Intergenerational Social Mobility of 1970–1984-year Generation: A Reproduction of Social and Cultural Capital

Ernesta Platūkytė

Vytautas Magnus University, Lithuania

Presentation is based on the data of qualitative research of the intergenerational social mobility in Lithuanians 1970–1984 generation. Empirical research was conducted out in the framework of the ESF-funded project "Families, Inequality and Demographic Processes". Of the 88 biographical interviews, analyzing intergenerational social mobility were selected 30 narratives. To cover different experiences and capture the existing diversity of social mobility models, narratives have been chosen in which informants represent different socio-economic status, have different education and gender. As social mobility is a complex phenomenon, the analysis was assessed in terms of individuals' position through the interaction of cultural and social capital resources. Empirical research shows that the opportunities of the transition generation for intergenerational social mobility are largely related to the ability to get benefit from the assistance provided by the immediate environment or institutions. They create additional resources for the socio-economic growth of the individual. However, differences are observed between informants with medium / low and high socioeconomic status. Families with high status create opportunities to have the necessary contacts and gain the necessary reinforcement by creating a wide social network. Meanwhile, in families where is poverty, low parental education, dysfunctional relationships between family members, there are additional barriers to family members' educational opportunities and, at the same time, lack of motivation for change. As intergenerational social mobility is an important measure of societal justice, research on intergenerational social mobility in specific generations provides an opportunity to identify significant factors and their limiting influence on the growth of individuals in the structure of society.

Gender Inequality and Social Inequality: The Class Dimension of Division of Housework in Croatia

Augustin Derado[1], Mirko Petrić[1,2,] Inga Tomić-Koludrović[1]

[1]Institute of social sciences Ivo Pilar, Croatia; [2]University of Zadar, Croatia

Gender asymmetry in the division of household labour is one of the most reliable proxies of gender equality. However, it is most often measured quantitatively (at country level), thus falling short of providing rich accounts of practices in localised settings. Likewise, the classed nature of the distribution of household practices is largely ignored in research and presents a particular challenge in the study of social contexts in which clear class self-identification is missing.

This paper attempts to provide an empirically grounded account of the connection between gender inequality and social inequality in contemporary Croatia, a society which has undergone a major transformation of both gender and class relations in the post-socialist period. Drawing on 92 semi-structured interviews (sampled for socio-demographic heterogeneity) and a multi-step qualitative analysis, typologies of strategies in the division of housework were constructed. On the other hand, we utilised Bourdieusian multiple correspondence analysis, as well as a multidimensional model of class analysis for hybrid societies developed by Cvetičanin et al (2021), to quantitatively construct the social space of inequalities in Croatia. In the final step, we projected the empirically established types of household strategies of division of housework into regions of social space, enabling an understanding of their class dimension.

Our mixed methods design is based on Bourdieu's philosophy of research, and data were gathered within the Croatian Science Foundation-funded project "Relational gender identities in Croatia: Modernization and development perspectives" (GENMOD – HRZZ-IP-2016-06-6010).

Keywords: division of housework, gender, class, mixed methods, Croatia

Socio-Economic Differentials In The Effect Of Formal Childcare Availability On The Timing And Level Of Fertility: Spain 1994-2015

Pau Baizan[1,2]

[1]Universitat Pompeu Fabra, Spain; [2]ICREA

This paper assesses the impact of the expansion in formal childcare availability on fertility in Spain during the period 1994-2015 focusing on its differential impact by women's level of education. I use fertility histories derived from the Spanish samples of the European Union Statistics on Income and Living Conditions (EUSILC) for the years 2016, 2012 and 2008, and regional level data on childcare enrolment rate, women's labor force participation and unemployment. The results of the event history analyses show a substantial effect of the availability of childcare on both the timing and the parity progression ratios for first and second births. The impact of childcare is considerably higher for the better educated women.

Gender, Parenthood and Intra-household Inequality in Europe

Alba Lanau Sanchez

Centre d'Estudis Demogràfics, Spain

Co-residence with extended family is increasingly recognised as a strategy used both by single parent and couple families to cope with poverty and income losses. Households have been shown to prioritise children's needs, but the consequences of such prioritisation for other household members are little understood. Yet, intra-household resource allocation has consequences for both gender and generational inequality. This article explores the following questions: How common is the prioritisation of children's needs in couple and extended households? Who goes without when households prioritise children? and, to what extent do gender, age and labour market participation affect the probability of deprivation in couple and extended households? Using individual material deprivation data from 37,917 households in 22 countries in the 2014 European Union Survey on Income and Living Conditions, the paper provides new evidence intra-household inequality in households with children. Parents are substantially more likely to sacrifice their needs for children compared to

other household members. Mothers are more likely to be deprived compared to fathers, particularly in extended households. Unemployment, part-time work and being a homemaker are associated with higher odds of individual deprivation and going without to cover children's needs. Households allocate resources according to varying rules that consider age, gender, as well as the labour market position of household members. The paper furthers the evidence with regards to the usefulness of deprivation data to better understand intra-household inequality between and within generations.
Keywords: deprivation, generations, inequality, parenthood, gender

Who Gives Birth (First)? Lesbian Mother's Birth Mother Choice In The Netherlands.

Allison Geerts, Marie Evertsson

Stockholm University/Swedish Institute for Social Research, Sweden

The emergence of "new" family forms, such as lesbian parent families, and increased family diversity have contributed to a rise in research interest into the reproductive trajectories of these families. Within lesbian parent families, one choice in this process that has received relatively little research attention is how they decide which partner carries the child. In this paper, we examine what birth motherhood means to women in lesbian relationships and how they chose which partner would carry the child, through semi-structured interviews with 42 mothers-to-be in 21 couples in the Netherlands. Our dyadic perspective allows us to pay attention to the workings of power (resources) in the reproductive decision-making of lesbian couples.
Our analysis shows that informants ascribed multiple, and ambivalent, meanings to birth motherhood, including reflections on the embodied experience of pregnancy, the social recognition of birth motherhood, and the value of the bio-genetic tie. For most couples, deciding who would carry the child was not a difficult decision, even when their interests were contradictory. When both partners wanted to carry, the decision was often made based on age, with the younger partner letting the older "go first" and planning for two children or more. Closer examination revealed how the age-argument subsumed different gendered temporalities. Still, the promise of future "turn taking" for subsequent

births enabled partners to defuse potential conflict. The narratives show evidence of larger cultural discourse on what it means to be a woman, the centrality of reproductive motherhood and kinship, and gendered time.

Creatively Becoming a Family in the Fertility Clinic? Matching Donors with Non-heterosexual and Single Recipients in Commercial Care

Riikka Homanen

Tampere University, Finland

New and transgressive third-reproductive-party technologies, including donor tissue treatments, bring about new ways and choices not just of perceiving family and kinship, but also of becoming related. Regulations concerning ART, treatment practices, public (e)valuations and cultural normativities, however, set limits to those choices and freedoms. This presentation is an experiment in thinking through the room and potential left for creativity in fertility care practices of matching gamete donors with recipient intended parents to enable kinship and families. Drawing from ethnographic research from four commercial fertility clinics in Finland during 2015–2020 I explore two groups of donor gamete recipients who are often excluded from fertility treatment practice: single women and lesbian couples. Non-heterosexuality and singlehood open up spaces for creativity in family-building, because homosexual and single people sometimes come under less pressure than their heterosexual or coupled peers to conform to certain family norms. These norms are particularly concerned with a requirement to reproduce plausibility of genetic relatedness in matching. In this way, clinics allow these women the potential to defy heterosexual intercourse as the baseline of reproduction and kinship, and to problematize and challenge perceptions portrayed as 'facts of life'.

Similar Imaginaries, Different Plans: Lesbian Mothers-To-Be Imagine Parenthood and Parental Leave

Madeleine Eriksson

Stockholm university, Sweden

In Sweden, lesbian couples tend to divide parental leave more equally than their heterosexual counterparts and the income gap that arises at childbirth – in all couples – closes over time in lesbian couples. The literature suggests we explore how couples envision and plan for parental leave to understand its motives and how things unfold, possibly altering plans. This is the first study to do so among lesbian couples in Sweden. Based on in-depth interviews with 40 lesbian mothers-to-be (20 couples), findings show that the most common plan is to take a substantial amount of joint leave in the beginning, and thereafter divide the leave more or less equally. This is a new way of organizing parental leave. Parents in Sweden typically split the leave in two distinct halves by having the birth mother go first and for a longer period than her partner due to breastfeeding. Breastfeeding was not neglected by the interviewees, on the contrary, all couples intended to breastfeed. However, unlike heterosexual couples, where shared parental leave often revolves around what is best for the child, the lesbian couples emphasized in-couple benefits from planning to share the initial care. The lesbian couples recognized this period of parenthood as a time of burdens and bondings important for both to be responsible of. Rather than arguing for equality from the perspective of the child's interests, equality was relational and involved the partners. These couples show how strong norms about how to divide parental leave and initial care-taking can be reimagined. Keywords: lesbian couples, parental leave, equality, work-family balance, division of work

Early Labor Market Outcomes of Children in Same-Sex Families: Evidence from Population Data.

Silvia Palmaccio[1], Deni Mazrekaj[2,1], Kristof De Witte[1,3]

[1]KU Leuven, Belgium; [2]University of Oxford, UK; [3]Maastricht University, Netherlands

This paper provides first evidence on a large representative sample of early labor market outcomes of children who lived in a same-sex family during childhood. We exploit a unique administrative dataset from the Netherlands, where we observe year by year the address where every child (and parent) lives since birth. By matching household member identifiers with demographics, we are able to distinguish whether the child has lived in a same-sex or a different-sex family while growing. We focus on the population of children born between 1995 and 1999, who are old enough to first approach the labor market. Relative to this population, we estimate a pooled linear regression model on gross wage, hourly wage and employment . We find no significant differences in labor market performances between children in same-sex families and children in different-sex families, both for the sample of part-time and full-time workers. Our results suggest that children who lived in a same-sex family during childhood are likely to perform just as well as children who grew up in a different-sex family, when entering the labor market. From a theoretical point of view, our findings support the evidence that children in same-sex families 1) are equally encouraged to participate to the labor market by the balanced division of paid and unpaid labor among same-sex parents; 2) are equally motivated and productive as a result of the libertarian background in which they grow that stimulates them to choose their future occupation according to their preferences.
Keywords: same-sex parents; administrative longitudinal dataset; labor market outcomes; coarsened exact matching

Getting Behind the Wheel: A Closing of the Gender Gap Without a Bargain

Ivaylo D. Petev, Hadrien Le Mer

CREST, CNRS, Institut Polytechnique de Paris, France

The post-1970s period is associated with a reconfiguration of household gender roles. To evaluate its extent we analyze historical data on how heterosexual couples negotiate the access and use of automobiles. We address two basic questions. First, how do women negotiate their access to a household's car as principal driver? Second, if successful, does female driving lead to an extension or a decline in the gendered division of domestic labor? We use four waves of data (1973, 1981, 1993 and 2008) from a nationally representative survey of transportation practices of French households. Results show an increase in the access of women to the household's vehicles. Higher levels of education and employment status act as resources for negotiation. But the "bargain" is predicated on the presence of young children, on driving a smaller car and on taking on a higher share of domestic labor.

Greater Participation Of Women In The Domestic Economy? The Effect Of Money Management On Egalitarian Values

Olga Jimenez Rodriguez, Felix Requena Santos

University of Malaga, Spain

This study explains the type of values of couples, according to the way of organizing the domestic economy. Money management practices among couples from 27 countries were studied to understand how they reflect more or less egalitarian values. The welfare system was used as a classification criterion, to account for the distinct socio-political contexts in which couple relationships are formed. The data is sourced from the 2012 Survey on Family and Changing Gender Roles of the International Social Survey Programme. The analytical strategy used has been binary logistic regression. The results obtained demonstrate that participation of the woman in the household economy and financial decision-making indicates higher levels of egalitarian values in the couple. Couples who distinguish between a common fund and individual funds demonstrate more egalitarian values than those who put all their money in a common fund. Besides, symmetry in the couple in terms of the income level of each partner increased the probability of having more egalitarian values. Less equality was found among couples who resided in countries with a Latin American welfare system. This study shows some of the elements necessary for greater gender equality in couples.

Couples Where Woman Have A Higher Income Than Man And Management Household

572

Nadia Khamis Gutiérrez, Luis Ayuso Sánchez

University of Malaga, Spain

This research focuses on analyzing some topics of couples' life. Advanced societies are characterized by a greater incorporation of women into the labor market, with women having increasingly higher levels of education and occupying more prominent positions. This trend has resulted in growing number of households in which women earn more than their partners. This study analyzes the presence of these women in countries with different welfare models, examining their most relevant characteristics and the impact on the family and on household management. To fulfill these objectives, we used the latest wave of the International Social Survey Programme (ISSP) Family and Changing Gender Roles IV (2012). The characteristics studied were grouped into four dimensions: country of residence, socio-demographic characteristics, egalitarian values, and the management of intimacy. Our results indicate that female primary breadwinners tend to be older and more educated than their partners, less religious and more likely not to have children; they have more egalitarian values and a greater tendency to manage money separately. These results help to understand better some behaviors of families, which is interesting for the public and private sphere.

What Determines Reasons of Financial Disagreements in Russian Couples? Relational Sociology Approach

Polina Zhidkova

National Research University Higher School of Economics, Russia

For now, studies about financial disagreements are very broad and general, considering the issue without deepening into the questions of the reasons and the structure of the conflicts. Also, the topic of financial conflicts in families is completely understudied in the Russian context. Russian case is significative for countries with conservative and slow types of family institute development and change. Thus, despite having an unusual type of power, money, and labor distribution within the marriage (with the prevalence of woman's whole wage systems and mass women's representation in the labor market), Russian couples remain very patriarchal in family values and financial decision-making. This research focuses on this gap to provide an understanding of the determinants that lead to the different types of financial disagreements in Russian families. With the framework of relational sociology, which places the partners' values into consideration, 5 types of financial disagreements are empirically studied: values conflict, price conflict, necessity conflict, goals conflict, and salary conflict. The analysis is built on the 2018 wave of Survey of Consumer finance that presents dyadic data for 3503 Russian couples, the regression models were calculated for men and women separately to identify gender effects. Only different attitudes of partners towards money provoke all the considered reasons for financial disagreements. The share of woman's income increases the likelihood of price conflict, goals conflict may be forced by partners' traditionalist attitudes, salary conflict depends on the dissatisfaction with the decision-making process. Thus, the research shows the significance of considering partners' values when analyzing financial situations within the family.

How Race Matters to Black Women's Agency? An Analysis of the Path to Corporate Leadership in Brazil

Dahra Maciel Quintella, Cibele Priscila Dametto

University of Barcelona, Spain

Social discrimination against black women in Brazil is a reality that has been anchored in the country's socio-cultural formation. This reality is reflected in many aspects of society. The social impact of sexism and racism is more substantial for those women, affecting the access to fundamental rights, such as education and equal remuneration, compared to white women and men. This research intends to study how discrimination affects black women's agency freedom in their career paths toward leadership in the Brazilian private sector. Thereunto, we have combined the methodologies of literature review connecting agency, race, and gender; analysis of data about race inequalities in Brazil; and qualitative interviews with fifteen women, some starting their careers and others already in leadership positions. With this data, we seek to understand how the agency concept applies to black women's reality in Brazil and how discrimination affects their agency freedom, work experience, and career achievements. Through phenomenology, it was possible to capture the various challenges perceived by these women as discrimination and how they faced them over the life-course. The results of this work will focus on the aspects that helped these women overcome the unfavorable objective agency and maintain their subjective agency throughout this process. As preliminary results, it is possible to mention self-efficacy, black consciousness, and generational impact. It is recognized that the stereotypes connected with the group identities also varies according to the context, so this research contributes to a better understanding of agency for black women in Brazil.

Self-Responsibility and Responsibility for the Others: Pious Muslim Entrepreneur Women in Turkey

Eylem Mercimek Göğüş[1], Ece Esmer[2]

[1]Kadir Has University, Turkey; [2]Boğaziçi University, Turkey.

This paper examines women entrepreneurship in Turkey with an intersectional approach by focusing on business owner women's multiple positioning processes in the discourses of entrepreneurial subject and pious Muslim woman. As heavily discussed in the literature, the market logic of neoliberalism has diffused into individual forms of governance and has created an entrepreneurial woman subject who takes risks in business and social life, calculates self-interest and prioritizes self-development and self-responsibility. Leadership workshops, popular autobiographical books, and social media posts spread various discourses on strategies and ways for living as a successful and empowered entrepreneur woman. On the other hand, pious Muslim women are subjects of religious discourses that regulate their everyday life, that lay a burden on them to be representative of Muslim community and that give special responsibility to them for maintaining the family and its ties. Thus, for the pious entrepreneur women, the responsibility for the self and for the religious community and family become two sides of the same coin. Pious Muslim entrepreneur women tend to participate in labour market in Turkey due to their increased economic capital and involvement in pro-government business networks with the support of market-oriented and neo-conservative policies of Justice and Development Party. We argue that pious Muslim women entrepreneurs in current Turkey take positions with various tactics in the field of these discourses on ideal entrepreneurship and Muslim womanhood, thus constantly reconstruct their own subjectivities. Therefore, this study intends to focus on these women's positions that become visible through their work-family balance practices, self-representation tactics in social relations, and the social and economic risk management skills they have in their lives.

574

Women on Boards: An Analysis of the Intra-board Dynamics of Companies Bound by the Gender Quota Law in Portugal

Sara Falcão Casaca[1], Maria João Guedes[2], Susana Ramalho Marques[3], Nuno Paço[4]

[1]University of Lisbon, Lisbon School of Economics & Management; [2]University of Lisbon, Lisbon School of Economics & Management; [3]SOCIUS - Research Centre in Economic and Organizational Sociology; [4]SOCIUS - Research Centre in Economic and Organizational Sociology

Affirmative action programmes, although usually surrounded by great controversy, represent essential fast-tracking and temporary measures that can help mitigate historical disadvantages. One of the fields where these types of measures usually come into play relates to women's attainment of leadership positions and their participation in decision-making. In order to neutralise the systemic gender-based constraints sustaining the corporate board glass ceiling, a group of EU countries have already implemented legislative quotas designed to attain a greater gender balance in management bodies. Portugal was among the European Union latecomers in passing legislation to promote a balanced representation between women and men on corporate boards, in 2017, introducing gender quotas in the management and supervisory bodies of public sector (state-owned and local government) companies and listed (Euronext Lisbon) companies.

This paper explores whether the entry into force of the gender quota law had an impact on the intra-board dynamics of the companies bound by the law. Data were collected from a survey and semi-structured interviews undertaken with men and women serving on the management and supervisory bodies of targeted companies, in order to gain insights into the intra-board dynamics. The paper is based upon the empirical work that has been developed under the scope of the project Women on Corporate Boards: an integrative approach (2018-2021), funded by the Portuguese Foundation for Science and Technology (FCT) and by the Ministry of Science, Technology and Higher Education (MCTES) through national funding (PIDDAC).

RN14_T02 | Gender Family and the Labour Market

Caring Men At Work: Work Adaptations Of Male Caregivers In Six European Countries

Irina Fernandez-Lozano, Cristina Castellanos-Serrano, Teresa Jurado-Guerrero, Juan Ignacio Martínez-Pastor

UNED, Spain

Men are increasingly challenging the assumption that care is a feminine task and are getting involved in childcare and in the care of dependent adults. However, this does not necessarily have a reflection on their work, as they very rarely adopt flexible work arrangements. In this study we propose a definition of male caregiver as a working man who has made any work adaptation in order to meet care needs (excluding any decision to increase income). After a general overview of the EU´s member states, we analyse deeper the prevalence of male caregivers among men living with children below age 15 in six European countries (Spain, France, Austria, Norway, United Kingdom and Poland) which are representative of different care, gender and welfare regimes, using recent representative data (the European Labour Survey and its 2018 ad hoc module on work-life balance). Much of the research on flexibility for men has focused on how middle class men (mostly in the US) experience work-life balance and care, thus adopting a qualitative perspective. In contrast, our research offers cross-national evidence at the EU level of how many these men are, what kind of adaptations they do and which factors foster them to challenge the male breadwinner role. It is proposed that their becoming male caregivers ultimately depends on three sets of factors need, external incentives and gender ideology, which can operate at the micro (household), meso (organization) and the macro (national context) levels.

575

Development of the Partner Pay Gap Within Couples, Over Time

Antje Mertens[1], Martina Dieckhoff[2], Vanessa Gash[3], Laura Romeu-Gordo[4]

[1]Berlin School of Economics and Law, Germany; [2]University of Flensburg; [3]City University London; [4]German Centre of Gerontology

This paper studies the income dynamics within couples and investigates how the partner pay gap has developed over the past two decades in different regions of Germany. Moreover, we study separately the income growth of men and women within partnerships to gain a deeper understanding of the ongoing dynamics. We look at cohabiting couples, which we follow over the duration of the partnership starting the moment they move in together. Using growth curve modelling, we first describe the development of the partner pay gap, defined here as the difference in monthly labour income between partners, excluding outliers at the top and bottom of the distribution but retaining those with zero labour income. Our growth curve model shows how the partner pay gap increases strongly with relationship duration in Western Germany, while it remains relatively flat in Eastern Germany. Children, as expected, have a strong influence on the development of the partner pay gap, with wage differences increasing more strongly over time for couples with children than those without. For couples in Eastern Germany without children, the monthly earnings difference even decreases slightly over time. To understand which factors are driving the labour income difference dynamics between men and women, we then go on to estimate wage growth fixed effects regressions separately for men and women. In our fixed effects regression - that control for selectivity into employment - we regress the difference in log monthly labour earnings on time-variable sociodemographic and job characteristics, controlling for the relationship duration using a set of dummy variables. These dummy variables pick up the 'unexplained' dynamics that are going on over time.

Family as a Gender-dysfunctional Insitution

Ana Maria Lopez-Narbona

University of Malaga, Spain

Family has been a functional institution for men and children but dysfunctional for women. The family institution is changing (new division of gender roles, decline of the male breadwinner family model, and new parenting styles) but not disappearing. Although the family institution has evolved to become a contemporary institution in many ways, some hindrances still persist for gender equality. Hetero patriarchy in Western countries is smoothing but it is very resistant to disappear. Is this resistance due to the gender dysfunctionalities of the family institution? This paper analyses the impact of the family institution on the professional/occupational projection of women. Principal component analysis and regressions will be used to examine the World Values Survey database (6th and 7th Waves). Western countries representative samples will be analyzed in order to understand whether family is the last gender-dysfunctional institution in society.

The Politics of the Heart and the Head: Developing Intersectional Solidarity Amongst Mothers from Female Headed Households

Susan Eileen Cohen[1], Tove Samzelius[2]

[1]University of Bristol, United Kingdom; [2]University of Malmo

The Covid 19 pandemic has highlighted pre-existing intersectional inequalities endemic in female-headed households. These inequalities increasingly exacerbated by deteriorating labour conditions, precarious housing and the ever-unfolding strictures of the welfare state, are further limiting the life chances of one parent/BAME families on low income. How do mothers experiencing these conditions develop a collective consciousness of their common and diverse oppressions and find voice? How can they organise together against the causes of inequality and discrimination, in a political environment that nurtures politics of division and populism?
This paper considers how motherhood and motherwork can empower the politics of the heart and inform the

politics of the head; how agency develops when personal injustices are shared with others and given common cause; the potential for change when knowledge and passion experienced by mothers from diverse cultures and backgrounds are channeled into collective leadership. We take the Single Parent Action Network (SPAN) UK as our case study, informed by our long history of working together in this multi-ethnic organization that from 1990 – 2015 developed a form of "rooted cosmopolitanism" which led members to take collective action against poverty, racism and gender discrimination at local, national and EU levels. Referencing our involvement in participatory/co-produced research with women since that time we consider the opportunities and challenges faced in organizing in the present day given the disembodied trappings of social media and the state's enforcement of individualization and time poverty on female-headed households.

RN14_T03 | Immigration, the state and labor relations

Care Workers Without Papers in Pandemic Times: Notes on the Socio- Institutional Responses to the Essentiality-irregularity Dilemma

Sònia Parella Rubio[1], Clara Piqueras Cerdà[1], Thales Speroni[1], Romina Tavernelli[1], Paula Contreras[1], Alisa Petroff[2], María Fernanda Barrera Rodríguez[1]

[1]Universitat Autònoma de Barcelona (UAB); [2]Universitat Oberta de Catalunya (UOC)

For decades, researchers have emphasized the importance of migrant care work to sustain and reproduce European welfare regimes. Simultaneously, some analyses on the social production of migrant "illegality" have shown that migrant workers must face significant obstacles in Europe. The current socio-sanitary crisis requires that this dilemma be addressed in migratory studies and at different public administration levels. In this sense, this paper analyses a public policy developed by Catalonia's government to discuss the forms and obstacles to socio-institutional responses to the essentiality-irregularity dilemma in Europe.

In June 2020, Catalonia's government opened a call for subsidies for the employment of migrant people in the field of care work. The policy consists of economic aid to employers (families) to covers the costs of Social Security contributions corresponding to 12 months. The policy aimed to regularize the care workers' residence status and to formalize labor relations. Therefore, this institutional initiative involved the (inter)action of a sub-national public administration level, the employing families, and migrant workers. For this reason, the evaluation of this policy and its comparison with other similar international proposals is a fruitful way to reflect on the essentiality-irregularity dilemma in Europe.

This paper is organized into three parts. First, we analyze the design and implementation of Catalonian policy and interpret interviews conducted with representatives of third sector organizations. After, we develop a brief comparison of this policy with similar ones to recognize how the differences and similarities may explain the positive and negative outcomes identified. Finally, we discuss the limitations of this type of policy and, to conclude, we reflect on other types of institutional initiatives needed to face the essentiality-irregularity dilemma in Europe.

Perception of Agency in the Biographies of Precarious Migrant Workers

Lenka Formankova

Institute of Sociology, Czech Academy of Sciences, Czech Republic

The agency of precarious workers, particularly migrants, had been attracting more attention in the past years. Yet, the attention focused mostly on workers' ability to change their structural condition and negotiate their position on the labor market or labor conscious. Existing research points out how the agency is often reduced to minor acts of resistance, in which the power structures are more often normalized than challenged and recalibrated (Paretand and Gleeson, 2016; Standing, 2014).

Our article develops a unique perspective, which emphasizes precarious workers' perception and experience of the agency. We show how the perception of agency is embedded in a worker's life experience (Hitlin, Elder 2007, Emirbaye, Goodwin, Mische 1999). We often analyze the precarious situations of a worker in time perspective; we show how important it is to include

temporal dimension into the analysis - if our aim is to understand workers' perception and reflection.

Using data from biographic-narrative interviews (Erel, 2007, Plummer, 2001) with Ukrainian female migrant workers in the Czech Republic, such an approach allowed us to show the multiplicity of layers of reasoning which can make precarious work not only acceptable but can also provide those working these positions with a sense of agency and control within the set and restricting conditioning.

Focusing on female migrants with children also allows us to further explore the simultaneous exploitation and empowerment experience (Tyldum 2015, Fedyuk, Kindler 2016, Rydzik, Anitha 2020) and better understand why actors perceive decisions that are reproducing a precarious status or (gendered) role as transformative. Emphasizing the importance of experience can also contribute to understanding the impact of long-term experience with precarity.

What Is Going On When Migrant Women Integrate Into The Labour Market? Autonomy, Dependency Or Gender And The Couples' Division Of Housework.

Tanja Fendel[1], Yuliya Kosyakova[1,2,3]

[1]Institute for Employment Research, Germany; [2]University of Mannheim; [3]University of Bamberg

The division of housework time among migrant couples is far from even and gender differences are higher than among native-born couples. Using data from the German Socio Economic Panel for the years 1995-2018 and fixed effects estimations, this study examined the impact of the migrant women's labour market integration on her and her partners' housework time. Theoretically, the analysis considered the relative resources, the gender deviance, and the autonomy perspective. A comparison to native-born women gave insight concerning the impact of housework on the migrant wife's integration process. Results showed that among Western migrant and native-born women, the relative compared to the absolute income has more impact on the wife's housework time, meaning that a bargaining process is taking place in these couples, contradicting the gender device perspective. The labour market entrance has a negative effect on the Western migrant and native-born women's housework time, but only among natives, the

women's labour market entrance has a positive effect on her husband's housework time. Furthermore, non-Western migrant women hardly adjust their housework hours to the absolute or relative income or the labour market entrance. The adjustments of their partners are even higher than the own adjustment. Policy measures that support the social integration in terms of more contact of persons outside the women's households are highly relevant. Thereby they may get in touch with couples who respond to their earning and employment situation not only with a more even division of housework time, but also with a higher outsourcing rate of tasks.

Learning to Work at the "Italian Way". Ethnography of a Work Training Course for Migrant Women

Noemi Martorano

University of Padua, Italy

578

The paper aims to interrogate, with a critical and intersectional approach (Crenshaw 1991), the relationship between the "integration" of migrant women (Farris 2017 ; Gargiulo 2018), workfare policies (Handler 2003 ; Lewis 2002 Krinsky & Simonet 2012) and social reproduction (Kofman & Raghuram 2015 ; Anderson 2001). It is based on an ethnographic research of an online training and work orientation course addressed to a group of migrant women in Italy carried out in the pandemic context. The contribution analyses how institutional actors, by reformulating and reproducing religious, cultural, sexual, racialized and gender relations, produce normative values and behaviours and guide the choices and work trajectories of the populations they address. While the training course promotes empowerment, emancipation and the sharing of experiences and instruments, it is also a place with a strong moral and normative dimension. The paper highlights the normativity reproduced within the trainings not only from a cultural point of view, but also in the material definition of the relationship that the participants maintain with the labour market, strongly conditioned by the Covid-19 pandemic.

RN14_T04 | The state and the Politics of Budgeting

Marginalizing The Budgeting Of Care Services During The COVID-19 Crisis

Orly Benjamin

Bar Ilan University, Israel

Healthcare, welfare and education system posit a challenge for intersectionality researchers who focus on fragmented employment arrangements. All social workers, both those employed by the public sector and those employed by NGOs, were sent home, on unpaid leave, on the first day of the COVID-19 lockdown. They were all deemed 'non-essential workers'. The emergency situation created by the COVID-19 pandemic was defined as a matter for military and scientific experts, excluding contributions from the care perspective. How was the temporary halting of a range of caring services constituted as rational? Following earlier analyses of the disproportionally high cost paid by women for the policies applied to deal with the COVID-19 crisis, I examine how care changed its meaning in statements made by Israel's Ministry of Welfare, the Central Bank of Israel, and the Ministry of Finance between March 2020 and April 2020. These decisions created an opportunity to consider the position of care and caring services in relation to other funding issues. In examining the logic of budget cuts to this sector at a time of urgent need, I found that the rationality of ignoring care was constituted by a combination between two silencing mechanism and the appropriating of the concept of 'categories in need'. Such a rhetorical combination made it possible to detach government assistance from any feminist content related to responsive care and its manifestations in formal and informal care. The exclusion of care, performed by silencing mechanism that marginalize care, facilitated the marginalization of budgeting the costs of required salaries at the healthcare, education and welfare system by allowing banking services to override all other needs.

Labour Market Policy In Post-Crisis Scenarios: Women's Mobilization And Party Preferences

Lorenzo Cattani, Roberto Rizza

University of Bologna, Italy

In recent decades there has been a growing interest in combining studies on welfare regimes and political and electoral competition. Some scholars (Rueda 2007; Beramendi et al. 2016; Lindvall and Rueda 2014) theorize an insider-outsider divide that fuels dualisation in social protection. More specifically, according to this stream of literature, social-democratic parties tend to invest mostly in passive labour market policies targeted at insiders, such as short-time work schemes (Beramendi et al., 2016; Rueda, 2007).

We contend, however, that this analysis does not consider that collective agency may influence party politics. This is important since women are the largest and most politically organized group of outsiders, with important ties to social-democratic parties. Furthermore, female employment increased significantly among sociocultural professionals and low-skilled service workers (Oesch, 2016), that may prove strategic in forming "new welfare state coalitions" in support of social democratic parties, and more oriented towards active labour market policies (Gingrich and Häusermann, 2015; Hausermann and Kriesi, 2016).

This paper tries to highlight how women's mobilisation may influence the labour market policy mix. Through a historical reconstruction of women's mobilization and a content analysis of party manifestos, we show how collective agency may influence decision-makers to undertake reform paths that differ from the "insider-outsider" model expectations.

The countries analysed will be Italy and Spain. The paper entails two elements of originality: it sheds light on the relationship between gender and labour market policies and highlights divergent trajectories between countries traditionally considered as part of the same labour market policy regime.

We Are at War. How the Coronavirus Spread Within the Gender Based Violence Society. Italy and the international scenario

Fatima Farina

University of Urbino Carlo Bo, ITALY, Italy

This paper analyses the war metaphor's immediate and pervasive diffusion during the Covid19 pandemic in Italy and an international comparative key. Italy was the first country to be affected after China, the first to experiment with restrictive measures for the management of the health emergency, which were immediately accompanied by the proposal of war as an interpretative lens of the health state (consequently social, economic and political), through the protagonists of the public scene, becoming the horizon of political action.

The war in its inevitability and a-historicity, from the first moment available, has produced a restriction of public space and a re-proposition of the re-naturalisation of gendered roles (between male warfare and female welfare). The 'men of the nation' dominating the public scene have developed emergency measures that have effectively reduced social participation by gender, as well as an invisibilisation of the female presence. This produced significant effects on political representation, economic and labour participation, as well as on the management measures before and recovery ones now. The gap between myth (representation) and reality (consequences) is analysed here in an interpretative key of excess control over care between frontline and domestic invisibility. The analysis of the public discourse is focused on the identified four "myths of war": We are at war (there is no alternative), The market does not stop (economic primacy, consequences and contradictions of fact), The heroes (heroes and victims), The safe home place, The myth of post-war reconstruction (post-pandemic management). The relationship between the "weapons of control" used (in the public discourse) and its consequences (data, intervention measures) offers an opportunity to analyse the processes, taking place between exception and paradigm shift.

A Struggle Over The Moral Center: Ward Nurses' Critique Of Management As 'Real Utopias' In The Crisis-stricken Public Healthcare Sector

Rebecca Elizabeth Selberg[1], Paula Mulinari[2]

[1]Lund University, Sweden; [2]Malmo University, Sweden

Based on a feminist and critical historization of the Swedish public sector together with vignettes grounded in extensive qualitative data (interviews, n50), this paper identifies management, managerialism and organizational logics – and not only specific management regimes – as a problem in public sector work places. The paper specifically explores what nurses identify as central areas of conflict shaping their work, and what forms of structural and organizational change they view as necessary in order to create a more socially sustainable work situation, for themselves as well as for their patients. The article argues that workers within the public sector are key knowledge bearers in confronting the global crisis of care. Inspired by the work of feminist scholar Nancy Fraser, who has developed the concept of a care crisis, as well as Erik Olin Wright's discussion on real utopia, the paper analyzes what public sector workers know about the workings of their workplaces, and how this knowledge can be used to change society to become more sustainable, just and equal.

RN14_T05 | The welfare state, Gender and Employment

Stigmatization, Access to Promotion, Job Quality Perceptions of Fairness of Educational Opportunities and Income: Intersectional Analysis in a European Comparative Perspective

Rumiana Stoilova[1,2], Petya Ilieva-Trichkova[1]

[1]Bulgarian Academy of Sciences, Bulgaria; [2]Bulgarian Sociological Association

The transition to market economy in East and Central Europe has drastically multiplied inequalities among many social groups - especially among women from ethnic minority origin such as Roma - who have been simultaneously trapped by the patriarchal tradition in the family and the demands of the global labor market, suffer from discrimination and low education, beside ethnic background. Little research has been carried out on the simultaneous negative influence in strictly intersectional terms of lower educational status, of ethnicity and of gender in the European comparative perspective.

Main focus of the paper is on Intersectionality based on social class (low education- both of the individual, and of the parents), ethnicity and gender. The proposed paper offers theoretical and empirical intersectional research. It aims at contributing to the different levels of complexity meant by the intersectionality: intracategorical, anticategorical and intercategorical (McCall 2005), comparing the effects within women as a group and between women and men concerning the judgment of two dimensions of distributive justice: fairness in educational opportunities and of the received income. We further draw on the Sen's capability approach looking at the negative effects of gender specific norms on the differences in the justice perceptions comparing men and women.

The empirical basis of this research is the European Social Survey (2018).Being a cross-national survey it provides micro-data for the analysis of intersectionality in a comparative perspective. Using multi-level regression analyses we explore how the grouping of European countries into "gender regimes" (Blossfeld et al. 2015) contributes for reducing the negative effects of individual characteristics, social norms and discrimination within the women, seen as a socially constructed group and between men and women.

Feminisation of Joblessness in Contemporary Poland. Between Gender Beliefs and the Weakness of the State

Arkadiusz Karwacki, Katarzyna Suwada

Nicolaus Copernicus University, Poland

Our aim is to develop a new theoretical concept of the feminisation of joblessness. We concentrate on the experiences of women in Polish society, yet we believe that it has the potential to explain various processes taking place all over the world that leads to exclusion of women from the labour market. In our reasoning the feminisation of joblessness results from the cultural patterns, in particular gender roles and care norms that reinforce women's withdrawal from economic activity, and institutional conditions, in particular the weakness of the state that does not protect the rights of its (female) citizens and does not provide services needed by women. Consequently, women are exposed to more situational risks that lead to joblessness and are overburdened with unpaid care and domestic obligations in family life. Our analysis is based on the data from two qualitative research projected conducted 2018 in Polish society. The first one collects over 320 narratives of women experiencing unemployment using the diary method. The second one is based on fifteen in-depth interviews with parents, in particular mothers, of children with disabilities aged 1-18 years. The experiences of researched women allowed to identify fifteen key characteristics of the phenomenon of the feminisation of joblessness and to show how and through what mechanisms cultural norms and institutional settings together reinforce gender inequalities in the public and private spheres.

Keeping Up With Disposable Income? Women's Labor Force Participation And Their Economic Position

Ariane Aumaitre

European University Institute, Italy

The last decades have witnessed an unprecedented increase in women's economic independence through higher educational attainment and labor force participation. However, up to date there is a gap in the literature concerning how this increase in independence has translated into women's economic position. Using a RIF regression based decomposition, this paper unpacks the relationship between the increase in female labor force participation and women's economic position as a group. The analysis unfolds three stories regarding the relationship between increasing economic independence for women across developed economies and women's economic wellbeing. First, a story of emancipation for women at the top of the income distribution, who have seen an increase in their living standards. This is especially the case for highly educated women in dual earner couples. Secondly, a story of compensation and stability of living standards for women at the middle of the income distribution, whose entrance in the labor force manages to balance, at the household level, the decrease in male earnings witnessed during the last decades. And, finally, a story of deterioration for women at the bottom of the income distribution, who have experienced a relative loss in their economic wellbeing, especially when belonging to non-traditional family structures such as single mother households. From a welfare state perspective, the analysis suggests that traditional welfare regime classifications cannot fully explain differences in living standards among women.

RN14_T06 | Gender relations in Specific Occupations

'We've Always Done It This Way' – Exploring Career Barriers and Enablers For Working Mothers in British Horseracing

Kate Clayton-Hathway[1], Bianca Stumbitz[2]

[1]Oxford Brookes University, United Kingdom; [2]Middlesex University London

It is generally recognised in the horseracing industry that women form an increasing proportion of the workforce. Close to half (49%) of stable staff are women, with more women than men (approaching 70% of new recruits) coming into the sector through its racing colleges. Leadership and senior positions, however, remain dominated by men with entrenched horizontal and vertical segregation along 'traditional' lines. Working patterns and structures are slow to adapt, leading to many women leaving the industry prematurely.

Within this landscape, motherhood and childcare can lead to marginalisation, reduced job stability and lack of career progression, contributing further to the 'leaky pipeline'. This paper draws on a qualitative study conducted in 2020 in collaboration with Women in Racing, an independent organisation supporting women's development in the sport. It explores the experiences of women across the industry, including mothers and those who are child-free by choice, whilst they navigate myriad structural and attitudinal barriers across a complex and demanding sector.

The study also identified possibilities and drivers for positive change. These included a growing emphasis on well-being support within the industry, a 'COVID legacy' offering potential to open up conversations around new possibilities for flexibility and adaptation, and the aspirations of a younger generation to have improved work-life balance. Drawing on this analysis and discussion, the paper offers some conclusions on policy and welfare interventions for the sector.

Perceptions, Attitudes And Barriers Towards Women In The Italian Construction Industry

Eleonora De Stefanis[1], Elena Scarcella[2]

[1]University of Milan, Italy; [2]Independent

In Italy, researchers have not yet addressed gender equity in the construction industry, even though it is one of the most male-dominated in Western countries. Through semi-structured interviews with professionals, we assess the extent to which women are widespread in the Italian construction industry and which roles they usually hold. We find that they are predominantly white, able-bodied, qualified professionals, and embedded into a binary and heteronormative framework.

Then, we examine the main issues and criticalities faced by this particular segment of the workforce according to the existing, foreign, literature. Our findings show that women construction workers are mainly restorers. Moreover, women chiefly appear to hold clerical, professional, or entrepreneurial roles. In line with the previous foreign literature on the issue, Italian women professionals and entrepreneurs seem to be facing (in)direct forms of sexism and gendered stereotypes in the workplace, leading to the adoption of coping strategies to deal with colleagues, suppliers, and employees on an everyday basis. In particular, young women entrepreneurs assess the worsening of gender stereotyping when either taking over or inheriting their father's firm, as their entrepreneurial role is easily associated with nepotism rather than expertise. Moreover, both women professionals and entrepreneurs feel the pressure of making decisions concerning the balance of their working and private lives, as eventually impacting their (already limited) career possibilities.

