the 'common good'. We will conclude our presentation by inviting your insights and inputs into our project.

The Challenges of Media Education and Digital Commons for Youth Social Inclusion

Gianna Cappello, Roberta Di Rosa, Marilena Macaluso

University of Palermo, Italy

A vast majority of teenagers are actively involved today in what Henry Jenkins (2009) defines as online participatory cultures where youth create and share multimedia content developing some kind of "artistic expression and civic engagement" and some "degree of social connection with one another". These collective practices of cultural production/circulation – albeit with different levels of creativity and technological affordances – share a "commonist" logic, that is they function as a form of Digital Commons where cultural creation stems from practices which blur the identities of producers and consumers often overflowing privatized, "enclosed", property rights. Arguably, teenagers acquire the key skills and competencies necessary for carrying out Digital Commons activities on their own, simply because they are "digital natives". In fact, in this contribution, we contend the need to adopt a Media Education approach to fully develop the cultural, creative and participatory potential of the Digital Commons, and promote active citizenship and social inclusion of young people, particularly those living in at-risk urban areas. Playful, creative and motivating learning strategies based on digital media and online social networking may ensure that un-effective traditional educational approaches do not leave behind the young people living in these areas. This kind of informal learning may challenge them with the technological, organizational, and operational skills they usually associate with "their" daily media uses. It also may increase their motivation to learn, self-esteem and peer relationships; develops numeracy/literacy/digital literacy skills; reduce marginalization, stigmatization, "gang antagonism" and "gang feuds"; support active participation by using digital media as tools for individual and collective empowerment.

New Modes of Youth Reading in Digital Semiosis

Mariana del Valle Prado

Universidad Nacional de Tucumán, Argentine Republic

The everyday life of youth -and people in general- is crossed by a new media ecology. The hybridization is such that the "real" world cannot be separated from the "virtual" world. The scenario in which daily life takes place is what I have defined digital semiosis, understood as that narrative continuum of actions that involves life itself. In other words, there are no aspects restricted to the digital sphere, but rather the life experience, interpreted as a semiotic flow, takes place in this single space, where the daily life of social actors develops.
Digital semiosis is configured as a decentralized educational environment in which a cognitive, sensory and affective metamorphosis occurs. Today, young people not only read words, but also they read symbols and a multiplicity of languages. The texts have changed and so, the reading modes. Between the papers and the screens there are not differences of support, but of interfaces. New relationships emerge between the reader and the content.
The main objective of the present paper is to describe the reading modes of the students of the National University of Tucumán (Tucumán, Argentina) in order to draw a mapping of formal and informal learning strategies. The results that are analyzed were obtained from an exploratory investigation, carried out during 2018 and 2019.

Participatory Audiovisual Methodology and Educational Commons

Mònica Figueras-Maz, Mittzy Arciniega-Cáceres

Universitat Pompeu Fabra

The present proposal exposes the experience of the research Activismos en Femenino. El discurso feminista de la mujeres jóvenes en grupos culturales y su cotidianidad (ActiFem), specifically focuses on the audiovisual participatory methodology that was inspired by the Photovoice that is based on visually frame a certain social problem to later generates a reflection on the images that represent it (Wang, 2006).
In this line, ActiFem performed workshops with participants to present the narrative possibilities of the audiovisual to reflect about social problems and translate them into stories. As a result, participants produce 4 autobiographical pieces that portray an aspect of their

1457

daily life, especially linked to their experience as a young woman.

So, taking this experience as a starting point, we propose to complement the perspective of the educational common with audiovisual participatory methodology, specifically on the execution of two recently awarded European projects: "Educational Common Spaces. Passing through enclosures and reversing inequalities" (SMOOTH - 2021-2024) and "Blended Short-cycle Training Courses on 'Commoning Practices" (ComPra - 2020 - 2023). Thus, we propose the design and execution of audiovisual workshops in which, based on reflection and debate, participants produce their own collective pieces in which they express their vision of different inequalities and the ways to reverse them.

Finally, in both projects, audiovisual will be presented as an empowering tool at the individual level, while enabling self-reflection, critical thinking and the expression of their own personal growth, but also in the construction of collective identity and a more critical, committed and participatory citizenship.

Interdependence and Dialogue of Knowledges. Development of Educational Communing Practices Through the Arts and Technological Appropriation

Esperanza Jorge-Barbuzano1, Lucia Del Moral-Espin2, Lucía Benitez Eyzaguirre3, Inmaculada Antolinez-Dominguez4, Beatriz Gallego Noche5

1University of Cadiz, Spain; 2University of Cadiz, Spain; 3University of Cadiz, Spain; 4University of Cadiz, Spain; 5University of Cadiz, Spain

The development of educational communing practices in universities can be an essential step toward disseminating and transferring these practices in social life. To this end, it is necessary to design innovative pedagogical experiences for students from various fields of knowledge (education, communication, social work, social sciences, among others) to contribute to the reflexive development of skills and bits of knowledge about the commons as relevant competences for their present and future well-being and social change.

This paper specifically addresses the need to develop educational content on 'commoning practices' from a feminist and ecological justice perspective. In this sense, our contributions are a) To address the Sociology of education, youth, and childhood, specifically rethinking the commons' construction from the perspective of interdependence and care, considering the dynamics of mobility and co-participatory and inclusive educational practices. b) To approach the field of Communication from the perspective of diversity and interculturality, with a dialogue of knowledge as the axis; also from a critical epistemology of communicative practices and emancipatory languages. c) To consider, in a concrete and crosscutting way, technology and its appropriation as sources of analysis of local needs, innovation, and social transformation. Likewise, we address the need for mainstreaming participation and artistic creativity as critical elements for fair and open relations that consolidate the commons.

Reproduction Of Culture Through Non-Formal Activities In Civil Society In Turkey

Hülya Mete

Mimar Sinan Fine Arts University, Turkey

The purpose of this research is to focus on the reasons for youth participation in civil society activities. The presentation is part of the Cultural Heritage and Identities of Europe's Future (CHIEF) project which is funded by the European Union's Horizon 2020 research. Youth empowerment is one of the main reasons to attend civil society activities. Youths support their same-age groups to make themselves better equipped in the labor market and social life. Youth who cannot allocate a great portion of their income for gaining the necessary skills might rely on peer support and have more opportunity in the social life through networks they have built in those circles.

Civil society participation affects the cultural identity and social inclusion of the youth. Qualitative analysis with young people conducted for the project made us reach at the conclusion that their views of culture also determines which civil society activities they prefer to take part in. To understand how non-formal education settings provide cultural participation and cultural literacy to young people, we conducted qualitative field research on two civil society organizations that use alternative education methods and content.

This paper aims to discuss how a non-formal education setting differs from a formal education setting in providing cultural participation and cultural literacy, how youth define civil society activities based on culture, and how their participation reproduces and transforms their conceptions regarding/their identities.

1458

Commons And Commoning As Informal Or Non-formal Education. The Case Of A Rural Community In Greece

George Papagiannitsis, Paschalis Arvanitidis

University of Thessaly, Greece

The Commons constitute collective organizational structures that enables and enhances networking among autonomous, yet interdependent participants. They are based on some kind of membership, commitment to shared values, interests and purposes, alongside collaboratively defined, usually informal, rules, arrangements and institutions. Such an organizational structure facilitates groups of participants to solve problems in a self-organizing mode (relying at a low degree on markets or the state), where control and coordination are based on personal and social relations built upon trust. Even though different kind of commons have been identified and discussed in the relevant literature, they all share certain values such as a democratic ethos, egalitarianism, creativity, and sustainable relations between humans and nature.

Acknowledging the potential of the commons as a different way of social life refiguring, education has been conceptualized as a catalyst for advancing processes of experimentation alternative social construction, and active inclusion, particularly focusing on how children and young people are involved in commoning processes. Yet, informal and non-formal types of education in relation to the commons have received less attention. The paper delves into a rural community at the outskirts of the city of Volos, Greece, which due to a number of reasons has formed a "commons", in order to explore how commoners have deployed education (of informal or non-formal types) to confront shared issues of every day life at the locality. In doing so, we search to inform the relevant literature on good practices.

Processes of Endoculturation and Acculturation on Common Goods: Hydroelectric Dams in Local and Indigenous Communities

Lorién Jiménez Martínez

Universidad de Zaragoza, Spain

Common goods has historically been a main object of attention for both modern legal-political systems and local communities. In this sense, the conflict and diversity of paths in the transit between traditional and (post)modern social forms has meant the development of processes of endoculturation and acculturation (with respect to those resources) adapted to the circumstances of states, communities and types of commons. This paper synthesizes specific extended case studies of strategies of cultural transmission and learning about the nature, management and exploitation of hydroelectric dams adopted in communities of the French and Aragonese Pyrenees; it also compares the structure of such processes with the general conclusions and categories created in other relevant cases in indigenous communities in New Zealand (Maori) and the United States (Diné / Navajo). Finally, a synthesis of the features and factors that influence a greater effectiveness in the practices of these communities in facilitating an autonomous endoculturation, capable of establishing frameworks for dialogue, conflict or negotiation with other acculturating agents, such as the state or the extractive-energy industries, is offered.

The Fight Against School Segregation: One Of The Great Challenges Of The Common Good.

Eva María Jiménez, Paloma Candela

Universidad de Castilla- La Mancha, Spain

Education is understood as the result of a process of co-production between all components of society (Locatelli, 2018). Indeed, the concept of education as a common good can represent a decisive scenario for the governance of education in changing and challenging contexts. This issue calls for innovative practices and approaches more in line with the diversity of contexts through greater participation of their citizens and communities as a fundamental idea for building more democratic education systems.

1459

Such aspects are, in theory, an essential element of common commitment, but in practice it must be recognised that the determination of solutions that take into account the different educational contexts and that contribute to the democratic development of the system is not a simple matter, especially in those educational spaces that are home to a minority and socially excluded community.

The study presented here deals with the analysis of educational contexts of poverty and social stigmatisation in which the real opportunities for development and participation among its components (researchers, teachers and students) and organisations (universities, schools, teaching communities) are far from the real meaning of education as a common good when school segregation monopolises the reality and quality of education.

Addressing a proposal for awareness raising, reflection and empowerment of the educational community to make important decisions about the institutions in which they live is probably the most effective way to make educational opportunities more equitable in these exclusionary environments, as we present in this research.

Has Higher Education Become Too Common? On the Expansion, Perception, Privatisation And Distinction Of Higher Education In Germany.

Gregor Schaefer

FernUniversität in Hagen, Germany

In Germany, as in so many other countries in Europe and in other regions of the world, the attendance rate of students and ratio of students in higher education in their respective cohorts is on the rise for many years and decades now – at least before corona. This is only partly due to social democratic-driven political reforms to allow people from all social classes to obtain higher education, but also because of the economic need of many people to secure a decent-paid and secure job in the future in the light of continuing precarisation of other sectors of work. The rising numbers of students provoke counter-opinions, that deem this development unnecessary and contra-productive for various reasons (supply and demand in the job market, 'over-academisation' of practical education and work). My contribution will contextualise this discussion in Germany with a historical-theoretical literature review and further the question of 'massification' of higher education by presenting the student's take on this issue. Based on 80 narrative interviews with German master students in management, medicine and music, I will retrace different positions on this matter and how they are intertwined with the fundamental perception of what higher education should be and aim for. As well as the student's own institutional embeddedness in higher education and social background in line with Bourdieusian theory of relational power struggles.

The German ESD Competence Centre: Scope, Research Methods and first Results

Ronald Gebauer

Helmholtz Centre for Environmental Research – UFZ, Germany

In the face of the many human-made crises, that threaten the future of mankind and our planet itself, UNESCO recognizes Education for Sustainable Development (ESD) as an integral element of all efforts to achieve the SDG 4 of a world-wide inclusive and quality education. What is more, ESD is also regarded as a key enabler of all the other SDGs, which aim to bring about significant progress in terms of sustainable development. In order to promote ESD on a municipal level the German Federal Ministry of Education and Research funds the recently launched ESD Competence Centre. The major task of this project is to support 50 pilot municipalities at varying levels of ESD advancements within the course of integrating already existing and future ESD activities into their local structures. Moreover, this task will be supplemented with quantitative and qualitative empirical research, that further on will be used to optimize local implementation processes. The contribution to the ESA conference will address these local processes by focusing on the relevant educational and civil-society actors who are involved in initial and further negotiations. Since hitherto there is no all-encompassing or consensus definition of ESD, intensified research attention is paid on the first major steps within these negotiations, particularly on ESD understandings, which will be recorded and analyzed by expert interviews. The contribution will report on first research results on prevailing views on ESD among relevant local educational and other actors and the Governance of local negotiation processes.

School Shows in Istanbul's Primary Schools: Socialization into Social Class and Production of Unequal Childhoods

Ayse Yilmaz1,2

1Bahcesehir University, Turkey; 2Ecole Normale Supérieure de Lyon, France

Towards the end of every school year, children stage shows at schools in Istanbul. This is a widespread activity in public and private primary schools. Depending on the resources of the schools and the parents, the shows may differ, as may their preparation process. This paper focuses on these differences and it inquires how the inequalities between children of different social classes are produced and reproduced through the school shows. It explores the socialization of children into social class, underlining the social, cultural, economic, and political aspects of this process. The significance of this research is that it explores school shows as instances of socialization, and this approach has not been a focal point of inquiry in the sociology of childhood. Within this field, the study employs the socialization perspective.

The work is based on ongoing doctoral research, for which I am conducting ethnographic fieldwork, including on-site observations and in-depth interviews.

This research shows that in schools attended by the upper classes, children are offered a wide range of activities. By contrast, in schools with middle-class populations, a single activity is imposed on children, and they have no other choices. As for schools with children from the lower classes, shows are rarely observed because of the lack of resources. Thus, it is argued that the school activities in which children are involved contribute to the production of unequal childhoods.

RS15 | Teaching, Learning and Training under Covid-19 Lockdown Conditions

Online Schooling during Covid-19: Renegotiating Power, Resources, and Status/roles between Teachers, Pupils, and Parents

Ramona Alexandra Hosszu

University of Bucharest, Romania

The Covid-19 pandemic shook the educational establishment and actors renegotiated power structures, access to resources and status/roles in the context of online or distance education. Responsibility for learning and educational results shifted in part from schools and teachers, to students and parents. The school as physical space ceased to exist, being replaced by computers, tablets, phones and students' and teachers' private homes. The teachers had to reinvent their teaching strategies and to find coping mechanisms for engaging and motivating students and themselves. The students had to fine-tune their engagement with professors and classes, thus shaping their learning outcomes during lockdown in novel and unanticipated ways. Parents' role became more active and teachers' expectations on their involvement in their children's school work increased. Moreover, the online education brought to the negotiation tables and public attention previous, persistent inequalities and digital divides, as the access to online or distance education was variable among students. Obstacles referred, among others, to the availability and quality of digital devices, internet connectivity, digital literacy, housing conditions and privacy, and to children's other household responsibilities (taking care of younger brothers and sisters, working the field etc.). Such inequalities were also visible for teachers. The study identifies and analyzes emerging interaction patterns and ensuing redistribution of power, resources and status between students, teachers, and parents, in the context of online education during Covid-19 pandemic, with a focus on renegotiated roles. Using semi-structured interviews with students, teachers, and school principals in Romania in the months March-May 2021, I examine alternative and competing discourses about online education experiences and I highlight how this fast-paced digitalization opened the space for renegotiating the social organization and significance of school learning.

Empowerment Through Accessibility: Teaching and Learning in Unprecedented Times

Gyða Margrét Pétursdóttir, Thamar Melanie Heijstra

University of Iceland

Despite its remote location, and much like other countries life in Iceland became heavily disrupted by the Covid-19 pandemic. Overnight on March 11, 2020 on-campus university teaching was replaced by what we refer to as Emergency Remote Teaching, ERT (Hodges et al. 2020). This type of digital teaching is similar to online teaching but lacks the proper preparation, professional development and technical support that assures the quality in distant learning. This presentation is about ERT and its consequences. As feminist collaborators and critical friends we are able to analytically and critically review and reflect on our own teaching practises during the 2020-2021 teaching periods, by addressing the following research question: What are the implications of COVID-19 for teaching gender studies and statistics in the near future both for us as teachers and for our students? Our initial observations indicate that ERT has - despite its shortcomings and challenges - brought with it many positives. Using an intersectional approach, we discuss these positives in terms of gender, nationality (more specifically language), geographical location, class and disability. In doing so we draw on our experiences, information collected from our students and anecdotal evidence collected from Icelandic media.

1462

Understanding Teachers' Response to Digital Teaching under Covid-19 Lockdown Conditions in Greece

Vasiliki Kantzara

Panteion University of Social & Political Science, Greece

In Greece, as in other European countries, a complete lockdown was issued in March 2020 to minimise the expansion of the coronavirus. Schools were given two weeks the time to prepare for the transition to digital education from a distance. The transition from a daily live, contact with students at school to an online, neutral, devoid of any physicality digital classroom was beyond any imagination prior to this moment.

The challenges were complex as these involved issues of pedagogical, technological, and social nature. Teachers had to translate their teaching material to reach students in a meaningful way. Soon, teachers found out that students may face similar problems as themselves, such as lack of equipment or connectivity issues with the internet. Teachers also saw that their students faced other problems at home and many of them felt very isolated.