Finally, we claim that this negligence in recognizing women's presence in the Italian construction industry may also result in higher risks for (everyone's) safety, particularly when accessing construction sites.

Domestic Work in Spain: the Impact of the Latest Legal Reforms 10 Years After

Magdalena Díaz Gorfinkiel[1], Begoña Elizalde-San MIguel[2], Irene Lapuerta Méndez[2]

[1]Universidad Carlos III, Spain; [2]Universidad Pública de Navarra

The configuration of domestic work as a professional sector, in Spain, has developed around two main features: feminization and ethnicization. Until 1985 the professionality of this economic activity was not recognized and, from then until 2011, its regulation was outside the General Social Security Scheme, which meant that domestic employees were excluded from the usual social protection system in this country. This situation changed substantially ten years ago, in 2011, when two legislative reforms were approved in order to regularize this activity as well as provide it with greater social protection.

The aim of this research is the evaluation of the impact of those reforms ten years later, and with this objective a survey that analyzes the degree of compliance with current regulations as well as the impact that the current coronavirus crisis has had on the sector has been designed. The results show that, ten years later, informality is still a constant in the field of domestic work and regulations are routinely broken on fundamental issues such as the ways of hiring, firing or basic labor rights. Likewise, it shows the inability of public policies to incorporate this sector into the measures to face the pandemic.

The application of an intersectional perspective has been incorporated into the analysis, and it has shown the unequal conditions experienced by the population of foreign origin versus national origin.

Gendered Division of Home and Professional Work among Clergy Couples

Emőke Török, Emese Biró

Károli Gáspár University of the Reformed Church in Hungary, Hungary

Since the ministerial profession for women was opened by the protestant churches, women in ministry – similar to some secular professions – have faced a practice of "marginalizing integration" (Wetterer 1999). This means that clergywomen are driven typically (partly by unintended structural conditions and partly by their own decisions) towards the marginal tasks of the ministerial profession, and so female ministers are labeled as "special" or "inferior" in the power dynamics of the profession.

The division of labor in a married couple in ministerial profession is a special case of the gender-specific division of labor. Since their relationship is marital and professional at the same time – and the pastor's house is both a private and a professional environment for them –, the division of the professional and familiar tasks are interconnected. Previous researches demonstrated that in such cases the professional status can be partly overlapped by the gender, and thus the clergywomen easily come close to the traditional role of the pastor's wife (Offenberger 2013).

In the framework of our research on women in protestant ministry, we currently investigate those clergywomen who work together with their husbands in the ministry. We have conducted fifteen semi-structured in-depth interviews with female members of ministerial couples in Hungary; we are analyzing the transcripts with ATLAS.ti qualitative data analysis software.

We are exploring what professional and family roles, divisions of labor and power relations characterize the pastor's houses in these cases. Our assumption is that the unequal relations in the professional and in the family tasks are reinforced by the mostly traditional gender roles typical for Hungarian clergy.

RN14_T07 | Care in contemporary welfare states

Configurations of Gender Inequality and Segregation in Employment Across Welfare Regimes

Helen Rebecca Kowalewska

University of Oxford, United Kingdom

In analyzing women's employment across advanced economies, comparative scholars of the welfare state rely heavily on the welfare regime approach. Gender-sensitive welfare regime typologies are typically based on how far welfare state institutions, ideologies, and policies – usually, in relation to the family – support or undermine women's employment. Missing from the literature is an assessment of how far these typologies hold when we measure countries' simultaneous performance across multiple outcomes for women's employment, rather than a single outcome at a time and in isolation from others. This article contributes to addressing this 'gap' through a hierarchical cluster analysis of 24 countries by eight dimensions of gender inequality and segregation in employment.

The analysis suggests that gendered welfare state institutions do indeed matter for a range of women's employment outcomes, as the outcome-based typology overlaps with institutional ones – mostly. Notably, France's positioning in the Liberal regime and greater heterogeneity across Eastern Europe than conventionally assumed suggest that the broader context in which family policies are situated also matters. The analysis additionally highlights how each welfare regime is a unique and complex mix of high inequality on certain dimensions but low inequality on others. Thus, gender equality in employment is an internally inconsistent concept. However, claims of a welfare state 'paradox', whereby more gender-inclusive labor markets are associated with various 'trade-offs' for women's earnings and occupational progression, appear too pessimistic. The evidence presented here suggests that countries with low female employment participation do not necessarily perform better on indicators of segregation and pay gaps at higher educational levels than more progressive welfare states.

The Value of Early Years Education and Care: Evidence of the Sector's Sustainability Through COVID

Jennifer Tomlinson[1], Helen Norman[1], Xanthe Whittaker[1], Katie Cruz[2], Nathan Archer[1]

[1]University of Leeds, United Kingdom; [2]Bristol University, United Kingdom

The COVID-19 pandemic amplifies the devaluation of feminized early years' (EY) education and care work. Current conditions are testing workers' resilience and many are considering leaving for less intensive, more COVID-secure work. Despite its foundational role within the UK economy, little attention is given to how this crisis in the EY sector will affect its workers, nor what this means for its future sustainability.

We present new data from our UKRI/ESRC large-scale rapid response study of how the COVID-19 pandemic has affected the sustainability of the EY sector in England and Wales from an employment relations perspective. Early findings from four large quantitative surveys and 180 in-depth interviews with nursery managers, practitioners, childminders, nannies, parents and grandparents, show how formal and informal EY education and childcare has been disrupted during Covid.

The predominantly female workforce has been excluded from support packages and side-lined in discussions about safety. Nursery staff have been treated as 'indispensable and disposable', continuing to work during a third national lockdown without PPE or access to regular testing nor priority access to vaccines. While care is central to their jobs, respondents feel their work as educators is rendered invisible in government and public discourse, and the absence of paid sick leave is a major concern. We examine the labour market and state-driven processes which institutionalize the undervaluation of feminised work and the care penalty (Folbre, 2017) to produce a highly-skilled workforce that earns little over national minimum wage with limited pay progression (Whittaker, Hardy and Tomlinson 2021).

Welfare State and Care Regimes during the Covid 19 Pandemic: the Working Experiences of Migrant Women in Turkey

Zeynep Ceren Eren Benlisoy[1], Ezgi Tuncer1, Eleonore Kofman[2]

[1]Kadir Has University; [2]Middlesex University

During their 19-year period of uninterrupted rule, AKP governments have strengthened the placement of their social state obligations mainly on the shoulders of women under the guise of 'family' which leaves women with two basic options. Women either withdraw from the labor market and be responsible for care at home, or they take advantage of (rather) limited public facilities, and hand over care to 'other women' (mostly grandmothers) or turn to privatized care services (migrant/local care givers, kindergarten) while keeping their positions in the labor market. This transformation of the welfare state also coincides with the replacement of women from the Former Soviet Union countries, who today form the majority of live-in workers, with the local female workforce in the private care sector.

Based on migrant women' work experiences and practices, this study discusses the impacts of the Covid-19 pandemic on the employment of domestic and care workers from a feminist perspective. While women's subject positions are understood within the structural conditions of the labor market, their strategies to cope with the working conditions and the (dis)empowering effects of work on their lives during the pandemic are examined. This presentation is based on the Gendered Dynamics of Labour Migration project funded by UKRI Gender, Justice and Security Hub. Preliminary findings draw on 12 in-depth interviews conducted in Istanbul as well as two with unions of domestic workers (IMECE and EVID-Sen) and two with NGOs focused on migrant women labor. This study will contribute to the existing literature on the transformation of welfare state, care regime(s), gender- and nationality- based care market in Turkey, as well as migrant women' agency.

585

Who Cares? Welfare State And Gender (In)Equality In The Labour Market In Switzerland

Sandra Valérie Constantin

Department of social policy and intervention, University of Oxford

In Switzerland, care activities continue to be primarily envisioned as the responsibility of women. About two-thirds of women contribute formally in the labor market. However, Swiss women, as in other OECD countries, are two times more likely than men to hold a part-time job position , especially after becoming mothers. Global trends in female employment rate, albeit indicative, conceal variations and inequalities in labor market participation according to the individual position in the social stratification, ethnicity, legal status (work permits type), age, etc. (Hook and Pettit 2016; Pettit and Hook 2009). Global trends also blur the role played by social policies in the (re)production of a gendered social organization. Feminist scholarship on Welfare States has revealed that acting as an instance of resource redistribution social policies can either bolster or overturn the organization of gender relations prevailing in the society, in the labour market and within the family (Daly and Rake 2003; Koven and Michel 1993; Orloff 1996; Sainsbury 1999; Skocpol 1992; Wilson 1977). A large corpus of research demonstrates that childcare related policies significatively explain cross-country variations in mothers' employment rate and in how mothers and fathers engage in parenting activities (Ciccia and Sainsbury 2018; Ciccia and Verloo 2012; Leitner 2003; Pettit and Hook 2005; Ruhm 1998). This communication intends to present a new conceptual framework that sheds light on caring models promoted by childcare related policies in Switzerland. It articulates the familization/defamilization framework (Lister 1990; Leitner 2003) with Fraser's proposed typology (Fraser 1994). It also differentiates families and problematize the role of fathers in care work.

RN14_T08 | Vulnerabilities between the labor market and the State

Gender Quotas in the Kurdistan Region of Iraq: obstacles, resistances and possibilities

Ana Cristina Marques[1], Mamilan Hussein[2]

[1]Independent researcher, Kurdistan Region of Iraq; [2]University of Kurdistan Hewler, Kurdistan Region of Iraq

Since 2009, the Kurdistan Region of Iraq (KRI) has legislated gender quotas that guarantee 30% of the seats in parliament for women. Thus, in the Kurdistan parliamentary elections of 2018, from the 111 seats available, women were able to secure 33 seats. However, gender quotas remain highly controversial, with several arguments being put for and against their implementation. In this article, we focus on the consequences of the implementation of quotas for women in the KRI, in the broader context of federal Iraq. Our data is based: on (participant) observation on/of a two day debate on women's quotas in federal Iraq and in the Kurdistan Region, held in Erbil, during the 18th and the 19th of October 2019; document analysis of Kurdish online media, of legal documents, plans and directives, and of reports produced by regional, national and international (non)governmental organizations and foreign states; and 9 in-depth interviews with members of parliament and members of the civil society. Based on the themes that emerged from the data, we discuss three main factors that enable and/or limit women's political participation in the KRI: "patriarchal" cultural norms; (lack) of meritocracy and affiliations with political parties; and legislation as an enabler or as a hindrance. We conclude by arguing that in the KRI, though gender quotas can be seen as an important tool to increase women's presence in decision-making positions, they have not yet had the intended result of transforming gender power relations at the political level.

Finding Status In Gender Roles Or Disability Identity? Examining Disabled Women's Perceptions Of Inactivity On The Labour Market

Mathéa Boudinet[1,2]

[1]Observatoire Sociologique du Changement; [2]Laboratoire Interdisciplinaire d'Évaluation des Politiques Publiques

Disabled women are marginalised on the labour market, with higher unemployment rates than in the general population. In a global context of activation policies, French disabled women are facing incentives to work. Nevertheless, as disabled people and as women, not having a job can be perceived as viable option. A part of the disabled population can ask for a disability allowances, which are conceived to accommodate people supposingly unable to work. On the other hand, women can be in a heterosexual context stay-at-home wives or mothers. This paper explores the way French disabled women define themselves in relation to employment in this particular public policies context.

Drawing on biographical interviews with 24 French disabled women, I analyse the way periods of employment and economical inactivity are perceived by disabled women, and the way they define themselves while living through them.

Being employed is perceived as the norm for the interviewed disabled women. However, most of them have had periods of inactivity during their life course. I argue that in order to deal with the position of being jobless, disabled women engage a boundary work to distance themselves from a stigmatised position. This work passes by the affirmation of gender role in opposition to a disabled identity : not working because of housework or care is considered acceptable, whereas not working because of disability is not acceptable. Using an intersectional framework, the paper shows how systems of ableism and gender intersect and come to influence the individual experiences of disabled women.

Ways of Subtle and Diagonal Solidarity in Domestic Work: The Case of Silk Carpet Weaving in Turkey

Pinar Karababa Demircan

Beykent University, Turkey

Silk "Hereke" carpet in Turkey's weaving sector, while partially lost its economic glamour in the world market, still keeps its contradictions in the employment sector. Most of the weavers start this process around the age of 12 since weaving silk carpets requires neat fingers. In addition to loss of childhood, almost all women suffer from health problems due to working conditions. The work alienates women from the other weavers whom are given different prices. The income is mostly controlled by the family. Due to its invisibility and lack of health security, access to health services becomes difficult. On the other hand starting from the negotiators, all the rest of the carpet sector profit from silk carpet, which is the most expensive carpet type.

In my research between 2019-2020 on Hereke silk carpet sector, accessing women weavers were the most difficult thing since the rest of the sector chose to speak for women but hesitant to introduce them to me. When I finally met with women and made 31 interviews, I realized that this overall frame for domestic labor also have another appearance for women. When they start to narrate these processes subtle ways of coping with the burden and solidarity types appeared. While being invisible workers, women consider themselves as laborers and artists and value their work independent from the economic gain. Their narrations compose diagonal ways of solidarity with more distanced relatives to decrease close relative control over their work. By these subtle and diagonal ways, their narrations show that at some point they develop a control over their work and body, and the ways to transfer or stop the flow of knowledge.

587

"Good Care Vs. Safe Care? The Impact of Covid-19 on Residences for Elderly People"

Marina Sagastizabal, Emilio-Yus, Matxalen Legarreta Iza

Universidad del País Vasco/ Euskal Herriko Unibertsitatea, Spain

Numerous voices have been raised for decades to point out the essential nature of care work: a job that maintains life and provides well-being for the entire population (Torns 2008; Carrasco 2001; Pérez Orozco 2011, among others). These characteristics have become even more evident during the Covid-19 crisis. In this communication, we focus our attention on a specific sector of care work: residences for the elderly. The objective is to reconstruct the experiences of workers and directors of Basque residences in the context before and after the crisis. We analyze the impact of Covid-19 on the quality of care work, and, in order to do so, we focus on the relational and intersubjective dimension of care work. It is closely linked to human contact and the creation and maintenance of links, which is an essential characteristic of care work in order to guarantee "good care". Through in-depth interviews with workers and directors of residences in the Basque Country, we observe how the anti-Covid-19 protocols and security measures (use of PPE, restriction and control of visits, limitation of mobility…) make it difficult to perform many of the relational and intersubjective aspects of care. Therefore, we observe tension between "good care" and "safe care" that seems insoluble.

RN14_T09 | Policies of Financialization in the welfare state

Gender impact of the Great Recession in Southern Europe

Olga Salido

Universidad Complutense de Madrid, Spain

As previous research has shown, the effect of the Great Recession (GR), and particularly of the austerity and fiscal consolidation policies developed as a response to it, was particularly harsh in Southern European countries, threatening previous trends of convergence towards EU levels regarding gender equality and policy development. This work aims to empirically explore to what extent and intensity these changes occurred in the different countries -Portugal, Spain, Italy and Greece, belonging to the so-called 'Mediterranean welfare regime'.

How was the effect of the crisis on the relative position of women in the labor market and gender equality in each of these countries? Is there a common pattern in all of them or do they present singularities that compromise the prevalence of a common "welfare regime"?

For addressing these questions we comparatively analyze a series of indicators related to the position of women in the labor market, considering changes in both intensity and quality of female (vs male) employment across the recent economic cycle in those countries, setting them in the context of the ongoing processes of modernization and social change previous to the GR. To what extent these changes worked in the direction of deepening gender inequalities in the labor market giving way to a geographic fragmentation in the EU, is a question that gains special relevance in the context of the current crisis associated to the COVID-19, which threatens to have particularly intense economic, social and political impacts in these countries.

588

Activating the Family – Conditional Welfare Rights in Five European Countries

Laura Lüth

University of Hamburg

The proposed paper asks how European welfare states reproduce gender inequality in times of social investment. It links feminist perspectives on social citizenship with ideas of the activating social investment state. A gender sensitive analysis of contemporary European welfare states, it argues, needs to shed analytical light on both sides of 'individualization': the institutional promotion of a) independency from family and b) private self-responsibility.

Empirically, the paper builds upon a comparative institutional analysis of contemporary family and labor market policies in five European countries (Frericks et al. 2017). Such strategy allows to analyze both a) the familial or the individual nature and b) the activating character of welfare institutions.

Preliminary findings thereby suggest that status maintaining individual entitlements to welfare depend on participation in standard and well-paid employment. At the same time, benefits and services for individuals, who do not earn a (decent) living through paid employment, tend to activate both the individual and its (nuclear) family to cope with social risks by themselves.

The proposed paper fruitfully contributes to the aforementioned scientific debates in two ways: first, by adding the activating character of welfare institutions as an analytical dimension of feminist perspectives on social citizenship and second, by introducing the activation of family relations into the scientific debate of the activating social investment state. Empirically, it thereby takes into account that welfare institutions reproduce gender inequalities dependent on socioeconomic and employment status.

The Making of the Indebted Women: Financialization and Everyday Life in Turkey

Pelin Kılınçarslan

Koç University, Turkey

In the last two decades, Turkey has had the highest rates of household debt growth and the highest levels of household consumption among OECD countries. In the face of weak social protection schemes and growing precariousness in the labor market, many households have come to depend on debt for the necessities of social reproduction. Given the pervasiveness of the phenomenon in everyday life, this paper studies the formation of indebted subjects through women's lived experiences in Istanbul, Turkey. Based on interviews with women who are residents of low- and middle-income households in debt, it shows how women make sense of indebtedness in multiple and contradictory ways as they negotiate neoliberal discourses of rationality and gendered responsibility for family care. Narratives reveal that women constantly distance themselves from other debtors who they describe as extravagant and lacking in financial skills, which I call the "irrational others". Women's self-definitions as debtor, in contrast, are based on a language of financial skills and self-responsibility, which I call the "rational self". Women's ability to manage and secure debt, being a "permanent debtor" as I call, is key to the reproduction of indebtedness, and therefore, the reproduction of the everyday maintenance of the household. If they cannot satisfy the need for borrowing, women confront greater financial insecurity and future uncertainty, turning into a "debtor interrupted". I show that these subject positions are shaped by three interrelated processes: global financial circumstances which determine the availability and politics of domestic credit, the class backgrounds of indebted households which affect the reliance on debt, and the gendered relations of financialization which position indebtedness in the realm of social reproduction.

Linking the Macro to the Micro: a Multidimensional Approach to Investigate Intersections of Policy and Attitudes in the Contribution to the Variety of Motherhood Earnings Penalties in Europe

Triin Lauri[1,2], Marge Unt[2], Kadri Täht[2]

[1]University of Konstanz; [2]Tallinn University

The central question of the paper: what is the role of childcare policies in mitigating the motherhood penalty and whether prevalent norms play a role in impact of policies?

Scholars (Budig et al. 2016; Misra et al. 2010; Hallden et al. 2015, Keck and Saraceno 2013) agree that the childcare policies mitigate the motherhood penalties across developed countries. Furthermore, there are few contributions highlighting that norms are also import in influencing the effect of the childcare policies (Budig et al. 2012; Cukrowksa-Torzewska 2017). However, Central and Eastern European (hereinafter CEE) countries are rarely covered by those analyses, although their presence could offer a valuable empirical case as countries relatively recently experienced an important political economic transformation. The CEE countries have historical legacies of de-familiarization and new, often re-familiarising policy initiatives accompanied by a diverse mix of attitudes. We are intrigued by this gap in literature in setting up our research design and by adding a multidimensional approach to motherhood penalty based on cross-sectional data of 28 European countries. We rely on EU-Silc data that allows us to conduct pan European analysis. Our preliminary analyses reveal that traditional gender norms may trigger the adverse effect of more generous leave policies, which might give policy relevant insights into the CEE countries and more broadly. We consider it an important contribution given the ambiguity the question of long and generous leaves has had in the literature of comparative family policies (Ferragina 2020; Mandel and Semyonov 2006).

RN14_T10 | The Academia and civil Service as labor markets

Intersectionality and the Academic Profession: Contingent Employment and Career Pathways During a Crisis

Ana C. Lopes[1], Elina Meliou2

[1]Newcastle University, United Kingdom; [2]Aston University, United Kingdom

Evidence suggests that 54% of all academic staff in UK universities are in contingent employment (Megoran and Mason, 2020) and may be employed under a fixed-term or short-term contract, including zero-hours (Bauder, 2006; UCU 2013). While academia has gone through dramatic transformation in recent years (Dany et al, 2011) as a result of changes in funding mechanisms and increased marketization, the pandemic crisis calls into question how these careers are structured. A great proportion of contingent academics are women (Vicary and Jones, 2017), who simultaneously navigate career and family demands (Lopes and Dewan, 2015). Due to tenuous links with their institutions, contingent academics are often largely invisible and face increasing employment uncertainty. New priorities during the Covid-19 pandemic have bound people in place within countries and blurred the boundaries between work and home – creating new (often unequal) barriers, and challenging career opportunities. This paper will examine the intersections of employment/contract status and diversity for the management of academic careers, drawing on intersectionality theory (McCall, 2005; Anthias, 2013).

The paper will report the findings of a qualitative study with approximately 30 contingent academics in UK universities. Interviews are being conducted online and aim to understand career histories, current employment, in/exclusion from institutional support, job search processes, as well as work-life balance and psychological well-being. Interviews will be analysed thematically (Braun and Clarke, 2006). Interviews will be complemented by diary research (Brown et al, 2010) using a bespoke mobile application (Indeemo). Using a solicited diary, participants will record their thoughts and

feelings via a combination of written word, verbal and visual data (Rose, 2007).

One Step Back or One Step Forward? The Ambivalent Gender Effects of the Neoliberal Academia.

Camilla Gaiaschi

University of Milan, Italy

Women have made a significant progress in academia and science. Yet, gender inequalities – in retention, pay and career progression - persist. Explanations include biases in recruitments, a chilly organizational climate, the maternity penalty, women's concentration in service tasks, the lack of support and exclusion from relevant networks. Recently, many authors have focused on the implications of recent neo-liberal University transformations on women, arguing that they may enhance existing disadvantages.

The Italian university system has not been exempt from neoliberal trends which have been characterized by the precarization of early-career phases, the introduction of systems of evaluation of researchers' productivity and the cuts in public funds, with consequences in terms of research funding and new recruitments. The implications are twofold: on a structural level, they have tightened the access to the tenure-track; at the cultural level, they have promoted a new culture based on productivity and entrepreneurship.

Following a previous work on the structural consequences for women, in terms of access to the profession and career advancement, of University transformations, this paper aims to focus on the cultural dimension of change. To do so, twenty-three in-depth interviews were conducted within an Italian bioscience University department.

The findings suggest that the new managerial culture has ambivalent implications for women. On the one hand, the growing emphasis on productivity may hide existing inequalities. On the other hand, it contributes to weaken the old hierarchical system thus opening up new spaces of agency for women. These opportunities, however, do not come without costs, both in terms of work-life choices and social equality.

Women's Work in Local Administration: Another Pending Women's Issue

Eva Bermúdez-Figueroa

University of Cádiz, Spain

This work provides a critical analysis of the situation of women's employment in the local administration, based on a study case of a middle-sized city in the south of Spain. The main objective of this paper is to analyze and describe the gender differences in the roles and work positions developed by men and women in a local administration. We conducted this research using both quantitative and qualitative methodology, analyzing the distribution of women and men in job posts list of the civil servant's staff, together with in-depth interviews with woman workers in the organization. In the sample for the interviews, there were three different groups related to the neutral, male or female-dominated areas, and also women working in outsourced services. We addressed aspects such as their access to employment, their professional categories, labor relations between men and women, the distribution of power, access to decision-making, the reconciliation of work and family life, and their view of the generic treatment of women and the social valuation of women's work in the administration. We finally make visible the consideration of local administration as a gendered institution. These administrations, supposed to become a public guarantor of equality, produce and reproduce the inequalities of the private labor market and wider society, contributing to maintaining the patriarchal patterns.

591

Gender Pay Gap as a complex social problem

Alena Křížková[1], Aleksandra Kanjuo Mrčela[2], Andreja Poje[2]

[1]Institute of Sociology, Czech Academy of Sciences;
[2]University of Ljubljana

Closing the gender pay gap (GPG) is an important aspect of women's economic empowerment. Women´s emancipation through paid work has been one of the state-socialist projects, which proved challenging in Central and Eastern Europe. Although for the last two decades GPG in Czechia is one of the highest within EU comparison, including GPG for the same work, and GPG in Slovenia is significantly increasing in the last decade from one of the EU lowest levels. In both countries GPG has been a long neglected problem. We use linked employer-employee data to analyse GPG at occupation, workplace and within-job levels in the last two decades in these two post state-socialist countries. To explain gaps at various levels of segregation we respond to calls for more in-depth analysis of the impact of policies. Our qualitative socio-historical in-depth policy analysis demonstrates the interplay of relevant: 1) cultural factors; 2) particular welfare state provisions; and 3) wage setting and gender equality institutional regulations. Comparative frameworks tend to categorise CR and SI as part of a post state-socialist block of countries, yet they exhibit very different patterns of female labour market participation and experience including different character and development of GPG. We show the complexity of this social problem and its constantly changing nature in the context of diverging post-state socialist past dependent policy paths. This mixed method approach allows analysis of continuity and change in factors contributing to GPG at country and cross-country level.

RN15_T01 | Transnational and translocal migrations

'Home' For The Highly-Mobile: Transculturation In Multiple Migrations

Manisha Mishra

University of Agder, Norway

With the growing complexity of networks and connections on a global scale, cultures can no longer be characterised by post-Enlightenment notions of 'one culture one nation', but by their fluid and hybrid (Bhabha, 1994) natures. Although the social sciences are increasingly aware of this development, methodological nationalism (Wimmer & Glick-Schiller, 2002; Beck, 2007) is still extant, particularly in migration studies. As a result of this preoccupation with the nation-state, transnational migration studies primarily focus on migration from the south to the north (Croucher, 2012; Kunz, 2016). Furthermore, as certain forms of migration are viewed as problems that need solving (Anderson 2019), other forms of migration that are not low-skilled or characterised by financial hardship (Fechter & Walsh, 2010) are not given adequate attention.

In order to present an alternative perspective on privileged migration, this study focuses on the children of highly-mobile individuals – those who have moved multiple times across multiple nation-states from birth until the age of 18. Sometimes dubbed "Third Culture Kids" (Pollock & Van Reken, 2009), this migrant population is growing, but has seen little representation in migration studies. Although the term "Third Culture Kid" assumes a Herderian position on culture, this study eschews methodological nationalism through the application of a transcultural framework. Drawing from interviews with 16-18-year-old highly-mobile youngsters, this study uncovers how moving multiple times in childhood influences perceptions of identity, belonging and 'home' and what this means for future mobility or immobility. Furthermore, it proposes transculturation (Ortiz, 1940) as a compelling perspective on highly-mobile migration and as a critique of methodological nationalism.

RN15_T02 | Transnational cooperation

"Mutual Learning in International Development Cooperation Partnerships: a Paradigm Shift"

Silvia Malacarne

Università Cattolica del Sacro Cuore, Italy

593

Global society, with its challenges and contradictions, has led international development cooperation towards a paradigm shift. Pursuing a less hierarchical cooperation, going beyond the donor-beneficiary logic, is one of the objectives of this transformation, which can be achieved with the construction of inclusive development partnerships. Thanks to the collaboration in partnership, each party can act as a protagonist by making available its own material and intangible resources and therefore benefit from those of others, according to the criterion of mutuality. This concept of mutuality in the literature on cooperation is also mentioned with the declination of mutual learning: a sharing of resources, experiences, successful policies that can be exchanged between less advanced, emerging and industrialized countries. Since sociological studies on this concept are still very limited, a qualitative research was carried out, based on semi-structured interviews administered to key respondents operating in different sectors of cooperation (public-governmental, private profit and non-profit, academic), that has tried to enrich the definition of mutual learning, combining theoretical aspects with data strictly connected to the practice of cooperation. Three are the most significant results: 1.It is an expression rarely used among the actors of cooperation. 2.However, the two components of "reciprocity" and "learning" represent aspects that are shared and promoted by those who work in this sector. 3.It is considered one of the favorable conditions for the proper functioning of effective development partnerships. Analyzing the concept of mutual learning and not simply of mutuality in North-South relations, makes it possible to enhance the equal

and inclusive perspective explicitly promoted from 2000 onwards by the various actors of international

Faltering Nordic Solidarity? COVID-19 National Strategies and the Regionalization of Nordic Health Cooperation

Alban Davesne

OsloMet, Norway

When the bridge across the Øresund strait between Denmark and Sweden was inaugurated on the First of July 2001, it was celebrated as a symbol of Nordic regional integration. Yet for its 20th anniversary, the bridge has come to embody border shutdowns as it remained closed for weeks due to COVID-19 restrictions while Nordic governments struggled to coordinate their pandemic responses. Looking at the health care sector and analysing Nordic integration and cross-border cooperation trajectories since the 1990s, this contribution investigates a paradox of Nordic health policymaking: how could one of the leading European region in the field of cross-border healthcare cooperation have become one of the most inconsistent in terms of health policy coordination once the pandemic hit? This contradiction, the paper argues, is in fact part of a largely overlooked process of "regionalization of Nordic cooperation". While local or bottom-up cooperation initiatives in border regions benefited from both the Europeanization and regionalization of health care provision, the institutional or top-down approach to Nordic health care coordination, historically channelled by the Nordic Council, has been struggling to build on past achievements. As a result, cross-border Nordic cooperation initiatives grows but remains bounded by the territorial and legal framework of national health systems, while national authorities have lost the impetus to engage in Nordic affairs and tend to hold on to what remains their national competencies. Building on these arguments, this contribution will provide insights on the potential effects of the crisis on the interplay between top-down and bottom-up strands of Nordic cooperation.

Inventing The Cross-border Region. New And Old Border Practices In Cross-border Cooperation And Cartography

Ulla Connor

University of Luxembourg, Luxembourg

Maps of cross-border regions are more and more part of trans-border cooperation processes within the European Union. Practitioners highlight the benefit of maps in political trans-border cooperation in political and administrative processes, such as joint spatial planning in the border area. Several scientific case studies show how mapping contributes to the cross-border region-making process, the visibility of the region and the emerging forms of cross-border regional identities (e.g. Gaberell/Debarbieux 2014, Grosjean 2019, Haude 2017, Reitel 2020). The European Union promotes the evolving cross-border regional cooperation, hoping for effects of social cohesion in border areas. However, what does "border crossing" actually mean regarding the practices of cooperation and cartography in border regions?

In my presentation, I would like to address this question through a praxeological approach. Based on own ethnographic data from fieldwork in a (anonymized) cross-border region I will follow the cross-border maps as a specific practice: What are the characteristics of cross-border mapping? What forms of cross-border mapping are in use? Along these interrogations, I will follow the thesis, that "inventing cross-border regions" actually creates new occasions to reproduce territorial borders. Nevertheless crossing state borders in the observed practices leads to transformed forms of bordering practices, where new and old borders come together to create the cross-border region. When the mapping practices, their production and usage, undermine the visibility of state borders, they highlight at the same time a previously invisible set of administrative borders. The cross-border region emerges within territorial practices, where the border as "line" is still alive.

RN15_T03 | Local and global pandemic experiences

Global Life and Work in Pandemic Times: The Experiences of Transnational Professionals

Irene Skovgaard-Smith

University of East Anglia (UEA), United Kingdom

The COVID-19 pandemic transformed our globally interconnected world almost overnight as immobility was enforced, striking at the heart of globalisation. The coronavirus spread along international network ties and was tackled everywhere with lockdowns, travel bans and closed borders. The present study explores the impact of this disruption on the everyday transnationalism driven by international business, travel, global work, career mobility and high skilled migration. The study focuses on the lived experience of transnational professionals in global corporations whose lives and work span geographical boundaries. 23 narrative interviews were conducted (virtually) from May 2020 onwards. The participants come from across Europe and beyond (Azerbaijan, Australia, Brazil, Canada, India, Indonesia, Mexico and the US) and live in Amsterdam, Berlin, Dubai, Geneva, Hamburg, Liechtenstein, London, Oslo, Perth, Vancouver and Singapore working for 20 different global corporations. The study explores how the pandemic has impacted the transnational lives of these professionals and their sense of 'home', belonging and identity. Their stories reveal the emotional toll of geographical distance from family and friends in other places (no longer 'just a flight away') as well as a new sense of precariousness. For some this included fear of becoming 'stranded' in case of unemployment – perhaps unable to access national support schemes and unable to move to other global cities for work or return to country of origin. Some began questioning their transnational life while also doubting they could ever 'go back'. They talked about feeling more 'foreign' as national priorities and borders were reaffirmed, while also feeling abandoned by their 'home' country. They talked about feeling 'stuck' and grieving the sudden loss of the geographical mobility they took for granted.

Pandemic Fictions, Viral Realities, And Cosmopolitan Science

Fabian Hempel[1,2]

[1]Bundeswehr University Munich; [2]University of Bremen

Throughout the pandemic, a tension can be observed between science and other social spheres that has impacted the societal approach to the viral threat. Among others, there appears to be a considerable neglect of and contempt for scientific expertise, for instance in political and economic decision making. Nevertheless, scientific knowledge remains decisive in mitigating the epidemic consequences. Thus, it could be argued that COVID-19 both interrupts and consolidates the cosmopolitan imperative of the autonomy and social responsibility of science in modern societies.

While some science and health policy institutions initially hesitated in their threat assessment of and response to COVID-19, the epistemic productivity of global science has been profound for, e.g., the first genome sequence of the virus was made publicly available just ten days after the closure of Wuhan's seafood market on January 1, 2020. This contribution looks upon the societal responses to the cosmopolitan role of the institution of science during the pandemic by utilizing pertinent literary fiction, especially Albert Camus' The Plague, Philipp Roth's Nemesis, and Lawrence Wright's The End of October. First, an analysis of these pandemic fictions serves as an epistemic prism to reflect upon science's function as a primary producer of insight on the pandemic. Subsequently, the emphasis lies on the multi-layered reactions – ranging from substantial counter-expertise over diffuse and concrete skepticism to intentional ignorance – of social forces that question the utility and legitimacy of a viral expertise that is the outcome of cosmopolitan scientific cooperation.

595

The 9/11 Terror Attacks and the COVID-19 Pandemic: The Global Politics of Dehumanization

Salvador Santino, Fulo Jr. Regilme

Leiden University, Netherlands

How and under which conditions do global crises such as terror attacks and pandemics exacerbate the politics of dehumanization and undermine the dignity of minoritized groups, particularly in the context of the United States and beyond? Comparing the 9/11 terror attacks and the COVID19 pandemic, this paper argues that global disasters and pandemics constitute as enabling conditions for the discursive construction of a crisis. The construction of a global crisis exacerbates the systemic and enduring dehumanization of individuals from minoritized groups within and beyond the United States. This process of dehumanization emerges from four key social mechanisms of repression:1) the construction of the threat (securitization); 2) the expansion of the United States domestic and global coercive apparatuses; 3) the proliferation of human rights abuses and 'death hierarchy'; 4) and, the perpetuation of a necropolitical culture.

Patterns Of Responses To Pandemics In Relation To The Political System And Political Culture

Damjan Mandelc

University of Ljubljana, Slovenia

COVID-19 pandemics is a global public health challenge, forcing countries to respond with the resources available and within the specific national political, economic, and cultural environments. The scale of measures undertaken to fight the pandemics is unprecedented in modern times, with no clear predictions on several consequences in terms of economic effects, public response to strict measures, short and long-term political repercussions. There is no clear way to understand the different responses without understanding specific national cultures, traditions, political systems, etc., therefore disciplines like (political) sociology and political sciences must collaborate with scholars of public health and other

respective fields in order to shape the future conversations about the meaning and lessons of this disease.

The ambition of this paper is to explore the similar responses in countries with distinct political systems and traditions, as well as diverse responses of countries with similar geographies and political traditions. In this regard, political sociology is extremely useful for its understandings of several dimensions of political regimes, of institutions involved in the decision-making process, the role of mass and social media. Combining the findings of subfields of the sociology of globalization and sociology of nation and nationalism in recent decades, we can make a contribution to the wider debate taking place around the world and among the disciplines, while also analyzing the effects the pandemics have on the populist and extreme right movements and political parties in selected counties as part of our research agenda.

RN15_T04 | Europe and the European Union in turbulent times

Becoming Fully European: The Relationship Between East-European Xenophobia And European Racial Identity

Alexandru Vasile Sava[1], Sorana Alexandra Constantinescu[2]

[1]University of Bucharest, Romania; [2]Babeș-Bolyai University, Romania

In this paper we will trace how East-European nationals attempt to assert their claims to a European identity on the basis of their opposition to non-European migrants and refugees. This complicity in racist and xenophobic practices may seem paradoxical, as most East-European ethnic groups are, or were until very recently, frequently met with xenophobic hostility when emigrating towards West-European countries. However, such a phenomenon has historical parallels to how certain groups of European migrants (Irish, Italians, Slavic peoples etc.) were faced with racist hostility when migrating to the United States in the 19th and early 20th century. According to previous analyses of the subject developed within whiteness

596

studies, the inclusion of these ethnic groups into the racial category of White Americans was contingent on their participation in the racial oppression of African-Americans, as well as other racial minorities. We contend that a similar process is underway with nations from the Eastern periphery of the EU, as they fulfill a function of enacting racist behaviors. To this end we will analyze the voting behavior of diaspora populations and survey data on attitudes towards minorities to explore how the perception and self-representation of East-Europeans in Western European countries has shifted with the appearance of newer non-European migrant groups, and what potential implications this might have on the development of European identity in general.

From a European Union of States to a European Union of Regions

Oriol Ríos-González, Mar Joanpere

Universitat Rovira i Virgili, Spain

For centuries there have been many diverse realities in Europe, but with the creation of the nation state there was a suppression of these diversities by a dynamic of vertical inclusion and an oppressive integration that united under a different flag and border boundaries. During the creation of the nation state, there were many impositions, some of them by violence, and it has not been resolved until nowadays. Analysing the European countries, each state encompasses nations or peoples that are differentially marked, with a linguistic, historical, cultural, and political reality that is different from that of others. For example, in Italy there are Lombardy, Veneto, Sicily and Campania. In Spain there are the Basque Country, Galicia, Andalusia, Catalonia, etc. Citizenship and the states themselves have begun to question the historic heritage of a social and geographical composition that does not correspond to its historical, linguistic, cultural, and traditional essence. While questioned from the social sciences and especially sociology, significant contributions have been made to deepen the debate and to bring solutions with the aim of making the public live together. This contribution exposes sociological analyses to the current debate on the Europe of states from recent published studies (Garcia, Joanpere, Ríos, Morlà, 2020), with the aim of strengthening the concept of Europe, from the internal diversity it engenders.

Rethinking The Sociology Of European Union: The Relation Between Society And Law

Stefania Adriana Bevilacqua

Sapienza, Italy

The transnational governance will be the focus of the political, economic and social debate of the coming years, as accelerated by the pandemic crisis.

However, even before Covid-19 the process of European integration had shown the conceptual and methodological limits of traditional sociology applied to the supranational phenomenon.

In particular, universalism and Western rationalism applied to European society led contemporary sociology to consider fragmentation as the starting point of the European social world: infact, it is mainly considered as the result of a convergence between different societies, histories and values and as the arrival point of transnational processes that defined mere social commonalities (or differences).

In order to deal with complexity, which is nowadays undergoing rapid change, a rethink of this nationalistic methodological approach can no longer be postponed.

Rethinking European sociology in order to grasp its real phenomena means starting from the relation between law and society, since it is in this relations that society is formed and acts.

This is for two reasons: firstly, legal harmonisation is both the birthplace of European society and its ultimate goal; secondly, the constancy of the relation between the European citizen and law leads us to consider homo europeus as homo juridicus.

In conclusion, the paper intends to show the need to start from the "acquis communautaire" of rights in order to reconceptualise the sociology of European Union in an "acquis communautaire social".

597

Awaiting Brexit: The Discursive Negotiation of the Risks of Brexit in Kent and Nord-Pas-de-Calais

Cedric Demian Jürgensen

Leipzig University, Germany

European disintegration is a prominent topic in academic and political debates. However, a substantive theory or a common understanding of both the nature and consequences of disintegration are lacking. What are the competing meanings and narratives that shape this debate and why do different actors have different understandings of (the consequences of) disintegration? In order to answer these questions, I conduct a discourse analysis on the negotiation of the risks of disintegration using a case study of the Brexit impacts in the border regions Kent and Nord-Pas-de-Calais. These regions are home to the Dover-Calais crossing and therefore particularly affected by Brexit.

Methodologically, this work builds on sociology of knowledge approach to discourse developed by Rainer Keller, which focuses on the way knowledge is produced through discourse. Using this method, a total of 74 articles from four different local news sites published between June 2016 and June 2020 are analyzed, thereby identifying the prevalent interpretative schemes, frames, and narratives of the discourse.

This study finds that the discourse is marked by the absence of sound knowledge. This makes defining clear risks difficult if not impossible for some actors. Nevertheless, actors use various strategies and frames of Brexit (as an opportunity, a catastrophe, or simply as uncertainty) to define risks. These frames of Brexit form different competing narratives, which correspond to the interest of actors. This indicates that competing interests may be the reason for the continued lack of a common understanding of European disintegration and its consequences.

RN15_T05 | Issues on belonging and identity in a global world

Street Corner Travel. In search for a Cosmopolitanism at Home

Sylvain Beck

Sciences Po Paris, France

This communication proposes a reflection after ther lockdown of the half of the human inhabitants of the Earth. In contradiction with a lot of discourses about the "world after", the world didn't collapse, but the Great Acceleration effectively stopped suddenly: the planes on the ground, the cars in the garage, the deserted railways... The cultural hegemony founded on the geographical mobility has collapsed in a few weeks. Politically, the public health suddenly got the upper hand over the economic growth.

The lockdown has revealed social inequalities and obliged individuals to experience what "living at home" means. This reflection lays on fieldwork about students in social work from 2015 to 2019 in Paris (Beck, 2018b), in continuity with my research on expatriation (Beck, 2018a). Inspired by the human ecology (Park, 1915), I have analyzed their relation to the otherness in terms of mobility and migration, by the transformation of self. I have emphasized the encounter of students in social work with vulnerable people in different social services and institutions (child protection, disabilities and homelessness). I have often found more cosmopolitan mind (Cicchelli, 2012) in the discourses of French students in social work than those of French expatriates who travel around the world (Beck, 2015). It emphasizes the possibility of a cosmopolitanism without displacement. This paper deals with "repatriation" of the self at home, redefining our relation to other in space and time with more "resonance" (Rosa, 2016): the sense of existence (Martuccelli, 2011), materially (human, objects, plants, animals, virus, etc., notably for work and food) and spiritually (invisible entities like God, myths, dreams, fictions, spirits, AI, etc.) to share our common humanity (Chernilo, 2007).

598

Liminal and Liminoid: Exploring Students' Identity in Academic Mobility

Pierluca Birindelli

International Studies Institute, Italy

The analysis of 50 international students' autoethnographies reveals that studying abroad constitutes a rite of passage. It can be considered a liminal and transitional space-time towards adulthood, Europeanism and/or cosmopolitanism. The liminal phase clearly takes place during the sojourn abroad, and the 'cosmopolitan status' is achieved only after a series of highly codified steps, such as passing exams and earning a degree. When the young adult completes this ritual-cultural path, family, friends and the academic community (both at home and abroad) should recognize the new socio-cultural status of international or cosmopolitan student. However, the international student's post-liminal stage remains unclear and consequently, since it is a narrative, even the pre-liminal and liminal stages become hazy. My analysis leads to interpreting the (quasi-) ritual of studying abroad as a script without a story, i.e. a structured story, such as a book or a movie. If this is the case, the implicit and preconscious meaning of studying abroad grows enormously. Consequently, the young person's self-story lacks a 'centre of narrative gravity', leaving the student-protagonist alone both in acting out and recounting his/her epic. As a result, the overall myth-ritual is sabotaged, and even the recognition of the new 'cosmopolitan status' by the 'community' (institutions, family, peers etc.) becomes blurry.
Keywords: Academic mobility, young–adult, Liminal, Ritual, Europeanism, Cosmopolitanism.

Roots Tourism, at the Origins of the New Identity Tourism in the Glocal Era.

Riccardo Giumelli

University Verona, Italy

Starting from what was presented in the last editions of the ESA Conference, we will focus on a research that we are conducting with the Italian Ministry of Foreign Affairs on roots tourism. This is the tourism of those who have Italian origins and who intend to return to Italy to find out who they are.
Knowing the tourism of the roots means, first of all, knowing the world of Italians outside Italy. A world made up of "oriundi", descendants who arrived in every place of the world, during the great phases of mass emigration, and who have always shown a great sense of belonging, often steeped in nostalgia, towards Italy, and even more towards the city or the small village of origin. We will describe this collective identity through the lenses of cultural change, which took place with the acceleration of the processes of glocalization. Understanding this Italian world means understanding that there is an extraordinary resource for the future of tourism, after the end of this pandemic period.
In particular this world is the basis of the root tourism project. Without the italians widespread all over the world (more than 80 millions) and the awareness of being potential tourists of the roots, it is not possible to undertake actions capable of giving systematicity to this form of tourism. Alongside the more purely theoretical discourse, we will accompany the discussion with a research, where some trends clearly emerge that will be explained and contextualized.

599

Cosmopolitanism: New Forms of Belonging in Times of Intense Mobility

Jie Liu

University of Milano-Bicocca, Italy

Recently, it has witnessed a growing interest in debate on cosmopolitanism owing to the increasing transnational interconnectedness and encounters with difference on an unprecedented scale as a result of cross-border business, migration, mobility, media and consumption. Against this backdrop, sociologists have appealed for a critical turn from 'methodological nationalism' to 'methodological cosmopolitanism' (Beck and Sznaider, 2006) in sociological studies highlighting the cosmopolitan nature of transnational processes.

This article reviews the development of cosmopolitanism from its ancient philosophical root to contemporary figures in political philosophy, anthropology and sociology, and then gives weight to discussion on the triangle relationship between belonging, mobility and cosmopolitanism through sociological lens followed by an exploration to young people's mobility in transition to adulthood. This paper argues that sociology carves out an empirical way for the studies of cosmopolitanism through 'transnational mobility', which is central to the account of cosmopolitanism formation. The main proposition of the paper in respect of the triangle relationship is that belonging is a frequent topic of cosmopolitanism, mobility is an important marker of cosmopolitanism, whereas sense of belonging shapes and changes in the process of mobility. The primary role of mobility in shaping sense of belonging and forming cosmopolitanism is highlighted in discussing it as a crucial element of youth's spatio-temporal transition to adulthood. This paper mainly serves as a modest spur to induce a further in-depth discussion on new forms of belonging that shapes through mobility in the contemporary world of cosmopolitanization.

Key words: cosmopolitanism, mobility, belonging, youth

RN15_T06 | Transnational Ecologies of Surveillance: Colonialism, Capitalism and Crisis

Digital Sovereignty and the Bio/necropolitics of Transnational Surveillance Capitalism

Goldie Osuri

University of Warwick, United Kingdom

Surveillance capitalism (Zuboff 2019), platform capitalism (Srinicek 2017; Manokha 2018) and data colonialism (Couldry and Meijas 2019) are theorisations which describe the harvesting and commodification of data through capitalist and colonial analytics. Drawing on a critical political economy and decolonial approach, Couldry and Meijas (2019) argue for the lens of 'data colonialism' rather than 'data sovereignty' to compare the global transformation of political economy wrought though colonial capitalist logics in the 15th century to the current 'colonisation' of data. Yet, in the context of both past and current forms of colonial capitalism, a biopolitical and necropolitical differentiation is needed to understand the effects of digital sovereignty on those experiencing contemporary interfaced online and offline colonialism.

The context of Indian (post) colonial sovereignty in Indian-occupied Kashmir may be instructive in this regard. Corporate collusion with the Hindu nationalist Indian government's necropolitical techniques of digital shutdowns, surveillance, and the exploitation of resources (natural and digital) for the aim of 'remaking' Kashmir for Indian colonial ends poses questions that unsettle this undifferentiated framework of 'data colonisation.' In other words, a more appropriate approach might be to explore the contemporary capitalist and colonial conditions that enable digital sovereignty's biopolitical and necropolitical techniques to 'make live' or 'maim' (Puar 2018), let die, or kill (Mbembe 2003) at the interface of the online and the offline. To this end, this paper explores the theorisation of a transnational (post) colonial digital surveillant

600

sovereignty (Tawil-Souri 2018) to take account of the necropolitical effects experienced by Kashmiris in Indian-occupied Kashmir.

Assemblages of Surveillance: Indian State's Multi-layered Invasion into Everyday Life in Kashmir

Samreen Mushtaq, Mudasir Amin

Ashoka University, India, India

The Indian State has, for three decades now, employed violent counter-insurgency to suppress the struggle for Azaadi (freedom) in Kashmir, a Muslim-majority, disputed region. Human rights violations including killings, torture, enforced disappearances, sexual violence, mass blinding have been accompanied by an intensive surveillance architecture that puts the everyday life of Kashmiris under India's "gaze" and intrudes into their personal spaces. The paper explores the various assemblages of surveillance in the framework of the transnational character of Islamophobia, the global security space, and its ever-growing desire to "see" and regulate the actions of Muslims. India's deployment of human intelligence in Kashmir is now supplemented by digital technology, constituting a cyber occupation that has meant a continued expansion of this panoply of surveillance. In this paper, we trace the varied modes of surveillance employed by the Indian State as a practice that is as invisible as it is visible. While it is routinised for "superpanopticon" effect on the ever-suspect Kashmiri subject who is aware of being under surveillance, the entire infrastructure is rendered invisible with no information in the public domain on the kinds of its application and management. Contending that such invasive forms produce specific relations of power, the paper centers an analysis of surveillance and the security logic in Kashmir to understand the politics of its usage for strengthening occupation, producing a culture of fear, and routinising of the "exceptional," showcasing biopolitical control and repression to undermine resistance.
Keywords: Kashmir, India, surveillance, panopticon, biopolitics

The Bio/Necropolitics of Citizenship Making in the Age of Surveillance Capitalism

Nisha Kapoor

University of Warwick, United Kingdom

Over the course of the pandemic we have seen a recasting of the discourses surrounding digital surveillance technologies. Where surveillance as a necropolitical governmentality employed via patrolling border vessels, drones, detention processing centres and refugee monitoring regimes has been implicitly narrated in terms of action necessary for preserving the health of the nation by excluding and disposing of pathologised bodies who are themselves targets for exclusion, abandonment, death and destruction, the forms of tracking, biosurveillance, and invasive health checks long routinely carried out at state borders have now found a new lease of life in their redirection towards the citizenry and their uptake for biopolitical purposes, to safeguard life. Track and trace technologies are used to criminalise the 'illegal immigrant', to enforce precarity, institutionalise systems of citizenship, and maintain zones of abandonment (Mbembe 2003) and the threat of deportability. Simultaneously, the encouragement of the masses to engage with the use of track and trace technologies is presented as in the interests of the security and vitality of the nation, as part of what it means to be a good citizen. This easy rerouting is in large part thanks to the continuities in the service providers tasked with delivering solutions to both sets of state projects. Now responsibility for border surveillance and healthcare provision both fall within the remit of the techno-corporate bureaucracy. This paper seeks to explore the entanglements of surveillance infrastructures, including the state-corporate nexus driving surveillance capitalism, as they are built for both biopolitical and necropolitical purposes.

Translocational Spectrum: Locating Intersectionality Across Time, Locations And Spaces

Sajia Ferdous

The University of Manchester, United Kingdom

The paper develops a new conceptual tool that allows capturing the fluid relationships between identity, belonging, structure and agency from a renewed translocational perspective. We term this concept as 'translocational spectrum', which deals with simultaneous processes of identity construction and negotiation, integration sense-making and their intersections with structures, systems and agency within migrants' life trajectories across time, space and locations. Our conceptualisation is informed by empirical data gathered from in-depth semi-structured interviews with older South Asian British Muslim women in Greater Manchester. The new tool that helps locate migrants' integration level across a spectrum is built upon Floya Anthias' translocational positionality framework which takes forward the intersectional understanding of social inequalities, gender, and structural processes. The key contributions this paper makes to existing knowledge are two-fold: first, the concept of 'translocational spectrum' has the potential to be used as an intersectional lens helpful for mapping migrants' transnational lives. In doing so, it also exposes the underlying unequal social systems and shows how they manifest themselves through migrants' social and work attitudes to determine their life-long work-life trajectories.
Keywords: Translocational positionality, migration, ageing women, migrant worker, intersectionality, gender.

Kurdistan, as a Part of World Heritage: Seeking Links with the Global in the Kurdish Culture

Joanna Bocheńska

Jagiellonian University, Poland

Talking about 'cosmopolitanism' Kwame Anthony Appiah stresses our ability to communicate with others in the globalising world and suggests that establishing links with others is strictly connected to our ability to be rooted in a place, to enjoy the bonds of local cultures starting from the native language and hometown, and ending up with the many new global encounters and locations which offer us new opportunities for "getting rooted somewhere". As stressed by Appiah only in the past centuries, "as every human community has gradually been drawn into a single web of trade and a global network of information, have we come to a point where each of us can realistically imagine contacting any other of our six billion conspecifics and sending that person something worth having" (Cosmopolitanism, 2006). For Kurds this process started at the beginning of the 20th century and inevitably brought changes into their culture and into the image of the world they represented. Despite the brutal assimilation policies of Turkey, Iran, Iraq and Syria, the Kurdish language, folklore, as well as modern literary and art forms have survived and may be today understood as the "good idea" worthy to be shared with others. In my paper - based on interviews and text analysis - I will investigate the ways Kurdish folklore collectors, writers and artists apply Kurdish tradition in order to establish links with the global world and this way challenge the isolation and marginalisation of their society and culture imposed by the Middle Eastern states.

Re-shaping Corporate Social Responsibility Locally and Globally: Exploring Community Involvement Schemes of the Israeli Arms Industry

Itamar Shachar[1], Tamar Barkay[2]

[1]Ghent University, Belgium; [2]Tel-Hai Academic college, Israel

Corporate Social Responsibility (CSR) is often discussed as a form of private regulatory mechanism developed to address governance gaps created by economic globalization. The proposed paper questions the potential of CSR to play such a role by analysing the case of social responsibility programs of Israeli arms companies (weapon, security, and surveillance). While most companies in this sector directly profit from Israel's occupation of the Palestinian territories and serve as an enabling force in grave violations of human rights, they disregard their core business activity as a relevant CSR concern and place at the heart of their CSR strategy other aspects such as community involvement and employee volunteering programs. Based on insights from the authors' ethnographic studies in the Israeli field of CSR in the past 15 years, combined with new findings from analysing content produced by Israeli arms companies and by CSR ranking agencies, our paper analyses the efforts Israeli arms companies make in order to gain legitimacy and play an active role in re-shaping both the local and the global fields of CSR. By highlighting these efforts, the paper brings to the forth the arms industry involvement and impact on the local and global trajectories and contested contours of CSR - a neglected aspect in the scholarly discussions on the social responsibility of 'sinful industries'. This analysis contributes to the understanding of CSR as a dynamic product of the interrelations and mutual effects of local, national and transnational actors and fields.

MeToo Responses in Norway's Labor Party as Cultural Diffusion and Improvisation

Brian Hoeft

Nassau Community College (SUNY), Garden City, NY - USA

#MeToo reached Norway in late 2017. Complaints were lodged against a Labor Party deputy leader who had been elected by the party membership. Media coverage became intense, leading to more than 5,000 news stories over a two-month period in a country with 5.4 million inhabitants. Labor Party leaders split over how to respond, whether to engage in rapid crisis management that journalists craved, or to maintain slower customs of membership democracy. The party leader claimed executive authority, demoted the deputy, and boasted about it.
Here I argue that the leadership deviated from the Norwegian Labor Party's organizational customs of membership democracy. At issue for this analysis is a legacy image of the mass party ideal type with a bottom-up ethos of deliberative structures and chains of delegation, where each higher level would be held accountable to the level below, transmitting party members' influence from local party branches up to mid-level elected representatives, then up to top national leaders in party organs (Wolkenstein 2020; Allern, Heidar, and Karlsen 2016).
I examine more than 200 news items that track this chain of events involving a political party organization in globalized protests where social media figure prominently. My analysis takes from institutionalist and pragmatist theories to suggest transnational diffusion of American-style politics, tending to personify politics in top elites as mediatized figures. Over time, this case may be revealed to stand as an example of changes underway where Norwegian political parties become more like marketing to consumers (Safran 2009; Kirchheimer 1966).

RN15_T08 | General Session

Effective Cosmopolitanism of Children's Rights

Áron Telegdi-Csetri[1], Jørn Holm-Hansen[2], Asgeir Falch-Eriksen[2], Mari Roth[1], Viorela Ducu[1]

[1]Babes-Bolyai University, Romania; [2]Oslo Metropolitan University, NO

In a comparative Norwegian-Romanian study, we follow the democratically grounded implementation of both countries' cosmopolitan commitment to children's rights, by analyzing the standard versus variations of four basic rights principles: non-discrimination, best interest, participation and family as claimed, signed and ratified by the countries through the UNCRC. Therein, we ask:
(1) What does the individual child's cosmopolitan citizenship entail according to these core rights? and (2) What does successful protection of children currently entail in the light of the above?
Through 38 interviews with experts, on the Romanian side, despite declarations of good-will and non-partisan attitudes concerning policies for children, holdup is observed by an institutional system interested in the maintenance of the status-quo (or even in the return status-quo-ante), based on authoritative regimes, parent blaming, child disempowerment and pathologizing, and a lack of preoccupation for comprehensive data on the situation of children. On the Norwegian side, confronting universal individualistic child rights norms with cultural particularities of families and children seems to be an issue of CP professionalism that has recently attracted criticism, through international debates and even the largest single number of ECHR cases.
These lead to a deeper concern with regard to what the implementation of cosmopolitan norms in fact amounts to. Namely, while legislation and on-paper adaptation of norms seems highly adequate in both countries, respondents insist that the principles of the CRC are running separate trajectories in general principles, in structure and in practical - discretional, on-site, operative - application.

Organizations as Scientific Authorities in Parliamentary Debates: Four-Country Comparison

Jukka Syväterä, Marjaana Rautalin, Attila Kustan Magyári

Tampere University, Finland

The organizations far beyond the traditional academic institutions have become prolific science producers and a multitude of organizations engaged in providing evidence-based policy advice for national governments and policymakers now proliferate in all areas of policymaking. Neo-institutional sociology explains organizations' growing investment in research activities and research-based policy advice by the all-embracing scientization which has swept throughout the world. There is, however, considerably less knowledge available about how the organizations' increased knowledge production and the supply of science-based policy advice are reflected in national policymaking, like in legislative work conducted by parliaments, and in which extent distinct organizations are deemed authoritative in different countries. In this paper, therefore, we examine how different organizations are utilized as scientific authorities in the parliamentary debates over new legislation. Drawing on the analysis of a dataset consisting of 576 parliamentary debates from Australia, Finland, Kenya, and the United Kingdom, we address the following questions: In what extent are organizations of different types acknowledged as scientific authorities in the context of political debate over new legislation? What is the relative weight of various types of organizations as sources of scientific authority? The results of our comparative analysis reveal that while organizations in general are frequently evoked as scientific authorities in all four countries, there is, however, remarkable variation according to what types of organizations are conceived authoritative in the epistemic governance in different national contexts. We elaborate these findings by a rhetorical analysis identifying the most important rhetorical functions of invoking organizations as scientific authorities.

Is Russia A Sociological South? Towards To The History Of The Debates On Possibility of Emergence of Russian Indigenous Sociology

Ivan Kislenko

HSE University, Russian Federation / Ghent University. Belgium

This paper examines the history of the debates on the possibility of the emergence of Russian indigenous sociology. Russian sociological tradition has a huge history, even though that during Soviet rule it was banned for a while and then was re-established as an ideologically oriented Marxist sociology. The new period started when with the fall of the USSR. Social scientists began to analyze completely new reality which expanded rapidly. One of the arguable issue in the various debates on perspectives on the development of sociology in Russia was the possibility of Russian indigenous sociology. It interrelates with the state of the international discussion on the variability of sociological practices in the world and the possibility of the indigenous sociologies. As international scholars, Russian scholars divided by the same oppositions: universalism / position of northern sociology and particularism, position of southern sociology. Nevertheless, southern perspective in the debates was accompanied with the rather specific tradition of religiously orthodox ethics-based sociology. Such approach received a huge criticism from the adherents of Western sociology: mostly because of the intentions to invent purely ideological enterprise. The article analyzes the main arguments of the authors and present a brief history of the discussion for the international audience in order to better understand the current state of Russian sociological community

Families into the Syndemic Context, an Opportunity to Rethink Gender Inequalities

Ana M González Ramos[1], Esther Torrado Martín-Palomino[2], María de la Paz González Ramos[3], Alfredo Hidalgo Lavié[4]

[1]Universidad Pablo de Olavide, Spain; [2]Universidad de La Laguna; [3]Hospital Universitario de Puerto Real, Spain; [4]Universidad Nacional de Educación a Distancia, Spain

The COVID-19 syndemic has stirred a high-deeply impact not only for the global disease but the great social and economic consequences. Scholars and public opinion emphasize changes for the future in interpersonal relationships (i.e. health habits, social distance), digitalization of work and personal life (i.e. telework, videocalls). However, we need to know how this global phenomenon have impacted the family as a whole, observing the transformation/intensification on the gender inequalities.

Husbands and wives have spent more time together at home, providing reasons to both of them to take care of responsibility of children and household. But, according to Eurofound online survey last year (two rounds, spring and summer), women have remained in charge of these roles during this period affecting significantly to their wellbeing: stress, tired, resilience, pessimism. Work-life balance remains a burden for women.

From Eurofound survey and Centro de Investigaciones Sociológicas (CIS) series of data, we'll look over the physical and mental health of men and women during 2020-2021 handling with work, family and personal duties to examine what data series indicate. On the basis of these conclusions, we'll propose public policy recommendations and positive messages to stimulate the response-ability for citizenship, and particularly to men and women separately, oriented to gain ground in gender equality. The term response-ability grounds over the ability to conscious and deliberate choose our response with intentionally and care.

Gender Inequalities In Families Under COVID-19: Bringing Fathers Into The Frame, Again

Margaret O'Brien, Claire Cameron, Hanan Cameron, Katie Hollingworth, Lydia Whitaker

UCL, United Kingdom

In many countries, it appears that the COVID-19 pandemic is having a significant and disproportionate negative impact on mothers' jobs, livelihoods and caring responsibilities. Twentieth century advances in maternal employment, equality legislation, and innovation in publicly funded ECEC and systems of parental leave are under strain and appear fragile.

This paper explores this "COVID gender inequality crisis" through comparing parental accounts of caring for very young children while trying to get by financially during a global pandemic. The data is drawn from a mixed methods longitudinal study of the social, economic and health impacts of COVID-19 among families with young children under 5 years, and pregnant women living in London during three national "lockdowns" between March 2020- September 2021. It includes a baseline community survey of 950 parents/ parents- to- be and a panel of 20 households with multi-person on-line interviews. The study is located in inner East London characterised by an ethnically diverse population with close residential proximity of poor and rich households.

The paper compares what mothers and fathers say about how they manage care and jobs in daily life under lockdown and at critical times such as childbirth and in the postnatal period. Preliminary findings show diverse patterns of suffering, struggling and resilient caregiving and provisioning. Minority ethnic parents are more likely to experience hardship and precarious labour market conditions. It will be suggested that the "COVID gender inequality crisis" is best understood as part of a broader pre-pandemic economic environment, which has undervalued public and private resources for care, especially of small of children.

Dividing The Domestic Under Lockdown: The Mental Load

Marta Dominguez-Folgueras[1], Maria José González[2], Irene Lepuerta[3]

[1]FNSP Sciences Po, France; [2]Universitat Pompeu Fabra; [3]Universidad Pública de Navarra

The lockdowns enforced in many countries to contain the spread of covid-19 had important consequences for the domestic sphere. Because families are forced to spend more time at home and outsourcing domestic and care work becomes less available, confinements are expected to produce an increase in the domestic load of households. Given that the division of domestic work is gendered, and that women continue doing the lion's share, it is important to question the impact that lockdowns have had on gender inequalities within the family.

Previous research on the lockdown periods has shown that both men and women increased their investment in domestic work, but that gender inequalities persisted or even increased. In this paper, we analyse the division of domestic work during the covid-19 pandemic in Spain, and we contribute to the literature by focusing specifically on an under-researched aspect of the division, the mental load. We use data from a convenience online sample (N: 2,300) gathered during the lockdown period (April 2020) and also data from a representative sample (N: 1,700) carried out during the summer (July, 2020). Both surveys include information on different aspects of domestic work, including the mental load

RN16_T01_02 | Care Settings

Coercion and Care: A Team Ethnography in Six Italian Emergency Psychiatric Units

Mario Cardano[1], Luigi Gariglio[1], Raffaella Ferrero Camoletto[1], Valeria Quaglia[1], Eleonora Rossero1, Alessandra Algostino[2], Marta Caredda[3], Cristina Pardini[4], Claudio Carezana[5], Giuseppe Maina[6]

[1]Department of Cultures, Politics, and Society - University of Turin, Italy; [2]Department of Law - University of Turin; [3]Department of Law University of Rome 3 and Laboratory of fundamental rights - University of Turin; [4]Laboratory of fundamental rights - University of Turin; [5]Emergency psychiatric unit Martini Hospital - Turin; [6]Department of Neurosciences "Rita Levi Montalcini" - University of Turin

The paper presents the main results of a team-ethnography performed in six emergency psychiatric units, in the North of Italy. Italy is known as the country that was the first to close the asylums, substituting the institutionalisation of psychiatric patients with their – not always unproblematic – restitution to society. In Italy, psychiatric patients receive cure and care in health structures spread on the territory, where they go voluntarily, receiving pharmacological and relational therapies. When a severe crisis emerges, patients are admitted in little hospital wards (with 16 beds), both voluntarily or involuntary for a short period, on average a couple of weeks. The team-ethnography carried out compares six emergency psychiatric units, focusing on two main issues: the use of coercive measures as mechanical restraint and involuntary hospitalisation, and the relationship between the two central professional communities managing the psychiatric crises, the psychiatrists and the nurses. On the first topic, the paper discusses the organisational and cultural determinants of coercive measures. We analyse the local ontology of madness and the meaning ascribed to the coercive measures, moving from the idea of a necessary evil to a well-deserved punishment of improper behaviours, through the conception of the coercive measures as nothing more than a therapeutic tool. On the second topic, we analyse the impact of the relationships between the two communities of practices, namely

psychiatrists and nurses, on the psychiatric patients' cure, recognising how tensions and conflicts between this two "tribes" define the cultural climate of the ward and the quality of treatment.

Performing 'Good' Acute Psychiatric Care: An Ethnography of Restraining and Non-restraining Practices

Eleonora Rossero

University of Turin, Italy

Today's organization and provision of mental healthcare in Italy is characterised by great heterogeneity. The psychiatric reform introduced by Law 833/1978 was implemented with different outcomes resulting from different regional contexts, culture and resources. With respect to acute mental healthcare, the main difference seems to be that between 'restraint' and 'no-restraint' models, namely those which adopt mechanical restraint (which are the great majority), and those which do not. Two Italian regions – Piedmont and Friuli Venezia Giulia – have been identified to respectively represent the two models. Participant observation and discursive interviews have been conducted to explore care and coercive practices, as well as notions of 'good care' and values embedded in everyday working activities of hospital and community services in these contexts. After a brief introduction of the different institutional maps and definitions of 'proper patient' resulting from conflicts and negotiations between multiple actors, situated coercive practices – namely mechanical and other forms of restraint, but also involuntary treatment and enforced medication – will be addressed. Their performance in both 'restraint' and 'no-restraint' contexts appears either outsourced to external agents (i.e. police forces) or embedded in the notion of (good) care through four strategies: i) therapeuticisation of coercion; ii) proceduralisation of coercion; iii) relationalisation of coercion; and iv) multiplication of the 'objects of care'. Values and notions of 'good care' enacted in the two contexts will be discussed, and situated suggestions for possible improvement of future acute mental health care will be proposed.

Maintaining A Personal Identity: A Collective Process In A Medical Care-Home For Young Alzheimer Patients

Marine Jeanne Boisson[1,2]

[1]EHESS (LIER-FYT), France; [2]Université Paris Nanterre (LESC), France

This communication is based on an ethnographic research in a medical home for young Alzheimer's and neurodegenerative disease patients in the greater Paris area in France. Their appearance in young subjects, under 60 years old, induces a form of violence for these people, for their relatives, as for their caregivers. The challenge of care is then to maintain these subjects' abilities to pursue social exchanges. The caregivers' interventions aim at maintaining linguistic, physical, memory, as well as aesthetic and relational abilities, related to what is referred to as the central core of these individuals' "self" identity and "lifestyle habits".

First, I question the idea that those residents have a stable "identity for oneself" and an "identity for others". Rather, I show that the maintenance of their identity in the face of illness and disability should be seen as an uncertain process, involving collective inquiry and the interactive reconstitution of this identity. I then show that maintaining a subject's identity can be seen as the process by which relatives, caregivers and residents resolve tensions and contradictions in order to "say who they are". But it also becomes possible to emphasize that the "environment" in which these people are immerged, and how it provides caregivers, residents and their families with resources to overcome these contradictions, is equally important in the process of assigning an identity: this identity, in order to be judged "complete", must be recognized as never being multi-dimensional and irreducible to a single judgment (Strauss, 1959).

Italian Adolescent Young Caregivers Of Older Family Members: Qualitative Results From The "Me-We" Online Survey

Barbara D'Amen, Marco Socci, Sara Santini

IRCCS INRCA - National Institute of Health and Science on Aging, Centre for Socio-Economic Research on Aging, Ancona Italy, Italy

The theme of adolescent young caregivers (AYCs) of older relatives is still partially uncovered by research, although the phenomenon is increasing worldwide. This study analysed open ended questions included in an online survey carried out in 2018-2019 within the "ME-WE" project (https://me-we.eu/), focused on 817 AYCs aged 15-17, living in six European countries (Italy, the Netherlands, Slovenia, Sweden, Switzerland, the UK). Starting from this baseline, this study analysed two open-ended questions included in the "Me-We" online survey, aimed at exploring the difficulties and the type of support needed by 50 Italian AYCs of older family members, for shedding light on the conditions of this under-investigated category of caregivers.

The qualitative answers were analyzed thematically by using MAXQDA and following an open coding approach in order to highlight the main themes and subthemes expressed by the respondents.

The analysis shown that AYCs of older people are faced with care recipients' special needs arising from age related health conditions, e.g. multimorbidity, physical disability, dementia. They experienced three kinds of difficulties: "communicative" e.g. understanding the care recipient's requests, "emotional/psycological" e.g. fear of inability of provide care and "material" e.g. moving the disabled people which is the most common trouble. AYCs reported the need for "emotional" and "practical" support and comprehension by school teachers.

In terms of policy implications, it is suggested to adopt national legislation for recognising and supporting AYCs, and create a stakeholders' and AYCs' (and families) network for co-designing effective and tailored support services for this "hidden" but widespread phenomenon.

RN16_T01_03 | Migration & Culture

Self-rated Health among the Roma, their Neighbours and the General Population in six European Countries

Daniel La Parra-Casado[1], Jesús F. Estevez[1], Erling F. Solheim[2]

[1]University of Alicante, Spain; [2]UiT the Arctic University of Norway

Aims: To compare the health status of the Roma population and the General Population and its intersection with gender and educational level in six Central and Eastern European countries: Bulgaria, Croatia, Czechia, Hungary, Romania and Slovakia.

Methods: We analysed data from the UNDP/WB/EC Regional Roma Survey 2011 and Eurostat's the European Union Statistics on Income and Living Conditions for the six countries. Logistic regression was used to estimate predicted probabilities of good or very good self-rated health for the Roma, Roma neighbours and the General Population, stratified by gender, and adjusting by age, country and educational level.

Results: There was a distinctive social gradient in health by ethnic groups among both men and women, and a gap between primary versus secondary or tertiary education among all three groups, but Roma (men) and their neighbours with secondary or higher education had significantly worse predicted self-rated health compared to the general population with similar qualifications. The overall results also support a hypothesis of intersectionality between groups, education and gender, and that ethnicity and gender should be considered fundamental causes on how to explain structural health inequalities.

Conclusions: The results suggest that both future research and policy initiatives to tackle health inequities should acknowledge the status of ethnic minorities and intersectionality, study designs that allow for direct comparisons between ethnic groups and the general population should be applied, and more and better data about ethnic minorities are needed to document and monitor existing health inequalities.

609

An Immigrants' Paradox in Mental Health? A Life-course Perspective

Claudia Brunori

European University Institute, Italy

Recent literature on immigrants' mental health identifies a paradox. On the one hand, assimilation theories expect immigrants' mental health to increase with tenure in the destination country, with the improvement of social and economic position. On the other hand, recent studies found that immigrants have, on average, better mental health than natives upon arrival, but they gradually lose this advantage with tenure. While the former phenomenon can be explained by selectivity mechanisms, the latter has to do with cumulative exposure to disadvantage (labour market precariousness, economic fragility, discrimination), and failed expectations. However, previous literature has mostly relied on cross-sectional data, and the few longitudinal studies are limited in number of points in time and in geographical scope. In this article, using data from waves 1-9 of Understanding Society, I run random- and fixed-effects models to estimate immigrants-natives differences in mental health levels and trajectories, accounting for omitted variables bias and reducing selective attrition (and remigration) bias. Preliminary results indicate that ageing has a similar effect on mental health for immigrants and for natives, with its negative effect being even slightly stronger for natives. This would translate into a stable or increasing immigrants-native gap in mental health. This leaves us with an interesting puzzle: why is being an immigrant protective for mental health? In further developments of this paper, I will discuss the possible mechanisms leading to this result.

Cross Cultural Healthcare Practice at Norwegian Public Health Centers

Lydia Mehrara

Nord University

The Norwegian public health centers (Helsestasjon) are one of the main providers of maternal and child healthcare services at the community level. Due to their easy accessibility, they are often the primary as well as a regular point of contact for immigrant women in Norway during pregnancy and after childbirth. As such they are a place where encounters between community healthcare providers like nurses and midwives, and immigrant women are frequent. This makes cross-cultural care an important theme within practice at this environment, and the knowledge and discretion of healthcare providers key to its facilitation. Midwives and nurses at these centers play an important role as state employees in the targeting of universal healthcare provisions at the local level, this is especially important in reaching immigrant women and families with different cultural backgrounds.

This study employs a qualitative approach using data from nine semi structured interviews with midwives and nurses at different public health centers located across two Norwegian municipalities with large immigrant populations. Using thematic analysis, it investigates the health practitioner's experiences of working with immigrant women during pregnancy and after childbirth. The study focuses on exploring what cross cultural healthcare means for them, and whether and how they implement it in their practice. The findings highlight the importance of experience, time, and discretion in the provision of culturally sensitive maternal and child healthcare. This study has implications for universal health policy and training of health professionals with respect to the needs of an increasingly culturally diverse Norwegian society.

General Practitioners' Assessment Of Patients With Mental Health Problems And Diverse Migration Backgrounds: Professional Settings And Their Relation To Referral Recommendations

Camille Wets, Katrijn Delaruelle

Ghent University - Department of Sociology, Belgium

Despite a higher prevalence of mental health problems among people with a migration background, recent studies show an underrepresentation of these patients in ambulant and residential mental healthcare services. This study investigates (1) whether there are differences in general practitioners' (GPs) referral recommendations towards native Belgian patients, Belgian-born patients from Moroccan descent and patients with an asylum seeking background who all express symptoms of major depression, and (2) whether these potential differences in referral recommendations vary based on several GP-specific characteristics, with an explicit focus on their professional setting.

Data from the Mind-The-Gate Study (2020) was used, in which a quasi-experimental video vignette study was performed among 431 Flemish GPs. Each GP was randomly allocated to one of three hypothetical scenarios that simulates a conversation between a GP and a male patient with or without a migration background. Chi-square tests were used to examine the differences in referral recommendations towards the three patients, while binary logistic regression analysis was used to investigate the relation between differences in referral recommendations and GP-specific characteristics.

The results reveal significant differences in GPs' referral recommendations: while native patients and patients from Moroccan descent are more frequently referred to private psychologists' practices, asylum seekers are more often referred to social care services. Furthermore, the results expose a significant effect of the GPs' professional setting on their referral recommendations towards all three different patients.

This study shows that GPs' referral decisions are influenced by the patients' migration background and the context in which they are working.

Gender Inequalities in Health Behaviors and Domestic Life during the Covid-19 Pandemic in Turkey

Gulcin Con Wright[1], Oya Kalaycioğlu[2]

[1]TED University, Turkey; [2]Bolu Abant İzzet Baysal University, Turkey

The Covid-19 pandemic has had a transformative impact on the lives of everyone. Some individuals were affected by the virus directly; whereas almost all significantly altered their lifestyle to comply with specific regulations including hygiene, mask-wearing, isolation, and social distancing. This pandemic has also caused serious repercussions in economic, social, and political dimensions of everyday life. Several studies and reports have documented that gender shapes the way we experience the pandemic and the ways in which it changes our lives. In this study, we analyze survey data from 441 individuals in households from different socio-economic backgrounds in Turkey on their health attitudes and behaviors as well as their experiences in domestic life during the pandemic to examine their gendered patterns. Results show that women are more inclined than men to take certain life-altering precautions against the risk of infection. They are more concerned with their health and engaged in healthier practices overall; yet, they are also more likely to avoid doctor visits due to the pandemic. On the other hand, when it comes to the questions on solidarity among household members in several tasks from household chores to childcare, women report a less positive environment than men. These reports also notably differ by socio-economic background of women, but not men. This study provides supporting evidence for gendered dynamics in individuals' perceptions of and attitudes towards the impact of the Covid-19 pandemic on their lives. The pandemic provides a unique opportunity to document these manifest differences between men and women to better understand the pervasive gender inequalities which might otherwise often appear as difficult to observe.

"A Room of One's Own": Remote Learning among Palestinian Female Students in the Israeli Periphery Following the COVID-19 Crisis

Tal Meler Zefat

Academic College, Israel

The COVID-19 pandemic has had a significant impact on the health, wellbeing, learning, living-arrangements, work and family life of students worldwide. This study analyzed the effect of the implementation of remote learning on Palestinian-Arab female students from a college in Israeli periphery. This paper aims to address the perpetuation of inequalities while applying feminist theory to examine the intersection of remote learning with gender and family relations in populations of disadvantaged social position as an ethno-national minority. My qualitative study of Palestinian-Arab female undergraduates during the crisis shows that students were forced to study in a shared family space because they did not have their own room and sometimes shared equipment. Furthermore, they were drawn into family obligations, which reinforced their traditional gender role. The data indicate that these circumstances impair their ability to study. The study sheds light on the role of gender and family relations in barriers to persistent devotion to higher education and success in attaining an undergraduate degree. The insights gained from the study will provide necessary and much needed strategies and frameworks to ensure that policies and practices take into consideration the special needs of women across vast ethnic-cultural-class and educational backgrounds. Based on my analysis, observed on local levels, I conclude that gender inequality in higher education as manifested in remote learning is not specific to the Israeli institution or for the individuals in it: it is structural and demonstrates how emergency time solutions combined with a social gender regime become an inequality mechanism.

COVID-19 & Gender Occupational Segregation

Lidia Arroyo

Open University of Catalonia, Spain

As shown by previous research, both structural gender inequalities and gender normativity that conforms men and women's social practices and subjectivities, affect the risk of exposure with regard to health issues (Hare-Mustin & Marecek, 1994; Pujal i Amigot, 2010; Artazcoz, 2004; Velasco, 2009; Kingle, 2008; Regitz-Zagrosek & Seeland, 2012; Schiebinger, 2018). In particular, in the case of infectious diseases transmitted through social interaction such as COVID-19 the gender perspective is especially relevant in terms of identifying how gendered practices and structures are affecting the disease (Nkangu, Olatunde, Sanni, 2017; Smith., 2019; Smith, Avdiu & Nayyar, 2020; Wang, et al., 2020). This pandemic has shown the relevance of care work to sustain the current socio-economic system as frontline jobs, and, at the same time, it make visible some requirements of care sector linked with the quality of care services. This issues implies a redefinition of prevention of occupational risks from a gender perspective. The project, funded by the Agency for Healthcare Quality and Assessment of Catalonia (AQuAS), aims to analyse the effect of gender labour segregation to the prevalence of COVID-19 through the Data Analysis Programme for Health Research and Innovation (PADRIS). The analysis will look into gender inequalities with an intersectional approach, taking into account the age, origin and level of education. The project will also create an open data portal to share the produced data. The open data portal has started with the creation of the #COVIDGenderArchive on the open and collaborative portal GenPORT (www.genderportal.eu) to share resources on gender & COVID-19.

RN16_T02_02 | Aging &b End-of-life

End of Life Care in English Care Homes

Diana Teggi

University of Bath, Department of Social and Policy Sciences, Centre for Death and Society (CDAS), United Kingdom

Since the beginning of the COVID-19 pandemic, care homes have been in the eye of the storm. A large proportion of COVID deaths in England and Europe has come from those living in care homes. This should come as little surprise given the prevalence of chronic underlying conditions in the care home population (Teggi 2020) and that 28% of all deaths in England are of care home residents (NEoLCIN 2017). However, very little is known about dying and end of life care (EOLC) in care homes, the last multi-sited ethnographic study on the topic being more than 25 years-old (Sidell et al. 1995). This paper presents the ethnographic and qualitative findings from a mixed-methods study of EOLC in five

residential and nursing care homes in the South-West of England. It shows that EOLC in care homes is shaped by: (1) the uncertainty of death's timing in old age; (2) the need for staff to predict and anticipate the time of residents' dying; (3) the need to balance institutional pressures to keep residents alive (or let them die) with residents' agency and best interest; and (4) staffing levels enabling or disabling carers to sit and just 'be with' residents as they are dying. The study depicts a complicate picture of failing bodies, existential uncertainty, EOLC governance and relationships of care between staff and residents that challenges received notions of medicalisation, institutionalisation and social death in very old age. This knowledge is crucial in the wake of a pandemic that risks stigmatising care homes once again as places for bad living and bad dying.