The questions that arise are, What did inform teacher's choices on which method of digital education to use? What issues did arise and how did teachers deal with them?

The paper presents preliminary finding of ongoing research on teachers, and it is part of a larger project involving comparing cases between Germany and Greece. The theoretical framework draws on sociology, pedagogy and other disciplines focusing on discovering how stances and views are constructed. For this purpose, the research uses qualitative methods of inquiry.

Some of the findings point to the importance of the web of supportive relations together with a teacher's professional habitus of care. This includes, for many teachers, the ability to use every means possible to overcome obstacles to provide education to their students.

Impact of COVID-19 on the Academic, Family and Social Dynamics of Nursing Students in Portugal.

Beatriz Xavier, Ana Paula Camarneiro, Luís Loureiro, Aliete Cunha Oliveira, Eva Menino, Ana Paula Monteiro Health Sciences Research

Unit: Nursing (UICISA: E), Nursing School of Coimbra (ESEnfC), Portugal

Background: Due to COVID-19, educational establishments were closed and students went into lockdown.

Objectives: To know the academic, social, family and behavioral changes of nursing students, caused by COVID-19; understand the uses of time and the difficulties related to academic changes resulting from confinement.

Methodology: Quantitative descriptive-correlational study with 425 nursing students. The COVID-19 International Student Well-Being Study (C19 ISWS) was used. Ethical assumptions were met.

Results: The students expressed stress regarding the change in teaching and the possibility of not completing the school year. They reported an increase in online materials, but did not see an increase in academic work. Upon returning to their parents' home, they reduced contact with friends and favored online communications. They say they have less financial availability and, for consumers, the consumption of tobacco, alcohol and others has decreased significantly. The information conveyed by the health entities was considered timely and understandable and the students adhered to the sanitary measures implemented

Conclusion: COVID-19 brought changes to the lives of nursing students, marked by a return to the family home, concerns about academic performance, distance from academic social relationships, and thorough compliance with the recommended health measures.

Supporting Student Nurses Through The COVID-19 Pandemic Via The "Woke'n'Spoke Café"

Sheila Sobrany1, Georgina C Cox1, Elisheba R Gardner1, Jezelle Z Simon Miller1, Gina Awoko Higginbottom2

1Middlesex university, United Kingdom; 2Nottingham university, United Kingdom

This paper seeks to explore the methods used to support student nurses during the Covid-19 pandemics. The worldwide spread of Covid-19 adversely effected the world populations daily living activities, such that it was necessary to put populaces into lockdown to protect its citizens and control the spread of the virus. In the UK frontline National Health Service [NHS] workers caring for Covid patients were predominantly Black Asian and Minority Ethnic [BAME] staffs and were clustered around the lower working grades, as noted by the Workforce Race Equality standards [WRES, 2018]. This resulted in higher death rates within the BAME staff community. Lockdown effected many businesses, but facilities such as university's, transferred teaching to online platforms. This galvanised the shift toward e-teaching technology for theoretical and clinical simulation to facilitate healthcare training. However to generate clinical competency, student nurses had to continue attending placement. The London area has a high BAME demographic and this is reflected in Middlesex University's student nurse cohorts. Naturally student awareness of pandemic issues were high and and gave rise to a grounded fear of going to placement. This was fear was allayed through the implementation by Healthcare Academics Race Equality Diversity Inclusivity Network [HAREDIN] utilising a crises café online concept the "Woke'n'Spoke Café". This biweekly online forum provided a safe space for student nurses to gather and share experiences. Support was gained from Academics and between student nurses from all years and fields of practice so they could thrive not just survive the placement experience.

Educating Prisoners In Greek Prisons During The Pandemic: A Bet Destined To Be Lost.

Gelly Ntilia

Extra English School, Greece

ABSTRACT Educating prisoners in Greek Prisons during the pandemic: A bet destined to be lost.
Among many other difficulties and obstacles that Greek Prisons face generally, education was among the first to be hit harshly with dramatic effects. Although, it cannot be denied the fact that it is not an easy task to teach and train inmates normally, due to the lack of infrastructure, equipment and staff, the health crisis only made matters worse. Teachers and volunteers, like myself, were forbidden to enter and contribute to their education. Schedules and visits were primarily postponed and then cancelled by The Ministry of Civil Protection, as an attempt to protect them from being infected. No one was happy, especially prisoners who not only lost their contact with the «society» but also their right to be educated like every other Greek citizen. That deeply affected their psychology and made them even vulnerable and more isolated, as no distance learning scheme was implemented to alleviate the pains of imprisonment. The marks of the lost time and lost chances are still haunting the pupils of The Second Chance Schools operating in Greek Prisons who consider having lessons as an escape to the real world of knowledge.

1464

Education and Prison under Covid-19 Lockdown Conditions- The case of School of Korydallos Prison.

Kalliopi Matheous Orfanaki

Economic University of Athens, Greece, Hellenic Open University,

The pandemic is not only a medical phenomenon but has various social and political dimensions, one of which concerns the education of individuals. In Greece, in order to limit the spread of the COVID-19 virus, it was decided, to suspend the operation of educational units and to "switch" to distance education. At the same time, measures of social isolation of prisoners were imposed in the prisons of Greece. In this context, the object of this announcement is the empirical investigation of the triptych, Education - Prisons - Pandemic, with the aim of a) recording the educational practices applied to prison schools during the pandemic and b) exploring the lived

experience of students detainees regarding these imposed practices. Based on the critical pedagogy and criminology, the research was conducted among a sample of inmates attending the school of the Korydallos Prison as well as 11 school directors of prison educational units that operated during the school year 2020-2021. To investigate the research goals, a qualitative research is conducted with the holding of group and individual interviews and of participatory observation. The first findings of the investigation showed that the prison schools were led to a cessation of their educational activities, due to the lack of material and technical infrastructure of the schools as well as the prohibition of the Internet access for prisoners, for reasons of order and security. This condition could not be regarded independently of the choices of punitive and education policy. Keywords:pandemic, school, jail, prisoner

Education In the Time of COVID 19 in Armenia

Marina Galstyan

Center For Educational Research and Consulting, Armenia

Following the rapid surge of the coronavirus disease (COVID-19), the Government of Armenia has adopted the decree on the State of Emergency (on March 16, 2020) and all educational institutions, including schools and universities, have been closed down. The need to practice "social distancing" has resulted in transition to remote learning system. Unfortunately, the education system of Armenia was not prepared enough with necessary infrastructure and technology to ensure right to education for every student. Moreover, the social and economic inequalities were exacerbated and many students especially those living in rural areas were affected by so-called "digital divide" as they were lacking the essential technological equipment and adequate internet connectivity to pursue their studies at home. According to the UNICEF report on "Child Poverty in Armenia", 64 per cent of children are multidimensional poor, and 37 per cent of children are monetarily poor. There is a sharp rural/urban divide in deprivation, and in particular in educational dimensions. One in three children in Armenia aged 6-14 is deprived in educational opportunities and the introduction of remote learning system have further marginalized these unprivileged groups.

This paper provides an analysis of the research findings on online teaching and learning practices in secondary schools in Armenia. In total, 600 teachers, 800 pupils as well as 750 parents were participated in the research. The research findings highlighted the need of the support system in the times of emergency for teachers and pupils, especially for different vulnerable groups.

Impacts of Online Support Services On Quality of Life During Pandemic (Covid-19): The Case Of Individuals With Intellectual Disability And Their Mothers

N.Beril Özer Tekin1, Ayşenur Namlı2, Tuba Kapucuoğlu3, Zeynep Zeynel4, Duygu Ece Şimşek4, Aynur Aydoğan4, Büşra Süngü4, Dilara Özer4

1Doğuş University Faculty of Arts and Sciences Sociology Department; 2İstanbul Kent University Faculty of Health Sciences Physiotherapy and Rehabilitation Department; 3Marmara University Institude of Education Sciences Pre-School Teaching Program; 4İstanbul Kent University Faculty of Health Sciences Child Development Department

In the process of Covid-19 pandemic, individuals with special needs, who are one of the vulnerable (disadvantaged) groups that require special attention in the field of sociology, have experienced an even more difficult period with all family members. In this process, the quality of life (QoL) of people with intellectual disability (ID) and their mothers who provide primary care to individuals has decreased. Accordingly, online support services were provided to individuals and their mothers as a part of a project.

The purpose of this research is to examine the impact of online support services provided to adults with ID and their mothers on the QoL of their's in the context of shared common experiences. Within the scope of the research, 3 focus group interview sessions were held with 17 mothers and 3 older sisters selected among the participants. The data obtained were analyzed in accordance with the Interpretative Phenomenological Analysis (IPA).

As a result of the study, 3 main themes were determined, which are "Difficulties of life", "An alternative journey to cope with difficulties: Online support services" and "The end of the journey and expectations from the future" and also many sub-themes were obtained related to these themes. Finally, it has been demonstrated that the sessions positively affect the QoL of the mothers and individuals and make them feel included in the society. QoL of each family member also affects the QoL of the individual with intellectual disability. Families and individuals with ID need such projects a lot.

Rural School in Poland during the Covid-19 Pandemic

Sylwia Michalska

IRWiR PAN (Institute of Rural and Agriculture Development Polish Academy of Sciences), Poland

Basing on the unique sources - the diary of the director of a rural school (plus 60 attached documents), written during first 4 month of pandemic and memories of rural inhabitants, who wrote them for the "Everyday life in the time of coronavirus" contest, we will analyse work of the rural school in the crisis situation. We will point out the most important problems, analyse how were they solved in the new reality and try to find out, what is a role of rural school as the institution for rural communities today. It is a part of more complex question of the place of school and it's relations with local actors. Polish scholar system in last 25 years experienced big reforms, strongly connected with the political changes. It had an influence on both: organisation of teaching but also the programs and contents of lessons. Last reform brought liquidation of gymnasiums (junior high schools), changes in examination system, new forms of employment for teachers. This, and constant lack of money, provoked the strike of polish teachers in 2019. In the 2020 to all mentioned difficulties the pandemic of Covid-19 added new challenges and problems. Online education during the pandemic was challenging not only for teachers and students, but also for their families and local groups. This crisis showed up many deficits in the organisation of teaching, financing education, lack of adaptation to modern reality and challenges.

Confronting Multidimensional Exclusion Of Refugee Students: An Action Research In Brandenburg, East Germany

Birgit Behrensen

BTU Cottbus-Sachsendorf, Germany

The lecture discusses activities of civil society in Brandenburg, East Germany, that aim to overcome educational exclusion and disadvantages of refugees in school, which were exacerbated by distance learning in the course of Covid-19 pandemic measures.

When schools in Germany closed in March and April 2020, each parent or parent substitute was put in charge of supporting and supervising the schoolwork of their children. Since May 2020, the pandemic school measures varied from one federal state to another. Schools in Brandenburg opened up very restrictive and with unclear perspectives.

In the case of refugee students, the inadequate learning support during distance learning is particularly evident. Many schools in Brandenburg miss an established practice in dealing with refugee students and their families, who only immigrated in larger numbers in 2015 and 2016. There is a lack of competences in dealing with multilingualism and with super diversity as well as a lack of skills in student oriented learning, individual promotion and digital learning. Additionally, there is a shortage of teachers and a poorly developed internet. Furthermore, many refugee students have no access to a computer and many of them live in collective centres, having not even regular access to a quite study room.

The lecture presents first promising practises of how civil society deals with this multidimensional problem. The research is based on an inequality-sensitive action research in cooperation with several civil society alliances in Brandenburg, in which refugees themselves are involved as equal stakeholders and agents.

Upper Secondary Education in Iceland During the COVID-19 Pandemic: Students Perspective

1466

Guðrún Ragnarsdóttir, Súsanna Margrét Gestsdóttir, Elsa Eiríksdóttir, Amalía Björnsdóttir

University of Iceland, Iceland

The global crisis brought on by the Covid-19 pandemic has had an enormous impact on education in Icelandic upper secondary schools as everywhere else. The sudden shift to emergency remote teaching while simultaneously the domestic situation of most families changed radically provides a unique opportunity to study the impact of a sudden crisis, within the educational context and the homes. Our data is comprehensive and aims at the long-term effects of this unprecedented situation. It is based on mixed method. In this paper our focuses are on interview data conducted early 2021 with students (N=12) with different socio-economic status from three different upper secondary schools. Preliminary results are already appearing, shedding a light on various aspects of education and social justice, and the interplay of the principal stakeholders, in particular students, parents and education professionals. The project emphasises social justice, socio-economic factors and class. Its historical value lies in its documenting the consequences of current events from multiple perspectives. A well-documented example of one country, Iceland, should serve others who are doing research in the field, contributing to a body of knowledge of how to react when disaster strikes but also

to learning what to avoid and to identify vulnerable groups.

Learning from Coronavirus in Italian Schools. The Points of View of Pupils, Parents, and Teachers

Mariagrazia Santagati

Università Cattolica, Italy

Italy is one of the first Western countries that, at the end of February 2020, decided to close all the educational institutions during the pandemics. After few weeks, following the recommendations of the Italian Ministry of Education, schools implemented Distance Learning (DAD), proposing various activities to be carried out through ICT. Among the main practices, there were videoconferencing lessons, assignment of exercises and materials through digital platforms, socialization activities with pupils (INDIRE, 2020).

During the national lockdown, "children have little voices to advocate their own needs" (Wang et al., 2020) and little attention was paid to their life and school experience. Starting from this absence, the paper presents a qualitative research started in April 2020 and still in progress (Santagati, Barabanti, 2020), conducted with the aim of understanding both lessons learned and difficulties experimented emerging from the school closure. The research project Vo.Ca.Le. (Voice Care Learning) has adopted the technique of vocal messages, exploiting the MIMI (Mobile Instant Messaging Interview) methodology, during a period of physical and social distancing and of particular overload for families and teachers (Kaufmann, Peil, 2019). Parents, teachers, pupils have answered to a brief grid of interview through vocal messages via Whatsapp and to a questionnaire on Qualtrics, giving socio-demographic data and general information about home schooling. Overall, nearly 150 vocal messages were collected from April to September 2020. Thank to a thematic analysis, two types of critical issues emerged both in distance teaching/learning, and in home-school relationships. The analysis of vocal messages allows us to reconstruct generative and amplifying dynamics of school inequalities, especially for the weakest groups of pupils, as well as formal and informal strategies implemented to limit these criticalities.

Upper Secondary Education in Iceland During the COVID-19 Pandemic: Teachers

Súsanna Margrét Gestsdóttir, Guðrún Ragnarsdottir, Amalía Björnsdóttir, Elsa Eiríksdóttir

University of Iceland, Iceland

As in other parts of the world, the COVID-19 pandemic had an extensive impact on the Icelandic education system. The sudden shift to emergency remote teaching posed significant challenges for schools and teachers, requiring them to instantly adapt their teaching practices and course plans to a digital environment. In May 2020, all upper secondary school staff were sent an electronic questionnaire on different aspects of working and teaching during the first phase of the pandemic. In this paper the focus is on the answers of upper secondary teachers (N= 680) to three categories of questions: (1) management and support during the transition to remote teaching; (2) changes made to teaching practices, such as teaching methods and assessment; and (3) impact on students, in terms of demands, participation, and homework. The results highlight the challenges facing upper secondary teachers in the spring of 2020, but also demonstrate that teachers worked hard in overcoming these challenges and adapted to new circumstances. The results show that most teachers would have liked more pedagogical support in changing their teaching practices and that there can be a fine line between professional independence and lack of support. During the past decade or so, teaching and assessment in upper secondary schools has gradually become more diverse, in line with new curriculum guidelines. However, the results here show that teachers struggled with using diverse teaching and assessment methods during the pandemic, indicating a relapse in this development. This gives cause for concern, especially if the situation is prolonged.

1467

Teachers' Perspectives On Their Work Under Covid-19 Crisis in Athens/Greece.

Eleni Tsiknakou

Panteion University of Social and Political Sciences, Greece

The present paper examines teachers' perspectives on their work in relation to the policy measures taken for Secondary Education under Covid-19 crisis in Greece.

As part of our research on teachers' perception of their work we asked Greek teachers of Secondary Education in Athens about their experience of teaching under Covid-19 measures and about the obstacles and challenges they faced at their work. We used a qualitative interviewing method (semi – structured interviews) and examined the teachers' views through the prism of their professional role and identity.

A grounded theory method of analysis was used to develop an empirically – derived description of this interaction. Findings are discussed in relation to the personal and the professional status of the teachers additionally to the phases of the policy measures.

Results show that Greek teachers face a continuous change of teaching procedures since the first measures for Covid-19, which leads them to re-evaluate their perspective on their work at Secondary Education.

Key words: teaching, secondary education, Covid-19, Greece.

Entablado: Performances of Academic Work in the New Normal

Louie Benedict Reyes Ignacio1,2, Ellen Joy P. Pacudan2,3

1University of Santo Tomas, Manila, Philippines, Philippines; 2De La Salle University, Manila Philippines; 3De La Salle Medical and Health Sciences Institute, Dasmarinas

Due to the abrupt need to transition from face-to-face to online set-up of education, the situation presents difficulties both on the students, teachers, and administrators. The shift to distance learning forces students and teachers to adapt old learning practices into and create new ones to achieve educational outcomes. This study uses Erving Goffman's dramaturgical approach to describe the performance of academic work in the online environment through the self-presentation of academicians in their roles as educators, researchers, or students. This study utilized interviews and entries on a daily journal. Using interviews with eight participants engaged as teachers in higher educational institutions, while doing either administrative work, research, or graduate studies, this study argues that the experiences in online education manifest the same aspects of Goffman's dramaturgy as observed in a face-to-face set-up. Though there are a lot of adjustments, changes, and retro-fitting, the participants push for a re-establishment of the same sense of order, structure, and control similar to when classes are done face-to-face.