RN16 | Sociology of Health and Illness

The Making Of Palliative Care – Norms, Values and Emotions In Backstage Palliative Care

Ann-Charlotte Nedlund, Daniel Boethius, Barbro Krevers

Linkoping university, Sweden

The Covid-19 crisis has fuelled the debate on how we are dying and what constitutes good palliative care. Thus, the crisis compels us to reimagine Mills's sociological vision, to differentiate between a personal problem and a public issue, such as the collective organisation of dying. Various institutional logics, such as regulative, normative, and social-cognitive, influence palliative care's organisation and delivery. Springing from the hospice movement, palliative care has traditionally been concerned with cancer treatment. However, new diseases and institutional changes put pressure on healthcare organisations and their inherent structure. This paper examines how a palliative care team interprets and negotiates ambiguous institutional logics in palliative care through collegial interaction. We use ethnographic field observations to show how the reciprocal process of institutional logics, organisational features, and collegial interaction creates standards in healthcare organisations. Ethnographic fieldwork also enables us to show how professionals weigh up different types of knowledge, values and experience through collegial interaction when managing limited resources in their everyday practice. Thus, this paper contributes with empirical knowledge on how healthcare professionals make decisions in complex situations, when there is no "right" answer, and when resources are limited and time is scarce. In so doing, we also shift focus from macro-institutional approaches to the construction of standards "backstage", beyond official policy documents and regulations, where norms, values and emotions contribute to the creation of healthcare standards. The paper also contributes to the debate on how fair palliative care can be viewed and constructed, even in times of crises

Students View On Dealing With COVID-19 Epidemic In Nursing Homes In Slovenia

Adriana Kozina[1], Marija Milavec Kapun[1], Jožica Čehovin Zajc[2]

[1]University of Ljubljana, Faculty of Health Sciences; [2]University of Ljubljana, Faculty of Social Sciences

Even before the COVID-19 epidemic, Slovenian nursing homes were struggling with a shortage of nursing staff, the spread of coronavirus exacerbated this problem. They also encounter a lack of personal protective equipment, spatial problems, lack of knowledge, guidelines, and protocols for acting in epidemic situations, and organisational problems. As a response to their severe shortage of staff, associations of nursing and medical students in Slovenia organised so-called "Covid expeditions". In the most affected nursing homes, students helped as caregivers for ten days or longer. They had an opportunity to observe problems/challenges faced by nursing staff and residents as well they could notice good and bad practises. Good practises could be used in similar epidemic situations in the future. Yet, revealing bad practises could serve as a good opportunity to learn how to prevent unfavourable outcomes in case of spreading infection. We posed the following research question:

What kind of difficulties, good and bad practises regarding work organisation, resources, and personal protective equipment, did notice students who helped in nursing homes during their work?

In the first phase, in-depth interviews were conducted with students who worked in nursing homes during the COVID-19 epidemic. The content analysis of the interviews was the basis for the creation of a questionnaire that was sent to all students who worked in Slovenian nursing homes during the COVID-19 epidemic (approximately 200). Preliminary results of the study and recommendations to facilitate the management of possible similar epidemic situations in nursing homes will be presented at the conference.

Keywords: COVID-19 pandemic, problems, residential care, health care students

Towards Testing the Intergenerational Contact Hypothesis: Prevalence and Inequalities in Intergenerational Interactions in a Covid-19 Epicenter

Raffaele Vacca[1], Federico Bianchi[2], Matteo Piolatto[3], Flaminio Squazzoni[2]

[1]University of Florida; [2]University of Milan; 3University of Brescia

A popular argument during the Covid-19 pandemic has been that the faster diffusion and higher case-fatality rate of the disease in certain regions of the world, such as Southern Europe, are due to higher levels of social interaction between the elderly and younger generations. This Inter-Generational (IG) contact hypothesis has motivated certain restrictive measures to limit contagion, yet it has never been empirically investigated with actual data on social interactions. We propose the first analysis of IG contact based on real-world, highly granular data on social networks among the elderly in Brescia, a major Northern Italian city located in one of the earliest and most hardly hit Covid-19 epicenters in the world. Using results from an egocentric network survey in a random sample of elderly Brescia residents (N = 107), we examined the prevalence and variation of IG contact as a function of individual sociodemographic and health characteristics, as well as features of social ties and personal networks. IG social ties were more numerous among older, married, and lower-SES Brescia elderly; among elderly with more family-centered personal networks; and, paradoxically, among individuals with poorer health and more limited physical autonomy. Overall, results from individual-level and tie-level models consistently indicated that IG contact was significant but unequally distributed in this population. Family was confirmed to be a major driver of IG interactions. Alarmingly, individuals who were older and more vulnerable in terms of health and SES tended to be more at risk of IG contact.

RN16_T02_03 | Health Innovation

ACCESSing Healthcare and Preventive Services: An Explorative Study of a Co-designed Human Navigation Targeting People with Multimorbidity (ACCESS)

Sine Grønborg Knudsen, Anne Katrine Enevold Krogh, Nana Folmann Hempler

Steno Diabetes Center Copenhagen, Denmark

People with multimorbidity (MM) often have complex healthcare needs. They are expected to coordinate services and information from multiple healthcare professionals (HCP) emphasising the importance of healthcare systems being responsive to their needs. MM is associated with low health literacy skills which are necessary to access and utilise healthcare systems – especially during a pandemic moving consultations online. Human navigator models attempt to reduce these barriers by bridging gaps in service and communication across sectors based on the needs of people with MM. However, limited knowledge exits about such models in terms of effectiveness and practice integration.

This research project (ACCESS) protocol presents an explorative study of a human navigator intervention aiming to improve access to and utilisation of healthcare and preventive services across sectors for people with MM between 18 and 65 years of age living on a remote Danish island. The intervention is co-developed with people with MM, HCPs and local stakeholders and based on a comprehensive needs assessment.

Using mixed methods and the framework of realistic evaluation, ACCESS explores the implementation of the navigator intervention and what works, how it works and for whom it works. Objectives are to explore improvements in (digital) health literacy skills, perceptions and intervention benefits for people with MM, and system facilitators and barriers of health literacy responsiveness.

By involving people with MM, the local community and HCPs across sectors, ACCESS aims to improve the understanding of human navigation models in Danish healthcare. Findings of the present study may inform and

615

enable healthcare systems to be more responsive to diverse needs and preferences and promote equitable access for people with MM.

Can Digital Tools Improve Coordination in Elderly Care? A Stakeholder Perspective from Germany and Sweden

Katharina Gerda Koch

University of Mannheim, Germany

A major task in all welfare states is the coordination of health care (HC) and long-term care (LTC) services for the elderly. Up to now, the communication among the different actors and professions is challenging for health and care professionals as well as for clients and their relatives. In this light, digital tools are often regarded as effective devices for solving these problems. This paper examines if digital tools can bridge the various systemic, financial and professional gaps and barriers between health and social care services.

Using Mayring´s Qualitative Content Analysis, we analyse data from 27 expert interviews with representatives of stakeholder organizations in Germany and Sweden and from position papers with a focus on digitalization issued by key institutions. Applying a comparative perspective is promising as those countries are at different stages of implementing digital tools in elderly care. This cross-national perspective captures institutional and organisational barriers and success factors.

Preliminary results indicate digital tools have the potential to improve care coordination under specific circumstances. These include technical and structural factors like the access to and compatibility between systems as well as personal factors like digital competence or willingness to use those systems. Barriers to implement digital tools for care coordination are mostly linked to countries' specific institutional settings. The paper closes by discussing the role of policy innovation to create ideal framework conditions for making advantages of digitalisation usable in elderly care.

From Innovation To Translation: How New Concepts Shape Health Care Practices

Barbara Hendriks[1,2], Martin Reinhart[1], Cornelia Schendzielorz[1,2]

[1]Humboldt-Universität zu Berlin; [2]German Centre for Higher Education Research and Science Studies, Germany

Imagining alternative health futures needs concepts – preferably novel concepts – that capture ambitions and expectations of practitioners and researchers alike. It seems that the policy discourse provides plenty of such concepts: e.g. responsible research and innovation, sustainability, or personalized medicine. For such concepts to materialize in actual health care requires practitioners such as broadly trained physicians with sound knowledge in clinical practice as well as in medical research to make sense of them and incorporate them in their work practices. We explore two such concepts – innovation and translation – and show how they are used and understood in the dynamic professional context of clinician scientists. While innovation as the older umbrella-term of the two has been subject to thorough conceptual analysis, translation is very much "in the making". Both are sometimes used interchangeably but also sometimes to decidedly mark a difference. Based on qualitative interviews with clinician scientists and their collaborators in research and clinic, we trace shifts in the meaning of innovation in the medical field and contrast it with the more recent notion of translation. While we find that innovation has acquired field-specific, increasingly fixed meanings, parts of its former connotations are becoming covered by the term translation. As a relatively fresh concept, the latter has the advantage of being less appropriated and, thus, leaves room for individuals to interpret their practice as translational. From these results we draw more generalized conclusions on the dynamics of concepts between political discourse and professional practice of clinician scientists.

E-prescribing: Turning Innovation Aging Failure Into Success for Oncological Patients During Covid-19 Pandemic

Monica Murero

University Federico II, Italy

International evidence shows several benefits of the "dematerialization" of medical prescription (e-prescribing) for stay-at-home elderly during the COVID-19 pandemic lockdown, particularly in countries where digital health practices are already diffused (Koster et al., 2020; Craston et al., 2020; Urik et al., 2020). During the COVID-19 pandemic, newly introduced e-prescribing protocols in Italy aiming at avoiding contacts at the point of care and relying on user's availability of using ICT fails to reach the digitally illiterate, fragile, stay-at-home older population in great need of medications. This study presents original empirical findings with an ethnographic approach showing that interdigital agents' "invisible" work, securing medication availability to old people during the pandemic, may turn innovation aging failure into success. E-prescribing appears to affect the social health relation by a) changing places of access to care (avoid doctors' offices during the pandemic), b) creating new socio-tech networked connections among family doctors, patients, and caregivers, particularly when fragile stay-at-home patients suffer from an oncological condition and need chronic medication and care. Previous literature showed the importance of situational practice and informal work supporting aging care (Miele et al., 2020; Fornasini et al., 2016; Bruni e Gherardi, 2007) besides "formal" regulation. Building on the theoretical work of Mol (praxiography, 2002, 2010) and Murero (interdigital communication theory 2006, 2012), the presentation investigates how e-prescription modifies trajectories (Glaser and Strauss,1968) and family care re-organization (Riemann and Schütze, 1991) around older people disproportionally affected by COVID-19 severe complications (Mueller et al., 2020).

RN16_T03_01 | Gender & Health I

Effects of Retirement Transition on Physical Activity among Older Men and Women in Italy. A Qualitative Longitudinal Study

Marco Socci, Sara Santini, Barbara D'Amen, Andrea Principi

IRCCS INRCA - National Institute of Health and Science on Aging, Italy

The retirement transition is a major life change affecting people's daily routines, lifestyle and health behaviors, including physical activity (PA), one of the key components of active and healthy ageing. It is still not clear how retirement affects older individuals' PA behaviors, due to controversial results from previous studies. This 3-years qualitative longitudinal study, based on the outcomes of the Extending Working Life research (2014-2017), aims to examine individual behaviors towards PA and PA levels practiced by 24 women and 16 men during the transition from work to retirement in Italy, with semi-structured interviews carried out one year before retirement, and one and two years after, respectively. The study research questions were: 1) Which typologies of behaviours of older adults can be identified, related to PA, during the transition from work to retirement? 2) Which are the main drivers and barriers for practicing PA? Are there gender differences? Contents were analysed with the support of MaxQda2020. Six types of older people's behaviours were identified, based on the engagement in PA, along the transition from work to retirement. Women's main driver to PA is socialization, while caregiving is the main barrier. Among men, the willingness to look and feel better is the main driver and poor health the main obstacle to PA. For both genders, one of the main drivers of PA in older age is PA practiced in younger age, too. Public policies to promote PA in a life-course approach are needed, paying particular attention to retirees with poor health.

617

Future Bodies in Immunologal Science Practice

Elina Oinas

University of Helsinki, Finland

The paper will discuss the imagined human immune system, entity-ness and human exceptionalism in contemporary bio-medical research in immunology. The paper presents results from an ethnographic study where a cutting edge pharmaceutical trial testing a diarrhea vaccine was followed for three years by a group of feminist sociologists. The trial offers an opportunity to detect various ways the bio-medical researchers imagine their gendered and gendering object of research, the human immunity and corporeality, as a lived everyday experience when the scientists were busy conducting the trial in West Africa and Finland, and when designing and explaining the science to diverse audiences. Although the trial is on e-coli, the findings are relevant also for COVID-19 immunology.

The imagined body in immunology is never stable but for the scientists inevitably a future oriented body. By the diverse practices it is diffracted to many potential possibilities, including an individual entity-body as a fortress of the Cold War, as well as the holobiont body where the contours of an entity no longer is relevant but a self is dispersed to an entagled co-existence with other "critters" (Martin 1994, Haraway 1991, 2016). To us sociologists there seems to be an ambivalence in the fictioning of the immunity system and the lived practices, but for biomedicine a future oriented paradox appears as a given. The paper will discuss this practice of "diffractive holding-together" typical for ambivalent and paradoxical science-fictioning in contemporary future-oriented science, and the methodological tools feminist sociology of health might use for analytical work.

Peer Group Pressure To Engage In Violent Sporadic Sexual Relationships: Health Consequences And Alternatives

Sandra Racionero-Plaza, Ramon Flecha

University of Barcelona, Spain

Gender-based violence is a global health and social problem with increasing prevalence among adolescents and youth. In the attempt to identify the roots of this problem, a coercive discourse which links sexual attraction with masculinities that have violent attitudes and behaviors, has been identified. Adolescents are socialized into this discourse by learning processes that take place in multiple spaces. The R+D Spanish project MEMO4LOVE examined whether the dominant coercive discourse is reproduced in social interactions in the peer group and, if so, how it manifests and the health consequences that it implies for the victims. For that purpose, communicative focus groups and in-depth interviews with female and male adolescents (aged 15-16) were conducted in three high schools in Barcelona. The results showed that adolescents do experience different types of coercion and pressure in peer group interactions which pushes them to violent sporadic relationships that have very negative consequences in their development and health. This paper will also share how interventions of preventive socialization of gender violence implemented in the course of the project contributed to raise awareness of this situation among the participant youth. The importance to acknowledge peer pressure in gender violence victimization among adolescents and youth will be pointed out, as well as the relevance to recognize that this pressure and coercion occur to engage in sporadic violent relationships. This last evidence adds to the existing knowledge on sporadic relationships as a context of much gender violence.

618

Unveiling Multiple Discrimination: Chronic Illness, Gender and Disability

Lucila Finkel

Universidad Complutense de Madrid, Spain

Different studies have addressed the analysis of the relationship between disability and sex, as well as the influence of the health condition on women's participation in the labour market. However, the particular situation of chronically ill patients is insufficiently studied, and most of the data from official surveys do not allow us to analyze the relationships between chronic disease, disability and gender.

This communication explores this triple situation of discrimination and is based on the data of a survey carried out by the Platform of Patient Organizations in Spain that addresses the particular situation of women with chronic disease, focusing on the labour sphere and paying special attention to the situation of disability.

The analysis of 2,656 responses has made it possible to identify the labour, economic and educational impact that chronic disease have on the lives of women, as well as the differences found in the official recognition of disability by gender, which affects the benefits received and their job placement. On the other hand, the results show that women with chronic disease play an important role in caring for other sick people. Similarly, the chronic disease has a greater impact on women's social relationships. The conclusions of the study have made it possible to put forward concrete proposals to alleviate this triple discrimination suffered by women with chronic diseases and disabilities.

RN16_T03_02 | The Impact of COVID-19 I: Healthcare

Covid and Disability: the Impact of the Pandemic on Learning Disabled People's Health Needs

Alice Scavarda, Mario Cardano

Università degli Studi di Torino, Italy

As Armitage and Mellus contended (2020) COVID-19 pandemic is likely to disproportionately affect disabled people, putting them at risk of increased morbidity and mortality. The authors suggested the presence of three barriers for disabled people: difficulties in accessing public health messaging; risk of disrupting service provision, due to self-isolation and social distancing measures; risk of severe acute respiratory syndrome coronavirus 2 infection because of existing comorbidities. Despite this claim, the report "Disability rights during the pandemic" on findings of the COVID-19 Disability Rights Monitor, states that many governments, also in European countries, have failed to take sufficient measures to protect the rights and to respond to health needs of disabled people during the pandemic. Drawing on the findings of a qualitative study which combines semi-structured interviews with health professionals and representatives of disability organisations, analysis of official documents and digital ethnography, the paper produces some reflections on the health care provision for learning disabled people in Italy during the pandemic. One of the preliminary results is the lack of involvement of disabled people in the design and implementation of the national and local responses to the pandemic by policymakers. Disabled people, particularly learning disabled ones, are still considered objects of care or passive service recipients, although their activism: their voices were raised during the spread of the virus especially via social and digital media. The latter could allow them to express their perspectives and to easily access public health messages and services.

619

Covid-19 As A New Indicator Impelling Health Inequalities: The Perceptions Of Frontline Healthcare Professionals In Estonia

Kadi Lubi[1],[3], Kadri Simm[2], Kaja Lempu[1], Angela Eenalu-Lind[1]

[1]Tallinn Health Care College, Estonia; [2]University of Tartu, Estonia; 3Riga Stradins University, Latvia

COVID-19 pandemic has posed several challenges and ethical dilemmas to the medical system of developed Western countries. Based on the perceptions of frontline healthcare workers, the research aims to investigate the role of COVID-19 in terms of health inequalities.

As a part of mixed-method study, we conducted a thematic textual analysis for data collected from frontline healthcare professionals via open-ended answers of 226 quantitative survey questionnaires and 8 semi-structured in-depth interviews. Research was approved by Research Ethics Committee of the University of Tartu.

Preliminary data analysis reveals that due to COVID-19 various changes were implemented in the processes of patient management. Partly these changes were related to the reorganization of the work in ambulances, emergency rooms and intensive care units. One of the main criteria for changes in triage pathways were related to the symptoms attributed to COVID-19. Respondents admitted that while the reorganizations had positive implications for healthcare professionals, including ensuring the effective functioning of healthcare sector, individual patients could have perceived those as stigmatizing. Participants perceived COVID-19 as an indicator for increased health inequality due to stigmatization, long-lasting examination and cleaning of ambulance cars that prolonged the access of care for those in urgent (non-COVID) need, limited access to healthcare among other patients (e.g., chronically ill) and lack of unified guidelines between healthcare institutions to manage patients with different illnesses.

To secure access to healthcare to all relevant population groups, countries need to develop sustainable and unified guidelines considering also the potential of COVID-19 to increase further health inequalities.

Informal Helping in a Lockdown: Examining the Effect of the First COVID-19 Lockdown in the Netherlands on Informal Helping

Marlou Ramaekers, Ellen Verbakel, Gerbert Kraaykamp

Radboud University, the Netherlands,

In March 2020, the Netherlands went into an 'intelligent lockdown' to combat the spread of COVID-19. Media and politicians called for solidarity and to help each other to get through this lockdown, yet COVID policy restrictions discouraged social interactions, which are necessary for helping. Hence, despite calls for solidarity, the provision of informal help may have declined during the first lockdown in the Netherlands. Our paper provides more insight into the changes in informal helping during the first lockdown by performing two studies. Our first study is descriptive and answers the question to what extent informal helping changed and the regional differences therein, as the outbreak of COVID-19 was largely limited to a few regions during the first lockdown in the Netherlands. Our second study uses theoretically derived hypotheses to explain whether people that had higher motivation (e.g. stronger feelings of solidarity), more opportunities (e.g. more social contact) or more resources to help (e.g. more time) reduced their informal helping less. For both studies, we use panel data from SOCON, collected in February 2019, February 2020 and July 2020, allowing for a natural experimental design. Preliminary results show that people reduced the amount of help they provided. Surprisingly, we found little regional variation in this change in informal help; informal helping changed in a similar way across regions, regardless of the prevalence of COVID. Moreover, our study shows that people who were motivated by increased feelings of solidarity and increased opportunities indeed declined informal helping less.

Cultivating a Self-Aware Self: A Study of Yoga as Transformative Health Practice

Albert Banerjee, Sachne Kilner

St.Thomas University, Canada

Sociological research has provided a unique frame to understand the rapid growth of alternative health. It suggests that people's engagement with alternative health is not motivated merely by medical concerns but may be seen as forming part of a broader social movement responding to the limits of modernity. Within this view, alterative health modalities are seen to act as cultural laboratories, wherein people experiment with non-modern ways of being and living. Contributing to this line of inquiry, our paper seeks to explore the transformative dimensions of contemplative practice, specifically yogic meditation. Inspired by de-colonizing methodologies, we conducted an interdisciplinary, collaborative ethnography of a yogic meditation institute in India. In this paper we describe the goals of yoga and the strategies employed by experienced practitioners. We found that yogic practice was oriented around revealing an underlying, unchanging awareness. By employing the strategies of sifting, sourcing and dwelling, practitioners sought to establish their sense of self as this awareness. Practitioners reported experiencing not only a radical transformation in their experience of self but also in their relationship to the mind, thoughts, and emotions. We conclude the paper with a discussion of yoga as a technology of self and explore how it may contribute to re-imagining health in more sustainable, life-affirming directions.

How Can Somatic Approaches Influence the Well-being of Vulnerable Communities?

Diana Szakal, Eszter Kelemen

Environmental Social Science Research Group, Hungary

While the types of risks that different vulnerable communities face are very diverse, what these groups have in common is that they are at an even higher risk of experiencing challenges in terms of health and well-being (Priebe et al., 2012) and their social circumstances decrease their ability to face these challenges (Hester, 2015). In our collaborative research with the initiative of AdniJóga (https://www.adnijoga.hu/), a Hungarian social enterprise providing trauma-informed yoga classes to a diverse group of vulnerable communities, we set out to explore the possible benefits of this somatic approach to the well-being of participants. Via a multi-stage qualitative process, centred around a grounded-theory based analysis of focus groups and semi-structured interviews, we were able to identify several impacts on the physical, emotional and mental wellbeing of individual participants. Going beyond the individual level, the yoga teachers' change in perception, resulting in the reconceptualization of individuals living with vulnerabilities can help to increase the visibility of and the sensitivity and acceptance towards these communities. In addition, the ability of this type of somatic approach to build bridges among diverse languages, cultures and social circumstances point towards the creation of new social places of inclusion, acceptance and support. The research has been funded by the EU H2020 project INSPIRES (grant agreement No 741677).

Study of health in two communities in Northern Norway

Jorid Anderssen, Trude Gjernes

UiT The Arctic University of Norway, Norway

In this project, we have studied health understanding and health beliefs in people living in the northern part of Norway. In this county, the mortality and morbidity rate are higher than in other counties in Norway. Even though the health differences have decreased over time, health differences remains. We have studied two rural communities where most of the population is mainly involved in primary industry: a Sami inland municipality and a coastal fishery community. The question we ask is what health means to the people living there. How do people interpret health in their everyday life? What do they emphasize with regard to health issues, and do they think that they have control of their own health outcome? What are their explanations for the differences in health between their county and the rest of Norway? In this study, we have used a qualitative approach. We have interviewed men and women in different age groups about their relation to health issues. We use biographical interviews that focus on health in their everyday life over time. By doing this, we have been able to explore to what extent the population is concerned about the differences in health outcome between this county and the rest of Norway. We want to explore their thoughts of what can be done to change their health situation. The theoretical framework is influenced by Cokerham's lifestyle model and critical realism.

Well-being Under Covid-19 Lockdown Conditions: A Multilevel Analysis Of The Italian Case

Carlotta Piazzoni, Tiziano Gerosa, Chiara Respi, Marta Pancheva, Egidio Riva, Davide Bussi, Mario Lucchini

Università degli Studi di Milano-Bicocca, Italy

The beginning of the COVID-19 pandemic and the related stay-at-home policies may have been a significant shock for people's quality of life. Therefore, our aim is to model the effect of COVID-19 on Italians' subjective well-being. The objective of this paper is to model individual subjective well-being (SWB) as a function of an exogenous aggregated "ecological" variable, namely, mortality rate. We use data from "ITA.LI COVID-19 survey", a survey on the impact of COVID-19 in Italy conducted on a respondents' sample drawn from the longitudinal survey on Life Courses in Italy (ITA.LI – Italian Lives). Thanks to the sampling design we are able to introduce a multilevel model in which two occasions (before and after the pandemic outbreak) are nested within subjects, which are then nested within municipality of residence. In this way, it is possible to introduce a three-level hierarchical model. More precisely, together with the repeated occasions (e.g. data on SWB, age, employment status, insomnia, and physical activity collected both before the pandemic and after the pandemic outbreak), individual variables (constant within individuals such as gender, citizenship) and context variables (aggregated measures such as mortality rate, illiteracy, unemployment, mobility, and conservation level of residential buildings) can be introduced in the model. We expect to find a significant effect of such an exogenous shock (approximated by an excess of mortality, our focal predictor) on individuals' well-being.

'It Feels It's Wasting Whatever Time I've Got Left: Emotional Work And Living With Treatable But Not Curable Cancer During The COVID-19 Pandemic

Eloise Radcliffe[1], Aysha Khan[2], Richard Berman[2], Sara Demain[3], Claire Foster[1], Susan Restorick-Banks4, Alison Richardson[1], Richard Wagland[1], Lynn Calman[1]

[1]University of Southampton, United Kingdom; [2]The Christie NHS Foundation Trust Manchester, United Kingdom; [3]University of Plymouth, United Kingdom; 4Patient Representative

Background. People diagnosed with treatable but not curable cancer (TBNCC) are increasingly living for months or years with incurable disease, often undergoing multiple episodes of treatment that may delay progression of cancer, alleviate symptoms and prolong life. They are a growing group with a complex set of needs. In 2019 patients and informal carers were recruited into the ENABLE study (Calman et al 2019) which aimed to conduct longitudinal interviews over a year to understand self-management for people with TBNCC. Interviews continued during the period of UK lockdown allowing the opportunity to gain rich insights into the experiences of patients, who were shielding, and their carers during the COVID-19 pandemic.

Aim. To understand the impact of COVID-19 on the lives of people living with TBNCC.

Methods, Qualitative telephone interviews were conducted, audio recorded and transcribed verbatim, analysed using an iterative, inductive approach.

Findings. Thirty-five participants (21 patients and 14 carers) living with TBNCC participated.

Participants already lived with and coped with uncertainty, however the COVID-19 pandemic heightened this uncertainty and the sense of lost opportunities to do the things that were important to them in the limited time they had left to live. Drawing on Hochschild's (1979) notion of emotional work, this paper will discuss the types of emotional work patients engaged in to manage this uncertainty and sense of loss, as part of their self-management. We will also discuss the emotional work of the carers who engaged in work to manage their own feelings as well as those of the patient. We will conclude by discussing the wider implications of our findings within the context of living with and manging a life-limiting illness.

'I'm Afraid to Be Left Alone with This Disease': Originals of and Ways to Overcome Fear of Cancer

Daria Asaturian, Sergey Startsev

HSE University, Russian Federation

Cancer represents the second most important cause of death and morbidity in Europe and Russia (WHO, 2019). Besides, 60% of Russians are afraid of cancer and 36% are sure that cancer always leads to death (Levada-Center, 2018). The issue is becoming even more burning as this carcinophobia keeps people from early screening, while approximately 40% of newly diagnosed cancer cases in Russia is stage III or IV (Cancer Medical Care in Russia, 2018). Despite the magnitude of the problem there are almost no studies that help us understand what and why so scares people about cancer as well as how this fear is manifested and overcome in everyday life and practices. During the study we conducted 27 in-depth interviews with Russian people of different age, gender, socio-economic status and family history of cancer to rich the data reflecting ordinary beliefs and fears about cancer.

According to the results, members of our study use not only 'universal' explanatory models of their fear - cancer is perceived as deadly, painful, random, and unpredictable disease, but also socially and culturally embedded ones, highly related to the level of country's socio-economic development, level of general trust, trust in key institutions (e.g., medicine), and conditions of palliative care in Russia. Moreover, cancer is believed to make an individual both an emotional and financial burden for their family. To overcome those fears people resort to lay epidemiology (using a private understanding of genetics and category of "blind" destiny) and the idea of controlling health risks.

The Redistribution Of Power Between Patients And Healthcare Professionals In Cancer Patients Engagement Practices

Marta Gibin

University of Bologna, Italy

Patient engagement challenges traditional power relationships, promoting a shift from a paternalistic to a patient-centred approach in doctor-patient interactions. Research shows that patient engagement is associated with higher compliance, costs cut, and increased patient satisfaction towards the care process, so it is key to invest in the promotion of these practices, even more so in the case of chronic illnesses such as cancer. However, translating this approach into practice remains sometimes still problematic. Through in-depth interviews with healthcare professionals and members of cancer patients' organizations, the paper provides a focus on the level of dissemination of engagement practices in the assistance provided to cancer patients in the Italian region Emilia-Romagna. Engagement practices involve a process of power redistribution between healthcare professionals and patients; an ongoing change which has started with the advent of technology, the increased health literacy of patients, and the primacy of patient's autonomy promoted by social movements. The focus of the study is to understand how patient engagement practices are perceived by healthcare professionals and what impact they have on the organization of the healthcare system. What are the challenges that healthcare professionals encounter if they try to engage patients in the care path? What is the new role of healthcare professionals in this context? Results show that, while there is general agreement on the importance of engaging cancer patients in the care path, some doctor-oriented practices still persist.

Balancing Individual and Institutional Cultural Health Capital: the Case of Prevention Lifestyles and Organised Cancer Screening Programmes

Vincent De Prez[1], Vladimir Jolidon[2], Piet Bracke[1]

[1]Department of Sociology, Ghent University, Belgium; [2]Institute of Sociological Research, University of Geneva, Switzerland

Background. Within the agency-structure debate for explaining inequalities in preventive healthcare behaviour, cultural health capital and 'preventive lifestyles', alongside institutional factors, have been suggested as explanatory pathways.

Aim. This study investigates the link between individual women's primary and secondary prevention lifestyles and Pap smear, mammography and FOBT screening uptake, in relation to the availability of organised cancer screening programmes. Doing so, we aim to assess the dynamics between individual responsibility, institutional cultural health capital and crowding out.

Methods. A two-level multilevel design with 50-64-year-old women (N=43'727) nested in 31 European countries was used to analyse data of the second wave of the European Health Interview Survey. Separate models were estimated for primary and secondary prevention, and for the different screening outcomes.

Results. Firstly, women with a primary and secondary prevention lifestyle had a higher likelihood of screening uptake for all three screening outcomes. Secondly, we found that these effects are smaller in countries where organised cancer screening programmes are in place, compared to countries without such programmes.

Conclusion

The findings suggest that having a prevention lifestyle at the individual level has a cumulative effect on doing other forms of secondary prevention too. Further, as individual preventive lifestyle matters less when organised screening programmes are available, cultural health capital at the institutional level can compensate for absence of cultural health capital at the individual level, resulting in lower levels of inequality in screening uptake. This indicates organised screening programmes' potential of socialising a whole population into a general prevention lifestyle.

RN16_T04_02 | The Impact of COVID-19 II: Psychosocial Consequences

Exploring Determinants of Worries Related to COVID-19 of Higher Education Students in Hungary During the First and the Third Wave

Anikó Vincze

University of Szeged, Hungary

The Coronavirus pandemic has been challenging societies and individuals for more than a year by now. Health anxiety and worries have been rising since the beginning. When COVID-19 appeared and began to spread all over the world, people started worrying because the virus was a yet unknown threat. During one year people gained experience, many got sick themselves or had family members, friends struggling with the disease or - in the worst case - even lost their loved ones. The extent of worries and the factors influencing them therefore went through a change during this period of time. My presentation aims to reveal the determining social factors of the extent of worries about COVID-19 at the individual and the social level from a time perspective. The analyses will be based on two online surveys which intended to explore the well-being of students and the changes in their lives in times of COVID-19, conducted in May 2020 and March 2021 among higher education students in a Hungarian University. The first survey was part of an international research partnership therefore the Hungarian results can be interpreted in an international context. The presentation will consider the role of socio-demographic factors, health status, social embeddedness and experiences with the virus in the extent of worries for oneself and for people in the personal network to get infected and ill. The revealing of the influencing factors of worries can contribute to a better understanding and identifying of mentally vulnerable groups in future pandemics.

RN16_T04_03 | The Body & Bodily Practices

Fitness Interrupted - Exploring Fit Bodies In Crisis

Anne Louise Fink, Alev Kuruoglu, Dorthe Brogård Kristensen

University of Southern Denmark, Denmark

During the Covid-19 related lockdown, fitness practitioners were cut off from the spaces, objects, and socialites that facilitated their workouts. We investigate how a crisis such as the current pandemic, which brings about serious spatial limitations upon one's modes of social as well as bodily conduct, in turn affects bodily practices, orientation and well-being in the context of a consumer society based on values of performance and productivity. Based on interviews and diaries with gym-goers enrolled in high-performance fitness cultures, we set out to construct a critical phenomenological account of "fit bodies" in crisis. We find that for practitioners of body cultures centered around performance, routine and progress, the lockdown of gyms not only disrupts routinized practices but also challenges the ethos of fitness. Drawing on Sara Ahmed's work on the relations between bodily orientation and space, we demonstrate how being shut out from habitualized fitness spaces generates bodily and affective disorientations; expressed through emotions of longing for the gym and fears of losing control over the body and its capacity to perform and progress. We also identify the ambivalences in modern high-performance cultures, highlighting the alternative possibilities that the lockdown opens up, such as feelings of relief and a reorientation of the body towards less performance-oriented types of fitness activities or other bodily practices. We find that new bodily experiences surface when practices, forced by the spatial transformations brought about by lockdown, transform into modes of workout or other activities based on a bodily scheme of the here and now.

Obesity as a Social Problem: a Qualitative Study of Eating and Physical Exercise Practices in Households with and Without Childhood Obesity

Sonia Otero-Estévez

UNIVERSITY OF OVIEDO, Spain

Obesity is one of the main health problems in modern societies. Available sources of information show that it has increased throughout the world and is more widespread in lower-level socio-economic groups. The most recent studies indicate that the key to understanding the problem lies in the social routines where the changes linked to modernity have been laid down. These changes have transformed how health and the body are understood and have made the ideal of well-being—and with it, physical exercise and eating—the center of attention. All these aspects show that obesity, more than being just a health problem, is a social problem.

Adopting the Theories of Social Practices approach, this paper aims to investigate the processes that lead to obesity through analysis of practices relating to food and physical activity, and the social factors that favour or hinder individuals' participation in and commitment to these practices. Using a qualitative methodology, it compares two groups of households: those with obese children and those without. Thirty semi-structured in-depth interviews were conducted with households at different socio-economic levels.

The main conclusions show complex relationships of collaboration and competition between practices which, together with personal experiences, learning, knowledge and resources, affect how far individuals feel committed to eating patterns and physical exercise, imprinting these variations in their lifestyles. These relationships also require cooperation between individuals. The results contribute new evidence on areas where public policy could intervene to establish or break links between practices, or to take the key elements—materials, competences and meanings—that make practices tend towards less healthy configurations and replace them with others that lead to better results, making them more attractive to individuals.

Performing Health, Body Control, And Virtuosity In Lockdown? Fatphobic Memes As Expressions Of Regressive Body Politics

Hannele Harjunen[1], Saara Särmä[2]

[1]Hannele Harjunen, University of Jyväskylä, Finland; [2]Saara Särmä, Tampere, University, Finland

A long term conflict exists between healthism (culminating in the obesity epidemic discourse) and progressive body politics (e.g. the body positivity movement, fat activism, and HAES). This conflict resurfaced during the Covid -19 lockdown period in the spring of 2020. Initially, media reported and social media filled with posts about the rise of home cooking, baking and comfort eating. However, this soon turned to concern and anxiety about weight gain. Health officials began to give advice on how to eat during the lockdown, and social media in particular was filled with posts about "corona weight", "corona pounds" and fatphobic memes about the threat of weight gain. Sensitivity toward weight and eating promoted by some public health officials, eating disorder advocates and body positivity movement were forgotten.We examine how these fatphobic memes work as visual discursive arguments that may appear innocent on a personal level, but align harmfully in the wider political context creating a hostile environment and conditions for weight discrimination. We interpret the situation as an (re-)emergence of what we have named regressive body politics, i.e., body politics that uses affective tools such as shaming, fear, and threats in order to (re-)produce normative body ideals. These tools have been common in official public health, media and, marketing discourse, and now also this particular set of memes function as performative visual acts through which individuals prove their worth and virtuosity while possibly inadvertently engaging in regressive body politics. Through a categorization and critical feminist analysis of these memes, we examine different components of regressive body politics. Furthermore, we argue for the need to better understand regressive body politics in order to dismantle its harmful effects.

Aging in a Sami Society

Trude Gjernes[1], Jorid Anderssen[2]

[1]Nord University; [2]UiT. Norges Arktisk universitet

Physical activity is often presented as a significant determinant for health and wellbeing. This paper explore why ordinary people take part in physical activities, such as exercise and outdoor activities , what informants mean when they talk about the physical activities they are engaged in, and to what degree these physical activities are motivated by health concerns or wellbeing.

The paper is based on interviews with 60 women and men equally divided, in the ages 30-70 years old, living in three municipalities in Norway. Theoretically the paper draw on social practice theory and theories of extended cognition.

Preliminary findings indicate that interviewees are engage in three forms of physical activities; physical exercise, outdoors activities and work-related physical activities. Informants' preference for exercise and outdoor activities seem to be profoundly governed by external structural or environmental conditions. Their choices pf physical activities are affected by nature, different forms of environmental material factors and cultural traditions and habits typical of where they live. Local conditions and structures disclose affordances and restrictions with regard to physical activities that people adjust to, and influence which activities are considered as possible or common to practice and not. When local conditions change, social practices related to exercise and outdoor life seem to change.

The three forms of physical activity are partly differently determined and partly not. In particular are exercise and some forms of work-related activities determined by health and body projects, while outdoor activities are mainly determined by the informants' wish for wellbeing.

'English Medicine From A Pharmacist I Know': Self-Medication With Pharmaceuticals In Rural Sri Lankan Households

Supuni Liyanagunawardena[1,2]

[1]Victoria University of Wellington, New Zealand; [2]University of Sri Jayewardenepura, Sri Lanka

Pharmacists play an increasingly important role in terms of access to biomedical pharmaceuticals and self-medication practices. Their role becomes further accentuated where biomedicine, as the most popular therapeutic modality, is both conflated with postcolonial tensions and creolised by indigenous therapeutic knowledges. Drawing from my ongoing doctoral research into household therapeutic practices in Sri Lanka, this paper is an attempt to explore how community pharmacists engage with and shape the treatment seeking practices in a rural community.

My research findings indicate that community pharmacies were widely accessed by households, in contrast to the public sector health services that are free-of-charge. Low state regulation, resulting in increased flexibility of pharmacy services (despite potentially risky practices), added to their popularity. Pharmacists appeared as 'locals' straddling the boundary between health professional and the (lay) people. On the one hand, they had close affinity to the community and were knowledgeable of people's health and economic concerns; while on the other, they were gatekeepers to pharmaceutical access. In a health emergency or economic hardship, pharmacists offered cost-effective and tailor-made solutions. Further, by translating the biomedical into local idiom and vice versa, they enabled the biomedically illiterate to access pharmacotherapy on their own terms, overcoming the popular construction of 'English medicine' as risky and toxic.

Based on household interviews and deploying notions of trust/mistrust, I argue that the unique positioning of pharmacists in the community and their (perceived) expertise are vital towards the popularity of biomedicine, and particularly for pharmaceuticals to become therapeutic substances in the household.

A Long and Winding Road: Narratives on Habitual Use and Cessation of Sleeping Medication and Tranquillisers

Melissa Ceuterick

Universiteit Gent, Belgium

The widespread use of benzodiazepines and z-drugs (BZD/Z) -the most widely used class of sleeping medication and tranquillisers- has been called a silent epidemic. In Europe, Belgium ranks indisputably high in international comparisons, with at least 13% of the total population using sleeping medication and sedatives. As prescription medication, the use of BZD/Z falls within legal boundaries, which is likely to contribute to a wider social acceptability and to a potential underestimation and underrecognition of dependence and other health risks of habitual use. Public perceptions of these prescription drugs are not always aligned with scientific evidence about their relative harm. Moreover, social perceptions of use and dependence are slow to change and considerably influence individual users' perceptions. As such the use of BZD/Z gradually becomes part of users' health identities or the embodied subjectivities of people using medical technologies and pharmaceuticals. Drawing on a narrative analysis of the medication trajectories of 30 long-term and former habitual users (interviewed between August 2019 and January 2021) we explore how these habitual/former users construct their health identity and build images of their pharmaceutical selves through interpretation and appropriation of mainstream labeling categories of medication use and dependence. These results are increasingly important given that since COVID-19 there has been a substantial rise in sleeping problems and anxiety and related medication use (with 18,2% of BZD/Z use in March-May 2020).

Pluralistic Microbial Healing: Local Health Traditions, Embodiment, and Inequalities

Andrea Núñez Casal[1,2]

[1]Centre for Socio-Legal Studies, Oxford University; [2]Instituto de Estudios de Género, Universidad Carlos III de Madrid

Local health traditions have largely been devalued in the biomedical understanding of health and disease. This approach fails to recognise that a population can be 'self-reliant' in its health care practices, a philosophy and perspective that is held within non-Western health cultures such as Ayurveda in India and traditional medical systems in East Asia. Among the unintended yet damaging consequences of Cartesian divides (traditional medicine/biomedicine, science/people), the overuse of drugs such as antibiotics and antimicrobial resistance (AMR) have become critical matters of public/global health agendas. The coronavirus pandemic demonstrates that biomedical disease control alone is insufficient when considering the overall health and wellbeing of a population. For example, in the absence of appropriate (health)care, dietary changes along with supplements from various medical traditions have not only emerged as effective cures and remedies for healing from Long Covid; they have also become biopolitical tools to self-manage vulnerabilities and inequalities (i.e. healthcare, employment, and childcare) in convalescence.

The paper engages with local, traditional, and profane healing knowledge-practices as a collective and sustainable health care approaches as well as biopolitical tools of individual responsibility. This paper introduces the socio-cultural histories of microbial healing as key to resurface and update folk cures as effective approaches to 'recalcitrant infections', those recurrent or persistent without a clear biomedical explanation or treatment. In doing so, it demonstrates that embodied narratives, informal personal and collective pharmacopoeias and domestic management of persistent and relapsing microbes (E.coli, SARS-CoV2) offer rich data on how to understand and approach recalcitrant infections differently.

628

Pain in Discourse and Pain in Practice. Contradictions between Public Discourses and the Experience of Pain

Jose Antonio Cerrillo Vidal[1], Isabel García Rodríguez[2]

[1]Universidad de Córdoba, Spain; [2]Instituto de Estudios Sociales Avanzados (IESA-CSIC)

Pain is not a simple physical or external stimulus. It has to be interpreted by the brain to be considered as such pain. To this extent, it has a strong sociocultural component. In this contribution we present the results of a qualitative study about the legitimacy of pain in Spanish society, including 8 focus groups and 19 interviews . The results point to a strong divergence in public discourses on pain and the experience of people suffering from different types of pain. Thus, attendants to the groups showed great empathy and understanding towards all variants of pain, including psychological and emotional pain. However, the interviewees agreed to recognize a huge pressure from the environment to normalize their behavior or hide their suffering. It included different strategies, such minimize the pain suffered, question the credibility of the people in pain and estigmatize them as weak or false. Both possible causes of these differences between public discourses and daily practices, and the implications for the quality of life of people in pain will be discussed.

RN16_T05_02 | The Impact of COVID-19 III: Health Experiences

Vulnerable People Between Pandemic and Lockdown in Some Cities in Lombardy. Everyday Life, Assistance and the Uncertainty of the Future

Lia Lombardi

University of Milan, Italy

629

COVID-19, the largest and most serious pandemic of the last hundred years. According to Ulrich Beck (2000), we can interpret the pandemic as an example of the "Risk Society" highlighting the uncertainties in science and its experts; insecurities in the welfare state; lack of safety in our lives and health. In this context SISS (Società Italiana Sociologia Salute) has designed a quantitative and qualitative study which focusses on the impact of the virus and lockdown on the everyday life of vulnerable people in some Italian region, on the reorganization of social and healthcare policies and future prospects. The research proposed is part of the aforementioned study and it concerns Lombardy, the region in Europe most affected by the virus.

The study - carried out between June and July 2020 - used a qualitative methodology that included twenty in-depth interviews with stakeholders of local institutions and the third sector of the cities of Milan, Brescia, Cremona, Mantua and Pavia.

The multifactorial nature of social vulnerability emerges from the research. Illegal migrants, homeless, sex workers, the poor are at risk of survival because of isolation, lack of resources, exclusion from welfare benefits. Conflict and domestic violence worsen; poor children and students do not have the means to continue their schooling from home. There is a higher rate of infection among migrant women than men, probably due to women's working environments: hospitals and elderly care facilities. In Lombardy, in the face of a great weakness of regional healthcare, a significant programme of city policies for the management of social and health emergency has been implemented, in collaboration with local institutions and organizations of the third sector.

"I Will Tell You About My Covid": Voices Of People Healed From Sars-Cov2. First Results Of An Empirical Survey

Maurizio Esposito

University of Cassino e Lazio Meridionale, Italy

In this work, an attempt was made to explore how people have dealt with the experience of Sars-Cov2 disease, by analyzing the construction of meanings related to a highly traumatic event that suddenly disrupts, altering a person's individual balance and his whole social life. The research was conducted in the Central Italy, a frontier territory, where the population is distributed over numerous small municipalities, which represents a social laboratory to study how the incidence of a pandemic on a planetary scale has affected individual lives in a fragile area.

The corpus of data consists of 25 individual deep interviews conducted remotely on a virtual platform. The analysis was conducted following the Narrative analysis method through the R-Text Mining Package software using text mining, word relationships and sentiment analysis tools.

From the analysis of the interviews, a series of particularly relevant areas and dimensions emerged in order to assess the impact that the disease has had on people's lives both individually and socially. Specifically, two focuses emerged: social stigma deriving from the "return to society" of the healed people, and their evaluation of the health communication (on a direct and indirect level) to which they were exposed. In the first case, all the interviewees have experienced and continue to experience episodes of discrimination or in any case of social discomfort within the working environments and daily life. The second topic that emerged is closely linked to the first one, and it concerns the disinformation on the Covid disease to which the population considered in our empirical reference universe is exposed every day.

RN16_T05_03 | Health Technologies

Sharing Genetic Data For Research Purposes: Expectations And Concerns By Patients And Carers

Mariana Amorim, Susana Silva, Cláudia de Freitas

EPIUnit, Instituto de Saúde Pública da Universidade do Porto, Portugal

Genomic research demands access to large datasets, which are rely on individuals' willingness to voluntarily share their data. Understanding people's expectations and concerns with genetic data sharing is essential to ensure that their views are embedded in research design, to promote engagement and to develop ethical, legal and social research frameworks. Based on 651 questionnaires and 41 semi-structured interviews, this mixed methods study aims to explore the views of patients and carers followed at two Portuguese rare diseases reference centres about the benefits and risks associated with genetic data sharing for research. Questionnaire results showed that participants considered the potential to discover a cure for untreatable diseases as the most relevant benefit (87%), followed by the development of new drugs/treatments (46%) and of personalized treatments (39%). Patients, younger participants, and those less willing to share data were mainly concerned with lack of security and control over data access, while carers, participants with high education and white-collar occupations worried primarily about the possibility of extracting information that exceeds research objectives. Interviewees highlighted additional concerns related to data misuse and insufficient guarantees of privacy and anonymity. Participants asserted the need for governance practices ensuring data security and anonymization, supervision of data use, and a commitment to informed consent assumptions. Anticipating public expectations and concerns is crucial for promoting inclusive data-sharing initiatives and fostering social equity in genomic research.

Trust but Verify: Patient Experience in the Context of Healthcare Digitalization

Elena Bogomiagkova, Ekaterina Orekh

St.Petersburg State University, Russian Federation

The strengthening of the digitalization trend in healthcare has become one of the significant consequences of the global COVID-19 pandemic. Digitalization turns into a routine of modern man and transform the patient experience dramatically. In this regard it is important to study the process of integrating technological innovations into the health practices of ordinary people.

The empirical basis of this research was the results of more than 80 in-depth interviews with residents of St. Petersburg (Russia) over 18 years old who use digital technologies to maintain health and receive medical care. As a result, three main options for including technologies in health care practices were identified: using different telemedicine services; search for medical information and support on the Internet resources; digital self-tracking. Nowadays the patient experience acquires a hybrid character and is realized in augmented reality mode. The combination of online and offline practices, patient choice in favor of one alternative or the other, on the one hand, are context-dependent (e.g., the presence of chronic diseases, the severity and novelty of the symptoms, etc.), on the other hand, are determined by the solution of issues of autonomy, trust, and responsibility. Professionals are losing their monopoly on providing medical services and are forced to compete with different Internet sources, bloggers, and network communities. Online interaction with a doctor requires the patient to be more competent in assessing and understanding his own condition, that evens out the traditionally non-symmetrical interaction. A patient is encouraged to be self-advocated and pro-active, but at the same time this situation triggers a continuous search and (re)verification of relevant information on numerous resources, that introduce significant uncertainty in the patient experience.

Patients' Perception Of Arthroplasty Delays In Italy Due To COVID-19. Uncertainty As A New State Of Mind

Iuliia Urakcheeva[1,2], Marina Torre[2], Virgilia Toccaceli[2]

[1]Sapienza University of Rome, Italy; [2]Italian National Institute of Health, Rome, Italy

Italy has been one of the nations hit the hardest by the first Covid-19 wave. To face the emergency, from March until May 2020 all delayable elective surgeries were postponed in almost all hospitals and performed at a reduced pace until the end of 2020. As a result of these conditions more than 50.000 patients, mostly suffering from osteoarthritis in need of a prosthesis implantation (hip, knee, shoulder, or ankle), have not known when the surgical activity would finally resume and when they would be operated.

The first studies on this subject belong to surgery literature (Cisternas et al., 2020; Wilson et al., 2020). The intention of this explorative study is to tackle the problem of the emotional status of this vulnerable group. What were their key emotions about the situation of uncertainty, how did they manage it, and how did it influence the doctor-patient relationship? Our main objective is to obtain a snapshot of the situation and to lay the basis for further considerations on what can be done to mitigate the risk of the growing disorientation on the patients' side. From a methodology point of view, the research consisted in semi-structured interviews on a sample of patients of public and private hospitals in Italy, as well as with orthopaedic surgeons members of the scientific committee of the Italian Arthroplasty Registry (RIAP). Results have been compared to the international literature on the subject. Understanding patient's perception of both their own state of health and the uncertainty of the situation might help improve the decision-making in public health, hence benefiting the quality of the care services.

631

In the Eye of the Beholder: Perspectives of the Audiological Rehabilitation Process

Tali Bar-Moshe, Paula Feder-Bubis, Dan Greenberg

Ben-Gurion University of the Negev, Israel

The patient-clinician interaction shapes chronic patients' involvement and participation in health-care therapy. If these long-term relationships are based on trust, they enable the patients to share their needs and expectations. The patient-clinician alliance may create a synergy that in turn impact treatment's outcomes and both patients' and clinicians' satisfaction.

Such an alliance may be found in the audiological rehabilitation process, between audiologists and persons with hearing loss. The latter is a common chronic condition that affects different aspects of the lives of many older adults. This alliance includes, among others, counseling, shared decision making, training, hearing aids and assistive devices fitting, and elucidating hearing strategies. The purpose of the audiological rehabilitation process is to reduce the hearing loss impact on the function, activity, participation, and quality of life of the person with hearing loss. Unlike treatments for other chronic health conditions, the audiological rehabilitation trajectory is derived not only from changes in the hearing level, but mainly from the patient's preferences, hearing aids technologies, regulations, and other contingencies.

This presentation argues that hearing aids users and audiologists have common as well as dissonant perspectives regarding this process that may influence the patient-clinician alliance. Data were collected using three focus groups with 16 hearing aids users and 11 open-ended interviews with audiologists. Data were thematically analyzed; their coding and categorization were conducted using ATLAS.ti8 software. We will discuss the discrepancies between patients' and clinicians' perspectives and their implications for the long-term audiological rehabilitation trajectory.

RN16_T06_01 | Vaccines & Vaccination I

'I am Not a Sheep. I Think This is my Choice': Vaccination Hesitancy Among Russian Urban Parents

Ekaterina Borozdina

European University at St.Petersburg, Russian Federation

Attitudes toward vaccination - in particular, hesitant attitude - constitute a prominent subject for social studies of health and illness (see for e.g. Yaqub et al, 2014). The COVID-19 pandemic and the efforts to overcome it by the means of vaccination have enhanced relevance of this well-established research topic even more. This paper contributes to the sociological literature on immunization by investigating the reasons for vaccination hesitancy among middle-class urban parents in Russia.

The study is conducted in qualitative paradigm and relies on 30 semi-structured interviews with parents of pre-school children (7 years of age or younger). Interviews were collected in November 2019-January 2021 in Moscow and St.Petersburg. Parental strategies in the research sample reflect the spectrum of hesitant attitudes toward immunization of children: from complete refusal to selective vaccination.

The analysis of these materials follows two interconnected lines of argumentation. First, I argue that the attitudes and practices related to vaccination are instructive of social class formation in post-socialist society. Vaccination hesitancy among wealthy urban parents is indicative of the emergence of the new type of citizen - citizen-consumer - in major Russian cities. Second, I elaborate on how attitudes toward vaccination are embedded in institutional landscape of Russian healthcare. Parental distrust toward vaccination in this context does not equate with distrust in medical science or resistance to medicalization, it rather reflects citizens' relations with the state and healthcare organizations, which remain predominantly under state control.

632

Repertoires of Vaccine Refusal in Romania

Cosmin Paul Toth

University of Bucharest, Romania

In this study my aim was to analyze public repertoires which are available to parents as discursive resources to substantiate their decision not to vaccinate their children. Online content, two televised talk shows and a series of interviews with parents who refused vaccination from 2017–2019 were analyzed using discourse analysis (DA) and discursive psychology (DP) tools. The main analytic units in DA and DP are the interpretative repertoires defined as repeatable building blocks speakers use for constructing versions of actions or justifying decisions. As a result of this analysis, I have identified a series of repertoires such as distrust repertoires, rejecting any risks when it comes to children, vaccine ineffectiveness and 'immunity is a limited resource that should not be forced'. These repertoires do a discursive work that seem to go beyond signs of concern or challenges to vaccine safety to perform a moral and epistemic delegitimization of the current system of medical services, medical research and government authorities. Moreover, the identification of the repertoires that circulate in the public space as resources fulfil a discursive function of replacing the current system with new moral and epistemic perspectives.

The Non-Vaccination Stage Model (NVSM): The Decision-Making Process Among Israeli Ultra-Orthodox Jewish Parents Who Do Not Vaccinate Their Children

Ariela Popper-Giveon[1], Yael Keshet[2]

[1]The David Yellin Academic College of Education, Israel; [2]Western Galilee College, Israel, Israel

Although vaccination uptake is high in most countries, pockets of suboptimal coverage remain, such as those observed among ultra-orthodox Jews in Israel and elsewhere, posing a threat to both individual immunity and public health. Drawing on the Precaution Adoption Process Model (PAPM), this lecture proposes a Non-Vaccination Stage Model (NVSM) to analyze the decision-making process among Non Vaccinating Parents (NVPs), focusing on the ultra-orthodox Jewish population of Israel. In order to learn about the health-care decision making of this population, in-depth interviews were conducted with 10 Israeli ultra-orthodox Jewish NVPs (mothers). The interviews revealed five stages in the participants' decision-making process: being good mothers who vaccinate their children; emergence of doubts regarding vaccination; personal vaccination policy—hesitancy concerning vaccination; decision not to vaccinate; confirmation signs of what participants perceive as a wise decision. NVSM is a model that can help understand parents who consider non vaccination to be healthier behavior, and explore the various stages of their decision making process. Differentiating among the various stages of NVPs' decision-making processes enables application of different intervention approaches by policymakers and healthcare practitioners in order to increase vaccination coverage. Nowadays, when healthcare professionals and policy makers worldwide are engaged in efforts to vaccinate vast populations against the COVID-19 virus, these understandings can be even more beneficial.

Mobilizing As Professionals Or As Workers? Collective Action Of The Healthcare Personnel In Italy During The Pandemic Between Professional Identity And Class Solidarity

Costanza Galanti

University College Dublin / Università degli Studi di Padova, Italy

After years of mobilizing against the disinvestment in public healthcare, as well as against outsourcing, the freeze of unit wages and of employment turnover in the healthcare sector, the arrival of the pandemic brought an unprecedented attention to the demands of the healthcare personnel. My paper studies mobilizations organized by the healthcare personnel in Italy during the pandemic and considers how they managed to leverage this attention. I show in particular how, in these mobilizations, the negotiation between two identities and their associated demands, frames and networks of alliances played a crucial role. On the one hand, the healthcare personnel stressed their professional identity

and underlined the exceptional contribution brought by specific healthcare occupations to ask for monetary and symbolic recognition of a given category. On the other, the healthcare personnel made reference to class solidarity, framing their demands in terms of workers' rights. I also show how the tension between these two identities is negotiated in the attempt to make the public sympathetic to the healthcare personnel's demands. For my analysis, I draw on a one-year ethnography of collective action and industrial relations in the Italian healthcare sector. The ethnography involved participant and non-participant observation of meetings and protest actions organized by different kinds collective actors such as large and small trans-occupational and occupational unions, as well as groups of self-organized workers organizing over specific trade disputes. I also conducted over 50 recorded in-depth interviews with healthcare activists and trade unionists at the EU, national, regional and the local level.

The "Daily-Context" of Mass Compliance during the COVID-19 Pandemic: A Novel Approach to the Problem of Collective Action

Jon Gunnar Bernburg[1], Sigrun Olafsdottir[1], Magnus Torfason[1], Gudbjorg Jonsdottir[2]

[1]University of Iceland, Iceland; [2]Social Research Institute, University of Iceland

Mass participation in collective action, that is, action that aims to obtain a collective benefit, constitutes a core problem of social theory. This is particularly true of theory viewing individuals not as "cultural dopes", but as actors making "rational" decisions about participation in collective action on the basis of their "here-and-now" evaluations of the expected benefits and costs of the participation. Accordingly, examining participation in collective action ideally requires examination of here-and-now beliefs and perceptions that may shape the rationality of participation. However, studies of collective action rarely operationalise such "real-time" experiences, because individual-level measurement is usually performed after the action has taken place. This study obtains "real-time" data on participation in large-scale collective action, that is, in social distancing measures to slow the spread of the coronavirus in Iceland, in April through November 2020. Our real-time data consist of 1) individual-level data; a daily tracker survey of behaviour and perceptions, and 2) societal-level data; daily observations of the actual infection rate and the social distancing guidelines in operation. Multilevel analysis reveals that, net of the (objective and subjective) threat of the Pandemic, compliance is greater among those who in real-time 1) have higher expectations about collective success (i.e., a greater sense of "collective efficacy"), and 2) believe that many others are complying (i.e., who perceive a greater consensus). Moreover, the strictness of the authorities' guidelines is strongly associated with real-time compliance. Finally, net of all other real-time factors, individual compliance wanes as the objective threat (i.e., the Pandemic) lingers.

Why Croats do (not) Wear Face Masks: The Role of Conspiracy Mentality, Cultural Capital and Social Distance

Edgar Buršić[1], Marko Galić[2], Krešimir Krolo[3]

[1]Faculty of Humanities, Juraj Dobrila University of Pula, Croatia; [2]Department of Psychology, University of Zadar; [3]Department of Sociology, University of Zadar

634

The efficacy of face masks has been widely debated in mainstream and fringe mass-media and a large amount of incorrect information has helped to create and spread COVID-19 conspiracy theories. Findings from recent studies suggest that resistance to preventive behaviours can be predicted by beliefs in COVID-19 related conspiracy theories while psychopathy and risk-readiness were negative predictors of wearing a face mask. The aim of this study was to examine the role of conspiracy mentality, cultural capital and social distance in the explanation of face mask perceptions while controlling for sociodemographic characteristics. 793 Croatian citizens answered the online questionnaire which included sociodemographic questions, the Face Mask Perceptions Scale, the short Conspiracy Mentality Questionnaire, two ad hoc COVID-19 Conspiracy Beliefs, the Bogardus social distance scale and an adapted short version of Cultural Capital scale. The results of hierarchical regression analysis indicate that sex, age, post-graduate education, conspiracy mentality and two ad-hoc conspiracy beliefs have a significant role in the explanation of two reasons for not wearing masks. Namely, older male participants who believe COVID-19 is a hoax and are more prone to conspiracist ideation perceive face masks as a mean of limiting their independence while efficacy doubts about face masks are more expressed in older participants who believe that COVID-19 was human made and is a hoax. Although

political orientation and cultural capital were correlated with most of the reasons for not wearing masks they did not contribute significantly to the proposed models. Theoretical contributions and practical implications are discussed.

Citizens, Prosumers and Citimers during the Covid-19 pandemic

Dino Numerato

Charles University, Czech Republic

This paper analyses the role of citizens during the Covid-19 pandemic. By examining a variety of expressions of citizenship, the study suggests that the health behaviour of citizens can be understood through the lenses of the notion of a citimer (see Numerato & Giulianotti, 2018). The concept of citimer reflects the interplay of citizen and prosumer identities. The prefix citi- refers to the expressions of citizenship while the suffix -mer expresses the identity of a prosumer (e.g. Ritzer & Jurgenson 2010) who is a health care consumer and, at the same time, a health care (co)producer.

This paper provides an empirically informed conceptual analysis drawing on data from mass and social media in the Czech Republic. The paper extends the debates on citizen-consumers, elaborates upon the notion of citimer, and explores its multifaceted and hybrid nature. More specifically, this contribution suggests that as citizens, citimers have responsibly complied with quarantine measures. Furthermore, citimers have acted as volunteers, fundraisers, or, more reactively, as activists resisting the dataveillance quarantine strategies. As consumers, citimers have faced shortages of disinfectants, pharmaceuticals, or medical devices and called for a better choice of and access to medical goods. As producers, citimers have shared information, knowledge, and infrastructures, being, for example, involved in the production of masks, 3D printable respirators, or face shields.

The paper concludes that health-related behaviour in all three dimensions has political and economic implications and has been bottom-up oriented as well top-down driven. Finally, the concept of citimer is presented as a heuristic tool which can serve to comprehend health behaviours not only during the Covid-19 pandemic but in contemporary societies more broadly.

The Essentiality of Immigrant Farmworkers: Necropolitics of Expendability in a Biopolitics of COVID-19.

Panagiota Kotsila[1], Lucía Argüelles Ramos[2]

[1]Institute for Environmental Science and Technology, Universitat Autònoma de Barcelona, Spain; [2]Universitat Oberta de Catalunya, Internet Interdisciplinary Institute

The Coronavirus epidemic has highlighted and exacerbated pre-existing social inequalities worldwide, contradicting trending claims that "we are all in this together" which do not account for the invisibility, hardship and precarity characterizing the lives of marginalized groups, such as agricultural workers. In this article, we bring together theories of bio- and necro-politics (Foucault 1997; Mbembe 2019) problematize the declaration of farmworkers –among other migrant workers– as "essential", and the consequent exceptional immigration policies implemented during the pandemic including the (conditionally) open borders. Through a review of policies and testimonies from across Europe, as well as empirical evidence from one of the main large-scale agricultural areas in Spain between the regions of Lleida and Huesca, we show how such seemingly progressive policies did little to improve the position of immigrant farmworkers with regards to their access to basic welfare safety nets such as social security, healthcare, and labor regulations, or their social inclusion and non-discrimination. More importantly, we claim, this proclaimed essentiality and the related changes in migration policies were biopolitical acts that aimed at protecting the agrifood business and the well-being of Europeans, but made immigrant farmworkers more exposed to and more impacted by COVID-19. This demonstrated their position in a necropolitics of expendability and caused their further stigmatization as "health risks" in local societies.

RN16_T07_01 | Vaccines and Vaccination II

Vaccines in Times of Pandemic. Argumentative Time Work for Vaccine Hesitancy

Simona - Nicoleta Vulpe

University of Bucharest, Romania

Since the beginning of the COVID-19 pandemic there have been expectations for a future vaccine that would end the health crisis. At the same time, corona skeptics and anti-vaxxers have been persistent in their efforts to discredit the vaccine along with other health measures against the pandemic. The health risks they perceive, although dismissed by scientists, are embedded in lay epistemologies and forms of temporality that grant them credibility. I investigate the role of argumentative time work (Flaherty, 2011) in legitimizing vaccine hesitancy and corona skepticism using qualitative data from five editions of a radio show in Romania. Notwithstanding the fact that the radio program and the host have a pro-science stance, skeptics often take the floor to express the risks they perceive and to justify their position. In terms of social representations, vaccines are associated with long durations for development, testing, and effects on one's organism. The rhythm of developing the new coronavirus vaccines is a prominent concern among skeptics, as are the possible side effects temporally located in the post-vaccination sequence. Temporal justifications that precede the corona crisis condemn breaking away with a past when vaccines were produced in Romania. These justifications combine lack of trust in foreign developers and producers of vaccines and lack of trust in the Romanian medical system, with nostalgia for a trusted past when vaccines were developed in Romania, by Romanian scientists. Trust in past medical arrangements is combined with dissatisfaction regarding current public health measures and fear of future health risks.

Becoming A Vaccine Skeptic: How Vaccine Skepticism Trajectories Are Shaped By The Interplay Between Health-Related Events And Health Views

Josje Ten Kate, Willem De Koster, Jeroen Van der Waal

Erasmus University Rotterdam, Netherlands, The

Recent research shows more-educated parents are more likely to be skeptical towards vaccines in Western countries. Given that more-educated individuals are typically raised in milieus that inspire trust in science and modern institutions, this raises the question how these more-educated parents became skeptical towards vaccines.

While studies suggest that vaccine skepticism is dynamic and takes the form of a "trajectory", key questions remain about how these trajectories exactly take shape. Additionally, findings that health-related events (e.g., experiencing adverse effects) can play a pivotal role in (changing) attitudes towards health care, strongly suggest they are relevant to vaccine skepticism trajectories as well. However, it remains unclear how they do so exactly.

Answering the question how we can understand vaccine skepticism trajectories of more-educated parents, we conducted in-depth interviews with 31 Dutch parents who are (or were) skeptical towards vaccination. Reminiscent of Howard Becker's 'deviant careers', our respondents described being 'triggered' to start questioning vaccination. However, we find that how parents experience such a trigger, subsequently search for information, re-evaluate and re-affirm their vaccination views, and deal with stigmatizing reactions, depends on whether parents hold more 'nature-centered' views of health or are instead more 'science-oriented'. These variations in trajectories inspire parents' different vaccination decisions.

This study offers crucial insight into how some more-educated parents become skeptical towards vaccines. Moreover, it nuances universalist tendencies of a traditional deviant career framework by illuminating the role of health-related events and pre-existing health views in determining how vaccine skepticism trajectories (and resulting decisions) exactly take shape.

Vaccine Hesitancy and Refusal in the Light of Covid-19: The Case of Izmir, Turkey

Pelin Önder Erol[1], Hande Şahin[2], Burcu Özdemir Ocaklı[3], Cemal Hüseyin Güvercin[4]

[1]Ege University, Faculty of Letters, Department of Sociology, Izmir, Turkey; [2]İzmir Demokrasi University, Faculty of Arts and Sciences, Department of Sociology, Izmir,Turkey; [3]Ankara University, Faculty of Health Sciences, Department of Social Work, Ankara, Turkey; [4]Dokuz Eylül University, Faculty of Medicine, Basic Medical Sciences Department of Medical History and Ethics, Izmir, Turkey

As a protective and preventive health intervention, vaccination has been the most effective tool against epidemics and pandemics throughout history. Even though childhood vaccines have been at the center of discussion for vaccine hesitancy and refusal, the emergence of COVID-19 has aggravated the contemporary debate on vaccine hesitancy and refusal. Recent developments in information and communication technologies and the extensive use of social media has exacerbated the situation and resulted in the emergence of infodemics. Vaccine hesitancy and refusal is not only a public health issue, but also a sociological matter given its social and economic repercussions. Deriving its roots from "life politics" approach by Giddens, this study builds its hypotheses upon the constant reflexivity between human actions and behavior in a globalized risk society. Variation in attitudes towards COVID-19 vaccination can be explained by a complex combination of structural, social, individual and COVID-19 specific factors. In an attempt to disentangle this multifaceted relationship, this study conducted in the city of İzmir, Turkey employs a mixed methodology where the results of a structured survey (n=403) and in-depth interviews (n=15) are combined. The quantitative analysis aims to determine associations between attitudes towards vaccination and individual factors, COVID-19 vaccine specific factors and contextual factors while the qualitative analysis aims to depict the interplay between these different level factors for a deeper understanding of the phenomenon. The results of the study hope to contribute to the policy-making process for vaccination policies and therefore promote public health and welfare.

Enactment of Experiential Knowledge: Mutuality and Boundary Work in Mental Health Services

Sine Kirkegaard, Ditte Andersen

The Danish Center for Social Science Research (VIVE), Denmark

This article examines how participants enact peer support in mental health services. Peer support is a relatively new initiative within the formal mental health system, in which support are provided by individuals with lived experiences of mental illness. The growth of peer support is driven by the aim of supporting patients' recovery and agentic capacities through mutual exchange of emotional, practical and social support based on the individuals' lived experiences. While the supportive nature of peer work has been widely recognised in the mental health system, little is known about the everyday knowledge-building and emotional effort that such work requires. To address this gap, this study investigates participants' enactment of experiential knowledge and emotional labour in peer support within the formal mental health system. The article draws on ethnographic data collected in peer support groups, located within public mental health services in Denmark. Using ethnographic data of group-interactions with patients, relatives, peer workers and mental health professionals, we analyse how patients competently use different types of emotional labour and experiential knowledge to attain mutuality and authenticity in the peer support groups. The analysis demonstrates various ways in which patients try to authenticate their own as well as fellow participants' emotions and experiential knowledge according to organisational and situational demands. We identify these modes of engagement, and discuss the social implications of bringing lay knowledge and lived experiences into mental health services.

637

Heterogeneous Mental Health Development During the Covid-19 Pandemic in the United Kingdom

Lea Ellwardt[1], Patrick Präg[2]

[1]Universtiy of Cologne, Germany; [2]ENSAE

Aim. The COVID-19 pandemic and the mitigation measures by governments have upended the economic and social lives of many, leading to widespread psychological distress. However, how distress developed during the pandemic and who was most affected is poorly understood. We explore heterogeneity in trajectories of psychological distress during the first six months of the pandemic in the United Kingdom and relate this heterogeneity to socio-demographic and health factors.

Subject and Methods. We analyze six waves of longitudinal, nationally representative survey data from the UK Household Longitudinal Study (N=15,218), covering the first lockdown in 2020. First, latent class mixture modelling (LCCM) is used to identify trajectories of psychological distress. Second, associations of the trajectories with covariates are tested with multinomial logistic regressions.

Results. We find four different trajectories of distress: continuously low, continuously moderate, temporarily elevated, and continuously elevated distress. One-fifth of the population experienced severely elevated risks of distress. Long-term exposure was highest among younger people, women, those who lost income, and those with previous health conditions or COVID-19 symptoms.

Conclusion. Given the threat of persistent stress on health, policy measures should be sensitized to the unintended yet far-reaching consequences of non-pharmaceutical interventions.

Issues Of Reinstitualisation Of Mental Health System In Societies Affected By War (Case Of Ukraine)

Oksana Mikheieva

Ukrainian Catholic University, Ukraine

Ukrainian society is undergoing significant changes in the field of mental health due to the simultaneous effect of a range of political, economic, social and cultural factors. The obvious catalysts for change were the political protests in 2013-2014 that ended in the deaths of more than a hundred participants. The start of a hybrid and then real war with Russia, the annexation of the Crimean peninsula and the occupation of parts of the Donetsk and Luhansk regions led to mass casualties, injuries and forced migration. Since 2014, more than 2 mln people have left the uncontrolled territories of Ukraine. The massive and simultaneous nature of the problems acted as a catalyst for rethinking the existing mental health system. The Concept for the Development of Mental Health in Ukraine until 2030, approved in 2017, outlines the key challenges in this area. This document reflects a redefinition of the concept of mental health towards an understanding of the importance of preventive measures, addressing inequalities and facilitating access to services, etc. These processes have resulted in the dismantling of the medical approach's monopoly and the emergence of new actors influencing the formation of new understandings of mental health.

In-depth interviews with professionals in mental health support and representatives of charities, civic and international organizations (n=21) and surveys with medical professionals (family doctors) (n=432), conducted in 2019, allow us to assess the set of challenges and opportunities in the transformation of the mental health care system in Ukraine from the perspective of the actors who have already been actively involved in these changes and debates.

Suicidal Thoughts and Behaviours During the Covid-19 Pandemic: The Role of Social Support, Detachment, and Depressive and Anxiety Symptoms.

Aina Gabarrell-Pascuet[1,2], Joan Domènech-Abella[1,2,3], Paula Cristóbal-Narváez[1,2], Mireia Felez-Nobrega[1,2], Philippe Mortier[4,5], Gemma Vilagut[4,5], Beatriz Olaya[1,2,] Jordi Alonso[4,5,6], Josep Maria Haro[1,2,7,8]

[1]Teaching, Research & Innovation Unit, Parc Sanitari Sant Joan de Déu, Sant Boi de Llobregat (Barcelona), Spain.; [2]Centre for Biomedical Research on Mental Health (CIBERSAM), Instituto de Salud Carlos III, Madrid, Spain; [3]Department of Sociology, Universitat de Barcelona (UB), Barcelona, Spain; [4]Health Services Research Unit, IMIM (Hospital del Mar Medical Research Institute), Barcelona, Spain; [5]Centro de Investigación Biomédica en Red de Epidemiología y Salud Pública (CIBERESP), Instituto de Salud Carlos III, Madrid, Spain; [6]Department of Experimental and Health Sciences, Pompeu Fabra University (UPF), Barcelona, Spain; [7]Instituto de Investigación Sanitaria Princesa (IP), Madrid, Spain; [8]Department of Medicine, Universitat de Barcelona (UB), Barcelona, Spain

Purpose: Recent epidemiological evidence has revealed a decrease in social support and an increase in detachment and anxiety and depressive symptoms during the COVID-19 pandemic. These factors have been consistently associated with suicidal thoughts and behaviours (STB). Since studies about the mediating effects among these variables with STB as outcome are limited, the aim of the present study was to assess potential pathways connecting them.

Methods: A nationally representative sample of Spanish adults (18+) was interviewed during the first wave of the COVID-19 pandemic (June 2020), of whom 3,305 individuals answered a single-item question about detachment. STB, social support, and depressive and anxiety symptoms were measured with the C-SSRS (modified version), OSSS-3, PHQ-8, and GAD-7 scales, respectively. Multivariable logistic regression and mediation analyses were performed.

Results: Social support, its components (i.e., social network size, relations of reciprocity, and neighbourhood support), and living with a partner were associated with lower odds of STB. Detachment significantly mediated (19% to 28%) these associations. Symptoms of emotional disorders significantly mediated the association between social support components (26% to 48%) – but not partner status – with STB, as well as the association between detachment and higher odds of STB (52% to 58%). In both cases, depressive symptoms were slightly stronger mediating factors when compared to anxiety symptoms.

Conclusion: Social support and detachment are independently associated with adverse mental health. Therefore, interventions aimed at lowering depressive and anxiety symptoms and STB should provide social support and help tackle the feeling of detachment in a complementary way.

RN16_T07_03 | Gender & Health II

Perception, Care and Cure of "Athra": Reflections about a Pakistani Maternal Folk Illness

639

Rubeena Slamat, Melissa Ceuterick

Ghent University, Belgium

In rural Punjab-Pakistan some women are believed to suffer from 'athra', which is considered a contagious folk illness and a major cause of childlessness. When suffering from 'athra' women can have a miscarriage or multiple miscarriages, stillbirth or lose a newborn within a few days after giving birth. We present results from ethnographic fieldwork in a rural, religiously diverse Christian-Muslim community of Punjab, Pakistan, between January and June 2020. Women who experienced and were treated for 'athra' were interviewed in-depth to study the lived experiences of women who suffered from this condition. In addition, focus group discussions were conducted with elderly women and healers serving in the community, to explore the views of the community of 'athra'. Following a thematic analysis, we found seven different types of 'athra' in the lay epidemiology. Several types of treatments are utilized. We explore the concept and social explanation of 'athra', as well as preventive measures and cures to eradicate this condition.

Gendered Health Benefits of the Redistributive Local Welfare Policies: a Population-based Cohort Study in Andalusia (Spain)

Ángel Ramón Zapata Moya[1], María Jesús Rodríguez García[2], María del Carmen Navarro Solano[3]

[1]Department of Anthropology, Psychology and Public Health.The Urban Governance Lab (CSPL). Universidad Pablo de Olavide, Spain; [2]Department of Sociology. The Urban Governance Lab (CSPL). Universidad Pablo de Olavide, Spain; [3]Department of Sociology.The Urban Governance Lab (CSPL). Universidad Pablo de Olavide, Spain

Fundamental Cause Theory suggests the replacement of mechanisms that produce the persistent relationship between socioeconomic status and health over time. Its explanatory core rests on the purposeful use of flexible resources, people with a higher socioeconomic status can use a range of flexible resources to improve their health, avoiding the risks of preventable mortality at each historical time (Phelan, Link and Tehranifar, 2010). Although this theory has been empirically tested, more elaboration and empirical evidence is needed on how the health benefits of resource may vary by gender and social contexts (Masters, Link, and Phelan, 2015), and the idea that resources are not only allocated at the individual level should also be considered. Indeed, institutions can shape the distribution of these resources and even the ability of individuals to translate their effective use into health benefits. In this paper, we analyse the role of local institutions, through the redistributive orientation of their policies, on the risk of preventable and non-preventable mortality by gender and vulnerable contexts. Using the Longitudinal Survival and Longevity Statistics of Andalusia, we conducted a retrospective cohort study of individuals aged 50 years or older (N=132,252) residing in municipalities over 20,000 inhabitants between 2002 and 2016. Cox survival models segregated by gender and vulnerable neighbourhoods were estimated. The results indicate that redistributive policies are associated with a significant decrease in mortality risk from preventable causes, especially among women in vulnerable neighbourhoods. Practical and theoretical implications of our findings would be discussed from a sociological perspective.

Colorectal Cancer Screening Uptake In 29 European Countries: Gender, Social Support And Educational Inequalities

Vladimir Jolidon1, Vincent De Prez2, Stéphane Cullati1,3, Claudine Burton-Jeangros1

[1]Institute of Sociological Research, University of Geneva, Switzerland; [2]Department of Sociology, Ghent University, Belgium; [3]Population Health Laboratory, University of Fribourg, Rte des Arsenaux 41, 1700 Fribourg, Switzerland

Background: Research has evidenced inequalities in colorectal cancer screening (CRCS) uptake. However, little attention has been paid to the interactions between micro- and macro-level determinants of CRCS uptake. This study examines social support and educational inequalities in CRCS, taking into account gender differences as well as the role of country-level determinants in modifying CRCS inequalities across European countries.

Methods: We used multilevel logistic regression models in order to analyse data from 64,815 women and 54,486 men nested in 29 European countries from the European Health Interview Survey 2014 wave and the Swiss Health Interview Survey 2012 wave.

Results: Men and women living in countries with higher pension expenditures and CRCS programmes had a higher CRCS uptake. A gender gap was evidenced in CRCS uptake with women screening less than men. Higher social support increased screening uptake in men more than in women. Cross-level interactions revealed that screening programmes reduced the gender gap by increasing women's screening uptake more than men's. However, such programmes increased social support and educational inequalities in screening uptake among women.

Conclusions: Social support benefits men more than women in CRCS uptake. It may help the former to overcome the lack of awareness, misconceptions, negative attitudes and embarrassment highlighted by research as key barriers to CRCS uptake. Macro (country-level) factors such as organised CRCS programmes modify social support and educational inequalities at the individual level. Further attention should be paid to such factors and their differential interaction effects among men and women for the design of cost-efficient and effective cancer screening promotion policies.

RN16_T08_01 | Health Inequalities I: Healthcare

"Everything To Gain, Nothing To Lose"?: Patient Campaigners, Racialised Inequity, And Stem Cell Donor Recruitment

Ros Williams

University of Sheffield, United Kingdom

Blood or bone marrow stem cell transplantations are a treatment for a number of blood malignancies like leukaemia. Whilst many people find a match on existing donor registries, others do not. Often, it is patients racialised as minority ethnic who end up without a donor. In recent years, increasing numbers of these individuals and their families are turning to social media to amplify a message encouraging people to register as stem cell donors. They aim to locate their own donor, whilst also diversifying the stem cell registries more broadly for future minoritised patients. These efforts are key to understanding the intersection of new digital and 'traditional' media, and health inequities activism.

This paper builds on recent empirical work on health-related online crowdfunding, and more established literature on the role of health narratives. It offers analysis of semi-structured interviews with patients and families who've organised their own stem cell donor recruitment campaigns, as well as analysis of social media activity and 'traditional' media coverage of these campaigns. Data were collected for a Wellcome Trust Fellowship exploring minority ethnicity stem cell donor recruitment.

I argue for the importance of surfacing the vital work undertaken by these individuals. As part of this, I reflect on the ambivalence articulated by participants in deciding to expose one's own personal narrative of suffering to an unknown networked public, with the hope of both saving one's own life, and ameliorating the wider health inequity experienced by many minoritised people who need, but cannot access, stem cell transplantation.

Inequalities and Inequity in Utilisation of Health Care Among the Older People in Greece During the Pre-Crisis Period (2004) and at the Peak of Economic Crisis (2015)

Ismini Drakou

Panteion University of Political and Social Sciences, Greece - Social Policy Department

The objective of the study is to employ quantitative empirical methods (Horizontal Index and Odds Ratios) to explore key aspects of equity in the receipt of health care in Greece among the older population 50+, via the nationwide dataset SHARE, and shed light on the equity issue in the use of health care before the economic crisis during the Greek NHS reforms in 2004 (SHARE Wave 1) and at the peak of the economic crisis in 2015 (SHARE Wave 6) during NHS major reforms.