COVID-19 and Education: an Opportunity to Innovate? A Research on the University of Milan Bicocca

Sara Zizzari1, Alessandra Decataldo2, Brunella Fiore3

1University of Milan - Bicocca, Italy; 2University of Milan - Bicocca, Italy; 3University of Milan - Bicocca, Italy

Keywords: University, distance learning, technologies' acceptance, technologies' use, teachers

Nowadays, educational institutions around the world are deploying distance learning solutions and grappling with the complexity of remote education to contain the spread of the COVID-19 pandemic. It is relevant to investigate solutions developed by universities to provide learning activities, but also everyday practices adopted by teachers in the new context determined by the COVID-19 pandemic.

Despite positive expectations on the democratizing impact of digitalization at the beginning of its diffusion (Gilder, 1994), in recent years literature has highlighted that this process leads to possible new inequalities that go far beyond the mere division between internet haves and have-nots (Van Dijk, 2020). At the same time, the digital acceleration created by this extraordinary situation can represent an opportunity to innovate education, its tools, and its languages. Indeed, we are forced to digitalize universities and even before the pandemic a debated issue was exactly the distance between the educational system and the generation of digital natives in terms of communication models and skills, as well as in contents.

This proposal presents the outcomes of a survey research addressed to teachers at the University of Milan Bicocca. We investigate teachers' acceptance and use of technologies in their educational activities for distance learning. The COVID19 emergency can be an opportunity to ask ourselves what kind of university we want when the critical phase will be overcome.

Using free online tools to innovate in Social Research Methods teaching

Elisa Garcia-Mingo

Universidad Complutense de Madrid, Spain

Due to the obligation to swift from copresent teaching to remote teaching caused by the COVID-19 restrictions, we had to develop remote-teaching skills with poor training and in a short period of time. This presentation summarizes the innovation that has derived from the migration to online teaching-learning mode in my teaching of social research methods, research process and research project with undergraduate students and master students of Sociology at the Universidad Complutense de Madrid. The intended purpose of this paper is to reflect about the posibilities that free online tools offer to improve the conventional copresent teaching and also to point out existing digital resources that we can repurpose to improve higher education. The pivotal transformations of my teaching that I will discuss in my presentations can be organized in the following axes. First, the use of time-managament techniques to organize online lectures (the "pomodoro technique") in short periods of individual training combined with plenary discussions to improve que quality of attention and participation. Second, the creation of a fluid online learning community through the use of Slack channels. Third, the repurposing of free online tools to improve teaching, including: collaborative tools to create theoretical contents (Wiki, collaborative presentations...); free tools to create short videos (ScreenCast-O-Matic) and conceptual maps (MapMinder) to organize the discussion of readings and the use of flipcards (GoConqr) to discuss ethical resaerch dilemmas. Four, the transition from conventional research techniques to digital research techniques for the final research projects (digital ethnography, online interviews, online storytelling group techniques, visual digtial analysis, etc.) that have allowed the students to do empirical research in pandemic times.

Pandemic Crisis: Difficulties and Possibilities in Portuguese Schools

Eva Gonçalves1, João Sebastião1, Luís Capucha1, Ana Rita Capucha1, Luísa Delgado2

1CIES - ISCTE-IUL, Portugal; 2ESE, Instituto Politécnico de Santarém, Portugal

Following international guidelines to guarantee high quality and relevant education for all students for the 21st century, Portugal has invested in technologies and subsequent training for teachers, in the last decades. Some of the most important policies were part of the Education Technological Plan (2007-2010) which equipped schools with new technologies, like computers, interactive boards, routers and Wi-Fi networks, trained teachers and provided laptops for all students. After 2011 there was a clear disinvestment in technologies and training, and the technological equipment was not properly maintained. Besides, several studies have shown that the use of technologies is still incipient in many Portuguese schools. So how did school communities face the challenges brought by the pandemic waves, home confinement and closing of schools during the COVID-19 reality? Five principals of school clusters (responsible for a total of 38 schools from pre-school to the 12th grade, and around 735 teachers and 7260 students), located in different regions of the country and with distinct socioeconomic groups of students, were interviewed. Their answers display the difficulties faced by teachers with low technology skills associated to the unequal resources available to different students and their families. They also illustrate how local authorities and schools' boards had to step in to provide and maintain technologies since 2011, and especially during the pandemic, due to the lack of national policies. Nevertheless, principals are also hopeful towards the future by some of the possibilities brought by teaching at a distance.

Distance Between Online And In-Class Learning In Russia During COVID-19 Pandemic: Measurement And Empirical Case Of Studying

Daria Goloukhova, Elena Kuzmina, Antonina Noskova

Moscow State Institute of International Relations, Russian Federation

The situation of pandemic provoked a forced transition from in-class learning to online training during a lockdown. The aim of the paper is to highlight some issues concerning this problem and to test the methodology of measuring distance between in-class learning and online education during COVID-19 pandemic in Russia. As a hypothesis, it was suggested that the new dimension of educational differentiation between students is manifested in differences in the degree of acceptance of a new digital form of education, the speed of adaptation to new conditions of digital life. In the online-survey of Russian students (N=400) authors measured the semantic distance between online and classroom learning using the semantic differential and the analysis of contrasting statements on students' attitudes towards the distant learning and its potentials in comparison with in-class studying. The analysis of semantic profiles showed that students see in-class learning as more fundamental, reliable and of high quality compared to online format. However, online education has high potential for development as students perceive it as more innovative and rapidly developing. The semantic distance between two forms of education was significantly shorter among the students with a high degree of acceptance of online education. According to the analysis of contrasting statements, the main factor in differentiating students in their attitude to the potential of online education is the ability of online education to dampen the factor of educational inequality.

Social Contacts Of University Students In Serbia During The "Lockdown"

Ivko, A. Nikolić, Uroš, V. Šuvaković

University Of Belgrade/Teacher Education Faculty, Serbia

In a short period of time, the COVID-19 pandemic transformed people's lives. University students were not spared from this trend either. In addition to the health consequences for university students who were directly affected by the SARS-CoV-2 virus, the pandemic also left great consequences on the way students live, learn and communicate. The aim of the research was to determine the social contacts of university students, with who and to what extent they were maintained, with what intensity and how that reflected on their life and learning. Data for analysis was collected on a sample of 514 university students from Serbia, through an online survey, using a snowball sampling. Data was processed using standard statistical procedures. The results of the research showed changes in the way of life and study of university students in Serbia, caused by the COVID-19 pandemic.

The Impact Of COVID-19 Lockdown Conditions On Students' Wellbeing In Greece And Cyprus

Maria Chalari, Marios Vryonides

European University Cyprus, Cyprus

In this presentation, we report findings from an EU funded research project titled 'SHINE', which adopted a comparative and intersectional approach to exploring the impact of the COVID-19 crisis on students' well-being in Cyprus and Greece. In our study, we argue that this unprecedented global crisis and the health and safety measures imposed around the world (such as social distancing, strict lockdowns, home isolation and the suspension of all educational institutions) have strengthened existing educational inequalities with direct effects on students' quality of life and overall well-being. Specifically, they have highlighted conventional class hierarchies not merely in regard to wealth, income and economic security, but also inequalities regarding access to valued circumstances, to practices and 'ways of life'.
Our study gave secondary school students in Cyprus and Greece the opportunity, through an online survey and focus group interviews, to discuss their experiences and share insights into the impact of the pandemic crisis on

their society, on education and especially on their own everyday lives, and to share their thoughts and views on the role that education may play in tackling this impact. Thus, our study raised important questions about the possible role of education for the promotion of students' well-being in the context of the pandemic crisis, and aimed to lay a foundation for tracing new ways of exploring the practices and discourses through which well-being and happiness are constituted. In our attempt, Boudieu's theoretical concepts and, in particular, 'habitus' were used as the main conceptual and methodological tools.

Measuring Autonomy in Higher Education during the First Covid-19 Lockdown

Céline Decleire, François-Xavier Fiévez, Mireille Houart

University of Namur, Belgium

Among the success factors at university, autonomy, also self-regulated student learning, represents a key lever on which educators can tap. Indeed, if teachers want to support students in their learning of autonomy, it is important to question their degree of autonomy already existing at the start of their university course.
The present paper presents the results of a quantitative survey carried out among first-year bachelor students at the University of Namur (Belgium) which aimed to explore the different factors influencing student autonomy. Based on the answers obtained from 200 respondents, statistical analyses were carried out and an autonomy indicator was constructed in order to measure not only the degree of student autonomy, but also to determine the various internal and external impacts of their autonomy. Our results indicate that student autonomy is cultural and learned over time.
Additionally, the questions focusing on their work at home during the first lockdown (12/03/20) revealed considerable social inequalities amongst students. It appears that the students who are less autonomous struggle even more when more autonomy is required for their homework. Technological aspects of remote work, lack of self-organization or being overwhelmed with too many things to do, for instance, widens the inequality gap already existing.
Therefore, during a confinement or when students have their first university experience remotely, the teachers should need to take even more care of less independent students and guide them through their learning of autonomy.

"Staying in Contact Remotely. The Case of Early Childhood Professionals During the Pandemic Lockdown in Italy"

Rita Bertozzi, Tatiana Saruis

University of Modena & Reggio Emilia, Italy

In Italy, the lockdown due to Covid-19 in February 2020 and the interruption of schools and services for children aged 0–6 have led early childhood educators and teachers to develop strategies for staying in contact with families remotely, in order to offer parents and children both support and educational experiences. As their work is usually strongly based on physical and emotional proximity, they had to deeply rethink their role, aims, methods, tools and activities.

Ministerial guidelines for the 0–6 education system were developed only in May, highlighting the specificity of needs and actions, but the first emergency had already been managed by the local schools and services.

Within this framework, an online survey was conducted in June 2020 in order to examine how the professional figures involved reinterpreted their roles and redefined their tasks and objectives. The study involved 1,086 educators and teachers of children aged 0–6 across Italy. The analysis focus on: 1) the impact of different ECEC governance and territorial assets in managing the lockdown 2) how educative professionals adapted their roles and strategies to online education and what kind of obstacles and solutions they found 3) how the kind of support provided to children and families reinforced or overcame existing patterns of social inequality. The results highlight how the education offering had not been the same across the country: not all the families were reached and the most vulnerable were likely lost. However, when communication worked, a sort of new emotional connection between professionals and families emerged. Physical distancing has demanded considerable effort also from those working in the 0–6 system, with different professional spinoffs, but also opened up to some innovations.

Early Childhood Education in Greece Under COVID-19 Lockdown Conditions

George Charonitis1, Maria Chalari2

1University of Thessaly, Greece; 2European University Cyprus

In this presentation, we report the findings of a research study that attempts to shed light upon the way early childhood education schools and their teachers, both in public and in private sector, responded to the COVID-19 lockdown conditions. Specifically, our study explores: a) the way sixteen early childhood education schools in Athens (8 public and 8 private) and their teachers adapted their programmes in order to continue to provide education to their students during the first lockdown (Spring 2020) using different models of home-schooling and b) the views of some of their teachers about the teaching practices they followed at their schools, the teaching formats that their schools gave priority to, and the challenges they faced. In the absence of central guidance from the official state early childhood education structures, found themselves totally unprepared. We are of the opinion that schools' first reactions reveal the true essence of what they advocate, their real beliefs and their deep pedagogical goal. Thus, by revealing the aforementioned through content analysis of the schools' first communications with their students' families, and teachers' views on the strategies and practices implemented at their schools and on the problems they faced and still face through semi-structured interviews, we provide important data on how to rethink early childhood education in relation to our real social needs in the new COVID-19 era. In this attempt we use analytical tools developed by Michel Foucault and refined by Mitchell Dean.

Greek Primary School Teachers' Perceptions of Exclusive Distance Teaching During Covid-19 Pandemic

Loukia Papapanagiotou, Antigoni Alba Papakonstantinou

National and Kapodistrian University of Athens, Greece

The unprecedented health crisis caused by COVID-19 has rendered the implementation of distance learning at all levels of education more necessary than ever. Due to COVID-19 pandemic and the resulting interruption of schooling for several months, Greek primary education teachers had to face a new, unique and challenging educational reality. The present study aims to identify the perceptions of Greek primary school teachers regarding the exclusive distance education, during the school operation suspension, from March 2020 to June 2020 and from November 2020 to January 2021. More specifically, this study aims to determine the educational process applied by the teachers, seize the positive aspects and identify the obstacles that they encountered during this process and understand how teachers differentiated their teaching compared to teaching in a conventional classroom. A qualitative study was conducted and 12 semi-structured interviews with primary school teachers in Attica were performed. Data were collected and elaborated with content analysis. According to preliminary findings, teachers believe that their role is far more different during distance teaching. Moreover, they underline the importance of receiving sufficient training in ICT and distance teaching and learning in order to be able to successfully correspond to their new role. They finally admit that they had to overcome many practical, organizational and pedagogical obstacles in order to make distance teaching more effective for their students and satisfying for themselves.

RS16 | Theorising Men and Masculinities: European Insights

The Genesis of the Academic Term 'Masculinity' as a European Concept

Jana Fritsche

Ludwig Maximilian University of Munich, Germany

In my talk, I want to present some aspects of my Ph.D. thesis. I research the interlacing genesis of masculinity studies and 'masculinity/masculinities' as an academic term. Notably, the societal conditions and frames of the rise and development of this research field and theoretical concepts are of interest to my question. With this (social theory) perspective, I want to outline that the academic term of masculinity has always been a modern western philosophical term (and therefore a European). It assembles specific ideas of modern western societies: certain historically developed ideas of subjectivity and its relation to structure, ideas of time and social change, and ideas of reflection and work on the self. The latter might be the main focus of my talk. By showing this argument, I also want to highlight the aspect of a converted questioning in a methodological sense: Not to ask what masculinity is or might be, but to ask in which kind of society masculinity evolved into an academic 'problem'. Which problem do we want to solve with the term 'masculinity'?

No Hegemonic At All? The Patterns Of Polish Masculinity Against The Background Of Hegemonic Masculinity In The United States

Radosław Kossakowski1, Tomasz Szlendak2, Magdalena Żadkowska1

1University of Gdansk, Poland; 2Nicolaus Copernicus University, Poland

The concept of hegemonic masculinity (HM), which originated in individualistic cultural contexts and largely reflects gender roles and values within WEIRD (Western, Educated, Industrialised, Rich, Democratic) societies, may not reflect ideals of masculinity in other cultures. This study focuses on the development and contents of HM in Poland and contrasts it with HM in the United States using data from Polish (n = 326) and American (n = 326) men. As part of a larger multinational project, participants answered open-ended questions about contemporary masculinity. Unlike with American men, we found that masculinity ideals among Polish men did not generally fit the standard HM pattern. We claim that the Polish hegemonic masculinity model is in statu nascendi and patterns of Polish masculinities refer to the more traditional patterns of masculinity emerging from the history of Poland. Their characteristics reveal the volatile and uncertain nature of Polish (hegemonic) masculinity. As it turns out, Polish men know more about how not to be unmanly than about how to be a 'real man'. Our conclusions, then, broaden the concept of HM by shedding light on its potential cultural and regional variations by analysing threats and behaviours qualified as 'unmanly'.

Evidence-based police strategies to prevent the Teen Dating Violence: incorporating transformative masculinities

Blas Ortuño Puertas1, Marta López Nogales1, Oriol Ríos González2

1Universitat de Barcelona, Spain; 2Universitat Rovira i Virgili, Spain

Gender-based violence in adolescents has increased alarmingly in Spain according to official reports of the Spanish General Council of the Judiciary (2012-2019). It has also been proven that violence occurs in dating, in the so-called Teen Dating Violence (TDV), as a type of intimate partner violence. The scientific literature indicates elements that can influence police preventive activity, such as police legitimacy or professional culture. This paper will shed light on this debate through a research focused on how police officers perform TDV training sessions in secondary education schools. Using the communicative methodology, 9 experts have been interviewed and 12 training sessions have been observed. The investigation conducts an introspection on preventive police work, revealing exclusionary and transformative dimensions in the prevention of TDV.

Main results show the need to include theoretical elements based on scientific evidence to policing, such as preventive socialization of gender violence aimed at giving consistency to police preventive strategies against TDV. In the same vein, the analysis conducted illustrates the relevance to consider concepts not used by police culture such as love in these preventive strategies.

Findings also show that the inclusion of theories on new alternative masculinities is necessary. Thus, it has been evidenced in the training sessions with adolescents, the transformative effect of emptying of attractiveness violent masculinities and promoting it in egalitarian men. This is possible when the language of desire is employed to talk about these men instead of the language of ethics.