The findings suggest that before the economic crisis in Wave 1 (2004), strong pro-rich inequalities in health care exist for 50+ mainly for the probability of visiting GPs (PHC) and dentist private visits, and less pro-poor inequalities for inpatient and outpatient visits. Moreover, strong intra and interregional inequalities exist for visiting GPs favoring residents of thinly-populated areas and not for inpatient nights. Inequalities exist in the number of specialist private visits irrespective of the income and the region of residence. In Wave 6 (2015) at the peak of the crisis, there is significantly reduced use in all care services. Strong income inequalities are apparent in the use of all services (including hospitalization), favoring better-off and pro-higher educated. Strong interregional inequalities exist for inpatient nights and dentist visits favoring pro-rich residents of thinly-populated areas, except specialist private or GP visits. In addition, between pre-and at peak of the crisis, there exists a significantly reduced trend in OOP amount for all health care visits irrespective of income, or region of residence.

641

Socioeconomic Inequalities in the Overuse of Antidepressants over Time

Lisa Colman, Katrijn Delaruelle, Piet Bracke

Ghent University, Belgium

Background: Studies generally investigate the increase in antidepressants use from a biomedical perspective that perceives antidepressants as purely 'need-based'. In contrast, the medicalisation perspective states that antidepressants are more and more being promoted to treat normal-to-milder forms of distress, and hence that they are not always 'need-based'. To date, research about the individual and social harm from the 'overuse' (i.e., non-need-based use) of antidepressants is scarce. In addition, little to no attention has yet been paid to socioeconomic inequalities in the overuse of antidepressants. To address these shortcomings, this research will firstly analyse if antidepressants use is increasing over time, irrespective of mental health (i.e., measuring increasing overuse) and secondly, this research will investigate whether there are socioeconomic inequalities in antidepressants overuse.
Methods: Data from the Belgian Health Interview Survey (BHIS) is used. This study covers information from 6 successive waves: 1997, 2001, 2004, 2013, 2018. The weighted data represent a representative sample of the adult Belgian population aged between 25 and 85 (N=48.710). The research aims are addressed by using stepwise Poisson regression models.
Results: The results reveal evidence for increasing overuse over time. In addition, people with a tertiary education have a significantly lower prevalence of antidepressants overuse compared to people with no or primary education.
Conclusion: This study highlights the importance of the medicalisation perspective when analysing antidepressants overuse.

RN16_T08_02 | Mental Health I: Experiences

Extracurricular Activities, Social Relations and Adolescents' Mental Wellbeing in Sweden

Sara Ferlander, Alireza Behtoui

Södertörn University, Sweden

How do extracurricular activities (ECA) affect adolescents' mental wellbeing? Do adolescents feel better if they take part in sport or cultural activities after school or does a hectic schedule actually cause more stress? Levels of mental illness have risen dramatically among youth in Sweden in recent decades. School stress has been discussed as one potential factor behind the negative development of young people's mental health. Nevertheless, we need a better understanding of the factors which affect young people's mental health, both negatively and positively. The aim of this paper is to examine the association between ECA and mental wellbeing among adolescents in Sweden. The paper also aims to examine health impacts of different forms of social relations. The data was collected in 2016 from 42 Swedish elementary schools with pupils aged 15-16. Mental wellbeing was measured through questions from the General Health Questionnaire. The results demonstrate a positive association between young people's wellbeing and participation in ECA, particularly in sports and outdoor activities. It was also found that social relations in the family, at school and with friends and the support adolescents derive from these relationships, have a positive effect upon their mental health. In contrast, adolescents who feel they have controlling parents or are being treated unfairly at school report poorer wellbeing. In conclusion, ECA and different forms of social relations are significant factors for adolescents' mental wellbeing in Sweden. Consequently, ECA, especially sport and outdoor activities, and supportive relations appear to be important in counteracting school stress among youth. It is therefore crucial that young people despite background are encouraged and offered the possibility to participate in extracurricular activities.

Individual Predictors of Loneliness in Lithuania

Gražina Rapolienė, Vaida Tretjakova

Lithuanian Centre for Social Sciences, Lithuania

Loneliness has tremendous consequences for individual and public health. It negatively affects physical and mental health (Wilson et al. 2007; Meltzer 2013), increases risk of social isolation (Swader 2018) and alcoholism (Stickley et al. 2013), elevates mortality (Holt-Lundstad et al. 2015). The rates of loneliness are especially high in Eastern Europe (Hansen, Slagsvold 2015), but research from this region is lacking. With the highest rates of loneliness (Swader 2018), alcohol use and suicide, Lithuania makes an especially relevant case to study. The aim of our study – to explore the relationship between individual characteristics and loneliness in Lithuanian population using ESS (2014) data. Binary logistic regression model was applied. Previous research revealed various micro level factors of loneliness: age, gender, status of health, partnership and parenthood, financial situation (De Jong Gierveld, Van Tilburg 2010), living alone (De Jong Gierveld et al 2012). In our case, the main sociodemographic characteristics, such as age, gender, level of education are not statistically significant. However, ethnicity is important – lonely people are more likely to belong to other nationality than majority or main minorities (i.e., not Lithuanian, Russian or Polish) of the population. They are less likely to live with a spouse or partner, but more likely to live with children in the same household. Socio-economic inequality is important – lonely individuals more often experience serious financial difficulties and have a history of financial instability in their childhood. Lastly, loneliness is associated with poor subjective health. Source of funding: Research Council of Lithuania (LMTLT), agreement No S-LIP-20-23.

Exploring The Role Of Anti-Institutionalism In Less-Educated Individuals' Limited Uptake Of Nutrition Information

Tim van Meurs, Joost Oude Groeniger, Willem de Koster, Jeroen van der Waal

Erasmus University Rotterdam, The Netherlands

The well-established educational gradient in health can partly be attributed to the less-educated individuals' unhealthier diets. A caveat in tackling their unhealthier diets is their relatively limited uptake of the nutrition information employed to battle it, especially when communicated by governmental, health, and scientific institutions. As conventional explanations for their limited nutrition information uptake – e.g. adverse financial conditions and lower health literacy – can only partly account for this pattern, this study adds a novel explanation focusing on anti-institutionalism. Using a survey set out among a sample from a panel representative of the Dutch population (n = 2,398), we aim to uncover the role of institutional distrust and anti-paternalism in less-educated individuals' lower uptake of institutional nutrition information. We find that both aspects of anti-institutionalism account for more than a third of the difference in information uptake between the less- and more educated. This implies that current nutrition information inspires opposition among less-educated individuals, and that the development of future nutrition information should circumvent invoking perceptions of elitism, as to evade aversion amongst those who generally need it most.

Managing Covid-19 Pandemic Emergency: Primary Care in Italy Between Structural Weakness and Future Expectations

Angela Genova, Anna Rosa Favretto, Carmine Clemente, Davide Servetti

University of Urbino Carlo Bo, Italy

Covid-19 has been an enormous challenge for all healthcare systems, bringing to light several national healthcare system strengths and weaknesses. Even though the entire world has been facing the same pandemic challenge, the healthcare answers to such an event present specificities related to each institutional healthcare setting and policy . Each healthcare system's response to the pandemic must, in fact, be considered within each healthcare context as a result of previous years' policy processes because "history matters, and it matter a great deal" (Wilsford, 1994). The institutional uniqueness of each political system has favoured various configurations of interest coalitions according to neo-institutional analysis (Immergut, 1992), leading to specific healthcare policy.

Focusing on Italy as national case study, this research investigates regional differences in primary care in three regions in comparative perspective, through the analysis of regional regulative frameworks. The analysis of the reforms in the three Italian regions, in the last two decades, shows different paths in the implementation of primary care - community services, outlining a scenario characterised by high heterogeneity and structural criticalities in integrating family doctors and social services within the regional health care systems.

The results contribute to the debate on challenges and potentialities in health and social integrated services in primary care models, highlighting paradoxical aspects of primary care between structural weakness and high policy expectations, managing Covid-19 pandemic emergency.

Covid-19 Pandemic Management, Neoliberal Governmentality and The Use of Public Service Announcements in Turkey

Selin Atalay

Izmir Bakircay University, Turkey

Covid-19 is a global health emergency, that continues to threaten millions of lives throughout the world. Worldwide, the pandemic has crucial impacts on the living arrangements and social reality of billions. The management of this health threat involves the conflicting objectives of preventing containment and the continuation of social life.

In Turkey after the announcement of the first case on March 11,2020, measures were taken such as school closures, age specific curfews, travel restrictions, weekend, and weeknight curfews. A lockdown has not been enacted and the economic aid packages mainly targeted large businesses. Policies are implemented to contain the pandemic through means that prioritize production and consumption, i.e., the economic activity. In Foucauldian terms, neoliberalism is the contemporary 'truth regime' and neoliberal governmentality involves creating a society that functions like a 'marketplace'. Individuals, who are simultaneously the objects and subjects of this governmental rationality are the ones who are primarily responsible for making the 'right' choices. This study evaluates the pandemic management in Turkey as very much in line with the techniques of neoliberal governmentality. Policies ensure that individuals are assigned responsibility while the government takes a regulatory stance making sure that economic activity is unhampered. Within the scope of the regulation that forces television channels to broadcast certain public service announcements (PSAs), 51 PSAs provided by the Ministry of Health are analysed in terms of assigning the responsibility to individuals. The analysis is built on basic categories of personal measures, recognizing risk in everyday life, naming death and the use of storytelling.

The Health Crisis As An Opportunity: Can The European Union Reinvent Its Health Paradigm?

Noëlle Manuela Burgi

Centre national de la recherche scientifique (CNRS), France, Ecole Française d'Athènes

While the EU has often been identified as a driver of privatisation and commodification of public health due to its market-making and regulating role and its restrictive fiscal policies, it is possible that the Covid-19 pandemic will become a window of opportunity for a paradgm shift opening the way towards a more federal and solidarity-based functioning in this and other areas. As current research shows (e.g.The Palgrave Handbook of EU Crises, 2020), the premises for such a shift are already at work at EU level: the EU4Health plan (2021-2027), the unconditional EU debt facility, a new approach to fiscal governance point to a different path. A move upwards towards a positive federal perspective, founded on solidarity, depends however on a reinvestment of the health sector in Europe, the promotion of health as an normative priority of the Union, not subordinated to economic competition. In this context, this paper focuses on the necessary reconstruction and uplifting of the Greek public health system which was very severely impacted and deconstructed in the course of the sovereign debt crisis (2010-) and the dominant retrenchment policies implemented until recently by the European Union. It constitutes a paradigmantic case and provides inspiration for novel forms of community solidarity-based health provision, which could and should be promoted the EU along with much increased attention, in Greece and in the EU, to the medical agents of the health sector.

Crisis Responses. Experiences of Self-organisation in Primary Healthcare in Italy: the Social Clinics.

Sara Vallerani

University of Roma Tre, Italy

This research explores the role of collective social actors -social clinics- in initiatives aimed at guaranteeing the right to health before and during the Covid-19 pandemic in Italy.

Social clinics are self-organized entities of primary health care not affiliated to the National Health Service, and developed within social movements. The case studies are the clinics of Turin, Milan, Naples, and Palermo. The research question aims to observe how these self-organized forms of territorial medicine offer services to those who cannot access the NHS and how these clinics have reorganized themselves during the pandemic. The following research techniques have been used: participant observation, interviews and analysis of documents.

The investigation is based on two theoretical frameworks. The first concerns health inequalities and social determinants of health; the second treats primary care.

The analysis has revealed how attention to health is articulated on several levels, ranging from the organization of care, to health as a political issue. The aim of the clinics is to build horizontal and participatory models of care, at micro and meso level.

The relevance of this research touches two main aspects. On the one hand, how these entities have planned with foresight within the pandemic, especially paying attention to primary care and access to the NHS for those who live in a condition of social and economic uncertainty. On the other, this research is an exploratory survey of how collective actors within civil society have responded to the pandemic crisis at the grassroots level.

RN16_T10_01 | Health Inequalities III: Socio-Economic Issues

Intergenerational Social Mobility and Self-Rated Health in Europe

Patrick Präg[1], Alexi Gugushvili[2]

[1]ENSAE Paris, France; [2]University of Oslo, Norway

Occupational class and health are closely linked, however the health consequences of intergenerational social class mobility have not yet been systematically explored. A long tradition of research on individuals' class mobility and health reports mixed or no effects, however cross-national differences have rarely been tested comprehensively. Further, recent studies show that intergenerational social class mobility at the societal level is beneficial for population health. Using representative survey data from 30 European countries (N = 159,591), we present the first study to investigate the role that intergenerational class mobility both at the individual and societal level play for self-rated health. We find that, apart from four post-communist countries, neither downward nor upward mobility is significantly and systematically related to poor self-rated health. There is also no association between societal-level social mobility and the prevalence of poor self-rated health across the 30 societies. Results are robust to alternative specifications and suggest that individuals' own social class and partially their parents' social class are primary explanations of health rather than their mobility experiences between origins and destinations.

The Great Transformation, Social Mobility and Health: Evidence from The Polish Panel Survey

Olga Zelinska[1], Alexi Gugushvili[2], Grzegorz Bulczak[1]

[1]Polish Academy of Sciences, Poland; [2]University of Oslo

Recently there has been a surge of interest in the consequences of intergenerational social mobility on individuals' health and wellbeing outcomes. Yet, studies on the effects of social mobility on health, using a high-quality panel survey data, were almost exclusively conducted in Western welfare democracies. To account for this gap, using empirical data from one of the largest and most eventful post-communist countries, Poland, in this study we investigate how transitional changes in individuals' origin and destination socioeconomic position are associated with social mobility and how the latter is linked to physical and mental health outcomes. For this, we use the Polish Panel Survey (POLPAN) data to construct self-rated physical and mental health outcome variables, social origin, destination and mobility indicators, and an extensive set of socio-demographic covariates of health. We employ diagonal reference models (DRMs) to distinguish social mobility effects from those of origin and destination effects on health and also account for possible health selection effects. Our results suggest that there is a socioeconomic gradient in health in Poland and both parental and own occupational class matter for individual health outcomes. We also observe positive mental health effect for upward mobility from the lowest to the highest social class.

646

Physical Attractiveness and Health. Evidence from the United States.

Grzegorz Bulczak[1], Alexi Gugushvili[2], Olga Zelinska[1]

[1]Institute of Philosophy and Sociology, Polish Academy of Sciences, Poland; [2]University of Oslo, Norway

There is only limited evidence suggesting that physical attractiveness is related to an individual's actual health. Past empirical studies show that characteristics related to attractiveness, including symmetry, dimorphism, averageness, skin tone and quality; are more likely to be present in healthy individuals, including greater cardiovascular and metabolic health. This research addresses this gap by using a large longitudinal data set, the National Longitudinal Study of Adolescent to Adult Health, and examining the relationship between, in person, interviewer-rated physical attractiveness and actual health based on a set of relevant biomarker measures. We identify a robust relationship between individuals' actual health represented by allostatic load and physical attractiveness. Individuals of above-average attractiveness appear to be noticeably healthier. We carefully address the possibility of confounders affecting our results including sociodemographic characteristics, attainment, personality, BMI, past and present self-reported health problems.

Making Decisions During Childbirth: An Analysis of Real-time Interactions Between Women and Midwives

Ellen Carol Annandale[1], Helen Baston[2], Sian Beynon-Jones[1], Alison Brodrick[2], Jo Green[1], Victoria Land[1], Clare Jackson[1], Tomasina Stacey[3]

[1]University of York, United Kingdom; [2]Sheffield Teaching Hospitals NHS Trust; [3]University of Huddersfield

Based on 37 real-time audio/video-recordings within two English NHS hospital midwife-led units, this paper explores how decisions are made during labour and birth for 'low risk' women. Drawing on questionnaire data, we explore the associations between women's antenatal expectations (e.g., who they think should and who they think will make the decisions during labour, themselves or practitioners) and their postnatal accounts of how decisions were actually made. This analysis is set alongside analysis of visual and audio recordings of labour and birth which establish how decisions (1,347 across the 37 births) are initiated (e.g via assertion, requests, option-listing, offers and open questions) and followed up, and by whom (women, midwives). We find that while women generally want and expect to be involved in decision-making in advance of the birth, most decision-making is midwife- rather than woman-led and initiated by strategies such as assertion and recommendation, especially at the first decision-point (though this varies by type of decision being made e.g pain relief, vaginal examinations, fetal monitoring). Postnatal questionnaire data also indicate that although women reported being less involved in decision-making than they had anticipated antenatally, they were nonetheless generally satisfied with various aspects of the birth experience. The paper raises questions about the capacity of midwives to offer choice and women to make choices, that is, for 'shared decision-making' in a context where national guidelines for intrapartum care exert a strong influence on how birth takes place.

The Vital Tweet

Zoey Martin-Lockhart

University of Illinois at Chicago, United States of America

Over the past decade, Twitter emerged as the ground-zero node hosting and linking together online medical communities around the world. Used for sharing emerging medical practices (particularly during time-compressed moments like the Covid-19 pandemic), curating #MedEd[ucation] "Tweetorials", and networking, #MedTwitter is also space notable for its animated network of medical students and professionals from groups traditionally excluded from, pathologized by, and marginalized in biomedicine (often referred to as Under-Represented Minorities or URMs).

This paper focuses on the network(s) of disabled doctors and medical students on #MedTwitter. It explores their strategic use of specialized hashtags like #DocsWithDisabilities and #DisabledDocs to enumerate dis/ableist tropes and practices naturalized in biomedical culture, treatment practices, and epistemology: How does the networked omnipresence and invisible anonymity facilitated by Twitter's platform uniquely afford disabled doctors and medical students the stage and security to make visible dis-ableist medical practices and cultures hidden in plain sight? How, then, do disabled doctors and medical students craft a hybrid subjectivity and gravitas, drawing on their professional authority as physicians (or physicians-in-training) and their experiential authority as disabled people—and, inevitably, the subjects of biomedical investigations and treatment? In short, how is the #DisabledDocs spotlight changing online—and offline--medical culture(s)?

E-Health Literacy for Physicians: "Doctor Google" as a New Member in the Patient-Doctor Relationship

Fiammetta Pilozzi[1], Luca Falzea[2], Ettore Squillaci[3], Patrizia Frittelli4, Alessandro Di Legge[5]

[1]Università per stranieri Dante Alighieri, Italy; [2]Università degli Studi di Torino, Italy; [3]Università degli Studi di Roma Tor Vergata, Italy; [4]Ospedale Fatebenefratelli - Isola Tiberina di Roma, Italy; [5]Fondazione Magna Grecia, Italy

More than half of individuals have been using Online Health Research to find information about their health, before and after a medical appointment. Information about health is widely available online and it has been influencing patient's autonomy in the patient-doctor relationship. The general idea is that the patient is able to make their own decisions regarding their health status by gathering (health-related) information independently, without any scientific knowledge. The – often inaccurate – resulting self-diagnosis polarises patients' attitudes: they either emphasize or underestimate their symptoms. Availability of medical information online comes with important advantages (easier access to medical information, anonymity, users' empowerment, time and money saving) and the disadvantages are principally tied to the users' scarce medical literacy, which do now allow actual autonomy in evaluating the quality of online health-related information. Human-computer interaction in diagnosis and care produces meaningful effects on doctor-patient relation, that in an ideal setting would be characterized by a therapeutic alliance that stems from mutual respect and from practising medical science. This paper will present results from a research project conducted on a representative sample of Italian doctors. The aim of the research was to investigate – through qualitative and quantitative methods – how information collected online by patients is used during the medical appointment to answer these research questions: If and how doctors are able to mediate between contents coming from Dr. Google and patients; If and how doctors use information collected online by patients as an instrument to empower them and to engage them in the doctor-patient relation.

Workforce Diversity in the Context of Violent Conflict: Public Hospitals in Israel

Ariela Popper-Giveon[1], Yael Keshet[2]

[1]David Yellin Academic College of Education, Israel; [2]Western Galilee Academic College, Israel

Diversity is growing in work organizations, and inclusive climates are gaining increasing significance. Despite recognition of the potential benefits of inclusion for work organizations, diversity is still much more easily achieved than inclusion. The Optimal Distinctiveness Theory (ODT) can be applied as an organizational framework that designates both belongingness and uniqueness as components of inclusion. The present research sought to examine the experiences of healthcare workers who are members of a minority ethno-national group in the context of a violent conflict. Fifty in-depth interviews were conducted with healthcare professionals – Jews and Arabs – employed at eleven public hospitals in Israel. The interviews reveal the diversity of staff members and the multicultural climate prevailing in the wards at Israeli public hospitals. Arab workers, specifically, experience both belongingness and uniqueness. The former is reinforced by values of humanism and professionalism, whereas the latter cannot be fully manifested: Their cultural and religious uniqueness is respected, but their opinions regarding the Israeli-Palestinian conflict are silenced. They experience tension and ambiguity, and their inclusion in the organization is not effected in full. Jewish health professionals tend to stress their Arab colleagues' contribution as a collective to cultural competency and multiculturalism within the Israeli public health system. ODT improves our understanding of how to achieve inclusion of minority group workers in healthcare organizations including both belongingness and uniqueness, particularly in conflictual contexts.

Suicide Mortality In Lithuania 2007-2019: Sociodemographic Differences, Social Suffering and Mental Health Policy

Daumantas Stumbrys, Dainius Pūras

Vilnius University, Lithuania

In Lithuania, suicide rate was one of the highest in Europe over the last three decades. Suicide epidemic is associated to social suffering caused by post-soviet transition and challenges in implementation of mental health policy. Mental health system has been reliant on excessive institutionalization and medicalization since the Soviet era in Lithuania. After restoration of independence in 1990, there have been attempts to modernize mental health policy and services. Lithuania has a modern mental health strategy since 2007. However, many challenges remain in the level of implementation, promotion of human rights standards, empowerment of users of services and independent monitoring. The aim of this study was to estimate to what extent the suicide mortality is responsible for changes in life expectancy from 2007 to 2019 in the context of changing mental health policy. The analysis was based on life table decomposition method and data from Eurostat, Statistics Lithuania and the Institute of Hygiene (Lithuania). Life expectancy increased in 7.06 years for men and 3.95 years for women during the reference period. Results of our study showed that decrease in suicide rates contributed 0.36 years to men and 0.07 years to women life expectancy. The largest decrease in suicide rates was recorded in younger age groups, while suicide rates among the older groups, especially men, stagnated. The results of our study suggest that positive changes did not reach all sociodemographic groups with high suicide mortality rates. Thus mental health remains one of the major public health issue in Lithuania. This research was funded by the European Social Fund under the No 09.3.3-LMT-K-712 "Development of Competences of Scientists, other Researchers and Students through Practical Research Activities" measure.

The Effect of Early and Mid-life Work-family Trajectories on Self-rated Health and Depression in Older Age in West Germany and Italy: A Multichannel Sequence Analysis

Sonja Scheuring[1,2], Henriette Engelhardt[1,2]

[1]University of Bamberg, Germany; [2]State Institute for Family Research at the University of Bamberg (ifb)

This paper examines whether gendered insecure work-family trajectories increase the likelihood of a poor health status and depression in older age in West Germany and Italy. We contribute to the work, family, and health literature by incorporating and combining different aspects of life course research, such as cumulative disadvantages and spillover effects. We use data from the Survey of Health, Ageing and Retirement in Europe (SHARE, waves 3 and 7 of the retrospective SHARELIFE survey) to analyze in a first step gendered work-family trajectories after school-to-work transitions for West Germany and Italy by utilizing multichannel sequence analysis. We observe 20 consecutive years on these early and mid-life work-family trajectories. In a second step, we estimate the effect of these trajectories, which differ in their degree of insecurity, on the likelihood to report poor health and depression for persons aged 50+ by using binary logistic regression analysis. Our findings show the strongest health effect for Italian women on insecure work-family trajectories (13 percentage points higher likelihood to report a poor health status compared to the least insecure work-family trajectory). For West Germany, we observe such effects in smaller magnitude and statistical relevance for men only. We find that work-family insecurity increases the likelihood to be depressed for West German men and Italian women. The strongest effect occurs for Italian women (11 percentage points higher likelihood to be depressed compared to the least insecure work trajectory). These findings hint for a greater vulnerability of disadvantaged women in both family and work life for self-rated and mental health in Italy than in West Germany and emphasize the often-assumed vulnerability regarding consequences of poverty among women in old age.

RN16_T11_02 | Children & Young People

Risk And Uncertainty In The Lived Experience Of Chronic Pain In Childhood

Ana Patricia Hilario

Instituto de Ciências Sociais, Universidade de Lisboa, Portugal

Limited sociological research to date has been developed on parents' and children's experiences of uncertainty and risk perceptions related with a chronic condition during childhood. There is also a paucity of sociological research on children with chronic pain and thereby the present study intends to address this gap by exploring children's and parents' experience of uncertainty and perceptions of risk resulting from chronic pain in childhood. A qualitative, multi-modal approach was employed, using the draw, write and tell technique with seven children who suffer from chronic pain, and semi-structured interviews were conducted with their parents. The strategies developed by children to deal with their chronic pain, can be understood, on the one hand, as a response to the uncertainty that their condition entails, and on the other hand, as a manifestation of their agency. Although children were not directly asked about their perceptions of being at risk, their accounts revealed that risk was a key concept in their understanding of their chronic condition. Understanding chronic pain from the point of view of children is important to comprehend its meaning and impact in their lives. This study intends to encourage the discussion about chronic pain in childhood among both academic and non-academics.

Behaviors and Emotions in Children during the COVID-19 pandemic. A case study of Southern Italy.

Giuseppina Cersosimo, Lucia Landolfi, Patrizia Marra

University of Salerno, Italy

As the coronavirus pandemic spreads across the world, and protective measures to mitigate its impact have been enacted, parents and children alike experience widespread disruptions to daily life. Our objective in this case study was to determine how the pandemic and mitigation efforts affected the physical and emotional well-being of parents and children in our region through early March of 2020.

The methods used in our research include the analysis of childrens' drawings, as well as interviews with teachers and school administrators alongside interviews with the family members. During this period of the restriction, our research verified the presence of: childhood weight gain due to reduced physical activities, eating disorders, increased requests for and reliance on video games and screen time for entertainment, fears related to isolation, restlessness dreams, emotional withdrawal, and sadness/ depression. We detected unfavorable trends in the lifestyle behaviors of our participants.

The Covid 19 pandemic has had a substantial impact on parents and children in our region, and this is directly related to similar trends in Italy as a whole. Our case study considers additional measures to mitigate the physical and emotional effects of the pandemic, such as the actions ta-ken by schools to improve the wellbeing of children and families in this period.

Antinomy of the Gig-Development Debate: A Contribution to a Research Agenda on the Political Economic Analysis of Digitization of Work as a Development Program

Dilshan L Fernando

University of Guelph, Canada

"Gigging" may not be just a means, but also a mode of production. Each time a major technological break-through emerges globally, expectations rise high to assess its potential for boosting development. However, this gig-development debate is constituted by an antinomy. The supporters claim the renewed micro-agency of workers heightens economic growth. The skeptics argue that the macro-structure of metropole-satellite polarity survives this growth. The confluence of this structure-agency antinomy hinders political economic research. Hence, the theoretical motivations of this paper purport to explain the political economic determinants that create such an antinomy, which as a result is expected to contribute to an articulate research agenda of political economic analysis of digitization of work as a development program. In view of this, the paper attempts to deal with the literature on the relationship between platform work and development by situating this literature on the two overarching supportive and sceptic arguments. Since the debate is on development, much of the literature cited here will focus on the Global South. Finally, the paper will conclude by emphasizing the antagonistic nature of the two arguments, that each is equally plausible on its own, and by recognizing the need for a broader theory of the Division of Labor and the State which the researcher believes to foreground the worked out gig-development debate in this paper.

Anthropotropism: Searching for Recognition in the Scandinavian Gig Economy

Gemma Newlands[1,2]

[1]University of Amsterdam, The Netherlands; [2]BI Norwegian Business School, Norway

Work is a crucial opportunity for the experience of recognition, yet new forms of platform-mediated work hinder the development of affective, recognitive relationships by curtailing human interaction. Based on 41 interviews with Foodora Riders in Norway and Sweden, this article explores how recognition theory's current anthropocentrism renders it insufficient in understanding workers' experiences of recognition within technologically complex forms of work. Drawing on rich qualitative data, I identify a process of anthropotropism, a turning-towards-the-human within an organisation. Gig-workers turn to human connections where possible in an attempt to pursue traditional social scripts of collegiality and to gain recognition from a legitimate, human source. Further, I identify how platform-mediated communication from an organisation does not prohibit recognition, but when interspersed with automated forms of communication can disrupt the development of individual subjectivities and lead to feelings of mechanistic dehumanisation.

Indebted By Design: Uber Drivers Trapped In London's Gig Economy by Debt

George Maier

London School of Economics, United Kingdom

A central mythology of free market economics is the notion that a labourer is free to exchange their labour power. In economies without substantial unemployment support or a universal basic income, a labourer is instead forced to sell their labour as a means to survive. This dynamic creates a power relationship between the employer and the labourer, where the latter has little choice but to agree to the terms offered by the former. The emerging mythologies of the gig economy propose

652

that this relationship no longer exists because the legally defined employee relationship is no longer present, the worker is now a free and independent contractor within the market. On the one hand, this discourse misrepresents the problem of employment as the contract itself, rather than the power dynamics involved in the unequal distribution of economic resources in an economy; on the other, the discursive disguising of the power relationship between platforms and gig economy freelancers makes room for new mechanisms of exploitation. Drawing upon two years of fieldwork with gig economy workers in London, this article focuses on the experiences of debt faced by Uber drivers in the city. By brokering credit to drivers as a means to access the platform's market, Uber produces and maintains a labour force who are trapped by economic dependency. In this article I theorise this debt trap as a new form of indentured labour born out of free market mythology. I show that what is promoted as liberalisation is in fact a shift towards market authoritarianism in a new and emerging form of indentured labour.

Platform Delivery Workers' Self-exploitation: The Case Study of Glovo

Tiago Alexandre Vieira

Autonomous University of Barcelona (UAB), Portugal

Having the company Glovo as case study, the present article discusses the circumstances under which self-exploitation unfolds among platform delivery workers. Through a qualitative approach, relying on interviews to different stakeholders (N=22), findings of this research highlight how the intersection of post-disciplinary control mechanisms and the experience of precarity breed self-exploitation. This article suggests that those mechanisms facilitate the displacement of the locus of exploitation from an outer entity (the employer) to the workers' inner self, who - given their precarious situation - find themselves with no alternative but to comply with their employer's implicit guidelines. As such, workers find themselves experiencing overwork, exposure to hazardous circumstances and highly economically dependent. Under the light of the present findings, policy-makers are encouraged to go beyond the workers' employment status debate and address also the design of the algorithms organising the work process.

RN17_T01_02 | Precarious work 1

Being Your Own Precarious Boss. Solo, Dependent, And / Or Bogus Self-employment.

Filip Majetić[1], Chiara Bassetti[2], Miroslav Rajter[3], Dražen Šimleša[1]

[1]Institute of Social Sciences Ivo Pilar; [2]Italian National Research Council (CNR); [3]University of Zagreb

This study explores work precariousness among groups of EU-based self-employed people most prone to existential vulnerability: solo, dependent, and / or bogus self-employed workers (Conen & Schippers, 2019).
Ever since it became heavily represented in sociological debates (midst of 2009-14 economic crisis), precarious work - i.e., all forms of poor to modestly paid work that is uncertain and risky from the worker's point of view (Standing, 2011) -has been empirically investigated predominantly in the context of non-standard employment. However, widespread outsourcing practices in the traditional economy, as well as growth of the gig economy composed solely of "independent contractors" imply that focusing on employees (of any kind) might only partially elucidate today's work precariousness.
Therefore, by relying on previous operationalizations of the phenomenon (Vives et al., 2015; Creed et al., 2020), the most recent European Working Conditions Survey data (EWCS 2015) and multilevel modelling approach, we assess basic dimensions of work precariousness (e.g., work conditions, job remuneration, job security, job flexibility) and identify its basic determinants (e.g., voluntariness in becoming your own boss) among the explored groups of self-employed workers in 25 EU countries.
Although based on the data from 2015, the results provide a valid starting point for understanding the reality of freelancers and solo-business owners nowadays - in the midst of the economic crisis fueled by COVID-19 pandemic.

653

A Multidimensional Approach of Precarious Employment: Young Workers in EU-28 Countries

Guillermo Orfao e Vale Tabernero, Alberto Del Rey Poveda, Miguel Ángel Malo Ocaña

University of Salamanca, Spain

This work proposes the use of a new multidimensional indicator to measure precariousness among young workers across all EU-28 countries between 2009 and 2016, the aftermath of the economic crisis. This indicator measures both the incidence and intensity of precariousness and the contribution of each dimension included in the analysis. The analysis has involved five dimensions: wages, type of contract, type of working day, disempowerment, and job insecurity. Our database is the European Union Labour Force Survey for the period 2009-2016. The main indication of precariousness among young workers is low wages. In terms of the adjusted multidimensional precariousness rate proposed, we find high rates of precariousness for Mediterranean countries (because of low wages and temporary contracts), Denmark (low wages), and the Netherlands (expansion of involuntary part-time jobs). Central European countries have moderate rates, and most Continental and Eastern countries have low rates. We also find that a higher level of education is related to a lower probability of having a precarious job and that the probability of having a precarious job decreases as the number of hours worked increases. Finally, we find a greater probability of having a precarious among women in most countries, non-statistically significant differences by country of birth and a greater probability for younger individuals.

Comparing Precarious Employment Across Countries: Measurement Invariance of the Employment Precariousness Scale for Europe (EPRES-E)

Eva Padrosa[1,2], Mireia Bolíbar[1,2,3], Mireia Julià[1,2], Joan Benach1,[2,4]

[1]Research Group on Health Inequalities, Environment, and Employment Conditions (GREDS-EMCONET), Department of Political and Social Sciences, Universitat Pompeu Fabra, Spain; [2]Johns Hopkins University – Universitat Pompeu Fabra Public Policy Centre (JHU-UPF PPC), Department of Political and Social Sciences, Universitat Pompeu Fabra; [3]Department of Sociology, Universitat de Barcelona; [4]Transdisciplinary Research Group on Socioecological Transitions (GinTRANS), Universidad Autónoma de Madrid

Comparing precarious employment (PE) across countries is essential to deepen the understanding of the phenomenon and to learn from country-specific experiences. However, this is hampered by the lack of internationally meaningful measures of PE. We aim to address this point by assessing the measurement invariance (MI) of the Employment Precariousness Scale for Europe (EPRES-E), an adaptation of the EPRES construct in the European Working Conditions Survey (EWCS). EPRES-E consists of 13 proxy-indicators sorted into six dimensions: temporariness, disempowerment, vulnerability, wages, exercise of rights, unpredictable working times. Drawing on EWCS-2015, MI of the second-order factor model was tested in a sample of 31,340 formal employees by means of (a) multi-group confirmatory factor analyses, and (b) the substantive exploration of EPRES-E mean scores in each country. The results demonstrate that threshold invariance holds for the first-order structure (dimensions) of 22 countries (Austria, Belgium, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Lithuania, Luxembourg, the Netherlands, Norway, Poland, Portugal, Slovakia, Slovenia, Spain, Sweden, Switzerland, UK), but only metric invariance is attained by the second-order structure. The latter is supported by the exploration of mean scores, where we found that different score patterns in each dimension lead to similar overall EPRES-E scores, suggesting that PE is configured by different sources within the six dimensions in each country according to their broader socio-political trajectories. We conclude that, although EPRES-E can be used for comparative purposes in 22 European countries, the

654

scores of each dimension must be reported alongside the overall EPRES-E score

Contestations Of Precarious Work In HE: Protest In The UK And Germany

Maria Keil[1], Vera Trappmann[2]

[1]Freie Universität Berlin, Germany; [2]University of Leeds, UK

In recent years, European higher education (HE) has faced various contestations. Not only now with the confrontation of a global pandemic and forced remote teaching and researching, the academic labour market and the organization of academic work have been called into question, to different degrees though if it is public sector or privatized. Especially younger lecturers and researchers are challenging fixed-term and fractioned employment relations in times of brisk competition and are demanding for improved job perspectives. Looking at two different systems of HE, the British and the German, we find at first glance a mismatch between the degree of precarious employment and the mobilized protest against employment conditions with a high degree of objective precarity and low degree of political action in Germany and a lower degree of objective precarity and a higher degree of political mobilization in the UK.

This paper tries to explain this puzzle, investigating the representation of collective interests of precarious workers in the public, or partly public, sector. The paper draws on document analyses and 16 expert interviews with actors from trade unions as well as from initiatives and networks around precarity in academia in both countries. The case analyses show that not only budgeting, employment relations and career paths differ substantially between both HE systems, but also the academic culture and the valuation of work in HE explains differences in accepting precarious employment and in mobilizing political action. Moreover, trade unions play a crucial part in negotiations with HE institutions on the one hand, but also vary to the extend they actually represent HE workers on the other hand.

RN17_T01_03 | Labour mobility

"Labour Mobility As A Field Of Negotiation: The Role Of Old And New Industrial Relations Actors In The Making Of Brexit"

Jo Cutter, Gabriella Alberti

University of Leeds, United Kingdom

This paper engages with the debate on international migration and regulation in the field of industrial relations (IR). We explore how new regulations of migration have direct implications not only for migrants but for employment and industrial relations in general. While the realities of the new labour mobilities are as yet unclear, especially in the context of COVID-19 restrictions, we explore the process of the apparent re-regulation of labour mobility through a new "skill-based system" such as the one recently introduced in the United Kingdom post-Brexit. We show the entry of IR new actors and emergence of new forms of competition as well as cooperation between different regulatory forces as they attempt to shape the form of the new migration regime. We draw on the "regulatory spaces framework" as developed by MacKenzie and Lucio (2005, 2019) to observe the intervention and voices (as well as absence) of old and new actors in IR encompassing the national, supranational and local levels. Based on four years of qualitative research with trade unions, employers' association, local authorities, migrant groups and NGOs we suggest that the recommodification of labour and the greater regulatory complexity highlights the need firstly, for new forms of social dialogue on migration and, secondly the potential for new opportunities for cross-border cooperation between worker movements.

Posting Of Workers In The Construction Sector: The Italian Case

Rossana Cillo, Fabio Perocco

Ca' Foscari University of Venice, Italy

Based on the findings of the EU-funded projects Con3Post and PowBridge, this paper presents the trends of the posting of workers from Italy and to Italy and its drivers, focusing on the construction sector.

Over the last few years, Italian companies have increasingly sent posted workers to Central-Northern Europe, where the construction sector is having a good performance thanks to public or private investment. Indeed, Italian companies can offer lower costs and greater flexibility by employing a large reserve of skilled and unskilled workforce, which also includes workers who lost their jobs because of the 2008 economic crisis. Concomitantly, although Italy is not among the main receiving countries and despite the crisis that hit the construction sector, there has been an incoming stream of posted workers, which concerned the construction sector, particularly in the Northern regions.

The paper analyses the role of the international division of labour and subcontracting chains in shaping the stratification of the labour market and working conditions of posted workers sent and received by Italy, highlighting how this form of labour mobility is having social dumping effects on the national and EU market and how it is used to obtain competitive advantages by lowering labour costs and limiting workers' rights, particularly in labour-intensive sectors and low-skilled activities, like the construction sector.

Cross-border Labor (Im)Mobility: Commuting in Times of Pandemic and Border Closures

Elifcan Karacan

Technical University Berlin, Germany

Within the last ten years until the Covid-19 pandemic in 2020, short-distance cross-border commuting has increased massively. Following the enlargement of the European Union in 2004, the EU has encouraged the spatial mobility of labor across borders by removing the last obstacles for labor mobility with the declaration of the regulation on employment in 2011. Besides the higher income rates in the host country that attract commuters, it is discussed that other factors such as the housing situation and the advantages of the welfare state are also important in attracting people to commute, particularly in the Central European Region, and on the Dutch-German border where the real-estate prices show great differences. Although short-distance cross-border commuting is different than long-distance migration, in terms of temporality and geographical proximity, it is a multifaceted circular mobility, practiced across nation states and therefore has similar patterns of dealing with dual frames, having a family at a distance, establishing social networks, and the organization of daily life practices. With the Covid-19 outbreak, cross-border mobility in the EU is limited or even stopped for some border areas. Based on the research project funded by the German Research Foundation (DFG), this presentation discusses the characteristics of cross-border labor mobility in Germany as it is practiced before the pandemic and the impacts of border closures and limitations on the practices of commuters during the pandemic.

Bi-Local Labouring Of Women: Low-Skilled Circular Labour Migration As Employment Strategy

Marija Saric, Valerija Barada

University of Zadar, Croatia

Employment options for women are mitigated by their gender roles, placing them in work positions that often mimic their traditional family obligations. Domestic or international service and low-skilled labour are typical employment niche for women, even more occupied during strained domestic economic situations. Women participate in circular labour migrations to fulfil their re/productive roles and responsibilities (Morokvašić-Müller, 2002). The aim of this paper is to present research findings of experience of low-skilled circular labour migration of women. Twenty-three narrative interviews were conducted with women from the economically stagnant Croatian region of Slavonija who circulate for employment in care work, agriculture, and tourist industry to (and back from) the neighbouring countries. The results shed light on reasons for migrating, employment conditions and work experiences in the sectors, everyday life, and transnational bi-local living. The analysis indicates a variety of migrants' practices, contingent on their life-course and marital and family situation. Organizing their lives transnationally is more accessible and less precarious than gaining employment in their home region. Not only does work abroad enables or extends their workforce participation, albeit low-skilled, still stabilizing the migrant and their family financially, but elaborate female migrant networks safeguard against prolonged unemployment. Due to all-encompassing nature of work tasks, the migrants perceive their life abroad as the workplace itself, regardless of the type of employment, while difficult work is endured so that financially more dignified life at home is possible. Women labour bi-locally in gender typical positions but gain financial and quasi-employment independence in this process.

"On the Trail of Low-skilled Work: Characteristics and Working Conditions"

Lena Hünefeld, Marcel Lück, Arthur Kaboth

Federal Institute of Occupational Safety and Health, Germany

One-fifth of all employees in Germany perform tasks that do not require any vocational qualifications or that can be learned quickly (Müller et al. 2018). So-called low-skilled work has once again come increasingly important in the public and academic debate on the one hand against the background of digitalisation and, on the other, due to the discussion about essential work stimulated in the current Covid-19 pandemic. In previous research, low-skilled work is described as precarious, physically demanding, monotonous and hazardous to health (Abel et al. 2014; Lyly-Yrjänäinen 2008; Hall/Sevindik 2020; Wagner 2016). However, quite different definitions of low-skilled work based on the qualification ("low qualified work"), tasks ("elementary occupations") or income ("low-wage labour") are used in research. First results indicate that different definitions also cover different groups of low-skilled workers (Federal Employment Agency 2019; Hall/Sevindik 2020). A systematic overview of the similarities and differences between the various subgroups of employees in low-skilled jobs does not yet exist. Furthermore, it is unclear whether the different subgroups are also confronted with different working conditions. In the context of the research project "Work and health situation of employees in low-skilled work" of the Federal Institute of Occupational Safety and Health (BAuA) we address the question which (sub-)groups of low-skilled workers are represented by different definitions. Furthermore, we investigate whether subgroups of low-skilled workers can be identified whose work situation is associated with different hazard risks to health. In our contribution, we will present first results from this research project based on the BIBB/BAuA Employment Survey 2018 and draw conclusions for further research.

(Un)Satisfied (In)Voluntary Temporary Workers: A Cross-European Analysis Of Job Satisfaction

Leandro Iván Canzio[1,2]

[1]University of Lausanne, Switzerland; [2]Centre LIVES

The effects of temporary work on job satisfaction remain mostly unclear. Although some studies have identified a series of contextual and individual mediators, these have received little attention. I explore the effect of the reason for having a temporary contract, the temporary contract duration, and a set of labour market features, as mediators in the relationship between temporary employment and job satisfaction. By using the EU-LFS of 2017, I analysed the job satisfaction gap between permanent and fixed-term workers in 27 European countries. First, except in the Nordic countries, temporary workers are less satisfied than permanent employees only when the temporary job was an involuntary choice (they accepted a temporary position because they could not find a permanent one). When the temporary job is the preferred arrangement, an apprenticeship, or a probation period, temporary workers are equally or more satisfied than permanent workers. Second, among the involuntary temporary workers, the shorter their contract, the larger the gap in job satisfaction with respect to permanent workers is. Third, I explored the macro determinants of the cross-European differences in job satisfaction between permanent and involuntary temporary workers. The rate of unemployment, EPL, and the investment on Labour Market Policies had no association. Contrary to what the dual labour market theory would predict, union density and collective bargaining reduced the gap in satisfaction between the insiders and the outsiders: they had a positive effect on the temporary workers' job satisfaction workers and mostly no effect on the permanent workers alone.

Voluntary Flexible Working Arrangements and Their Effects on Managers and Employees

Stuart Sanders[1], Joanna Karmowska[2]

[1]Roland Berger; [2]Oxford Brookes University

The 21st century is witnessing increasing pressures on organizations to reduce costs, increase productivity, address environmental concerns, attract and retain talent. Consequently, traditional ways of working are changing for knowledge workers and others who do not necessarily need to be present in an office at all working times. Flexible working represents a way to address these challenges for employers and employees alike. While it is generally accepted that flexible working arrangements have a positive impact on employees, there has been only limited theorizing and research explaining how and why such impact is generated.

Previous studies in this area are mostly quantitative and focused on intentions of flexible working arrangements (Brummelhuis et al., 2012; Gerards, de Grip and Baudewijns, 2018; Van Steenbergen et al., 2018). Our work complements them as it provides fine grained and in-depth understanding of how employees and managers utilizing flexible working are affected. A case study has been conducted in a global management consultancy. The study concerns the impact of flexible working arrangements on job satisfaction, commitment and performance as well as well-being.

The results provide mixed evidence for benefits from flexible working arrangements where potential for increased employee performance, well-being and job satisfaction is offset by work intensification, blurred work/home boundaries, professional isolation and perceived organizational injustice. Practical implications of the study results have been intensified by accelerated organizational transition into flexible working arrangements caused by restrictions imposed as a result of Covid-19 pandemic.

Work Related ICT Use and Work Intensity - The Role of Mobile Devices

Sophie-Charlotte Meyer, Lena Hünefeld

Federal Institute for Occupational Safety and Health, Germany

In this paper we examine whether ICT use at work is related to different facets of work intensity, i.e. time pressure, multitasking and interruptions as well as the number of hours worked overtime as an indicator for work extension. For ICT use we distinguish different devices according to their mobility considering the use of a Desktop-PC, laptop and smartphone/tablet. Moreover, we explore whether further technology-related variables at the interface between technology, organization and the individual are related to work intensity or might even explain why ICT use is related to work intensity. The analyses are based on the German survey "Digitization and Change in Employment (DiWaBe)" 2019. OLS-results indicate that the use of a smartphone/tablet is related to a significant higher work intensity and work extension, regardless of the indicator considered. In contrast, we find no evidence that working with a laptop is associated with increased work intensity. This suggests the mobility of the technology to be crucial. Further analyses reveal that especially technology-induced disturbances and information overload are strongly related to work intensity. However, none of the additional variables explored seems to be a pivotal factor in determining why the work-related use of mobile technologies correlates with work intensity.

Attitudes tTo Trade Unions In Sweden: Changing Conditions, Changing Attitudes?

Jesper Prytz, Bengt Larsson, Tomas Berglund

University of Gothenburg, Sweden

While previously not showing such tendencies, there is today some evidence for an ongoing dualization and polarization on the Swedish labor market. Whereas dualization point to increasing number being temporary employed, polarization implicates that there is an increase in both low- and high-paid jobs, while middle-paid jobs are decreasing (Åberg, 2015; Adermon and Gustavsson, 2015; Heyman, 2016). Such tendencies develop in contradistinction to the historical Swedish social and labor market model, in which strong trade unions have shaped and defended working conditions and solidaristic wage policies through collective bargaining with employers (Baccaro and Howell, 2017; Thelen, 2014). Although collective bargain coverage and union density remains high, the latter is slowly decreasing in Sweden, as in most European countries (Kjellberg 2019). The problem studied in this paper is whether these changes are related to a change in attitudes toward unions among employees. The paper is based on data from surveys carried out in Sweden in 1997, 2006 and 2018/19. The main question concerns whether employees want to negotiate individually or through the unions, and what the attitudes to trade union activities regarding issues such as income redistribution, robotization, competence development, employment protection legislation, are. We find slight changes in such attitudes over time, however, less so than could be expected. In addition, we find significant effects from class/education, sex, age, sectoral belonging and trade union membership on these issues.

Ideational Development Of Trade Unions In The Changing Political Economy, 1976 - 2021, The Dutch Case

Saskia Boumans

University of Amsterdam, Netherlands, The

This paper argues that the ideational development of the FNV, the biggest Dutch trade union between 1976 and 2021 from a Keynesian welfare-state ideational understanding of the labour market to a more neoliberal approach has not merely been a matter of strategy and the consequential change in discursive practices in the face of changing political realities and power relations, but reflects a more profound ideological transformation. The role of the labour movement is often limited to the non-achiever. This fails to consider that trade unions might have went through an ideological conversion since the 70s themselves: that they have actually chosen to change their objectives. One reason for this probably is that industrial relations literature often assumes that trade unions interests remain unchanged, even in changing contexts. If we explore the possibility that trade unions can change their interests though a range of additional explanations to understand the fundamental changes in the political economy open up.

In this paper ideational institutionlism literature is combined with literature on trade union ideologies and identities to increase our understanding of the role of trade unions in the transformation of the political economy. The paper first provides an analysis of the shifts in ideas of the FNV concerning wages, employment and education and then connects this to a gradually shifting self-identification as a union and an alteration in their conception of employee interests. The changes in the socio-economic dimension of the ideational development towards a more neoliberal framework is coherent with adding elements into the self-conception of a trade union operating in a market environment.

Unionism In Times Of Remote Work: Challenges And Opportunities

Anne-Iris Romens, Valeria Piro, Francesco Campolongo, Francesco Eugenio Iannuzzi

University of Padua, Italy

Following the Covid-19 outbreak, public administrations and private companies have been encouraged to constrain their employees to work from home by resorting to a specific remote working arrangement. This kind of work has been largely defined in the Italian debate as 'smart working'. Despite smart working being hazily regulated by the Law since 2017, before the pandemic trade unions had only partially considered the issue in national and company collective bargaining. However, following the exponential growth of remotisation, unions have increased their attention towards this phenomenon, pushing for a greater regulation of this form of work. Nevertheless, unions' degrees of commitment and orientations towards smart workers depend on several factors, i.e. the workforce composition, the level of unionisation, the specific industry, and the peculiarities of local contexts.

The aim of this paper is to examine how remote work has modified trade unions' activities and strategies and how it has affected unionisation processes among the workforce.

We argue that on the one hand, remote work represents a challenge for unions, as they find it more difficult to reach workers and collectively organise them, due to an actual risk of individualisation of social relationships at work. On the other hand, the massive adoption of smart working has enlarged the typology of employees involved in union activities, encouraging white collars, hitherto little unionised, to become more participative in collective actions. The paper is based on fieldwork conducted in Northern Italy, consisting of 80 semi-structured interviews with smart workers, trade unionists, and other stakeholders.

Innovate to Represent: Hard to Represent Workers and Trade Union Strategies in Spain

Oscar Molina, Oriol Barranco, Ramon De Alos

Autonomous University of Barcelona, Spain

The diversification of employment situations in Spain is causing important difficulties for workers to have collective representation. Many of these situations are far from new, such as those of bogus or dependent self-employed workers, those of employees in small workplaces and those of workers with short-term jobs. Other situations are new, such as platform workers. The article analyzes strategies and practices developed by trade unions, riders associations, cleaning maids and home care assistants in order to respond to these difficulties. The article shows growing experimentation in strategies and practices aimed at representing these groups of workers, by the most representative but alson smaller trade unions. Moreover, the article also explores the representation strategies carried out by abovementioned associations

Rethinking Productivity In Remote Working Time: How Do Business Strategies Determine Inequalities Between Workers? Lessons From The Italian Branch Of A Multinational Service Company

Silvia Lucciarini, Irene Vitali

University of Rome, Sapienza, Italy

The pandemic has given a considerable acceleration to digitalization processes, which has found both workers and employers unprepared. The skepticism in the use of smart-working in Italy, especially by companies, was linked to the new relationship between this mode of organization and productivity, a relationship on which there are few studies and research (Angelics, Prophet 2020). The permanent experimentation underway since March 2020 is a sort of natural field experiment, a precious opportunity for the collection of experiences and testimonies. This work aims to emphasize the relationship between smart-working and productivity from the company's perspective, connecting it to the most well-known aspects of quality, autonomy, and control of work. This reasoning starts from Weick's reflections in "Misconceptions about managerial productivity," which compares the different ways of measuring productivity and their weight between the different professional positions in the company, highlighting the link between productivity and autonomy. We will explore an Italian company case, analyzing the experience of a large multinational corporation, multi-based in Italy (anonymous for privacy), using HR data of approx. 3.5 thousand workers. We will show how objectives' evaluation and measurement practices attributed to individual workers play a central role and have made it possible for management to compare productivity levels both in the ordinary regime and smart-working, considerations that have led management to rethink productivity, how it is measured and the strategies with which to pursue it.

Constructing Meanings of IT specialists' Work Employed in Polish and Multinational Business Services Outsourcing Centres in Poland. Initial Results.

Szymon Pilch

University of Wrocław, Poland

In the presentation, I will address the question of the process of constructing meanings of IT specialists' work in business service centers in Poland. Emphasizing selected structural, cultural and economic conditions, I will introduce a reconstructed preliminary typology of meaning attribution to IT specialists' work employed in Polish and in branches of multinational business services companies. Based on a collection of 15 autobiographical narrative interviews (Schütze 1992) conducted in the second half of 2019 with IT specialists in 3 Polish cities differing in the degree of social and economic advancement of the business services industry, I have made analysis of the transcription of interviews, inspired by the analytical procedures of the grounded theory

methodology (Glaser, Strauss 1967). Using on the one hand open and then selective coding, and on the other employing the notions of biography, career and resources as sensitizing concepts, I have discovered the basic social process – career planning. The emerged codes have been grouped into the three most substantial axial categories. These are respectively: a) subjective meanings and biographical experiences of work, b) objective context and experiences of work in the Polish BPO industry, c) career development resources. The three identified types are: (1) acquiring economic stabilization and gaining a social status, (2) a transition period in IT specialist career, (3) being an expert in IT. As a result of imposing these categories on the types, I have created a tentative typology. The properties of the latter will be discussed during the presentation.

Transnational Industrial Democracy: How Empowering are TCAs?

Isabel M. da Costa[1,2]

[1]CNRS, France; [2]ENS Paris-Saclay

Democracy at work and workers' participation and involvement at various levels from the local and national to the European and global, are crucial for the development of decent work that respects fundamental human rights, and are essential to tackle global challenges, including inequality, health and safety, and restructuring, for example, that have been increasing with the Covid pandemic. Democracy at work and workers' participation and involvement takes different forms in different countries and at different levels of industrial relations from the local to the global. In many countries freedom of association is not guaranteed and at the global level worker representation is still in its inception. At the EU level some forms of worker representation are still evolving as is the recognition of the results of their activities when they are of a voluntary nature beyond legal boundaries.

My communication proposes to address the development of transnational worker representation and participation. It will use the EU database, the Global Unions database and my own database to map Transnational Company Agreements (TCAs) and their evolution for the past two decades. I will focus on the issue of the empowerment of the actors involved in TCAs. The negotiation and implementation of TCAs entail a coordination of the national and cross-national levels which require innovative and autonomous practices, particularly as regards mandates to negotiate, sign, and

follow-up on the employee side in the absence of EU legal orientations. Does it empower, and which actors involved? Has decision making in transnational companies become more democratic?

RN17_T02_03 | Careers

Career Decisions in Academia under the Influence of the Unemployment Office

Susanne Wollin-Giering, Markus Hoffmann

TU Berlin, Germany

Today, fixed-term contracts have become the standard in the German academic system. In addition to the precariousness of such contracts, researchers are more likely to face episodes of unemployment between contracts. While being unemployed, researchers regularly undertake research activities and connect to their scientific community, e.g., by continuing to publish. Such activities are often understood as necessary to increase the chances of finding a new job when applying for positions at research institutions.

In many cases, unemployed researchers depend on financial support from the German employment office, and in return they must demonstrate application efforts. Thus, the relevant activities to find a new job in academia and the activities needed to ensure continuing financial support stand in stark contrast to each other. But unemployment offices have only limited knowledge of the specificities of academic careers, and only limited resources to reintegrate researchers into the academic labour market. Due to the expectation that researchers must make themselves available to the non-academic labour market as well, the unemployment office is able to financially sanction research activities during unemployment.

We will discuss how unemployment office requirements affect German researchers' career decisions. We expect discipline-specific patterns of influence of the employment office on research conditions, which enable, prevent, or limit the possibilities of research during unemployment with consequences for further academic careers. To demonstrate these links, we will report empirical findings from a preliminary study, based on semi-structured interviews with unemployment office staff and unemployed researchers.

Career Paths of Young Adult Poles in the UK Before Brexit in Light of the Annual Population Survey and Narratives

Olga Czeranowska, Agnieszka Trąbka, Iga Wermińska-Wiśnicka

SWPS University of Social Sciences and Humanities, Poland

Geographical and occupational mobilities are connected within migrants' biographies, as very often work-related motivations tend to be reasons for moving to another country and this, in turn, affects an individual's occupational situation. In this paper, looking at the example of Polish migrants, we ask the following research questions: What types of career paths can be identified among intra-EU young adult migrants in the UK? What can we learn from their narratives about their labour market situation 16 years after the biggest EU enlargement? We integrate data from the UK Data Service's Annual Population Survey (APS) and in-depth interviews from our research project "CEEYouth: The comparative study young of Poles and Lithuanians in the context of Brexit" (Funding source: National Science Centre Poland and Research Council of Lithuania, DAINA scheme). We then describe five types of career paths of young adult migrants identified through statistical cluster analysis focusing on their positions in the British labour market and their educational attainments. Subsequently, we explain the distinctions and transitions between these categories in more detail, using qualitative illustrations from the interviews.

The Gendered Barriers In Finance: The Doom Loop Of Window Dressing Diversity And Lost Transformative Policies

Giulia Porino, Luisa De Vita

Sapienza University of Rome, Italy

We investigate how policies promoting a higher presence of women in firms do not automatically increase inclusion and diversity. A greater representation of women is beneficial both for firms' performance and dynamics of role models. However, often women occupy non-strategic or non-senior executive roles and their participation fails to produce a spill over effect across firms' hierarchy. Moreover, if these women are in all aspects similar to their male peers but for their sex, it is likely that their contribution to increasing diversity within the working structure will be limited.

In this context, gender parity within firms becomes a mainstream tool for neoliberal praxis, with the goal of 'flatting' diversity and maintaining the status quo.

This paper critically debates these issues within the major trends and developments in the industrial relationships between the social partners (workers and employers), including the tripartite dimension where public authorities at different levels are involved.

We apply a qualitative methodology based on interviews with the above-mentioned categories of stakeholders in Italy and Denmark. We investigate how corporate cultures that implicitly prevent employees from claiming their rights, generate both social stigma and the internalisation of unequal praxis, particularly in male-dominated industrial sectors, like the financial sector, and in the current pandemic context. We also explore how women in top positions fail to foster inclusive organisational environments, if not supported by ad hoc social policies. The papers concludes with a set of recommendations that are of great relevance not only from an academic point of view, but also from the viewpoint of any policymaker trying to implement measures able to trigger a real change within firms' corporate governance and organizational praxis.

663

Women's Career Trajectories in STEM : A Life Course Perspective

Yung-Han Chang

University of Kang Ning, Taiwan

Studies suggested that gender segregation remains pronounced in Taiwan, particularly in the traditionally male-dominated STEM workforce despite the increase in female labour force participation. As an employment choice is a decision-making process interacting with life-course dynamics, this study adopted a holistic approach and examined the career path of women instead of their employment status at a single time-point. Based on the Kaleidoscope career model, the analysis drew on the longitudinal data from the TEPS-B and PSFD and the data from an online survey administered by the researcher. Career trajectories of women in the STEM were established with the sequence analysis. The results showed that women of different life stages demonstrated distinctively different career paths. The regression analysis found that, among those who just left the school, women had a higher retention rate in the STEM workforce and a higher likelihood to step onto the STEM career path than their male counterparts. However, as they moved along the course, women's attrition increased as they became significantly less likely to hold onto the "long-lasting STEM career path". Moreover, compared with the newbies, the finding that women with years of work experiences felt a higher level of work-family conflicts and hostility towards women showed that women's perceptions and understanding of the workforce changed even without career choices reflected upon explicit actions.
Keywords: gender segregation, gender equality, sequence analysis, career path

RN17_T02_04 | Collective bargaining and social partners

Between Industry and Establishment. Recent Developments in German Collective Bargaining and Codetermination

Thomas Haipeter

University of Duisburg-Essen, Germany

The German dual system of labour relations is at a crossroads. The two cornerstones of the system, collective bargaining at the industry level and codetermination of works councils in companies and establishments, are eroding. Only one third of the workforce is now covered by both institutions. The presentation, which is based on findings of several research projects conducted by the author, will focus on new strategies trade unions have developed to cope with these challenges, including new conflict strategies in derogations from collective bargaining agreements, new approaches to organising and new projects to activate works councils. An important consequence of these strategies is the blurring of traditional boundaries between the levels of action of the industry and the establishment, which traditionally were characterised by a strict separation of roles between works councils and trade unions. Trade unions are now developing an active policy at the establishment level with the aim of strengthening their position in the companies and improving the ability of works councils to act. At the same time, the importance of works councils as actors in collective bargaining is increasing. This new interplay of actors and levels seems to be an important precondition for the revitalisation of German industrial relations, even if it does not mean that all problems will be solved.

Resisting the Great Recession: Social Movement Unionism in Croatia and Serbia

Danijela Dolenec[1], Širinić Daniela[2], Balković Ana[3]

[1]University of Zagreb, Croatia; [2]University of Zagreb, Croatia; [3]Universitat Autònoma de Barcelona

Addressing the debate regarding the impact of the Great Recession on changing union strategies in post-socialist Europe, our analysis shows that in Croatia and Serbia the crisis, while depressing strike numbers, was nevertheless met with substantial union resistance. Developing a paired comparison and relying on protest event data for the period 2000-2017, we argue that varying levels of union institutionalization in the two countries have led to divergent union strategies described as social movement unionism. In Serbia the role of unions in protests articulating workers' demands remained more central and unions were overall more present in the protest arena while in Croatia unions have exhibited stronger propensity to forge alliances with civic initiatives and adopt innovative policy strategies such as citizens' initiatives for referenda.

Swedish Social Partners Take on Gender Equality on the Labour Market

Ylva Ulfsdotter Eriksson[1], Anna Maria Sarstrand Marekovic[2]

[1]Linnaeus University, Sweden, University of Gothenburg, Sweden; [2]Linnaeus University, Sweden

Sweden is one of the most gender-equal countries in the world (EIGE 2020). However, the labour market still suffers from sexual division of labour, pay gap, sexual harassment and work/family-conflicts (cf. SCB 2020). Swedish social partners, Trade Unions and Employer Organisations, have vast autonomy in regulating conditions at the labour market, not least through collective bargaining and agreements, but in other collaborative arenas as well (e.g. Kjellberg, 2019; Larsson & Ulfsdotter Eriksson, 2019). Still, the Swedish Women's Lobby criticized the labour market partners for not using these arenas as a platform for addressing gender inequality, and more purposeful confront inequalities in agreements and other collaborations. Also, Briskin and

Müller (2011) appointed social dialogue as a beneficial arena to address gender equality. Danieli (2006) argued that gender relations have been sidestepped, not only by IR researchers but within the Industrial relation-work and agenda as well.

This paper investigates the articulation of gender equality on labour market matters and aims to explore how Swedish Trade Unions and Employer Organisations address gender equality issues The empirical data consist of social partners public debate articles in media and public statements from social partners websites. The analysis is guided by Bacchi's (1999;2009; cf. Röbblom and Sandgren 2015) critical appraoch to policy and revolve around questions such as: How is gender equality addressed by social partners and do statements differ depending on actor and role?; What assumptions of gender relations underlie the approach to gender equality?; and How can social partners articulation explain the production and reproduction of gender relations on the labour market.

Precarious Employment Biography Types And Employment Policy Impacts

Cordula Zabel

Institute for Employment Research (IAB), Germany

Non-employed welfare benefit recipients are likely to have quite divergent employment biographies. Those with a history of precarious employment may be at risk of reentering peripheral work, while those with very little employment experience may have difficulties finding employment at all. This paper classifies welfare benefit recipients' employment histories using sequence analysis and cluster analysis, using register data for Germany and focusing on employment histories over the past seven years. The sample consists of welfare benefit recipients aged 45-54 in August 2012. Four main employment history clusters are identified for men and five for women. Approximately 50% of the women and men belong to clusters characterized by almost no employment experience, 25-30% have very little employment experience, 10%-15% have employment biographies characterized by many short employment spells, and the remaining approximately 10% were employed for over half of the past seven years, for

women divided evenly into a primarily regularly employed group and a group primarily employed in uninsured minijobs. Using propensity score matching methods, further findings on the impact of employment policies over the subsequent six years are that longer vocational training programs and to some degree also shorter training programs increase benefit recipients' probabilities of taking up insured and stable employment. This holds for each of the employment biography clusters, such that participants with previously instable employment biographies can for instance achieve more stable employment. Workfare programs, on the other hand, only minimally increase employment probabilities and only for welfare recipients with very little prior employment experience.

Precarious Employment, Job Insecurity and Stress Biomarkers: Exploring Gender Inequalities and Pathways to Chronic Stress

Sergio Salas Nicás[1], Mireia Julià[2], Mireia Bolivar[3]

[1]ESADE Business School - Universitat Ramon Llull; [2]Universitat Pompeu i Fabra; [3]Universitat de Barcelona

Background: Changes in the labour market have led to the proliferation of flexible and precarious forms of employment characterized by a high degree of insecurity that endanger workers' health. Despite growing evidence on the association between precarious employment and health, the mechanisms disclosing this relationship have not been addressed.

Objectives: The aim of this study is to analyse the role that perceived job insecurity has in the pathway by which precarious employment impacts stress.

Methods: Cross-sectional study in a sample of 255 workers of Barcelona, Spain, aged 25-60. We conducted a survey including questions on precarious employment, economic insecurity and cognitive and emotional perceived insecurity measures. Dependent variables consist of 13 biomarkers of the HPA axis related to chronic stress, including Cortisol and its related components found in hair samples. Linear regression models stratified by sex and controlled by age and BMI are applied. Building on these results a structural equation model is discussed.

Results: We found 14 significant associations between perceived insecurity and stress biomarkers, all individuals considered. Cognitive labor market insecurity is associated with an increase in six biomarkers when the whole sample or only men are considered. This association disappears among women. Instead, they experience an increase in four biomarkers when they perceived a high likelihood of worsening their schedule. Cognitive insecurity regarding salary and affective job loss insecurity do not associate to any of the biological indicators.

Discussion: Job insecurity could be a partial mediator between precarious employment and stress.

Precarious Work and Family Formation in Ireland

James Wickham, Alicja Bobek, Sinead Pembroke

Trinity College Dublin, Ireland

Early studies of 'the precariat' (e.g. Standing 2011) tended to aggregate the very different forms of precarious work and to abstract work both from household and national contexts. By contrast, our study of precarious work in Ireland differentiated between different forms of precarious work in terms of occupation and employment contract and between the different household contexts of the workers themselves. We used this to investigate the implications of the different forms of precarious work for family formation and child-rearing in the specific context of the Irish welfare state.

Organisations offering precarious work often claim that this suits contemporary lifestyles, but our interviews show how those on temporary contracts aspire to a 'proper job'. Furthermore, a proper job (a regular income with some employment security) was seen as a precondition for having children. Especially for women, parenthood was delayed not because of career ambitions, but simply for some security. Indeed, within partner relationships one partner in regular employment was seen as a precondition for parenthood. Contrary to our expectations, this could involve gender role reversal: if the female partner had a regular job and the male partner was in temporary employment, it would be the male who left employment for parenting. Whereas universal social services provision can moderate the impact of precarious employment, in Ireland the low levels of childcare provision exacerbate the impact of precarity.

Understanding Precarious Unpaid Work in Creative Industries: A Comparison in Europe

Valeria Pulignano[1], Deborah Dean[2], Markieta Domecka[1]

[1]KU Leuven, Belgium; [2]University of Warwick, UK

Creative work is often project-based and precarious, which takes different forms and dimensions (Curtin & Sanson, 2016; Friedman et al., 2017). The paper focuses on unpaid work as a key aspect of creative precarious work. By drawing from 40 narrative interviews in TV/film and voice-over industries in Germany and the UK, we identify the structural, cultural and biographical mechanisms explaining how unpaid precarious project-based work is produced, reproduced and maintained within creative industries. Especially, we argue that while structural mechanism of commodification at the level of the industry and country leads to unpaid in project work as the way to cope with underfunding and budget constraints on the one hand, cultural mechanism of stigmatisation at the level of the organisation ensures project workers' compliance to unpaid work since those who do not, are labelled as 'troublemakers' and blacklisted, and therefore excluded from the industry, on the other hand. Yet, while commodification and stigmatisation elicit unpaid in project work, it is the biographical mechanism of homology seeking between constructed identity and the work performed, which explains how unpaid is maintained in project work, thereby fostering precarity. Homology seeking accounts for why people carry on doing precarious unpaid jobs. Fuelled by passion, biographical projects of becoming a creative worker involve high investment costs, so in the end it becomes difficult to abandon them. Trying to pursue careers consistent with their identity, workers accept the need to do the unpaid in order to 'get in' and 'get on' in the creative sectors.

RN17_T03_02 | Meritocray and inequality

Can Closure Protect Against Discrimination? A Field Experiment in the United Kingdom Testing How Requirements in Job Advertisements Impact Bias in Hiring.

Katharina Stückradt[1], Valentina Di Stasio[2], Bram Lancee[1]

[1]University of Amsterdam, Netherlands, The; [2]University of Utrecht, Netherlands, The

Is discrimination lower in contexts where job requirements are specified in the job advertisement? We focus on the very first phase of the hiring process and investigate whether the formulation of job requirements in job advertisements is associated with lower levels of ethnic as well as gender discrimination on the UK labour market. Following closure theory, we test a competing hypothesis: specifying job requirements in the vacancy acts as closure mechanism which either overshadows discriminatory tendences, or increase discrimination. We explore whether closure mechanisms serve as shelter against discrimination by shifting salience towards applicants' objective qualifications, or conversely, whether they exclude outgroups from access to jobs by activating group stereotypes.

We use data from a correspondence test in the UK collected as part of the "Growth, Equal opportunities, Migration & Markets" (GEMM) project. The data contain 3.290 fictitious applications, the vacancies to which they were sent, and the response received from employers. The data allow us to investigate discrimination against applicants originating from western – as well as non-western countries and gender discrepancies independently. Linear probability models show that male applicants of the UK majority population are discriminated when applying in female-dominated occupations when requirements are specified that are considered stereotypically female. We furthermore find

high levels of discrimination against applicants signalling a non-western country of origin. However, ethnic discrimination is not mitigated by the formulation of job requirements in the advertisement. All in all, our findings do not support the hypothesis that job requirements in vacancies act as closure device that protect outgroups against discrimination.

Digital Inequality and Online Job Search. The Spanish Case of Study

Guillaume Dumont[1], Stefano De Marco[2], Ellen Helsper[3], José Luis Martinez[4]

[1]EMLYON Business School & OCE Research Center; [2]Universidad de Salamanca, Spain; [3]London School of Economics and Political Science; [4]Universidad Complutense de Madrid

Previous studies have widely shown that both internet users' material and educational resources and their level of digital proficiency are critical for maximising positive outcomes of internet use. This suggests that job seekers with high levels of digital proficiency should have a better chance of securing employment when they utilise online tools, such as LinkedIn and InfoJobs, for job hunting. Nevertheless, we currently lack empirical evidence that demonstrates this process. This paper addresses this insufficiency by investigating how digital inequality amongst job seekers shapes the use of online tools for job searching: specifically in terms of building a profile, interacting on employment platforms, and sending signals to potential recruiters. With this aim, we build upon the analyses of 90 semi-structured interviews with both recruiters and job seekers in Spain. Our preliminary results show that "digital communication skills" are of particular importance in markets with limited job opportunities, and that they have positive implications for finding a job online. Moreover, even though these skills may have little to do with the required competencies of the job positions posted online, we found that job seekers believe that they are an important indicator of workers' capacity to perform well.

Employability or Inequality? The Ambivalent Outcomes of Studying Abroad

Davide Arcidiacono[1], Maurizio Avola[2], Rosario D'Agata[3]

[1]Università degli Studi di Catania; [2]Università degli Studi di Catania; [3]Università degli Studi di Catania

After the establishment of the Erasmus in 1987, an increasing number of European young students choose to study temporarily abroad during their tertiary level of education. Since the late '90s, evaluating the impact of the Erasmus or other student mobility programs in terms of skills empowerment and employability has become a crucial concern both for European institutions and academic scholars.

The first studies on this issue are based on ad hoc large surveys to students, three or five years after graduation (Teichler and Maiworm 1997), also adopting a comparative perspective between countries and between students adhering or not to the program (Jahr and Teichler 2002). Later studies, using institutional data on national labour forces or specific national databases on graduates (Iriondo, 2020; Liwinski 2019; Kratz and Netz, 2018; Sorrenti, 2017), increasingly focus on access barriers, assessing how the potential "beneficial" effects of the program in terms of employability are influenced by the social origin of the participants (Souto-Otero et al. 2013; Rodrigues 2013; Di Pietro 2020).

Following this research stream and using two waves of a large dataset on Italian graduates collected by ISTAT, we analyze the effect of studying abroad on employability four years after graduation. In particular, we aim to answer three research questions:

1) Study abroad have any effects in terms of labour market outcomes (employment opportunities and job quality)?

2) Are these returns different depending on social origin, gender, and geographical area of residence?

3) Do these returns help to reduce inequalities between social origin, gender, and territories?

668

The Dark Side of Meritocratic Beliefs: Is Believing In Meritocracy Detrimental To Individuals From Low Socio-Economic Backgrounds?

Alicia García Sierra

University of Oxford, United Kingdom

Individuals' perceptions of how the path towards success is built might affect their choices and behaviors. Particularly, meritocratic beliefs have been shown to influence the level of tolerance for inequality, support for redistribution, or even health outcomes. However, it remains unexplored how believing in meritocracy could affect the socio-economic trajectories of individuals. This paper examines if holding meritocratic beliefs during the adolescence period has asymmetrical long-term effects on the occupational outcomes of adult individuals from different socio-economic backgrounds. A sibling fixed-effects model is implemented using data from the German Socio-Economic Panel (SOEP). The findings show that holding strong meritocratic beliefs in the late teenage period increases the odds of becoming unemployed and decreases the chances of finding a full-time job for those adult individuals from lower socio-economic backgrounds. Nevertheless, these beliefs have a positive effect on those from more privileged families. These results open a new avenue to explore how believing in the meritocratic discourse could be detrimental when it clashes with the barriers that disadvantaged individuals find in their life trajectories.

RN17_T03_03 | Gender and dignity at work

Consequences Of The Corona Crisis For Gender Inequalities In Working Hours In Germany

Susanne Wanger

Institute of Employment Research, Germany

When considering the working hours a reference value, women were only below average integrated into the German labour market before the corona pandemic. The high proportion of women who work part-time leads to a pronounced working time gap between women and men in Germany. The corona pandemic is leading to massive lost working hours and a drastic decrease in the number of hours worked by employees, which affects women and men to different degrees. We are therefore investigating whether and how the gender differences in hours worked have changed over the course of the Covid-19 pandemic. Using the IAB online survey "Living and working in times of Corona", the working time adjustments of women and men during the Covid-19 pandemic can be empirically examined. Panel analyses are used to examine the extent to which a change in current weekly working hours compared to before the Corona crisis is related to other individual, household and operational characteristics. The estimates show that the reductions in working hours for women are higher than for men, even under otherwise identical circumstances - for example with regard to children, training, short-time working and net household income. The reduction in working hours continued to be particularly large in the age group of women up to 29 years of age - in-depth analyses make clear that this only applies to women with children, who are particularly affected by the consequences of the restrictions on care facilities and schools.

Overall, the results show that women are particularly affected by the Covid-19 pandemic. The gender time gap between women and men increased in 2020 and carries the risk "retraditionalization" of gender roles.

Dignity at Work and Power Relations. Conditions and Guidelines for a Research Agenda

Sofia A. Cruz

University of Porto, Portugal

Achieving dignity in the workplace remains one of the biggest challenges for governments and social partners, particularly in the current COVID-19 pandemic. In fact, the COVID-19 crisis has drastically changed the way in which workers life and work, and at the same time it has heightened awareness of the importance of decent working conditions. This paper aims to reflect on the issue of dignity at work by presenting an analytical exercise on the dimensions that threaten and promote dignity in the workplace. This reflection on dignity emphasizes one of its particular dimension related to power relations in work that include autonomy and dependency. The first part of the paper provides a conceptual framework of dignity at work, considering its historicity and multidimensionality, and how is reflected in the set of 17 objectives on 2030 Agenda for sustainable development, defined in 2015. The second part proposes a questioning about the exercise of power, its meanings, actors and narratives, and the role that this dimension can play to create opportunities that foster a decent work agenda.

Exploring the Gender Gap in Regular Teleworking from Home. The Roles of Worker's Characteristics, Working Conditions and Gender Equality in Societal Context

Thordis Reimer, Stefanie Kley

Universität Hamburg, Germany

Before the Covid-19 pandemic urged working people to stay at home, telework in most countries was more a privilege than a necessity and was generally considered a flexible form of work that allowed for a better work-family balance. However, previous research indicates that fewer women than men are teleworking from home, indicating a gender gap in telework, although there is significant variation between European countries. This study explores how the gender gap in regular telework can be explained, by taking worker's individual and employment characteristics as well as the level of gender equality as a country characteristic into account. The analyses focus on workers for whom ICT use is a part of their work. Based on EWCS data from 27 European countries in 2015, logistic regressions with country fixed effects and two-level mixed-effects are estimated. The results show that before the pandemic, women were significantly under-represented in regular telework from home compared to men, even under control of demographic, family, and work-related characteristics. Neither working in part-time, nor having children or working over-hours did explain the gender gap among teleworkers. Higher gender equality at the country level increased the likelihood of teleworking in both, men and women. All in all, the findings support the view that in more gender-equal countries telework is more equally distributed among men and women with otherwise similar characteristics.

RN17_T03_04 | Labour digitalisation

Digital Labour and the Ambivalence of Technology. A Multi-sited Ethnography of Platforms.

Gianmarco Peterlongo

Università di Bologna, Italy

The paper concerns the digital on-demand economy understanding platforms as economic and technological infrastructures in urban economics (Plantin et al., 2016; Borghi, 2019). Lean platforms are result of long processes of neoliberalization and employment deregulation in Western labour markets, and, more globally, of a process of informalization of the economy (Breman & Van der Linden, 2014; Beck, 2000). The research focuses on platform workers, observing on a multi-sited scale how infrastructural conditions both affect and are affected by workers' experiences in different ways. The observation is based on two very distant urban contexts: Bologna (Italy) and Buenos Aires (Argentina). The case studies are food-delivery platforms like Uber Eats in the first case, and ride-hailing platforms like Uber in the second. Through these two cases, the aim is firstly to highlight the impacts of digitization on workers and address the issue of opacity of algorithms and information asymmetries (Pasquale, 2015; Rosenblat, 2018). On the other hand, the workers' socialization with digitality let them sometimes sabotage or counteract the digital infrastructure, showing the ambivalence of technology (Leonardi et al., 2019). While technology is used by companies to further intensify and subjugate work, on the other hand it also becomes a tool that can meet workers' needs and resistance. There is a lot of research on algorithmic management and digital control over workers (Wood et al., 2019), but few studies are beginning to consider platform workers as active subjects capable of challenging the models imposed by the digital architecture of platforms (Rossiter, 2016).

Biographical Experiences of Polish Healthcare Workers in the Context of the Marketisation Process

Jacek Burski

University of Lodz, Poland

In the presentation I would like to focus on the issue of biographical experiences of Polish healthcare professionals in the context of the processes of marketisation. Additionally, I am also interested in the context of the COVID-19 pandemic, during which workers involved in the healthcare system have a unique role and are also uniquely vulnerable.

I assume that functioning within an socio-economic environment that has been increasingly subjected to marketisation processes over the last three decades must have involved different kinds of biographical risks (trajectory potentials (Schütze and Riemann 1991; Waniek 2019)). Using biographical narrative interviews and other types of empirical material, I would like to trace how the biographical careers of Polish healthcare workers are shaped in a privatizing system, what types of adaptive strategies are taken, what transformations occur in the workplace, how individuals handle with work-life balance and, if possible, to what extent the pandemic accelerates or slows down these processes.

The basis for my considerations are materials from the research projects: "Experience of the Process of Transformation in Poland. A Sociological Comparative Analysis Based on Biographical Perspective" funded by the National Science Center in Poland (UMO-2013/09/B/HS6/03100) and „COV-WORK: Socio-economic consciousness, work experiences and coping strategies of Poles in the context of the post-pandemic crisis", funded by the National Science Centre in Poland, (UMO-2020/37/B/HS6/00479).

671

Digitalisation, dualisation and polarisation of manufacturing in Sweden and Norway – Consequences for Organisations and Employees

Anna Hedenus[1], Erica Nordlander[1], Johan Røed[2]

[1]University of Gothenburg, Sweden; [2]Fafo, Oslo, Norway

Recent research on the Swedish and Norwegian labour market show tendencies of both dualisation – with a growth in temporary employments – and polarisation – referring to increased employment in both low- and high-paid jobs, while the number of jobs in the middle decreases. Analysing the trends for permanent and temporary employment separately, however, it is shown that job growth at the low-paid end consists of temporary employment, while the increase at the high-paid end is mainly caused by open-ended contracts. Other studies of the Nordic labour markets, and of manufacturing in particular, show that an upgrading of work is largely driven by digitalisation. Digital solutions create expectations that all parts of the work organization are involved in production monitoring and quality control. This require higher cognitive skills among the employees, reallocation and recruitment of staff with the required skills, as well as outsourcing of blue-collar tasks. The tendencies of dualisation, polarisation and digitalization are thus clearly interrelated, with effects on skill demands and status of different groups of workers.

Using case studies of manufacturing companies in Sweden and Norway, this study investigates the combination of digitalization efforts, staffing strategies and competence development and how these strategies are expected to influence the organisation's competitive position and employee's labour market position. As the study is carried out during the pandemic, the impact of Covid19 will also be analysed as an important factor. The paper will present preliminary findings from the study.