Relinquishing Power Through Care? Caring Masculinities In Later Life

Miranda Leontowitsch

Goethe-University Franfurt, Germany

The concept 'caring masculinities' (Elliott, 2016) with its roots in feminist care ethics has proven an important heuristic in understanding the care practices of men* and has been described as a gender-equality intervention. However, there remains a lacuna as to how and under which circumstances men* relinquish power and embrace empathy, interdependence, and co-responsibility into their care practices. This paper sets out to explore the relevance of post retirement life on how men* engage in care. Older men's* pathways into care are varied: they may be pushed into care through personal and structural circumstances but may also engage in care for fulfilment. Older men's* engagements in care are therefore varied, change over time, and are influenced by their location in a network of privileges and inequalities. What remains unresolved is whether older men's* care practices remain imbued with notions of hegemony in which they provide for dependants within a (traditional) power hierarchy and thus focus on care practices that are in line with gendered notions of being a man*, or whether non-hegemonizing (i.e. power relinquishing) care practices are discernable. This paper draws on data from two qualitative interview studies conducted with retired men in England and Germany, in which the role of caregiving emerged as a central theme in their narratives. The paper aims to contribute to current theoretical work on caring masculinities by shifting the focus from identity and policy to an examination of power relationships through an intersectional perspective.

Relinquishing Power Through Care? An Ethnography Of A Care-Training-Program For Male* Refugees In Germany

Marina Schmidt

Goethe Universität Frankfurt am Main, Germany

Since 2015, thousands of people, mainly men from the Middle East and the North of Africa, have fled to Germany. Due to their pending asylum status, they have no access to the labour market. However, an exception was created for persons willing to train in the field of geriatric care work, a field which has been lacking sufficient numbers of employees for some time. German policy is now working to counteract the shortage of skilled workers in the geriatric care sector by offering a training program specifically aimed at refugees.

Accordingly, such policies raise questions whether the economical idea of increasing the numbers of care work by immigration can work and how dimensions of power relations, inequality and difference might be rendered visible. This paper will report on an ethnographic study that analyses power relation through the concept of differentiation focusing on ethnicity and gender. Data was collected during ethnographic fieldwork during training sessions.

On the structural level it is evident that while refugees are pushed into care, they also gain a residency permission and access to social participation by starting this training program. From an interactionist perspective it can be observed that the teachers frequently use role-plays to teach the ability of caring. Teachers assume that these 'foreign' male students need to learn empathy skills via hands-on experience. The male students begin to define themselves by their nursing knowledge and the traditional male coded ability to be in control of a situation.

Men's Family Participation and Care Responsibilities in Low-income Contexts Across the Lifecourse: Reflections from the UK

Anna Tarrant

University of Lincoln, United Kingdom

This presentation explores the dynamics of men's care responsibilities and family participation both across the life course and in the context of low-income family life. The insights presented are based on the multi-generational perspectives of twenty-six men residing in low-income families in a northern English city. These men participated in the Leverhulme Trust funded study 'Men, Poverty and Lifetimes of Care' (2014-2018). Taking a dynamic view of men's care responsibilities and configurations of care across the life course in these localities, the study generated significant insights into men's involvement in care for their families and has interrogated how this is affected by the resources available and the constraints upon them. The evidence highlights that men occupy a diverse range of caring roles and practices in low-income families, in a diverse range of circumstances. Men's pathways into care are also wide-ranging and driven by a combination of external circumstances and often constrained choice. Under austerity, informal care is being further privatised and individualised and indeed, the responsibilities of the men in this study were often a response to the needs of other generations and driven by interdependencies in contexts characterised by limited economic, material and place-based resources. The intersections of gender, generation and work, as well as the impact of austerity and welfare support are also considered. Illuminating aspects of care within economic hardship that often go unseen, this study deepens our understanding of caring masculinities and family life and the policies and practices that support or undermine men's family participation.

Masculinities In Institutional Care Settings

Rafaela Werny

Goethe University Frankfurt, Germany

During the last decade the concept of 'caring masculinities' (Elliott, 2016) has grown in significance within the scope of Critical Studies on Men and Masculinities. Usually the focus lies on the care practices that men perform. The opposite perspective, that of men receiving care and constructions of masculinities within such relations remains largely unexamined. Using a biographical perspective on old men living in institutional care homes, the paper analyzes how old men in need of care construct masculinities in an environment where woman are in the majority both as residents and as carers. Data shows that receiving care and living in an institutional care setting simultaneously challenge and allow unique constructions of masculinities. On one hand men can be the 'cock of the walk' in nursing homes. On the other hand, the institutional environment and their care needs have the potential of marginalizing them. As a result, biographically developed performances of masculinities can become fragile. Data from qualitative interviews with men in care homes will show that men with strong ties to patriarchal construction of masculinity experience difficulties, whereas men who integrate caring into their masculinity were able to adapt their enacted masculinity. Using an intersectional perspective, the paper will highlight the importance of gender, class and ethnicity in the representations of masculinities in old age.

Fatherhood: What happens after parents' separation?

Tatjana Elke Graf

University of Gothenburg, Sweden

In recent years, new concepts such as caring masculinities have been emphasizing the integration of care values in men's identities as an essential facilitator of gender equality. At the same time, men have increasingly been dedicating more time and emotional resources to family life and caring duties. Promoted by high rates of divorce and egalitarian gender role expectations, diverse family forms have started to replace the ideal of the nuclear family. After parents' separation, however, families experience a re-traditionalization of parental roles and mothers commonly take over the role of the main caregiver. Building on a gendered idea of parenthood, this arrangement has been institutionalized for a long time. Although, a major change has been the introduction of shared residency models facilitating an equal division of time and responsibility between parents. This new model is particularly common in the Nordic countries while slowly gaining more importance in other countries, too. Drawing on these differences, the ongoing qualitative research project takes on a comparative perspective of narratives on fatherhood after separation in Sweden and Germany. While in Sweden shared residency is broadly adapted and closely connected to gender-equal parenting ideals, in Germany however, it is only rarely practiced. Using data from semi-structured interviews conducted in both countries, the paper discusses the implications of the narratives for the concept of caring masculinities. Particularly, the questions of how fathers rearrange their paternal caring identities and integrate caring responsibilities after separation are tackled.

Covid19 Pandemic and Caring Masculinity: New Opportunities or a Wasted Chance?

Julia Kubisa

University of Warsaw, Poland

The early data regarding gender implications of COVID-19 suggest that men are more likely to die as an effect of infection (Purdie et al. 2020) while women are those who suffer the social consequences of pandemic (Wenham 2020) as they dominate in care-oriented professions, (Eurostat 2020) and bear the consequences of increased caring needs at home (UN Women 2020). The latter includes caring for children, who, in many (European) countries have been subjected to homeschooling. However, the lockdown resulted in the fact that also men (usually white-collar workers from middle class) changed their work organization and habits and have started working from home. Some studies suggest that this specific situation results in the increase of involvement of fathers into caring activities at home (Kreyenfeld 2020).

Hence, the main goal of our paper is an attempt to answer the question if pandemic opened new opportunities for larger involvement of men in caring activities. The study will locate research outcomes in the context of gender regime in Poland in order to investigate if lockdown, online work and care responsibilities enabled to challenge or to reproduce existing gender relations, with a special focus on masculinities patterns. It will be done by analyzing data from Poland, namely, semi-structured qualitative interviews collected in two waves – during spring lockdown 2020 and during late autumn and winter 2020/2021 with men and women working online at home and caring for underage children. By doing so, we expect to add more nuanced, crisis-related theoretical understandings of caring masculinity concept.

"Now, You See, We Are Trying to Wait Things Out": Prostate Cancer Support Group in the Time of Coronavirus Pandemic

Katarzyna Barbara Słaby

Jagiellonian University, Poland

In this paper I would like to tackle the methodological and epistemological question of "(dis)continuity" during coronavirus pandemic on two levels – as of the (im)possibility of pursuing my fieldwork on narratives within prostate cancer support group (PCSG) and as of (dis)continuity of the mission of providing support and information for men struggling with prostate cancer by the PCSG itself. Their mission is being empowered mostly by the some sort of extended "patient and physician male" dyad (see Oliffe, Thorne 2007).

My project remains comparative, though, as I am simultaneously investigating the narratives within breast cancer support group (BCSG) in the same mid-sized city in Poland. Compared with PCSG breast cancer support group differs considerably not only in terms of the model of the self-help group, but also in their response to the unexpected challenges.

In the light of the serious health and life hazards introduced by the coronavirus pandemic both BCSG and PCSG needed to figure out how to pursue their agendas and keep their members safe in the same time. My current research shows that the strategy chosen by BCSG and PCSG during the pandemic reflects somehow the previously embraced model, forming some sort of "continuity" which results, nonetheless, significantly different in BCSG and PCSG cases.

Considering masculinity as founded on life events and activities (Evans et al., 2011) I will discuss the question of peculiar dynamic of "(dis)continuity" of embodied masculinity in case of PCSG in the realm of pandemic. Thus, I will analyse PCSG's response to the extraordinary circumstances as outbreak of COVID-19 as a tell-tale which leaves PCSG's up to now "complicit-like" masculinity agenda affected.

A Changing Manscape: Why Are Some Athletes Resisting Heteronormativity?

Michael Duncan Kehler

University of Calgary, Canada

Historically sport has intersected masculinity, athleticism and heterosexism. According to Wellard (2009) "sporting masculinity" is fundamentally about how the performance of male bodies demonstrate or express other normative requirements relating to gender and sexualities. The bodily displays and performances of sporty masculinities is located at the nexus of masculinities, homophobia and sport. This paper examines the activist agenda and understandings of a specific group of athletes invested in resisting and challenging heterosexism and homophobia in sport. And while the bodily practices of privileged bodied men has typically lead to the silencing, shaming and the marginalizing of some men, I draw attention to a counter example of athletes challenging heterosexism and homophobia within team sport and beyond.

Drawing on masculinities studies, this paper builds on Connell (1995) arguing that some "bodies are more than recalcitrant, they disrupt and subvert the social arrangements into which they are invited." (p.58) Bodies are not limited as symbols or signs but rather they are "seen as sharing in social agency, in generating and shaping courses of social conduct."(p. 60) This paper critically examines the sport context as being "relatively unscathed by activist challenge" and in particular the ways some athletes actively and purposefully create competing and overlapping projects of masculinity that run counter to heteronormative sporty masculinity. Arguably engaged in "alliance politics", the author draws on qualitative UK research to explore the motivation and means by which privileged white, heterosexual men resist sexism and homophobia.

The data illustrates the tensions that counter narratives of profeminist men navigate to challenge homophobia. Finally, this research challenges arguments that there is a "declining significance of homophobia" and questions contradictory masculinized practices among men.

1478

'I Just Do It Myself, With Clippers': Male Pattern Baldness And Everyday Grooming.

Ashley Morgan1, Mohammed Malik2

1Cardiff Metropolitan University, United Kingdom; 2Nottingham Trent University

Male pattern baldness is a global issue which transgresses boundaries of ethnicities and cultures. As such, it appears to be a phenomenon unworthy of sociological research. Psychological research has found that a number of aspects of men's appearances, from their hair to height and penis size can cause considerable dissatisfaction (Tiggemann and Martins, 2009). In concert with increasing dissatisfaction, ministering to male appearance has become big business. Men are now shaving less, which means that industries which provided traditional male grooming products, are turning their attention to hair (Mintel, 2020), and there has been a significant increase in male hair transplants (Cave, 2016). While research into male pattern baldness already exists, it is outmoded and overly reliant on statistical information (Rhodes, et al, 1998). Very little, if any, contemporary research exists which contains men's personal views on their loss of hair, aside from hair loss due to Vitiligo and Alopecia. There is an absence of research in the ways in which the hair loss has contributed to men's wellbeing, the ways in which they dress and see themselves. This abstract presents a pre-analysis of semi structured interviews on a range of bald men from the UK. Initial analysis suggests a number of findings which relate to men's embodied experiences across the life course, including inevitability, familial connections, ways of dressing and the ways in which men have engaged in their everyday grooming and maintenance of their heads.

Sexist Masculinities and Discourses on Yoga In Turkish Social Media

Mehmet Bozok

Maltepe University, Turkey

Yoga is a widely known type of physical, mental and a spiritual exercise, with diverse forms and ways of practice. It is practiced almost everywhere across the world, with wide range of purposes from meditation and recovery to fitness. As a predominantly gender-egalitarian and gender-stretching practice, yoga is practiced by the women and the men, regardless of sexual orientation. Despite its gender-embracing emphasis, yoga is one of the prominent fields of sexist stigmatization amongst masculinities in Turkey.

This presentation discusses the representations of sexist discourses on yoga and yoga-practitioner masculinities, as represented in social media in Turkey. Focusing on Eksi Sozluk, Inci Sozluk and Instela, three of the most widely participated collaborative online dictionaries used chiefly by young and male adults, a nethnographic method is used for gathering information about yoga and masculinities. Although it has a longer history, nowadays yoga is practiced as a popular practice for wellbeing, especially amongst white-collar urbanites in this country. It has male as well as female and LGBTQI practitioners. However, in popular discourses in social media, yoga is often associated with women and the LGBTQIs and male practitioners of yoga are humiliated, mocked and stigmatized as "sissy", "effeminate" or seldom as "women-seekers", apparel, poses and environment being the main fields for sexism. In this sense, here I argue that, yoga practice (and its related materials) is used as a signifier, and a stigma for men and masculinities outside the heteronormative patriarchal orthodoxy. This process in online dictionaries contributes the reproduction of sexist masculinities.

1479

The Hierarchy of Masculinities: Case Study of Rural Poland

Marta Gospodarczyk

University of Warsaw, Poland

The purpose of this paper is to present the findings of the research conducted between 2018 and 2019 in one of Poland's rural communities, employing the methodology of participant observations and in-depth interviews. The main objective of the paper is to present a nuanced description of the ways in which rurality and masculinity intersect, both in a symbolic and material way. The location of the research area, the shape of the local labour market, and material living conditions shape the cultural, social, and economic resources available to the men studied, thus influencing the ways in which they perform and define their masculinity. The rapid changes that rural Poland is undergoing result in a greater stratification within the studied community - the men of the emerging rural middle class are now occupying a hegemonic position, relegating the lower class men to the bottom of social hierarchy. Thus, the paper aims to present rural men not as a homogenous group, but rather as a heterogeneous group facing internal tensions connected with class status. The findings show, in compliance with the theory of Raewyn Connell, that the emergence of a new model of hegemonic masculinity is possible, as a result of economic and social changes, that re-shape what is the most influential and desired model of masculinity (Connell, Messerschmidt 2005). The paper will present the ways in which the hierarchy of masculinities within the particular rural community is being created and the changes said hierarchy is being subjected to, as well as the methodological dilemmas that accompany the use of case study methodology and participant observation by a female researcher investigating rural masculinities.

"Racially Profiled Masculinities: Conceptualizations of Masculinity Among Trans Men in a Mono- and Multiracial Society"

Anna Maria Kłonkowska

University of Gdansk, Poland

The presentation concerns an impact of ethnic/racial identity on conceptualizations of masculinity among trans men in a mono- and multiracial/ethnic society. It is based on a comparative study of Polish and US societies, investigating the dynamics and superimposition of racial/ethnic identity and gender identity in trans men.
The obtained results have indicated the lack of inclusion of ethnic/racial identity awareness into personal constructions of masculinities among respondents from a monoracial/monoethnic society, similarly as in case of ethnic/racial majority group members in a multiracial/ethnic society. At the same time, there was a visible influence of ethnic/racial identity on masculinity models developed by members of ethnic/racial minority groups in a multiracial/multiethnic society. The research results have also indicated the social expectations and stereotypes attributed to certain (ethnically/racially defined) models of masculinity. The outcomes also refer to the socially dominant models of masculinity, perceived by the respondents as culturally universal, and the evolution of their own attitudes towards them.
The study was based on a qualitative research project: 60 semi-structured interviews collected in Poland and USA. The project was funded by NAWA (Bekker Programme research grant).

The Transnational Lives of Migrant Bachelors Between Freedom and Normativity

Andrea Priori

Fulda University of Applied Sciences, Germany

Based on first results from an ethnographic research taking place in Italy and Sweden, this presentation offers provisionary thoughts on relations between bachelorhood, transnational migration and masculinity. Bachelorhood works as a lens for observing how social and spatial positionalities impinge on the lives of migrant men. The interplay of factors such as the different national models for integration, the national, social, and (ir-)religious backgrounds of the migrants, their motivations for migrating, and their masculinity styles, affect the ways in which a gendered imaginary of bachelorhood and migration is constructed. Migration can work either as a way to reproduce hegemonic models of masculinity and bachelorhood, as it can give access to a material wealth often facilitating heterosexual marriage, or as a space of freedom where migrant bachelors experiment and deviate from normative patterns.

Mapping the Spanish Manosphere: Tracing Pickup Artists, Whoremongers and Other Misogynist Digital Subcultures in the Local Web.

Silvia Díaz Fernández1, Elisa García Mingo1, Carlos Moreno Azqueta2

1Universidad Complutense de Madrid, Spain; 2Universidad de Castilla la Mancha, Spain

Our project "Young men in the manosphere: the influence of misogynist digital subcultures in the perception of the sexual violence" aims to understand how the manosphere is contributing to the normalisation and legitimisation ofgender violence among young Spanish men. In this paper, we map the Spanish local manosphere, a conglomerate of digital masculinist subcultures (Pick Up Artists, Men's Rights Activists, whoremongers...) characterized by the use of a victimized and conspiracy-fuelled misogynistic discourse. While in Anglo-Saxon countries abundant empirical work has been done on this issue (Kimmel, 2019; Debbie, 2017; Massanari, 2015; Love, 2013), in Spain we have little evidence about our manosphere. With our work we are therefore addressing a significant gap in this emergent field of research. The central question that guides our research is the following: Do digital masculinist subcultures shape young men's understanding and perception of gender violence in non-virtual settings?.

To do so, we have implemented a mixed-methods approach. First, we have conducted in-depth interviews with experts in the field (e.g. research journalists, insiders); and second, we have carried out digital ethnographic work in the Spanish local manosphere. To do this, we have identified some of its key locations (e.g. Forocoches, Hispachan, etc.) in order to seek to understand: 1) the dynamics of social interaction; 2) the online-community building process; 3) the creation and circulation of misogynistic discourses. Our ethnographic results about online communities have allowed us to map the Spanish manosphere and reconstruct the dynamics of leadership and interaction between members, the self-definition of users and the communities and the conceptions and discourses about masculinity that emerge in these digital sites in relation to the object of our study.

RS17 | The Role of Co-Creation in Current Societies

Co-Creation Towards Socio-Ecological Transformation – A Sociological Perspective On Co-Creative Knowledge Production In Sustainable Urban Planning.

Lukas Franta, Nadine Haufe

TU Wien, Austria

The socio-ecological transformation is a central task for current societies demanding a profound societal change with inclusion of the knowledge of all members of the public. As a form of "open innovation" (Howalt & Schwarz 2010), co-creation intends to bring together actors from different sectors of society in a collaborative process in order to create knowledge and solutions together for achieving the socio-ecological transformation.

The current European research agenda (e.g. Horizon-2020) shows that co-creation has become a core concept for achieving socio-ecological transformation. In the transdisciplinary Horizon-2020 research & innovation action project SUNRISE (2017-2021), co-creation is the key concept for development, implementation, assessment, and facilitation of learning about new ways to address mobility challenges for sustainable planning in 6 urban neighbourhoods (Bremen, Budapest, Jerusalem, Malmö, Southend on Sea, Thessaloniki). Co-creation in sustainable urban planning offers the opportunity to mobilise experiences, knowledge and ideas of citizens and other actors to create solutions for socio-ecological transformation (Torfing et al. 2016). Thereby, co-creation allows integration of needs and requirements of local actors into urban planning and is often seen as a good lever to solve urban challenges (Zimmermann & Höflehner 2016). For understanding the social dynamics of co-creative knowledge production, a sociological perspective is essential but often under-appreciated.

At the example of the SUNRISE project, this contribution is: conceptualizing co-creation in the context of sustainable urban planning; examining the role of sociology in co-creative knowledge production processes; and discussing the benefits of co-creation for sociology and the socio-ecological transformation.

Actors' Engagement in the Dynamics of Social Innovations in Short Food Supply Chains in Europe

Eugenia Petropoulou1, Contantine Iliopoulos2, Irini Theodorakopoulou3,2,1, Theo Benos4,4,1

1Department of Sociology, University of Crete; 2Agricultural Economics Research Institute (AGR.E.R.I.), Athens-Greece; 3Agricultural Economics Research Institute (AGR.E.R.I.), Athens-Greece and Department of Sociology, University of Crete; 4Sustainable International Business (SIB) Research Centre, Zuyd University of Applied Sciences, 6217 HB Maastricht, The Netherlands, and Department of Sociology, University of Crete

In spite of the increasing attention being paid to Short Food Supply Chains (SFSCs), as alternative food distribution networks, research in the area of actors' engagement in the dynamics of Social Innovations (SI) in Short Food Supply Chains is still scarce, particularly in Europe. The engagement of actors in SIs has attracted the interest of researchers, policy makers, and practitioners alike while recent research shows that the drivers of actors' participation are among the top factors influencing the success of SI processes in SFSCs. In this case, the public policy goal is to promote and facilitate those practices that lay the ground for co-developing SI in SFSCs. According to the current state-of-art knowledge, such interventions do not have the desired effect if implemented in a top-down fashion. Instead, there is a need to include societal inputs and engagement as well as communication among the relevant stakeholders (those who will adopt SI practices in SFSCs and be affected by it immediately), together with knowledgeable facilitators and dedicated groups. Based on literature review analysis and 9 Community of Practice research in 9 European countries, we intend with this study to identify and present the critical drivers and tools necessary for succeeding in engaging all key actors in SIs in SFSCs. The aim of this approach is to propose policies that will enable policy makers to intervene and bring about transformational changes in the European agri-food sector.

Allinteract: The Promotion and Diversification of Citizen Engagement in Science.

Teresa Sordé Martí1, Marta Font2, Mengna Guo2

1Universitat Autònoma de Barcelona, Spain; 2Universitat de Barcelona, Spain

The perspective of citizen engagement in science is not new, although traditionally, citizens' participation in research has been linked to natural sciences, such as ecology or astronomy. For example, since 1900, the National Aubudon Society has organized an annual count of birds that engages every year between 60,000 and 80,000 volunteers (Cohn, 2008). Contributions like this, have been key to provide extensive amounts of datasets that would only be possible to collect through a participatory conception of science. In 1995, Irwin defined citizen science as the engagement of citizens in scientific research, not only in data collection activities, but also in decision making processes and "bottom-up" strategies. This new relationship between science and society would orient science in order to address the real needs of society and to promote science-based policies (Woolley et al., 2016). However, this approach has traditionally been focused on white and well-educated adults, while non-academic sectors of societies and vulnerable groups have not been included in cocreation of knowledge. In this line, H2020 ALLINTERACT project has a twofold objective: 1) to create new knowledge about how to transform potential citizen participation in science into actual engagement in scientific research with social impact; and 2) to discover new ways to engage societal actors in research, including young citizens (16-29 years old) and vulnerable groups that have traditionally been marginalized from science (e.g., low socioeconomic background, ethnic and religious minorities, women, LGBTQI).

Limits of Co-creation – Evidence from a Large-scale Empirical Study of Food Consumers

Krzysztof Klincewicz1, Katarzyna Dębska1,2

1Faculty of Management, University of Warsaw, Poland; 2Faculty of Sociology, University of Warsaw, Poland

Co-creation can leverage participants' insights, uncover latent needs, identify the most usable and feasible solutions and empower participants. Beside these obvious functional and ethical benefits, this participatory approach may also have relevant limitations. The paper will analyze findings from a large-scale social experiment, carried out in 2019-2020 as part of Horizon 2020 "EIT Food RIS Consumer Engagement Labs" project. Co-creation sessions were organized with companies and consumers in 14 European countries, aimed at proposing new food products, and stimulating the participants through a diversity of projection techniques, gamification and creative tasks. Over 220 consumers divided into 42 teams worked on developing over 350 new concepts in multiple food product categories. Researchers gathered in-depth observations of the creative processes, participants interactions with companies and the subsequent new product development and market introductions. This unique empirical setting offered insights into the prospects and perils of co-creation. The paper will discuss the limits of consumer creativity, which was inspired but also impaired by prior experiences and specifically understood heritage and traditions. Despite overly positive outcomes of the co-creation processes, participants demonstrated limited abilities of putting forward ideas radically new for the food sector. Some of their proposals appeared idiosyncratic, embedded in nostalgic memories and personal preferences, but less successful in addressing generally recognized problems. The research looked also into specific challenges of organizations trying to evaluate and implement selected ideas, struggling with the tacitness of needs and the participants' lack of expert knowledge about technically feasible solutions.

Whose Law? An Agent-based Model of Social Movement Influence on International Law

Katharina Luckner

University of Hamburg, Germany

Social movements are an important part of a functioning society and have always shaped local and national policy making. Their influence on international policy and law making on the other hand is only poorly understood, as there seems to be a disconnect between the local and regional nature of most social movements and the global nature of international law. However, as global connectedness increases, movements become increasingly coordinated internationally, especially when it comes to global problems, such as the climate crisis. In this paper, I therefore ask how the global anti-climate change movement impacts international environmental law-making, specifically the making of positive international law in the form of environmental treatise.

Base on a review of research on civil society advocacy and norms research, I propose and test three channels of their indirect influence: (1) bypassing locality, (2) creating normativity, and (3) changing conditions of law making. I test these channels by employing a method that is novel to the toolbox of international legal scholar and has also not found wide-spread application in the study of social movements: agent-based modeling. The model consists of civil society, economic, and political actors and their interdependencies, which produce dynamics that scale up in a process of international law making. A systematic variation in the channels of influence shows which dynamics are the most relevant for social movements' influence on international law making. The results may inform strategy development for social movements. It also opens up opportunities for further, more focused research into these dynamics at both an academic as well as an activist level.

Popular Knowledge? The Travel and Transformation of Participatory Action Research

William Kendall

LSE - London School of Economics, United Kingdom

Different forms of participatory research are attracting the interest of academic, civil society, and governmental organisations worldwide. Their proponents claim it empowers participants and democratises research. Yet critics argue it has been co-opted, even representing a form of "tyranny". I argue that debate is obfuscated by a lack of clarity over what participation really means. These practices must be analysed in their historical and institutional contexts. A better understanding of participatory research is essential for debates such as decolonising sociology, realising the Universal Declaration of Human Rights, and this conference theme 'Sociological Knowledges for Alternative Futures'.

This paper – based upon my ongoing doctoral thesis – proposes to do three things. First, I "re-historicise" participatory research, exploring the traditions of Participatory Action Research active in the Global South in the 1970s, often ignored in contemporary narratives. For example, the research-activist-collective developed by Colombian sociologist Fals Borda had goals of 'conscientization', critical recovery of history, and political mobilisation. Secondly, I use field analysis to map the contemporary field of participatory research. I explore its diffusion across varied institutional settings and provide a genealogy of contemporary participatory research practices. I argue that how these practices are designed by institutional actors is consequential for their ability to produce democratising effects. Thirdly, I theorise the travel and transformation of participatory research as a case of 'the new public participation'. This body of sociological work investigates the changing meaning of 'participation' in contemporary society in relation to shifting patterns of voice, authority, and inequality.

1484

Collective Research for Active Network to Generate New Knowledge and Engagement Across Europe

Mariella Nocenzi1, Giovanna Gianturco2, Arianna Calderamo3

1Sapienza Università di Roma; 2Sapienza Università di Roma; 3Sapienza Università di Roma

The paper aims at desfribing the Project CHANGE-21 which main goal is to develop a toolkit to promote changes in social and behavioural practices, according to the European Green Deal. The challenge is to collect and thoroughly analyse transnational data in order to: 1) promote the public, private, no profit and social stakeholders contribution to identify behavioral changes, looking at system dynamics and integrating historical, cultural, social, economic and psychological perspectives; 2) identify factors, resources, tools with different levels of influence on social practices and behavioral changes thanks to a transdisciplinary approach and intersectional research; 3) explore the indirect implications and their specific weight on the decision making, in order to plan possible social strategies for behavioral changes at both individual and collective level, among citizens, communities, businesses, workplaces, decision makers and institutional actors, taking into account vulnerable and marginalized people. The global impact of climate neutrality by 2050 will be analysed jointly with transnational and transcultural factors, practices, tools and resources, that can empower, or restrain, change at individual and collective level. Moreover, broader changes in social practices will be mapped and assessed. All that, to be integrated with the application of the One Health approach, thus linking with agrifood, nutritional and environmental sciences.The project CHANGE-21 is acting by a multi-actor consortium pooled by a core group of 20 Beneficiaries from 15 Countries, involving scientific experts with complementary knowledge in several disciplines: sociology, psychology, political sciences, welfare, economics, economics modelling, communication, epidemiology, health, nutrition, food sciences, circular economy, environmental sciences, statistics, ICT. A considerable network of stakeholders is committed to collaborate and take action in the co-creation process, assuring multiplier effects of the project results.

Co creation in Research with Persons with Disabilities

María Gómez-Carrillo de Castro

Universidade de Lisboa, Portugal

Participation of persons with disabilities as co-researchers has long been demanded by disability scholars and activists but remains a challenge to many and is fairly unknown in the Spanish academic context. Experiential knowledge is rarely recognized and participation in research has been exploitative in the past, with no external ethical review. There is also a tokenistic use of persons with disabilities to showcase research, or being invited to 'check the box' of participation.

This paper will explore the role and methodology of co-creation with persons with disabilities, using the experience of two participatory research projects. The first project is a research piece with autistic women, while the second one is a research piece with persons with intellectual disabilities, both located in Spain. In both projects, my co-researchers decided on the research topic, research methods, sampling and are involved in the analysis and dissemination of our research piece. The paper will cover strategies to counterbalance power inequalities within the research relationship, possible initial training and how to facilitate decision-making processes within the research without taking over the leadership or questioning the group's experiential knowledge.

Ethnographic observation and reflexive research tools were used to research participatory research methods and consider the different challenges and benefits arising from involvement of persons with disabilities in research. The findings were presented and discussed with co-researchers as well, to ensure adequate representation and enable further exchange and learning opportunities.

Digital Co-Creation: The Case Of The Socatel Project (H2020)

Blanca Deusdad1, Jon Switters2, Zanutto Zanutto3, Marija Djurdjevic1, Isabella Riccò1

1Rovira i Virgili University, Spain; 2FUNKA; 3ISRAA

The demographic shift has increased the need for health care services and social services. Furthermore, the last economic crisis (2008) and the COVID-19 epidemic have both put the European Welfare States under increasing pressure. As a consequence of this, the process of privatization and marketization has been accelerated. In order to cope with this "care crisis", a strong involvement of entire communities and citizens is required. Besides this, care services have to address citizens' real needs, so as to be useful and effective. The involvement of all stakeholders (Quadruple Helix, QH) in the co-creation of long-term care services is a guarantee for the use and success of long-term care services when they are put in the market. The SoCaTel digital co-creation platform for co-creating long-term care services with all stakeholders. At the same time, we will present the SoCaTel method carried out through the H2020 project SoCaTel (No. 769975) and the long-term care services co-created with it. The project has used different methods to scale-up the platform and transfer it to different territories. In addition to the piloting carried out during the SoCaTel project (Finland, Ireland, Spain and Hungary), the platform is being adopted by the Region of Veneto (Italy) through the twinning programme launched by the H2020 Digital Health Europe project.

Inclusive Co-creation In Health Research? Involving Patients and Carers in the Governance of Health Data

Cláudia De Freitas1,2, Susana Silva1, Mariana Amorim1

1EPIUNIT - Institute of Public Health of the University of Porto, Portugal; 2Centre of Research Studies in Sociology - ISCTE/IUL

Public and patient involvement in decision-making about data sharing, access and reuse can improve the ethics and quality of health research. Lay people's needs, lived experience, vision and creativity are of critical value to (re)think research priorities, recruitment and retention strategies and implementation. However, co-creation approaches to research need to be inclusive by design to enable power devolution and a fair distribution of societal impact. This presentation explores public and patient preferences for and expectations of involvement in health data governance, with the purpose of uncovering barriers to participation and devising strategies to alleviate them. It draws on a mixed-methods study entailing 629 questionnaires and 41 semi-structured interviews with rare diseases patients, and their informal carers, in Northern Portugal. Results show that 39% of participants want to get involved in health data governance and 45% are indecisive. Those unwilling to participate (16%) were more likely to be lower educated, hold blue-collar occupations and have less social trust. Motives underpinning interviewees' unwillingness to get involved include lack of information, knowledge and skills, limited time, disbelief in participatory processes, and trust in data managers. Strategies to promote inclusive co-creation in research need to anticipate and address the material, psychosocial and symbolic barriers that impede less advantaged groups from engaging in participatory initiatives and to deploy power once they are in. This means reaching out to diverse groups of people, ensuring equitable access to opportunities for participation and resources and promoting collaborative environments where all stakeholders can contribute for transformative action.

Co-Creating Artificial Intelligence for Social Provision: An Example of Cross-Sector Collaborations through the AI FORA Project

Albert Sabater, Cristina Sánchez, Beatriz López
University of Girona, Spain

In more and more countries, policymakers increasingly use Artificial Intelligence (AI) algorithms to decide on public service provisions and state benefits for their citizens whose profiles are assessed and evaluated for decision making. Delegating decisions based on such value judgements to machines raises ethical, philosophical and social issues and leads to important questions of responsibility, accountability, transparency and the quality of social decision making about the distribution of scarce resources. By using a co-creation approach and a wide range of cross-sector collaborations the AI FORA project aims to understand the status quo and the future options of AI for social provision in order to create improved AI technology for social provision in various countries (Germany, Estonia, Spain, India, China and the USA) with different social welfare systems. Our paper will provide, first, a review of the literatures on co-creating social AI and, second, some initial empirical evidence of how to build capacity for the co-creation process using a stakeholder-driven research framework co-developed internationally and between computer science and the social sciences. By undertaking this approach, our paper sheds further light on the way knowledge production in the development and design of AI use for social provision is (and may be) generated.

Co-creating Knowledge in Citizen Science Projects: Partnerships of Scientists and Citizens

Eglė Butkevičienė, Monika Mačiulienė, Bálint Balázs, Eglė Vaidelytė

Kaunas University of Technology, Lithuania

Citizen science encompasses partnerships between professional scientists and members of the public in authentic scientific research (Miller-Rushing et al., 2012; Tiago, 2017). Citizen science leads to possibilities of collective knowledge production and use in multiple areas. It has become prevalent in the fields of astronomy, medicine, meteorology and ecology (Follett & Strezov, 2015; Eitzel et al., 2017). Expected outcomes of CS projects include increased knowledge in the field of study by members of the society (Brossard et al., 2005; Jordan et al., 2011), participatory innovations (Hecker et al., 2018), promotion of positive attitudes towards nature (Evans et al., 2005), boosted science literacy (Crall et al., 2012) and responsive education (Wals et al., 2014; Miczajka et al., 2015; Bonney et al., 2016). Because of such ambitious intentions, citizen science is highlighted on the European Union agenda on science policy making as a mechanism fostering the public engagement into scientific processes, research and innovation and might be considered as a mean for knowledge democratization. This paper aims to explore scientists' attitudes towards public engagement into scientific processes, research and innovation. Based on interview data with scientists from academia, representing different disciplines, and citizen scientists, this paper discusses motivation to engage citizens in co-creation of knowledge as well as challenges making impediments to this process. This research has been funded by Research Council of Lithuania (project "CS4Welfare", Agreement No. S-GEV-20-6).

Investigating European co-creation: Towards a sociology of co-creation instruments

Carlos Cuevas Garcia, Renninger Julia, Pfotenhauer Sebastian

Technical University of Munich, Germany

1487

In recent years, strategies to increase the involvement of diverse societal actors in science and technological innovation has led to the establishment of a growing number of innovation policy and public engagement instruments. These include, for example, living labs, co-creation facilities, hackathons, makerthons and a variety of approaches to public procurement innovation. In this presentation we examine the role, opportunities and limits of "co-creation instruments" in involving society in science and innovation. Drawing on insights from the EU Horizon 2020 funded research project "Scaling up co-creation: Avenues and limits for involving society in science and innovation (SCALINGS)" -- which examined three co-creation instruments implemented in three technological domains (urban energy, robotics, autonomous vehicles) across ten European countries -- we interrogate how relatively standardized co-creation instruments are shaped by their context of application and in turn how they shape the outcomes they produce. We reveal key findings from investigating two exemplary in-depth case studies, and tease out their contributions to the sociological literature, including a methodological reflection on investigating co-creation in Europe.

Co-creation in Transnational Child Action Research

Viorela Ducu Telegdi Csetri, Áron Telegdi-Csetri, Maria Roth

Babes Bolyai University, Romania

In the EC-funded project "Children Left Behind by Labour Migration: Supporting Moldovan and Ukrainian Transnational Families in the EU," (partners: Babes-Bolyai University, Ukrainian and Moldovan research institutions, and Terre des Hommes international - Romanian, Ukrainian and Moldovan branches) we focus on the transfer of know-how in transnational family research concerning children's well-being within an action research-focused setup. Importantly, our perspective is a rights-based and welfare-oriented one addressing the cosmopolitan entitlements of families and their members, specifically, children.

Methodologically, the research is emphatically co-creative - it includes both interviewing as well as effective participation of stakeholders throughout the entirety of the project, from contribution to the research questions themselves, through capacity-building training by researchers to the final application. Moreover, the very selection of stakeholders will include, beside professionals working in the field, transnational family members, among them, children themselves, who will remain co-researchers and co-actors together with the researchers themselves.

Structurally, the project is intended to balance support with participation and knowledge-creation with application, therefore within the same action, beyond recommendation, it will result in grounded actions such as capacity-building training of stakeholders implemented through NGO partners and mass media campaigns aimed at relevant segments of the general population.

Our presentation will emphasize the normative and practical gains of such an approach in view of children's effective enjoyment of rights in the sense of their lived - and cosmopolitan - citizenship.

Young People as Co-researchers of Sustainable Well-being

Nina Heidi Maria Tokola, Irmeli Mustalahti

University of Eastern Finland, Finland

We challenge established thinking by arguing that knowledge co-creation is essential for understanding young people's interests, values and goals concerning sustainable well-being and for including these in decision-making processes. We see knowledge co-creation as two-way processes and as genuine interaction between scientists, young people, inter-action partners of research projects, decision-makers, and the public audience. Co-research allows us to study sustainable well-being with young, Finnish people, aged 15-29 years, Research often entails power hierarchies however, co-research is seen to fix the asymmetry of power relations between young people and researchers. Pyyry (2012, 37) defines co-research as "participation of people under study in the implementation of the research and considering them as capable actors who have knowledge about their own world". We adapt an approach in which co-research with young people is understood as "parallel pathways": the researcher jointly with the young people affirms that the latter have pathways that motivate and give direction to their participation (Lohmeyer, 2019). We share our notion of co-research as a method for more participatory, inclusive, and empowering research and highlight the ethical aspects to increase understanding on what considerations are crucial while planning and conducting co-research with young people. We discuss the possibilities and challenges of the parallel pathways approach based on six co-research processes.

1488

Co-production of recovery

Marte Feiring1, Anne Marit Mengshoel2

1Oslo Metropolitan University, Norway; 2University of Oslo, Norway

The term 'recovery' frequently occurs in medical and in public settings. This includes recovery-as-outcome (evidence), which was first used in mental hospital services, and recovery-as-experience (personal healing process), an understanding constituted as a response to the former by the voices of mental health survivors and ex-patients. Besides, recovery as co-production covers the new public emphasis on partnerships as well as people's accountability for their health. In the sociology of knowledge, the concept 'co-production of knowledge' or co-creation is applied on a new combined approach, analysing the social structure and cultural meanings, integrating theory and practice, macro and micro, and objects and subjects, as well as historical and contemporary studies (Jasanoff, 2004). In our society today, in healthcare systems and research, political documents emphasize evidence-based practice and consumers' or users' expertise. We will unpack these applications of the term 'recovery', analysed as different ways of producing knowledge, first in terms of curing disease and second in the language of a person's process of overcoming or coming to terms with disruptions from illness. Third, we discuss how it is possible to critically integrate recovery-as-outcome and recovery-as-experience in professional health practices into what has been referred to as co-production or co-creation of knowledge.
We argue that evidence-based practices and person-centredness draw on different understandings of the term 'recovery'. Therefore, we call for a critical rethink of recovery in clinical practice, educational curricula, and political documents, which we have called co-production of recovery.

1489

RS18 | The State, Organisations, and Established-Outsider Relations

"How Extreme Right-wing Hate Communication Reflects Established-outsider relations in Post-migrant Societies. A Qualitative Content Analysis of Political Speeches"

Claudia Tutino

University of Münster, Germany

Many societies around the world witness a rightward shift in sociopolitical relations during the last decade. The German political party "Alternative for Germany" (AfD) stepped up as a euro-critical and neoliberal faction in 2012. Politicians of the AfD cultivate a populist political style focused on the everlasting antagonism between "ordinary people" and the "political elite". They see themselves as representatives of the "ordinary people", who were ignored by established political parties over the past years. Their categorization of "common people" was disclosed during the refugee movements caused by the Syrian civil war in 2015. The AfD built an antagonistic image of a German "we" and an immigrant related "the others". In other words: They constructed an established and outsider relation between Germans and Non-Germans. Praise and blame gossip are one of the elementary strategies of established to mark outsiders as "not like us" by devaluation and stigmatization.

German parliamentary protocols are publicly available and provide a well-founded database to investigate political speeches by content. We analyzed parliamentary protocols containing inputs of one of AfD's leading figures, Björn Höcke, in the federal parliament of Thuringia in 2015/16 and 2019/20. The comparison of two periods of time allows insights in processual changings regarding the usage of gossip. We chose a qualitative content analysis to reconstruct explicit patterns of blame and praise gossip which are mainly based on an extreme right-wing ideology of inequality and exclusion. Identifying xenophobia and group-focused enmity in political speeches as extreme right-wing blame gossip is a wider extension of established and outsider relations. Our aim was to extent Elias and Scotson's findings regarding chancing power relation in plural societies.

Extending State Power Through 'Syrian Refugee Entrepreneurship'– The Social Positioning Of Outsiders

John Lever1, Deema Refai2, Radi Haloub1

1University of Huddersfield, United Kingdom; 2University of Leeds, United Kingdom

While immigration policy is still based on national need, the type of immigrant arriving in the Global North is now changing; even when immigration is labelled humanitarian, economic values tend to dominate – hence the growing policy focus on refugee entrepreneurs. In this context, like most subjects of neoliberalism, refugees are expected to fend for themselves as political questions of exclusion and exploitation are replaced by economic concerns linked to the development of entrepreneurial selves. In this paper, drawing on a study of Syrian refugee entrepreneurs in the North of England, we explore the skills and knowledge that refugees arrive with, the challenges they face, and the determination they need to succeed. In a hostile political environment charactered by ongoing attempts to reduce refugee numbers, we conclude that the most Syrian refugees can aspire to, despite the skills and knowledge they possess, is a precarious life as 'outsiders' on the social fringe.

1490

Privatisation As Practice: Understanding Why Left-leaning Councils Choose To Sell Land

Sacha Hilhorst

London School of Economics and Political Science, United Kingdom

Why does the state sell land? Of the major privatisations which have marked the British state since the 1980s, land is arguably the largest. A growing body of scholarship, particularly within the discipline of geography, has drawn parallels with the original enclosure movement and pointed to land privatisation as a key component neoliberal globalisation. Recent accounts such as Brett Christophers' 2018 book The New Enclosure portray land privatisation as an ideologically-driven process, which gained momentum as Margaret Thatcher and her allies took over Whitehall. By contrast, I focus on the post-industrial town of Corby, a Labour-led council which has pioneered a decades-long and on-going land sell-off. Why would a group of people which is ideologically opposed to Thatcherism enact a Thatcherite land privatisation agenda? Building on 23 interviews with civil servants, councillors, community leaders and regeneration workers, I paint an alternative, sociological account of why local councils choose to sell land. This is driven, I argue, neither by ideology nor by inevitable budgetary pressures, but instead by strategic practices of actors within the council. I use a Bourdieusian framework to show how privatisation was a practical response to a series of practical problems faced by a town which had lost its major industry after the closure of its steelworks. In doing so, I build on emerging sociological work on sub-national budgetary regimes and the neoliberal state. I also hope to add to a fuller account of how abstract macro-processes such as neoliberalisation are grounded in the actions of individuals and groups.

Civic Organizations' Impact on the Transformation of Search and Rescue Field in Russia

Andrei Nevskii1, Olga Basheva2

1Soiciological Institute of the Russian Acadeny of Sciences, St.Petersburg, Russia; 2The Institute of Sociology of the Russian Academy of Sciences, Moscow, Russia

Over the last decade the debate on civil society in Russia is marked by criticism of liberal model in which civil society is understood as an opposition to the State. In contrast, it is proposed to regard state-civic relations as social partnership in which civic organizations are seen as a subordinate "junior partner". However, there is ample research which demonstrates that civic organizations' role can't be reduced to mere passive executers that provide social services under the capable guidance of the governmental agencies. Instead, they develop strategies to strengthen their positions in state-civic relations and gain better opportunities for their activity.

The paper deals with Russian voluntary search and rescue organizations that could be seen as a textbook example of a junior partner, pronouncedly non-political and dependent on the state regulation. Based on the series of interviews and the online survey of volunteer search and rescue community in Russia our research aims to give more insight into this sphere of civic life. While sharing the abovementioned view of civic organizations as active participants of the state-civic relations we shift our attention away from the strategies they employ to benefit from the state-civic relations. Instead, the paper is focused on two issues. First, we examine volunteers' own understandings of their role in these relations. Second, we describe the ways volunteer organizations influence the transformation of the field of search and rescue work through their routine practices and discursive work they perform in their daily interaction with the state officials.

1491

Policy Schizophrenia and the Question of Housing in the Bureaucratic Field: From Wobbly Pillar under the Welfare State to Neoliberal Statecraft of Alternate Futures.

Troels Schultz Larsen, Kristian Nagel Delica

Roskilde University, Denmark

Torgersons (1987) famous lecture on housing and the welfare state outlined the tensions and the problematic relationship between the two and the lack of a unified policy field of housing nor stable institutionalization around it. Torgerson argued that this is so due to the particular type of commodity which housing constitute and because housing relates to other types of demands and services than traditional welfare policyfields (Togersen 1987:118). However he never outlined how we should pursue more sustained analysis of the complex relationship between housing and the many different functions of the state nor of how the institutionalization of different housing policy regimes matter? Here we utilize Bourdieu's concept of bureaucratic field and a unique dataset of all central state employees (in the case of Denmark) to analyze how spatial policies and housing, the state and its institutions are intermeshed and how changes over time are the result of struggle within the bureaucratic field. We claim that to comprehend the formation of spatial policies, we need to consider the structure of the specific policy-field and the bureaucratic field, and how this in its own right generates principles of policy making (Wacquant 2005b; Bourdieu 2005; Dubois 2014; Schultz Larsen 2014). Analyzing the policy field of housing within the bureaucratic field from 1993-2019 it becomes possible to explain the current state of policy schizophrenia – where the state is divided upon itself being a primary producer of established-outsiders relations through territorial stigmatization – as a particular form of statecraft aimed at producing alternate futures by removing the pillars under the remnants of the welfare state.

(In-)Formalisation Processes and Discrimination Awareness as task for Organisational Change.

Stefanie Maria Ernst

Westphalian Wilhelms-University Muenster, Germany

Current diversity and anti-discrimination policies are the result of intended and non-intended long-term social movements and changes.This implicates informalisation processes as well as formalisation processes of organisations, in which sexism, racism, homophobia etc. are blamed and fought. In this context, the presented EU-Cooperation-Project SPRYNG intended to prevent discrimination and to empower people; we therefore analysed the cognitive structure as well as the awareness of discrimination in order to empower students as well as teachers and to generate a process of sharpened sensibility. Based on The Established and Outsiders and the process-theoretical debate on diminishing power differences, informality and equality, the paper discusses the results about the socio-dynamics of stigmatisation and discrimination in educational organizations (schools) and society. Connected with macro-sociological aspects, the data (survey and expert interviews) give insights into the perception of discrimination. As part of organisational change processes, these collected data were reported back to students and teachers, who were involved in an anti-discrimination trainee programme. The paper reports about the results, pitfalls and theoretical implications of anti-discrimination politics in the area of education as part of organisational integration politics. Moreover, it aims to theorize the debate on greater integration of outsider groups in organisations and to develop indicators to re-shape organisational cultures.

Established-Outsider Relations and National Habitus in Polish Secondary Schools (gimnazja). Analysis of the School Newspapers (1999-2019).

Emilia Lucja Sieczka

Polish Academy of Sciences, Poland

The paper analyses the school newspapers issued in Polish secondary schools ('gimnazjum'). The analysis will be done from the creation of gimnazjum in 1999 to its recent closure in 2019 from the perspective of established-outsiders' relation. In the project we see the overlap between the post-transformational effort of modernization taken up by the Polish state through the reforms of 1998 and the process of social resistance to those changes that resulted in formation of the established-outsiders relationship between the old, elitist schools and newly founded, egalitarian 'gimnazja'. While the reform succeeded in augmenting the general level of education, it was felt, especially within the elitist conservative circles, that it was done at the expense of the traditional academic culture and community values. Therefore, we investigated the school newspapers from the perspective of how those deprecating notions of new 'gimnazjum' projected on self-image of those institutions as codified in the newspapers that were created by the teachers and students themselves.

The analysis revealed that even in those new institutions that were doing well in levelling up the local inequalities, egalitarian ethos has not been appropriated. Instead, they tried to model their identity on the historical identity typical to the 'established' elitist schools, while at the same time questioning the modernization process and globalization through the pedagogy of national values. Thus, our findings can be discussed in both established-outsiders and civilizational framework of Norbert Elias' theory. In the school newspapers, socialization to the proper national habitus is supposed to ameliorate the standards of morals and behaviour that have supposedly worsen.

Established-Outsider Relations Between Animal Welfare NGOs And The State - A Comparison Of New And Old EU Member States

Adrianna Kapek-Goodridge

Huddersfield University, United Kingdom

This paper argues that relations between the 'outsider' animal welfare NGOs and the 'established' governments are interdependent with the vegetarian/vegan social movements. It draws from two key cases – the United Kingdom and Poland – in order to highlight differences in the established-outsider relations in new and old European Union member states.

As a consequence of a shift from extensive to intensive farming in mid-20th century, British society expressed its concern for farm animal welfare(FAW), and by choosing a vegetarian/vegan diet as well as by lobbying the government for legislative changes, these 'outsiders' have started to develop relations with the 'established' state in the form of NGOs. However, as a consequence of poor relations between NGOs and the state, a unique discourse emerged about improving FAW: NGOs acquired a certain measure of power, one similar to that of top retailers, forcing suppliers and stakeholders for more ethical sourcing and labelling of animal products. Such activity helped NGOs to further influence consumers in their buying choices, and ultimately in gaining more vegetarian/vegan diet enthusiasts. Unlike in the UK, Polish NGOs do not focus on building partnerships and positive relations with the state and retailers, thus they are seen as a threat to the political order. Such differences between these two states stem from their length of membership in the EU, as people's concerns for FAW are significantly lower in Poland than they are in the UK.

These attitudes therefore influence behaviours of NGO groups in their relations with the state, and as such impact the quality of partnerships between them and retailers, resulting in various degrees of intensification of the vegetarian/vegan movements.

1493

Women As Outsiders: A Case Study On Polish Abortion Ban

Matylda Maria Szempruch

Univeristy of Warsaw, Poland

On the 22nd of October 2020 the Polish Constitutional Court ruled that abortion on the embriopatological basis is uncontitutional, baning almost completely legal abortion in Poland. It is a result of a conservative revolution (Grabowska, 2012) which has been happening in Poland since 1989. Through the analysis of the trajectory of reproductive rights in Poland it becomes apparent that the patriarchal society places women in the lesser position. Using the framework of established and outsiders (Elias and Scotson, 1994), as well Norbert Elias's and Cas Wouters' works on gender relations, I will argue that the Constitutional Court's ruling demonstrates the position of women as outsiders in a country governed by the national conservatives. I apply the tools offered by the established and outsiders model to the discursive practices of the established, which I will analyze as components of a civilizing offensive. I will examine the role of blaming inferiority as a powerful tool in the hands of the established and I will look into the women's disobedience to the morality which was imposed on them. Lastly, I will address a few potential issues with that approach, especially the problem of women in power and supportive of the national-conservative government.

Female Physicists: Outsiders In Their Own Field? A Figurational Exploration Of Men And Women In Male Dominated Working Organisations

Valerie Dahl

University of Muenster, Germany

In my talk, I will show that there is a power imbalance between male and female academic employees, especially in male dominated fields. However, the classic Eliasian figuration between Established and Outsiders falls short when an adequate picture of the finer, more differentiated processes of the arrangements between groups of academic employees is needed. Therefore, presenting my own innovative research in the field of "bystander experiences" of men and women in physics (a traditionally male dominated academic organisation), I will point out possibilities of modifying and expanding the renowned "Established and Outsider" figuration.
Combining research on discrimination of women in physics with organisational-sociological research on the perception of discrimination in the workplace and the resulting consequences for employees, my contribution explores the reactions and interventions in situations of discrimination in workplaces of male and female physicists. It becomes evident that the way physicists react and intervene in these situations differs depending on their position in organisational hierarchy and their gender.
The findings regarding the "bystander experience" as well as the expanded figuration between established and outsiders in the workplace add a fresh perspective on existing approaches to research on how supposed outsider groups in organisations can actively shape organisational culture: By actively intervening in situations of workplace discrimination, especially the female employees in lower positions of organisational hierarchy leave their former outsider position and the male dominated, hierarchical structure of academic physics.

Weaponizing the Outsider's Status: Politics of Memory in the Established-Outsiders Dynamic

Marta Bucholc

1494

University of Warsaw, Poland

In their description of the figurational dynamic between the established and the outsiders, Norbert Elias and John L. Scotson addressed the connection between the level of group cohesion and the ability of the group to forge and upkeep a positive We-image by mobilizing adequate symbolic resources to this end. The advantages of the established group such as the sense of "having been there first", comparatively stronger bonds within the group, and self-perceived moral superiority were thus used to compete with the outsiders for positions of power in the community. In my talk, I will focus on the uses of a particular symbolic resource which has not been addressed by Elias and Scotson: the claim to the status of an outsider. The rules of the social power play may be redefined so as to increase the benefits of the outsiders' position and to turn it into an important asset. Drawing on my research on the politics of memory and politics of history in East Central Europe I will offer evidence to the construction of the We-image of a national group as that of the outsiders. I will examine the conditions to weaponizing the outsiders' status in political struggles by tracing the uses of politically sponsored memories of national martyrology, victimhood and isolation in post-socialist East Central Europe.

Mobility Control as Order Producing Practice: State Restructuring in Civil War Greece

Giannis Gkolfinopoulos, Achilleas Fotakis

National and Kapodistrian University of Athens, Greece

The Greek state, after its army was defeated and the government fled the country, lost its territorial unity as it came under the administration of different (German, Italian, Bulgarian) authorities from 1941 through 1944. During the second half of the 1940's state power was rebuilt with the aid of its "allies" -of Britain first and the US after 1947- and through a fierce and prolonged civil war. The proposed paper uses an interdisciplinary, sociological-historical approach in order to trace the rebuilding of the nation-state by focusing on practices of policing, performed by both official and unofficial forces. These consisted of patrolling, checks and blockades in specific urban areas, (night) curfews and the project of issuing identity cards for the whole population. We suggest that the practice of zoning and the imposition of differentiated access to means of mobility should be conceived as a technology of producing the post-war national order, according to which the population was divided between "real Greeks" and (domestic) "aliens" seen to be threatening the very foundation of the nation. Even though it focuses on the past, the paper is consciously informed by the current mobility controls imposed by the police in Greece, as elsewhere, as a response to the spread of Covid-19. Part of the aim of this project is to contribute to a genealogy of order-producing practices, that is of state power over (social) space.

RS18 | The State, Organisations, and Established-Outsider Relations

RS19 | Transformative Rural-Urban Connections

A Life Course Perspective On Suburbanisation

Márton Bagyura

Centre for Social Sciences, Hungary

In the last three decades, suburbanisation has been one of the most significant socio-spatial phenomena in metropolitan areas of Central Eastern Europe. To understand the transformation and development of suburban villages several research projects have examined the causes and motives of people moving from cities to surrounding villages. Their results suggest that there are 'push factors' that push people out of the city (e.g. air pollution, crime) and 'pull factors' that attract people to suburbs (e.g. better living conditions). Although the life course perspective is often used as a framework in research on migration and spatial mobility, in case of migration between urban and suburban areas is rarely used. The study analyses the impact of life course events on the mobility from city to suburbs on the example of Budapest Metropolitan Area. The analysis is based on 40 semi-structured interviews, participants were living in suburban villages in BMA. Data collection took place in two different years, in 2012 and 2019. The research has three important findings: moving from city to the suburban area is often associated with two life events, marriage (intention to start a family) and birth of the first or more children; these life events primarily determine the intention to move, but people often choose to live in the suburbs because the house price is lower than in the city; several residents with rural background use these life events to move back to a rural environment.

Dependent Urbanization: The Growth of the First Ring of Localities Around the Larger Romanian Cities, 2009-2019

Norbert Petrovici

Babes-Bolyai University, Romania

Almost one-third of the larger European Cities experienced loss of population after 2000. Central and Eastern Europe was no exception and, given the political changes, the contraction was exceptionally severe, driven by outmigration and sharp decrease in fertility rates. Romania, with one of the largest diasporas to population, continued the trend. In the last decade 82% of the cities underwent population contraction. However, a new trend appeared in the aftermath of the 2008 economic crisis: the first ring or rural localities around the larger Romanian cities (with more than 12T inhabitants) had, on average, 32% rise in population, while the cities decreased with 2%. Using OLS regression based on official records of population and companies, I distinguish between two types of rural hinterland urbanization: (1) cities with new jobs in the service sector that remained stagnant yet had a surge of population in the hinterlands, an (2) cities with new jobs in manufacturing that lost urban population and had some increase in their rural hinterland. I claim that the new urbanization is highly connected with a particular type of dependent development. After the 2008 financial crisis, global organizations relocated their secondary processes, along their manufacturing processes. In Romania, by 2019, 26.2% of the employees in the private sector were working for a company with full foreign capital, either in the outsourced services sector (ITO and BPO) or manufacturing outsourcing. The urbanization of the rural hinterland is a consequence of this new wave of globalization.

Community-Supported Agriculture In Italian Rurbanities

Irina Aguiari

Scuola Normale Superiore, Italy

Inspired by the Middle Age open fields and rural civic uses, Italian communities in support to agriculture (CSAs) have been redesigning sustainable food production in ruruban spaces. The concept of rurbanity originates from the union of the terms urban and rural. It indicates the reciprocal hybridization of these two dimensions and refers to those areas of agricultural production that develop in predominantly residential contexts.

In between urban and rural, the collective management of cultivated land allows multiple precarities emerging from socio-economic cleavages to meet and organize and to radically transform their own existence. What are the characteristics of CSA in rurbanity? Which cognitive and action repertoires are developed in the local context? How does CSA emerge as an emancipatory and transformative project?

To answer these inquiries, empirical data are co-created with activists through the method of Participatory Learning and Action (PLA). PLA is a combination of techniques and dynamics thereby the participants develop meaningful elaborations for the community itself. Specifically, the research design is composed by collective workshops, mapping and diagramming. This strong qualitative methodology allows to observe how CSA in rurbanity is experimented by local communities to reinvent geographies of spaces and relations in order to resignify their material reality.

Conflictual Path of Defining Rural Areas at the Peripheries of Province of Izmir

Figen Akpinar1, Gamze Saner2, Pelin Onder Erol3, Umit Kuvvetli4, Duran Guler5

1Izmir Institute of Technology, Turkey; 2Ege University; 3Ege University; 4University of Bakircay; 5Ege University

In line with global Western central liberalization, globalization, and capital accumulation, the mode of production has been transformed, processes that decide on the spread of cities in space have changed as a result of technical advances in the fields of deregulation and communication/information in the national economies. With the processes of decentralization, the city is increasingly being brought into rural areas, building pressure is increasing, agricultural production and natural resources are being destroyed, and rural areas are increasingly fitted with urban uses (shopping, tourism, leisure activities, etc). Besides, the economic policies specific to the new period, the change of the administrative borders of the metropolitan areas deeply affect and transform the physical, social and economic structures of rural settlements. Rural areas in the vicinity of the metropolitan areas are therefore strategically important for understanding the changing nature of rural-urban interaction.

The study is therefore focused on the rural areas located at the periphery in the province of Izmir, where the interaction between the urban-rural areas is increasing considerably and the borders between them are redefined by socioeconomic changes and legislation (Law no.6360) that vary on a regional, national and local scale. In the Province of Izmir in the 2000s as a result of changes in the administrative border, we intend to investigate (1) the impact of changes on the rural areas related to administrative and spatial boundary variations, (2) the changing nature of the interaction between urban and rural areas. The discussion tries to find out ways in which coordinated development planning and management of rural areas can underpin sustainable rural livelihood.

Conceptualising Migration and Well-being in Rural Areas in an Era of (Im)mobility

1497

Loukia - Maria Fratsea1, Apostolos G. Papadopoulos2

1Harokopio University, Greece; 2National Centre for Social Research (EKKE) & Harokopio University, Greece

Over the last thirty years Greece was transformed from an emigration to an immigration country. During that time, international migration flows contributed to new socioeconomic realities in the country in rural and urban areas alike. The economic recession from 2008 onwards and related austerity policies affected both the size, the net migration and the labour market incorporation of migrant population in Greece, while in 2015 the economic crisis in the country was paired with the recent migration/ refugee crisis. Drawing from an empirical research in the context of the IMAJINE Project ("Integrative Mechanisms for Addressing Spatial Justice and Territorial Inequalities in Europe IMAJINE" received funding from the EU Horizon 2020 Research and Innovation Programme, under Grant Agreement No. 726950), our paper aims at discussing the changing conditions and challenges posed by the newly arriving populations of migrants and refugees in rural Greece, along with local people's views on the impact of the new arrivals in their rural places. The empirical analysis unveils the connections that are emerging between migrants and refugees and the economy, society and culture in rural

receiving areas. In this context, we reflect on the conceptualisations of rurality and well-being between the various population groups and juxtapose the challenges connected to well-being with the various mobilities between rural and urban areas of Greece.

Perceptions of Social Change and their Impacts on Rural-Urban Mobility Aspirations

Gergely Horzsa

Corvinus University of Budapest, Hungary

Based on a series of fieldwork and an altogether 211-hour length recording of semi-structured interviews, this presentation aims to provide insights on how perceived social change influence mobility aspirations of rural dwellers in Hungary.

A theoretical basis for the research is provided by Hein de Haas' concept of mobility capabilities and aspirations. He formulates the question of why development (in sending areas) might sometimes seem to foster rather than to reduce migration (as development policies, aimed at reducing rural depopulation claim)

In the time period of 2014-2019, fieldworks in altogether 8 Hungarian, non-agglomeration villages were conducted with the aim of providing answers for this specific question. The fields were selected in order to provide a variety considering location (central-peripheral), economic and socio-demographic status. Altogether 163 semi-structured interviews were voice-recorded and transcribed.

The research develops and applies a systematic categorisation of respondents, based on de Haas' theoretical approach, considering migration intentions. As the next step, perceptions on local changes (and development) are analysed in connection with these categories.

Results suggest that voluntary immobility is facilitated by positive changes in local career opportunities (instead of simply jobs), a sense of freedom and independence that the countryside may provide (instead of vivid local cultural life) and strong personal connections (instead of weak community ties). Development programmes, though typically do appear in personal narratives of voluntary immobile people, are less important in the question of staying. The few programmes facilitating personal career opportunities seem more important, but only among business owners and managers.

The Potential Transformation of Rural Territories by Urban Projects of Life

Maria Jesus Rivera

University of the Basque Country, Spain

The arrival of urban population to rural areas to live in is not a new phenomenon in the European context. Processes of counterurbanisation, pro-rural migration, urban-rural migration and so forth have played a key role in the transformation of rural territories during the last century. However, it is not a static phenomenon but a changing one that evolves along with the appearance of new material conditions in the rural territories, ex-urbanites' new expectations of life, and so forth, in a society in a process of permanent change.

This paper aims to present an exploratory work looking at diverse elements that shape the current relationship between rural territories and their new residents by considering whether rural scenarios can be the base for the new residents to settle in a permanent way or they represent just a volatile choice. For this purpose, the paper focuses on the kind of projects of life found behind the 'rural venture' of ex-urban population and their possibility of success or failure in the given rural context. In so doing, the paper discusses the influence of 'urban populations' in the configuration of new rural territories.

I

The Specificity of Rural Gentrification in Central and Eastern Europe

Dominika Zwęglińska-Gałecka

Polish Academy of Science Institute of Rural and Agriculture Development, Poland

Rural gentrification determines changes in the socio-professional structure of the rural population, consisting in increase in the share of various categories of the middle class. The aim of the paper is to present the specifics of the process of rural gentrification in Central and Eastern Europe. It was based on a critical analysis of the literature on the subject. Preliminary analysis allowed for operationalisation, which is reflected in the three main research questions:

-	What is the specificity of Central and Eastern Europe? (the characteristics of the specificity of Central and Eastern Europe, which may affect the specific course of the process of rural gentrification)

-	How does the process of rural gentrification occurring in Central and Eastern Europe progress?

(determining the course of the process itself in this part of Europe)

- Is the process of rural gentrification in Central and Eastern Europe different from that occurring in other countries?(indication of the differences in the course of the process in relation to Western countries).

The analysis shows two trajectories of rural gentrification: seasonal interest in rural areas and related to suburbanization. The author sees the reasons for the uniqueness of the process in the socio-historical specifics of the region: its agrarian character at the beginning of the 20th century, the specific ethnic composition of the middle class in the interwar period, underurbanisation in the period of real socialism and the process of post-communist transformation creating a "capitalist class without capital".

Rural areas in Central and Eastern Europe are in a state of constant transformation, among which there is also rural gentrification, which is noticed by some researchers. However, no comparative studies have been conducted so far.

"Just Ask Eric": On The Importance Of Governance Efficacy, Territorial Ties And Heterogenous Networks For Rural Development

Anja Jørgensen, Mia Arp Fallov, Rikke Skovgaard Nielsen

Aalborg University, Denmark

Territorial capital is more than economy, business and socioeconomic status of residents. It is also the way residents of localities form social networks and how these are intertwined with the local political, institutional and administrative configurations. Sampson (2011) argues that while social networks foster the conditions under which collective efficacy may flourish, they are not sufficient for the exercise of social cohesion and social control. Networks have to be activated to be meaningful. Interaction is embedded in local traditions and social order is produced locally. Analysing interviews from a rural location in Denmark, we examine how referential features of group life (spatial areas, relations, shared pasts) generate action. We develop the concept of 'governance efficacy' to denote the capacity to mobilise collective efficacy in relation to territorial development. We argue that such a concept is an important element in explaining why and how a peripheral location is able to manage social challenges despite population decline.

Urbanization and the Territorialisation of Organizing Cohesion. Results from a Danish Case Study on Territorial Inequality and Social Cohesion

Mia Arp Fallov, Anja Jørgensen

Aalborg University, Denmark

Purpose: There is a growing importance for public facilitation of corporate social responsibility and involvement of civil organisations in securing territorial cohesion and development. In the present paper, we focus on how we are to understand a locally sensitive organisation of territorial cohesion in the Danish context. Traditional sociological concepts and standardized area-types used for administrative purposes have turned out not being very helpful in understanding the interrelation between inequality, urbanization and territorial cohesion. We argue for a processual and relational approach to urbanization.

Methodology: The present article is based on interview material and policy documents from three Danish case studies representing urban, suburban and rural forms of settlement. The case studies is part of a cross-European research project.

Findings: We show how territorial governance play a key role in the strategies of densification/de-densification facilitating shielding capacities of collective efficacy, and reversely that bottom-up innovations are crucial for the ability of territorial governance to mobilize territorial capital and mediate in effects of territorial inequality. Spatial imaginaries legitimize these efforts to organize cohesion. The spatial imaginaries work as common frame of references for the interplay between strategies of (de)densification and collective efficacy, and they activate particular balances between growth agendas and everyday life.

Originality:These findings represent an original perspective on how and why urbanization impact on places in a more specific and variated way than often portrayed as it highlight how social capacities tied to place might work with or against existing social, economic and cultural structures shaping territorial cohesion.

1499

The Rural Gap and the Transformative Rural-Urban Hybridizations. Accessibility and Mobility as Drivers of Socio-territorial Development

Jesús Oliva1, Luís Camarero2

1Public University of Navarra, Spain; 2National Distance Education University, Spain

An inclusive and sustainable society requires tackling socio-territorial imbalances and accessibility. The consequences of failing to address regional disparities are already at the forefront of the conflicts that mark the political agenda in several countries. The decline of rural areas cannot be understood just in terms of economic development, but rather in terms of accessibility. The rural restructuration has meant changes in the productive organisation, by means of a wide diversification of activities and the extension of multifunctionality; however, it also has brought about an increase in daily commuting and rural-urban hybridization. Putting the focus on the rural gap, accessibilities and mobilities seeks a different observation of rural-urban connections as transformative relations. It is their hybridization what makes a difference and a way for rebalance. The consideration of accessibility as a matter of citizenship is the starting point for removing the rural issue from the socioterritorial problems' agenda, as well as for advancing the construction of a socially sustainable Europe. The paper presents the early findings from the project "Focus on rural gap: accessibility, mobilities and social inequalities (RuralAcces)" supported by Spanish Research and Development Plan (PID2019-111201RB-I00/AEI/10.13039/501100011033). The results let us evaluate these issues from the Spanish case. We suggest, as a conclusion, that emerging paradigms of digital, remote and assisted accessibility, as well as forms of shared mobility and on-demand transport systems, must be understood as a crucial transition. Moreover, due to its importance, this accessibility transition should be considered as a public common good and regulated into the rural-urban forms of governance.

Red-hot housing markets in peripheral regions: The case of the German North Sea Islands

Susanne Frank, Annika Guhl

TU Dortmund University of Technology, Germany

In our contribution, we present the German North Sea islands as particularly interesting cases in point when it comes to exploring transformative rural-urban connections.
On the one hand, the islands are officially classified as peripheral rural areas which are characterized by severe development problems such as lack of sustainable economic basis, declining and ageing population and endangered social infrastructures (education, medical care...).
On the other hand, however, they have extremely strained housing markets which are otherwise only known from booming big cities. Holiday and second homes supply and demand have driven rental and purchase prices to astronomical levels, making affordable housing extremely scarce and no longer sufficiently available for locals as well as essential and seasonal workers. These developments, occasionally referred to as "island gentrification", in turn threaten tourism, of all things, which is the sole foundation of the local economy. To counteract these developments, the island mayors have joined forces. However, dealing with these challenges is complicated because of local governance constellations familiar from small and middle town research: volunteer political involvement, strong personal interdependencies, and role conflicts.
In our presentation, we will, based on own empirical research, depict this unique overlap of rural, metropolitan and small-town structures and problems in more detail. We then discuss the strengths and limitations of concepts like "rural" or "tourism gentrification", "retirement" or "amenity migration", and "multilocalisation" in describing and explaining these novel and contradictory urban-rural amalgamations. In doing so, we consequently embed the German case in international scholarly debates on comparable cases.

1500

Creating New Connections Between Urban and Rural Spaces: Practices and Networks in the Italian Small-farming Context

Eleonora Noia

Università Cattolica del Sacro Cuore, Milano, Italy

In recent years, the debate on production and consumption within the Alternative Food Networks (Goodman 2012) has intensified. Literature has highlighted many aspects: the relationships established between producers and consumers and the new contacts that arise between the countryside and the city. The literature on prosumers has shown new meanings produced by consumers, especially when purchasing choices are covered by ethical, political and identity issues. Meanwhile, there has been less talk about cultural production by producers' side, and their contribution in creating new links between urban and rural spaces. The overlapping of production and consumption, in fact, has always characterized the model of management of the peasant economy. However, at nowadays this model seems to change its meaning, considering both the production and the country lifestyle choices related to environmental and cultural issues. In this sense the back-to-the-land phenomenon appears particularly relevant, concerning people withcount an agricultural background, often coming from a urban experience, who choose to live and work in countryside (Wilbour 2014; Dematteis et al. 2014; Nigh and González Cabañas 2015).

The paper therefore questions the ways in which the back-to-the-land phenomenon creates new links between urban space and rural space.

The research uses 17 interviews with farmers from Piemonte, Northern Italy, and 5 interviews with farmers from Basilicata, Southern Italy, participating in the WWOOF Italia network (World Wide Opportunities on Organic Farms, since '70s, internationally promotes organic farming and sustainable lifestyles through the work-hospitality exchange).

Deforestation of a Sweetgum Forest and Ecosocial Crisis under the Capitalist Ruins: The Case of Koycegiz-Dalyan Region in Turkey

Nihan Bozok1, Mehmet Bozok2
1Beykent University, Turkey; 2Maltepe University, Turkey

In this study, we discuss the deforestation of an endemic oriental sweetgum (liquidambar orientalis) forests in Koycegiz-Dalyan region in Turkey. Here we consider the sweetgum forest as a non-human social actor and place it to the heart of the transformation of rural-urban and urban-rural continuum. This transformation process lies at the center of the multilayered changes caused by neoliberal, transnational and conservative transformation in the region. Historically the deforestation had experienced two steps so far.

In the first step, for the plantation of citrus and pomegranate trees as an agricultural commodity, the sweetgum trees were begun to be cut in the first half of the 20th century. Then the region developed further with the entry of commodified agricultural products and mass tourism. With the 1990's, in the now-ongoing second step, the neoliberal transformation begun; the collapse of agriculture started; the peasants impoverished rapidly and proceeded to migrate to the urban areas for paid work. In that process, lifestyle migration to the region developed. Since construction sector is seen as a savior in the current neoliberal economy politics in Turkey, more sweetgum trees were cut day by day for the construction of villas of newcomers.

Based on the findings of two-year extended qualitative fieldwork, following Anna Tsing's feminist perspective (2004; 2015), we argue that, this deforestation causes an ecosocial crisis in the region. This crisis leads to the dissolution of rural relations, the impoverishment of peasants and destruction of forest ecosystem. The destruction of the forest leaves a capitalist ruin where the globalized and the local, the urban and the rural, the transnational corporations and impoverishing peasants clash with each other.

1501

Peasant Resistance And Authoritarianism In Turkey: The Agency Of The Peasant Movement Çiftçi-Sen

José Duarte Ribeiro

Middle East Technical University, Turkey

Since the verge of the 21st century and after 18 years of extractivist neoliberal policies in the Turkish countryside by the governing AKP (Justice and Development Party), the country faces growing de-ruralization and increasing insecurity for small farmers. Considering a new agrarian question, framed not just on the dispossession of peasants and rural poverty but on agroecology and food sovereignty, the flagship struggles of the transnational peasant movement La Vía Campesina, the research focuses on Çiftçiler Sendikası (Farmers' Union) – the first Turkish peasant movement and a member of La Vía Campesina.

The qualitative research methodology has been operationalized with fieldwork in two historical sectors of Turkey, namely grapes and olives, on the rural Aegean towns of Alaşehir and Ayvalık, respectively, where Çifti-Sen is actively involved.

The results and analysis focus on how to position the Turkish peasantry within the global agrarian question and the new peasantry debates. While we interrogate how Çiftçi-Sen represents the peasantry and mobilizes resistance, defining peasant agency, we also devote our attention on who constitutes that agency among the issues of food sovereignty and gender (in)equality. Preliminary findings point out to hardships and failures for continuous and organized peasant mobilization since 2004, when Çiftçi-Sen was officially formed. They are related with the historically weak class consciousness among the peasantry in Turkey, which undermines collective action. But more contemporarily with the pro-poor social assistance that constitutes the populist rural roots of the AKP and with its competitive authoritarianism that denies any form of resistance by repressive coercion.

Educational Pathways and Urban Mobility Expectations of Rural Youth.

Manuel Tomas Gonzalez Fernandez1, Carlos Lubián1, Delia Langa Rosado2, Carmen Botia-Morillas1

1Universidad Pablo de Olavide, Spain; 2Universidad de Jaen, Spain

The communication presents the preliminary results of the research project "Educational pathways, development and rural sustainability", which explores the expectations of rootedness or migration of rural students enrolled in the final years of high school and vocational training in Andalusia, Spain. The work attempts to establish the relationship between the pathway followed and such expectations, addressing the differences in gender and social class. In this sense, the pathways and the strategies of rural-urban mobility planned by students and conditioned by characteristics and social representations of the territory, represent a core element in the analysis.

The investigation is based on a general diagnosis of the different scenarios for rural youth in Andalusia. The research integrates, from a territorial approach, quantitative and qualitative perspectives conducting a survey in a sample of secondary schools and carrying on in-depth interviews with students, teachers and local economic agents involved in the training system. It proposes a reflection on the impact of the educational system, through its different modalities - with special attention to "dual vocational training system"- on the local development processes and, eventually, on the demographic and social sustainability of rural areas. Accordingly, it responds to public concern about the process of rural depopulation of many rural areas of Spain.

Keywords: Rural youth, post-compulsory education, academic expectations and aspirations, urban rural mobility, rural development, Andalusia.

Changing Place Identities in post-Soviet Armenian Rural Communities

Harutyun Vermishyan1,2

1Yerevan State University, Armenia; 2quot;Socies" Expert Centre, Armenia

Reform directed to the development of self-government system in the post-Soviet Armenia, the social programs meaning to overcome the social issues of the Armenian rural communities formed a new situation simultaneously tremendously changing local realities of rurality. The changes resulted in social problems linked to land use, family welfare, migration, place attachment and attraction with urban lifestyles. Place attachment of the rural population and identity issues have become more actual nowadays not only due to external factors, but in the context of rural local processes creating the need for observations of transformative risks and structural influences of subjective and non-formal aspects of the problem being reflexive factors to place planning and management. In this context the main research question is how do the place identities and place attachment features change within the Armenian rural communities? At the background of this research is a working hypothesis that the transformations of economic relations and cultural forms in Armenian villages in the post-Soviet period are shaping new rural lifestyles and dispositions, disrupting the local identity of the villagers and the quality of place attachment. This situation can be diagnosed as a crisis of rurality. As contemporary discourse of crisis of rurality is more demonstrated in the context of refusal to perform agricultural activity, the empirical study is formed of 16 biographical narrative interviews with villagers living in the village but having stopped farming. Based on findings from narrative interviews life stories explicating villagers' experience are subjected to narrative semiotic analysis. The problem here is to show how the current discourse on rurality is conditioned and where its crisis manifests itself.

The Living Environment of Rural Settlements in the Process of Interaction with Large Cities, on the Example of a Study of the Rural Population of Russia 1994-2019

Valentina Shilova
Federal Center of Theoretical and Applied Sociology of the Russian Academy of Sciences, Russian Federation

Based on the analysis of the official statistical data of Rosstat, the secondary mathematical analysis of the data from the Russian Monitoring of the Economic Situation and Health of the Population of the Higher School of Economics (RLMS-HSE) for the period 1994-2019, the author draws a number of conclusions about changes in the living environment of Russian rural settlements.

Because of the background of the growth of large cities this period in Russia is characterized by the problem of depopulation (complete extinction of remote small villages and a decrease in the number of inhabitants of rural settlements of all types).

In 1998, the availability of work for residents in rural areas reaches the lowest level. From 2000 to 2019, there has been a significant reduction in the practice of breeding livestock, poultry, fish and other beasts, as well as the cultivation in your site for sale or exchange by residents of rural areas.

In the period 1994-2019, there is a trend towards an increase in the assessment of their material status by residents of rural areas. Tracing the dynamics from 2000 to 2019, there is also an emerging trend towards an increase in the level of satisfaction from their material wealth. From 1994 to 2019, there has been a steady trend towards an increase in the assessment of their legal status by residents of rural areas.

The study of the peculiarities of the interaction of urban and rural settlements, the processes of migration and return migration in Russia made it possible to identify a number of systemic signs and to record the quantitative and qualitative changes in rural areas.

Changing the »Rural-Urban-Game«. Creativity on the Run in Peripheral Areas?

Thomas Doerfler1, Eberhard Rothfuß1, Claudia Globisch2

1UBT Bayreuth / University of Heidelberg, Germany; 2Institute for Employment research (IAB)

Creativity is an urban phenomenon. At least, when we have a look at the debate in urban / regional studies since Florida (2002) and Landry/Bianchini (1995) launched their insights to establish a new look at cities and their dwellers. What was regarded as deindustrialized ruins of the past turned to laboratories of the future. Cities are now regarded as the motors of modernisation, due to their unusual and experimental life- and work-styles. A new avant-garde is fuelling creativity, innovation and social change and also policies refer to that potential (sometimes rather instrumental). So cities became the ground for nearly all debates about aspects of modernizing societies in crisis (smart cities, post-growth cities, just cities etc.).

What if when we have to change perspectives and find creativity also in rural areas? What if when we can identify certain ‚non-urban' ways to deal with innovation and cooperation? What if when there's a distinct, even more creative style of networking and fostering innovation in peripheral regions? Our contribution wants to shed light on such aspects which we call ‚rural creativity' by giving examples from the former industrialized, highly subsidized and peripheral region of the Fichtel Mountains in Northern Bavaria. Once being home of more than one worldwide reknown producers of table and industrial porcelain (Rosenthal, Hutschenreuther, Winterling and others) the downfall of the iron curtain brought the region a deep depression. But recent initiatives like artists' networks, cultural freelance workers, tourism start ups or online fashion businesses are the agents of change and promise new developments. In our project Fichtel-LAB we do research on this process by investigating the grounds, styles and reasons for these new ‚creative' collaborations.

Care Farms as a Stimulante to Strength Social and Economic Rural-urban Connections

Wioletta Knapik

University of Agriculture in Krakow, Poland

Social farming is a form of farming appreciated in Western Europe, which combines agricultural and social activities. Social farms offer support to those at risk of social exclusion. Part of social farming is care farming, which focuses more on functions related to care for those in need. The primary justification of the care farming concept is the necessity to provide social and care services that would satisfy the expectations of the elderly in light of the growing demand due to population aging.

It is worth underlying the significance of care farming as a very important tool to strength rural-urban connection through the use of human and social capital (rural), and economic capital (urban).

The paper basis on the collected empirical material under the project "Care farms in rural development in the face of demographic challenges" (ID 381773, co-financed by the National Center for Research and Development in Poland). The key stimulant for the establishment of new care farms is the need for new social and care services that would be an alternative solution for daycare centers or nursing homes that are hard to come by and expensive in Poland. The goal of care farming is to promote the patient's independence as long as possible. The need for new services grows with the number of potential patients due to population aging. The benefits of care services for potential service providers include diversification of income, which is particularly valuable for small farms with fragile economies.

Rethinking Rural-urban Relations from Social Innovation Initiatives: the Utopia of Urban Gardens

Elvira Sanz Tolosana, Ion Martinez Lorea, Andoni Iso Tinoco

Public University of Navarra, Spain

In recent years, the classic rural-urban dichotomy has been questioned. Among the many situations that can exemplify this questioning, we are analysing the experience of urban gardens.

Urban gardens represent an activity and a space with a long tradition in our cities. However, we can say that they are currently helping to rethink rural-urban connections. For instance, the growing presence of nature and agricultural lands; new food supply chain systems based on a proximity model.

And likewise, they introduce a fundamental reflection on the modalities for management and use of urban spaces (community dynamics that deepen the logics of social cohesion and are based on an articulation of cooperation between social groups, neighbourhood collectives and local institutions).

In this case, we analyse the experience of urban gardens in Pamplona-Iruña as a kind of concrete utopia, where in 2016 a work dynamic is begun that in part connects with the urban garden tradition that existed in the city and its metropolitan area, but at the same time offers novel elements that must be studied.

This paper presents the preliminary results based on material collected in the context of the research project "Social innovation initiatives in urban governance practices. An analysis of the participatory processes and spaces within the framework of the urban policies of Pamplona-Iruña" that received funding from Public University of Navarra (PJUPNA1920).

Rural Entrepreneurship in Superfoods: Forging Urban-Rural Connections in South Turkey's Avocado-Producing Region

Baran Karsak

Northeastern University, Boston, MA, USA

Drawing on ethnographic research in south Turkey's avocado-producing region, I analyze the making of a market for "superfood" avocados in Turkey through a lens of rural-entrepreneurship. I find that avocados were made into a local tree and fruit during a period of four-decades roughly between 1960s and early 2000s in south Turkey. I identify that key local actors later emerged to build a market by forging connections between urban and rural conceptions of avocados as "superfood". I chronicle key processes for the making of a national avocado market in Turkey, and describe those actors involved in the process as "rural entrepreneurs". I also argue that these rural entrepreneurs were relying on a remarkably inspired incubation period of avocados in the region's peasant communities, which later allowed them to appropriate the labels of "localness" and "traditional use" of avocados, in addition to the globally circulating "nutritionist" rhetoric. I chronicle how, by tying the knot between urban and rural perceptions of the fruit and by adding globally flowing discourses into the picture, these rural entrepreneurs serve as market-makers. While existing accounts on contemporary food trends tend to emphasize urban consumption and cultural practices at the expense of agricultural producers, I argue that for accurately understanding these seemingly urban-elite food trends (such as superfoods), new cultural studies must take agricultural producers on equal footing to urban consumers for contributing to cultural production processes. In this case, it was first the country's peasants, and later its urbanites, developing an interest in superfood avocados