Precarisation Of Work And Life In Platform Economy

Miroljub Ignjatović, Aleksandra Kanjuo Mrčela

University of Ljubljana, Faculty of Social Sciences, Slovenia

A growing share of different platform-based variations of businesses commonly named platform economy have already caused structural changes in the contemporary labour markets and societies. Organisation of work on platforms utilising new technologies and a specific business model intensified the flexibilisation trends evident from the 1980ies and enabled businesses to further minimise labour costs (Streeck 1987) through continuous casualization of work and employment (Peetz 2019). A substantial body of literature confirms the growing strength of the platform economy and its numerous challenges for the labour force (Kenney and Zysman, 2016; Fabo et al; 2017 Kenney and Zysman, 2016; Srnicek, 2017; Langley and Leyshon, 2017).

During the Covid-19 pandemic (in 2020) platform economy experienced an additional rise, as the big tech companies like Amazon, Apple, and Google reported rising sales and profits due to increasing demand for their digital services. Eurofound (2020) data show that during the 2020 increasing share of European workers worked from home using ICT and platforms. In this article we will present (using quantitative and qualitative data) some of challenges of the mentioned trends. We think that it is especially significant as transformation of the role of platform work is expected – from the work that provides a supplement to the main income of workers in "standard" employment to the main source of income for growing share of especially younger workers many of whom experience underutilisation of their potentials, underemployment, lack of social security and increased precarity.

672

RN17_T04_01 | Non-standard employment

Does Taking up a Fixed-Term Job Reduce Poverty Risks? Evidence From German Panel Data

Stefanie Gundert[1], Michael Gebel[2]

[1]Institute for Employment Research (IAB), Germany; [2]University of Bamberg, Germany

Poverty as a social problem has been attracting considerable attention in recent years. Employment is commonly regarded as a safeguard against poverty. This view is challenged by recent debates on in-work poverty where there is a growing perception that not all types of employment are equally effective in reducing poverty. In this respect, non-standard employment is seen as particularly problematic, as it can contribute to precarious living conditions.

Against this background, we examine how the poverty risk of unemployed individuals changes when taking up a job and whether the effects differ according to the type of employment (fixed-term or permanent). From a theoretical perspective, wages and employment perspectives provided by fixed-term jobs vary according to their functions in different labour market segments. For example, it can be expected that in the low-skilled/low-wage sector, where they are primarily used to maximise employers' flexibility and therefore provide poor employment perspectives, fixed-term contracts are less likely to reduce poverty than in labour market segments where workers are better paid and have better employment prospects.

Using large-scale survey data covering the years 2010 to 2018, we apply panel data analysis to examine how the poverty risk changes immediately upon re-employment and in the longer term. We take the case of Germany as one typical example of the industrialized countries that experienced both an increasing share of fixed-term contracts due to partial labour market deregulation and an increase in the at-risk-of-poverty rate.

Escaping Uncertainty At All Cost? Downward Occupational Mobility Upon Transition To Permanent Employment In Poland

Katarzyna Kopycka

University of Warsaw, Poland

Research on transitions from fixed-term to permanent employment has been proliferating for more than two decades. Yet, the characteristics of the subsequent permanent position of those experiencing the transition have not been systematically studied so far. Specifically, the question of whether there exists a trade-off between stability/ security and other favourable job features, like wages of occupational position, has been neglected in the literature. Whereas dual labor market theories point to a positive correlation between remuneration/ social prestige and employment security, on the grounds of the compensating differentials approach it is plausible to assume these characteristics to be in some part substitutional. Utilizing panel data on employment trajectories of young temporary workers in Poland between 2003 and 2018, the proposed paper assesses to what extent a trade-off can be found empirically. Furthermore, it tests a number of hypotheses with respect to individual conditions of such a trade-off. I find that individuals experiencing long phases of insecure or unstable employment are more inclined to make concessions in return for security. Furthermore, social origin emerges as an important issue, significantly reducing the risk of downward mobility. Against expectations neither gender nor marital status are significant correlates of enhanced probability of occupational demotion for those making the transition to permanent employment

673

Employers' Perception Of Downsides To Non-standard Work Arrangements: Exploring The Role Of Strategic Motives

Lin Rouvroye[1,2], Hendrik P. van Dalen[1,2,3], Kène Henkens[1,2,4], Joop J. Schippers[5]

[1]Netherlands Interdisciplinary Demographic Institute (NIDI-KNAW); [2]University Medical Centre Groningen (UMCG), University of Groningen; [3]Tilburg University, Tilburg School of Economics and Management (TISEM); [4]University of Amsterdam (UVA), Faculty of Social and Behavioural Sciences; [5]Utrecht University (UU) Faculty of Law, Economics and Governance

Purpose: Non-standard work arrangements have become a permanent feature of employment in many industrial societies. This article examines disadvantageous organizational consequences of using non-standard work arrangements as perceived by employers. It presents and assesses theoretically informed hypotheses on organizational situations in which negative aspects of non-standard work arrangements are more likely to be perceived.

Research question(s): 1) To what degree do employers perceive downsides to the use of non-standard work arrangements? And 2) What role does employers' strategic motive for choosing non-standard work arrangements play in explaining their perception of downsides to this employment practice?

Design/methodology/ approach: This study draws upon data (n=761) from a bespoke employers survey, fielded in the Netherlands in 2019. Structural equation modelling is used to measure and explain employers' perception of downsides to non-standard work arrangements.

Findings: Descriptive statistics show that employers report distinct downsides to the use of non-standard work arrangements in terms of performance, management and employee-wellbeing. Model estimates show that employers are more likely to perceive downsides to non-standard work arrangements, when they subscribe to using these arrangements to acquire specific expertise or to follow other organizations in their sector.

RN17_T04_02 | Gender and working life

Systematic Review of the Gendered Economic Outcomes of Attractiveness in Working life

Tero Pajunen, Iida Kukkonen, Outi Sarpila

University of Turku, Finland

In lay knowledge, the link between physical appearance and social inequalities is notoriously well-known: attractiveness is considered an asset and plainness a hindrance in life. However, research on the subject paints a far more complex picture. The economic outcomes of attractiveness for men and for women appear to vary depending on the occupational field and cultural context studied. Previous studies show, for example that attractive women may be penalized in male-dominated occupational fields. To clarify the picture of the relation between attractiveness and economic inequalities, we conducted a systematic review focusing on the relation between attractiveness and gendered economic benefits and disadvantages in working life.

Earlier reviews on the subject provide contradictory results and plenty of new research have been published since, which invites to a novel revision of the existing literature. After wading through five databases and filtering all the matching articles, we included a total of 58 articles for review. The preliminary results support the lay knowledge that, in general, more attractive individuals are economically favoured in working life. However, while the economic outcomes somewhat consistent for men, the outcomes for women appear more context-dependent. We interpret the results more in-depth by reviewing the occupation-, culture-, time- and method -specific results in order to elucidate the mechanisms behind attractiveness-based inequalities in working life.

674

Refugee Women in Global Textile Industry. The Case of Istanbul

Basem Mahmud

University of Granada, Spain

This contribution examines the participation of refugee women in the garment industry. What is their role? What is their situation? What are the consequences for their future? It is a qualitative study based on ongoing research in Istanbul. Semi-structured interviews were conducted with 60 Syrian refugees, of whom 13 were women working in the textile industry in Istanbul. Due to cultural and religious beliefs that do not encourage women to work, almost none of them chose to work in the textile industry. Rather, they found themselves obligated to do so because of either their social status (often widowed or divorced), or a husband's illness or injury hindering him from working, generally from war injuries or work accidents (the latter being more common as a result of unsafe work conditions). Because of their precarious position, they suffer greater discrimination than Turkish women, and are more perceptive than others of incidents of sexual harassment in the workplace. They look for a workplace close to home with flexibility - allowing them to answer the phone, to leave to prepare food and return, or to continue working at home - and are willing to accept meager salaries for this flexibility. In the course of my research, I encountered women receiving roughly 50 euros a month for around 7 hours a day or more. This is the most common case among those who are paid according to the number of pieces they produce. Such a low wage is rarely found, even among minors, and is almost non-exist among men.
Keywords: female work, industrial relocation, informal economy, asylum seekers.

Burden Or Relief? The Relationship Between Work-Related Use Of Information And Communication Technologies And Health According To Gender And Family Responsibility.

Ines Entgelmeier

Bundesanstalt für Arbeitsschutz und Arbeitsmedizin, Germany

The use of information and communication technologies has increased, not least due to the corona pandemic. While studies have already pointed to a connection between flexible working conditions and health, little is known about the health effects of using digital technologies at work. On the one hand, communication technologies can facilitate the reconciliation of work and private life and, as resource, relieve the burden on employees. On the other hand, they can promote working in one's free time, restrict time for recovery and private demands, what can be harmful to health. Since women in particular are faced with the challenge of balancing work and private life, they could be more exposed to health risks than men due to demands that are transported into their private lives through ICT.
Therefore, based on the EWCS Data 2015, this article examines gender differences in the relationship between the work-related use of computers, laptops, smartphones and the health assessment of employees. Mediators, such as compatibility of private and working life are examined to explain the connection. First empirical results show that frequent use of ICT has a positive effect on the health assessment. This relation can be explained to a small extent by a better compatibility of work and private life. In addition, while there is no difference in the health assessment between women and men in general, there is one for mothers and fathers. Mothers who work with ICT rate their health worse than fathers who use these technologies just as often.

RN17_T04_03 | Collective action and labour power

Worker's Collective Action: Instrumental vs. Ideological Motives for Action

Bjarke Refslund

Aalborg University, Denmark

The individualisation thesis argues that collective action in the labour market is diminishing (Beck, 1996; Beck-Gernsheim, 2002; Giddens, 1991), and Beck further argued that evolving individualisation was linked to labour market developments (1992: 142). However, the evidence from industrial relations and labour market sociology literature remains ambiguous (Doellgast et al., 2018; Peetz, 2010). Rather it appears that fragmentation, decollectivisation and atomisation of employment relations (Doellgast and Greer, 2007; Marchington et al., 2005; Weil, 2014) driven by employer strategies and political deregulation rather than an erosion of collectivism in the working class as such explains the increasing individualisation of the employment relation. Therefore, while Beck (1992) was right in arguing that the societal individualisation was linked to labour market developments, it seems rather to be an individualisation of the labour relation rather than a growing individualisation of the workers (Alonso and Lucio, 2006; Stewart, 2006). Nevertheless, the sociological research investigating the (changing) character of worker's collective action has been limited. Furthermore, working class collectivism always had an element of instrumentalism (and hence individual reasoning) to it, and as Hyman (1992: 160) argues "… apart from moments of enthusiasm of mass mobilization – most union members have adhered to collective organization for instrumental reasons" . This paper sets out to discuss and illuminate the current state of workers collective actions at both workplace level and in a broader sociological understanding of the phenomenon, by scrutinizing the relation between individualism, collectivism and the concept of instrumental collectivism.

Working-class demonstrations in Turkey - 2015-2019

Ebru Isikli[1], Alpkan Birelma[2]

[1]Bogazici University, Turkey; [2]Ozyegin University, Turkey

We will present the analysis of working-class demonstrations occurred between 2015-2019 in Turkey. The research results answer several questions such as; why did it happen, in which sector, is it to promote rights or to defend rights, how many workers are involved, has the union been involved, what is the duration, is it for one time or is it a continuous, was the process of production stopped, are women at the front, what is the employment type of the workers, is there an attack either by police or employers security, what is the result, did it lead to a legal process? We evaluated the data from a broad perspective.

Descriptive analysis, carried out with a labor-intensive preparation process, is important in terms of showing that the working class continues to struggle in a period when the unions are weak. On the other hand, in this presentation, we will seek answers to new questions through descriptive analysis. For example what makes a worker resistance strong: the industry, the number of workers, its stubbornness, creative methods, its ability to include the public?

The data of working-class demonstrations compiled by scanning local and national print media and relevant websites were coded and analyzed by Labor Studies Group (LSG) collectively. The study also aims to contribute to quantitative methods in social sciences inspired by Beverly Silver's work. The limitation of the research is that the demonstrations analyzed reflect the ones that took place in the newspapers, not all.

Mobilizing Societal Power: Understanding public support for nursing strikes

Mary Naughton

University College Dublin, Ireland

It is well documented that public sector workers account for an increasing share of industrial action and that public support or societal power can play an important role in the trajectory and outcome of conflicts between governments and their employees. Yet the strategies unions rely on to generate societal power, and the power resources available to different types of public sector worker, are relatively unexplored. This article examines

676

why nursing strikes generate societal support, applying the power resources approach to a post-crisis national nurses' strike in Ireland. Through analysis of print media, I identify the collective action frames mobilized by the nursing union organizing the strike and the counter-frames employed by the government in their competition for societal power. By examining public expressions of support for the strike in newspapers and on Twitter I explore how the public interpreted the conflict and which of the framing strategies used by the nurses appear to have influenced or resonated with their interpretation. The findings from this discursive analysis demonstrate the influence of economic and societal change on public support for strikes and provide evidence that nurses' societal power is structural.

Foreign Immigrants' Response to Post-Fordist Capitalism Economic Cycles: 'Buffers' or Substitutes for Local Workers? EU Labour Markets During Economic Expansion, Crisis and Post-crisis Periods

Fernando Gil-Alonso

Universitat de Barcelona, Spain

This paper aims to analyse the impact of economic cycles on foreign immigrants' labour insertion levels (measured by economic activity, employment, and unemployment rates) in the EU labour markets –also comparing them to those of natives. A hypothesis –based on the 'buffer theory'– claims that foreigners act as a "buffer" absorbing labour market tensions. During economic growth phases, the number of immigrants rises as a response to an increasing demand for workers in the European economy. However, in deep economic crisis periods, they are expelled from the labour market in greater numbers than native workers. Nevertheless, other authors argue that this theory could be true for the previous Fordist economy but would be less valid in the current post-Fordist neoliberal capitalist context. This is especially so for highly dual labour markets, such as those of Southern European countries. This alternative hypothesis is based on a 'new migration model': European labour markets need foreign workers to fill low wage and unstable jobs, replacing national workers even during recession periods. Therefore, their higher adaptability to harsh working conditions would make

immigrants more resilient to economic changes. The paper uses EU-LFS to analyse which of the two hypotheses is correct. Preliminary results show that the way immigrants behave from the labour point of view varies by origin. While the 'buffer theory' seems to explain better the labour behaviour of Latin Americans, that of Africans and Asians seems to respond better to the 'new migratory model'.

RN17_T04_04 | Small firms

Lasting Cooperative Employment Relacions in SMEs: Underlying factors in Comparative Perspective

John Geary[2], Andrea Signoretti[1]

[1]University College Dublin, Ireland; [2]University of Trento, Italy

677

Cooperative employment relations (ER) are difficult to build and sustain over the long-term. The issue is that we still know little about the factors underlying long-term cooperation inside workplaces. We find a useful reference in the work of Bélanger and Edwards (2007). These scholars argue that the conditions of technology, product market and institutional regulation favour cooperation.
We enrich the literature by applying this conceptual framework and conditions for cooperative ER to medium-sized, family-owned enterprises in Northern Italy. We hypothesize the need of enlarging the conditions defined by Bélanger and Edwards when analysing these firms since such enterprises in countries like Italy are likely to be featured by cooperation based on local norms of reciprocity (Trigilia and Burroni, 2009).
Our four case-study manufacturing firms are characterized by cooperative ER and are located in the Trentino-Alto Adige region in north-eastern Italy. Semi-structured interviews were conducted with different actors inside and outside firms. In total, 35 people were involved.
We find that all the conditions for establishing cooperative ER as identified by Edwards and Bélanger are present in our case-study enterprises. However, we highlight how collaborative companies' local relations (Trigilia and Burroni, 2009) can be transposed 'within factory gates' to explain long-term cooperative ER.

Small Firms' Motivations For Offering Apprenticeship Training

Carmen Baumeler

Swiss Federal Institute for Vocational Education and Training, Switzerland

Firms play an important educational role in skill development because they qualify their personnel for present and future labour market needs. However, firms are not homogeneous entities, and they differ in terms of their size. In most countries, small firms (defined as organisations employing fewer than 50 employees) employ around half of the private sector's workforce. Against this backdrop, we intend to provide a deeper understanding of why specifically small companies engage in vocational training. The aim of this study is to answer the question of what motivates small firms to offer apprenticeship training. Notably, the current state of research provides various indications. While research focussing on the specificity of small firms identifies the important role of the owner and their personality, values, attitudes and experiences, economic research mainly refers to the explanatory factor of profitable cost–benefit relationships in apprenticeship training. Moreover, research focussing on the institutional embeddedness of firms points to the importance of institutional framework conditions. Our contribution serves to link these three usually unrelated research perspectives and focusses on Switzerland as a collective skill formation system. In this study, we used qualitative interviews to ask heads of small firms about their motivations for offering apprenticeship training. The results show that different motivations at the individual, organisational and societal level influence the provision of training positions. Furthermore, within small companies, we identified heterogeneous motivational configurations. In conclusion, if the participation of small firms in the provision of apprenticeship places should be promoted, their heterogeneity and motivations at various levels need to be addressed.

The Boundaries of Wage Employment: Vanishing Companies, Bogus Self-employment and Worker Cooperatives in the Spanish Meat Industry

Alberto Riesco-Sanz

University Complutense of Madrid, Spain

The mobilisation of the workforce, its connection to a certain sequence of activities in the wealth creation processes, today involves increasingly complex combinations. The traditional employment relationship, constructed in Europe around the principle of the legal subordination of the worker and their regular participation in a company within well-defined boundaries, today faces a transformation process that is putting pressure on the traditional boundaries of salaried work, as well as its fundamental mechanisms and institutions. To assess the consequences of these mutations, a specific case is examined: the Spanish meat industry.

The meat industry throughout Europe is characterised by the extensive use of subcontracting. In Spain, the outsourcing of activities has been carried out through (bogus) worker cooperatives that employ (bogus) self-employed workers. Based on interviews with the sector's main social partners (employer organisations, trade unions and labour inspectorates), as well as an analysis of other available materials (statistics, court rulings, labour inspectorate records, etc.), the most important features of the organisation of this industry in Spain, its evolution, mobilisations and recent disputes are presented. The objective is to show how the mobilisation and subordination of producers is currently being carried out, often on the fringes of traditional employment relationship mechanisms and institutions (social status of wage employment, employment contract, company institution, collective bargaining, etc.), leading to many challenges in terms of protecting workers' rights.

678

"If You Are Small, Nobody Cares": Young Creative Entrepreneurs of St. Petersburg and Their Relations with the State

Alina Maiboroda, Yana Krupets, Evgeniya Kuziner

National Research University Higher School of Economics, Saint Petersburg, Russian Federation

The article discusses the experience of interaction between young craft entrepreneurs of
St. Petersburg and the Russian regulatory authorities as well as entrepreneurs' expectations from the state as a participant in economic relations. The research was conducted within the qualitative methodology, the empirical base of the study is 58 qualitative interviews with young craft entrepreneurs.

Researchers studying the creative industries in Russia have noted the lack of state interest in the development of this economic sector (Lavrienko 2015; Zelenkova 2017; Gurova, Morozova 2018). Academic articles suggest the need for special government programs for young creative entrepreneurs, which would include measures to create a comfortable environment: grant competitions, preferential rental terms, educational courses/platforms for entrepreneurs.

The analysis of empirical data showed that young entrepreneurs are trying to maximize the distance between their craft business and the state. They combine both formal rules and informal / "unwritten" practices in everyday life that help them to maintain autonomy and ensure the "survival" of the business. The formality or informality in relations between entrepreneurs and the state is reproduced through the intersection of several coordinates: "visibility - invisibility","closeness - distance", "written - unwritten rule". The dynamic in changing positions (for example, from invisible to visible and vice versa) and the degree of youth agency also matter.

RN17_T05_01 | Work trajectories and working time

Comparing Labor Trajectories in Poverty: The Cases of Chile and Spain

Jose Zawadsky

Autonomous University of Barcelona, Spain

This contribution carries out a comparative analysis of labor trajectories in poverty in Chile and Spain, in order to identify how the working poor navigate through their labor trajectory under new conditions of greater precariousness and uncertainty in the labor market. Literature has identify several dimensions influencing labor poverty at the social, the household and individual levels. Characteristics of labor market segmentation appears to be the main variables influencing working poverty, which intermingle with welfare regime conditions, household characteristics and the worker´s occupational and sociodemographic variables to configure the experience of working poverty in each context. We will review the main literature on working poverty and labor trajectories to learn about the main social structures creating labor poverty. Secondly, through a quantitative analysis, we will identify the main variables influencing working poverty and recognize the main of groups of working poor in each country. Finally, through qualitative interviews we will get an in depth knowledge about worker´s labor trajectories in poverty, identifying how workers endure with the new conditions of labor market uncertainty and precariousness. Preliminary findings have shown that occupational conditions such as part time jobs, fixed term contracts, unskilled work and lower levels of education strongly influence experiencing in-work poverty and that social, family and individual resources must be deployed to their full extent during the development of their labor trajectory. The comparative study of poverty allows us a better understanding of its origins, with the aim of creating a general analytical framework.

679

In-Work Poverty Transitions in a Precarious Labour Market: Evidence from Spain

Mariona Lozano, Alba Lanau

Universitat Autònoma de Barcelona, Spain

The growing in-work poverty rates demonstrate that having a job is often not enough to escape poverty. This paper studies the factors associated with exits from and entries to in-work poverty in Spain. Spain has one of the highest rates of workers in- poverty in Europe, and a high incidence of temporary, low-paid, and low-quality jobs. The study of in-work poverty complements the current literature on precarious labour markets by considering the interaction between precariousness, low salaries and poverty. We use data from the most recent longitudinal wave (2014-18) of the European Union Survey on Income and Living Conditions (SILC, n= 28.992 households). By improving the understanding of factors associated with successful and unsuccessful transitions, the study provides new evidence to build strategies to support households exiting in-work poverty. In addition, the analysis will explore how in-work poverty experiences vary for different groups, with an emphasis on gendered experiences. For instance, women are more likely to transition to inactivity due to caring responsibilities, which will likely be detrimental for their entry to and exit from poverty. At the same time, women's working conditions tend to be more precarious than that of men. The initial findings suggest that n-work poverty in Spain is associated with low salaries, and that often gaining a worker within the household is insufficient to exit poverty. This contrasts with similar analyses in the UK where in-work poverty was associated with periods of unemployment.

The Organizational Conditions of the Technological Unemployment: the Case of Cognitive Automation of Work in Banking Sector in Poland

Renata Włoch[1,2], Katarzyna Śledziewska[1,3]

[1]Digital Economy Lab (DELab), University of Warsaw; [2]Faculty of Sociology, University of Warsaw; [3]Faculty of Economy, University of Warsaw

The banking sector is in the vanguard of the digital transformation of workflows, propelled by the introduction of Robotic Process Automation (RPA) and other systems based on AI algorithms (King 2019). Banking institutions are turning into digital companies based on the rules of "data-first, AI-first", with human work being increasingly datafied and complemented by the machines. Taking the research of Acemoglu&Restrepo (2019) and Autor (2020) and the notion of cognitive automation as a reference point, in this presentation we set to compare the differences in perceptions of the ongoing organizational change between the middle-level employees and the top-level managers of banking institutions in Poland. We anchor our observations in the empirical material gathered at the end of 2020 consisting of 172 questionnaires and 37 narrative qualitative interviews. We show that the employees do not relate the negative consequences of the automation to their professional trajectories, which lowers their motivation towards reskilling. The top managers are aware of the imminent changes which may result in massive layoffs, but also do not invest in reskilling as they are convinced that the banking institutions will be able to source more digitally competent workers from the local or even the global labour market (thanks to the popularization of the remote project work during Covid-19). Thus the case of digital transformation in the banking sector in Poland may add to our knowledge on the organizational causes of the technological unemployment, and offer the motivation for the state to engage in the wider reskilling public policy programs.

Are Stable Practices The Result Of The Temporal Ordering Of Work-Related Practices? Activity Network Analysis Of The Uk 2014-2015 Time Use Survey

Mate Lorincz

University of Reading, United Kingdom

Sociological research on consumption, inspired by theories of practice, highlighted that the allocation and coordination of everyday activities is strongly associated with the time of day (such as meal and work times) and week (Sunday as rest day). Southerton's (2020) qualitative study on time squeeze indicates that the institutionally fixed events (such as work and school schedules) create fixed moments within the day around which other type of activities are scheduled. Van Tienoven et al. (2017) seems to share this view when they describe the way individual practices are routinized. Defining daily routines as the repetitive social practices that reproduce the everydayness of social life, they suggest that individuals create certain routines to manage certain parts of the day and to deviate from the collective temporal rhythm of society. Our presentation deals precisely with repetitive social practices around which everyday life is organized. This offers an opportunity to explore the way employment related commitments shape the ordering of activities in everyday life. At the beginning, we discus the regularized pattern of behaviour, how it fits within the praxeological approach and how studying stable practices helps us to understand daily routine behaviour. This is followed by our analytical technique – social sequence analysis based on the 2014-2015 UK Time Use Survey data - used to assess routinised daily time use. Findings are visualized in terms of cohesion between practices based on work hours and connections and coordination between practices. In the end, we argue that work is not the main/only factor that affects the level of routinization.

RN17_T05_02 | Comparative and transnational industrial relations

International Recruitment In Shipbuilding: Employer Strategies And Trade Union Responses In the Italian Case

Guglielmo Meardi[1], Devi Sacchetto[2], Nicola Quondamatteo1, Francesco Iannuzzi[2]

[1]Scuola Normale Superiore, Italy; [2]Università di Padova, Italy

Italy has become, on most measures, the largest shipbuilding country in Europe, having managed to find some niches, such as yacht and cruise ship building, that can withstand international and especially Asian competition. An essential but understudied part of this success is linked to international recruitment of workers and a complex segmentation of the production process. The paper will look at the national level as far as at the dominant company, Fincantieri, to explain why, despite some investment in lower-wage countries such as Romania and Vietnam, employers have favoured labour mobility over relocation of production. On the basis of documentary and interview material with employers, unions and migrant associations, it reconstructs the development of the industry in the last twenty years to detect the Italian specificity. The role of the state and a particularly segmented labour market with a complex international labour hierarchy and subcontracting chain are the main explanations of this situation. Linked to local concentration on a specific site and a main established company, characterise the resulting global workplaces and distinguish them, despite some similarities, from the large construction sites or the ports. This constellation results in specific challenges for trade unions that tend to organise mostly local employees of the main company.

681

Plus Ca Change? Continuity and Change in European Governance of Labour After the Covid-19 Pandemic.

Roland Erne, Vincenzo Maccarrone

University College Dublin, Ireland

As social scientists know well, crises usually offer formidable opportunities to alter the status quo. After the 2008 economic and financial crisis, EU policy makers put in place significant changes to the European economic governance framework, which were all integrated in a new process of coordination of the economic and social policies of EU member states: the European Semester. The resulting EU's new economic governance regime (NEG) led to an increased capacity of EU actors to intervene into key areas of national policy making that had hitherto been shielded from direct EU interventions, such as wage setting mechanisms and employment protection legislation. The trajectory of EU NEG labour policy prescriptions was mainly a commodifying one.

In 2020, the world was overturned by another major crisis, the outbreak of the Covid-19 pandemic. This new crisis is also triggering significant changes to the EU's economic governance framework, including the creation of a European 'recovery fund', to be financed through a joint emission of EU bonds and the temporary suspension of EU fiscal rules. Yet, a closer look at the legislation enhancing the new EU's 'Recovery and Resilience Facility' uncovers also a degree of continuity with the post-2008 EU economic governance, namely in the persistence of the idea of conditionality on EU funds and the logic of exchange between financial support and structural reforms. This paper thus analyses trends of continuity and change within the European economic governance regime over the last decade and their significance for labour policy.

Performance-related Pay in Sweden: Sense-making and (E)valuation in Local Practices

Bengt Larsson[1,2,] Ylva Ulfsdotter Eriksson[1,2]

[1]Linnaeus University, Sweden; [2]Gothenburg University, Sweden

The Swedish wage-setting system has transformed over the last four decades. Tariff-based yearly pay raises and collective agreed general wage increases have been replaced by individual and differentiated wage setting, and yearly compensations are based on performance-related pay raise. Performance appraisal is thus a means to systematically (e)valuate both what the employee has achieved and how the tasks were carried out. This has been said to indicate a neo-liberalization of wage determination in Sweden, however, there are few studies of what is actually going on at the local level, where this performance-related pay determining system is put to practice. This study explores, describe and explain how qualitative performance criteria are used in evaluations, how they are interpreted, and how managers and employees approach makes sense of and practice performance appraisal and individualised pay determination. We analyse the overall yearly process from setting goals for individual employees, over the performance appraisal, to the ranking and pricing of the subordinates at the unit or team level. We focus in particular on the instruments used and the information collected by managers to perform the (e)valuation and ranking, and how managers and employees make sense of the policies and criteria in relation to concrete occupational tasks. Empirically the study is based on organisational documents such as policies, guidelines and performance appraisal criteria, and 47 interviews with 53 persons (employees, line managers, trade union reps and HR-staff) from four large organisations in both the public and the sectors.

682

The Closing of Ranks Between Business Organizations, Trade Unions and the State During the COVID-19 Pandemic: a Comparative Analysis of the Nature of the Tripartite Relationship

Bernd Brandl

Durham University, United Kingdom

The COVID-19 outbreak has led to an increase in social dialogue in general and in particular to an increase in tripartite cooperation between social partners' organizations and state authorities. This paper takes a critical look behind this cooperation and investigates the underlying rationales behind the tripartite closing of ranks in 19 countries. It is shown that even though the cooperation generally fulfilled its problem solving function, an expressive function that signaled unity was identified to be of equal importance in times of crises. The expressive function is also identified to potentially serve as the basis for a renewed social partnership.

RN17_T05_03 | Employment relations and the future of work

Shift from Doorkeepers to 'Digital Butlers': Changing Service Work Relations in the Platform Era

Ladin Bayurgil

Boston University, United States of America

683

Service work, the great majority of the labor force in the Global North and the empirical mainstream in the sociology of work, is transforming with booming digital platforms and platform-mediated provision of goods and services. By standardizing services through one-off encounters, digitalizing the payment and tip systems, and therefore minimizing the in-person economic transaction between the service provider and recipient, platforms restructure the conditions and mediums through which service transactions take place. This research brings in a relational work analysis into changing service relationships and underlines the role of intimate ties in shift from personal and habitual service relationships to impersonal and one-off encounters enabled by platform work. Through an ethnographic examination of changing service relationship in Istanbul, Turkey, this research examines the dynamics of shift from provision of services and goods by doorkeepers sustained through decades-long personal ties to platform-mediated workers sustained through digital technologies and algorithms. My findings demonstrate that while older generations prefer personalized service relationships as a mechanism of receiving unpaid and underpaid services, younger generations opt for impersonalized service encounters as a mechanism of maintaining anonymity and privacy. Since platform-mediated service encounters entail impersonalization of service orders, economic transactions, and service relationships, my research displays that platforms also relieve the service recipients of elaborate relational work and discretionary moral obligations, and hence flatten the inter-class tensions embedded in the service relationship.

Exploiting Explorers And Exploring Exploiters: Work Orientations As Pathways Toward Organizational Ambidexterity

Dominika Kinga Sarnecka

Harvard Business School, United States of America

This work theorizes the connection between individuals' work orientations and organizational outcomes. Through an in-depth case study of an American professional services firm, we find that employees' interactions with organizational structure vary according to the role the current job is supposed to fulfill in their career development plan. We characterize two distinct profiles of workers, explorers and exploiters. Examining the employee-organization relationships these workers form through the inducements-contributions framework, we show how their different orientations toward work translate into different behavioral strategies, which, in aggregate, contribute to distinct firm-level activities. Paradoxically, we find that behavioral strategies that explorers pursue contribute to their organization's ability to exploit and the behavioral strategies that exploiters pursue contribute to their organization's ability to explore. Together, actions carried out by the two types of workers complement each other and enable organizational ambidexterity.

When the client becomes her own caseworker: Dislocation of responsibility through Digital Self-support in the Swedish Public Employment Service

Ylva Wallinder[1], Ida Seing[2]

[1]Gothenburg University, Sweden; [2]Linköping University, Sweden

Caseworkers in the Swedish Public Employment Service (PES) has been subject to significant changes as professionals during the last years; in 2014, a major organizational reform was initiated aimed to develop digital self-services for clients. Based on interviews and ethnographical observations in local PES offices (2016-19), the aim of this article is to explore and compare on the one hand, caseworkers and, on the other hand, first-line managers perceptions and reflections on changes towards digital self-services for clients. The analysis focuses on frontline staff's views and responses to the ongoing organisational changes were caseworkers' personal interaction with clients become restricted, reflecting an existent conflict of interest between service ideals. Caseworkers view clients as vulnerable subjects in need of a personalised guidance and support, whereas first-line managers view clients as competent subjects ready to take charge of their own unemployment-situations. Overall, this study illustrates how digitalized client-interactions and support in the PES enables one further step in the development towards a distant relationship between clients and caseworkers where responsibility for finding employment is increasingly transferred from caseworkers to clients themselves. The technological development towards digital self-service implies that the client becomes her own caseworker.

684

Challenges Caused By Forced Digitalization In Business Communication Between Culturally Diverse Employees With Particular Reference To The COVID-19 Period

Martyna Katarzyna Czajka

University of Wroclaw, Poland

The purpose of my presentation is to discuss challenges caused by forced digitalization in business communication between employees with the particular reference to the COVID-19 period.

The growing role of digital technologies undeniably creates new reality. Contemporary employee of a multinational corporation has to confront the requirements established by the organization, applied technologies, as well as challenges of the cultural nature. The COVID-19 pandemic has not only accelerated the ongoing processes, but in many cases has also forced the digitization of work.

The following questions will be raised:
- What are the barriers to digital communication?
- What challenges does digitalization pose for communication?
- Does the cultural aspect (really) matter?
- What is the impact of digitalization on business communication during COVID-19?

The main focus is on everyday work, new technologies and changes in the labor market in the pandemic period. Although the situation is forcing an increase, if not a complete shift, to the virtual communication, it is important to question whether face-to-face communication plays a special role or fulfills a particular purpose compared to computer-mediated communication. Differences between face-to-face communication and online meetings will be discussed, including current global situation and cultural factors. Not only theoretical aspects but also a modern case study will be presented including both perspectives of employee and employer.

RN17_T06_01 | Labour markets in crisis situations

Crisis As Opportunity? Potential Effects Of Taking-over System-relevant Tasks On The Image Of Private Security Companies From A Sociological And Work Psychological Perspective

Malte Simon Schönefeld, Patricia Magdalena Schütte

Bergische Universität Wuppertal, Germany

685

The private security sector has been accompanied by a rather poor social image for years. Studies highlight a low social/public status of this occupation, which is also evident in the media. Even representatives of the field often describe "their kind" as in an unfavorable light. Besides other factors, work psychology documents the negative association of this low social status with job satisfaction, turnover intentions, and employees' health. However, the Covid-19 pandemic seems to cause changes within this sector. While operational fields closed (e.g., event sector) and existential crises loomed, new tasks have been emerging. Many of which can be characterized as system-relevant as they now support relevant stakeholders to fight and deal with the pandemic by bringing in their expertise to enable business continuity (e.g., vaccination centers, stores etc.). From a sociological perspective, this could constitute an impetus for lasting change in public perceptions of private security, consequently causing positive implications for this sector's development in post-Corona society. Derived from this, a central question arises: What impacts of the Covid-19 pandemic can be identified in relation to the private security sector?

To answer this question, firstly, we draw on media content analysis data of selected national and regional newspapers during the pandemic (03/2020-12/2020), focusing on articles with references to external and self-perceptions of private security in relationship to Covid-19. Secondly, this data is evaluated against pre-pandemic data from two current research projects with an

organizational sociological focus and an Austrian-German research project with a work psychological focus.

Double Transformation - Effects of Ecological and Digital Change on Production Companies in Energy-intensive Industries

Alexander Bendel, Thomas Haipeter

University of Duisburg-Essen, Germany

In the wake of climate change, many companies are facing increasing pressure to initiate a transformation towards ecological sustainable processes of production. This applies above all to energy-intensive sectors and the energy industry, which are faced with ambitious energy and climate targets challenging the traditional resource intensive modes of production. At the same time, these sectors of industrial production are running through a second process of transformation in the course of digitalization. The use of modern information and communication technology is constantly advancing in industrial companies, and intelligent, digitally networked systems and production processes are increasingly being tested and implemented.

Against this background, in the current research project "Double Transformation - Effects of Ecological and Digital Change on Production Companies in Energy-intensive Industries" we analyse the causes and effects of the double transformation. Our focus is on corporate strategies, the development of labour standards and qualification measures as well as on concepts and strategies of works councils and the union to cope with the challenges going along with the double transformation. In our contribution we will present first findings of our research based on interviews conducted with representatives of management and works councils from various sectors in the organizational domain of the German chemical workers' union, the IG BCE (Mining, Chemical and Energy Industrial Union).

Between Colonialism and Neoliberalism: The Emergence of a New Palestinian middle class in the labor Market, High-Tech field as a Case Study

Arees Bishara

Tel Aviv university, Israel

In the last decade, the participation of the Palestinians in the high-tech industry has significantly expanded on both sides of the Green Line. Social and governmental organizations were established, new branches of local and international business organizations began operating in Palestinian cities such as Nazareth, Ramallah, al-Rawabi, Gaza etc. As a result, three major high-tech markets have developed and collaborated through borders; An Israeli high-tech market with a Palestinian majority, an Israeli high-tech market with a Jewish majority and a Palestinian high-tech market in the west bank and Gaza districts. This flourishing and linkages entails the formation of a new social group on both sides of the Green Line, which can be called a new Palestinian middle class, third generation of "Nakba" (The Palestinian disaster in 1948) and first generation students. Few studies have examined the new Palestinian middle class which grew on both sides of the Green Line after 1967 and continue developing within a settler colonial and Neo-liberal contexts. Based on qualitative interviews with Palestinians from both sides of the green line, who work in various private hi-tech firms in both Israeli and Palestinian labor markets. This study seeks to understand how do Palestinians employees interpret, operate and shape their own collective identities in a complex structural context of neo-liberalism and settler-colonialism on both sides of the Green Line. The study will rely on Michèle Lamont' sociological framework on "symbolic boundaries" and "Boundary work" in addition to Anthony Giddens' "Structuration theory" and the "Positioning" concept.

RN17_T06_02 | Class relations and employment

Organized Employers are Back in Town: Employers' Associations and Anti-Union Legislation in Turkey

Irem Yildirim

McGill University, Canada

This paper explores the role of employers and business associations in anti-union policies and regulations in Turkey in the age of neoliberalism. Several scholars underline the state's role in the dramatic weakening of labor rights in Turkey, especially since the 1980s. These previous accounts of state-controlled unionism and union-party relations have provided valuable insight into the explanation of anti-union legislation following the 1980 military coup in Turkey. However, I argue that organized employers have also contributed to the anti-labor regulation of employment relations through their concrete impact on state labor policy since the 1980s. The representation of employers' collective interests, not just state will, matters in explaining the introduction and deepening of market reforms in Turkey. I also claim that the disproportionate role of employers' associations in influencing state labor policy, i.e. their relative strength to affect the content and direction of labor reforms, stems from their unification. Indeed, the three leading labor union confederations have significantly diverged on their political ideologies and positions toward neoliberalism in Turkey. However, organized employers have unified to defend their shared business interests effectively and established the Turkish Confederation of Employer Associations (TISK) as a single nationwide organization representing their collective demands. In other words, employer unionists managed to form a united front based on a cohesive business strategy since the early 1960s while labor unions have failed to create a frontal attack based on a shared anti-neoliberal commitment, which reflects the fragmentation of organized labor vis-à-vis the unification of organized capital in Turkey.

Is The Precariat A Self-contained Social Class In Contemporary Europe?

Tomas Dosedel

Masaryk University, Czech Republic

The proportion of people experiencing some form of labour market insecurity has been growing since the social and economic changes of the 1970s. The group of employees with uncertain, i.e. precarious jobs includes approximately 15–40 % workforce in various countries and under various definitions. For this group of people, the term precariat has been established. Since 2011, at the latest, there has been scholarly discussion whether the members of precariat form a separate social class. Therefore, I propose adding the precariat as a new class of the ESeC class schema (European Socio-economic Classification). Inspired by the original validity tests from the time of the creation of the ESeC, I perform the validity test of the adjusted schema ESeC + Precariat. The main research question in this paper is: "Is the precariat a self-contained social class in the contemporary European labour markets?", which raises some further questions. Does the generally accepted ESeC schema describe social reality better than the ESeC schema with the added class of the precariat? Is the internal homogeneity and external heterogeneity of the group of people performing precarious work sufficient for the group to be designated a self-contained social class? My conclusion based on the analysis of EU-LFS data is that the new schema describes social reality minimally as aptly as the original classification. Therefore, I suggest considering the new dimension of the social stratification schema, which expresses the degree of insecurity in the labour market.

From Steel City to Low Pay Capital: Class Composition and Prospects for Union Renewal in the City of Sheffield during the Covid Pandemic

Robert {Bob} Francis Jeffery, Peter Thomas, Ruth Beresford

Sheffield Hallam University, United Kingdom

Trade Unions in the UK have undergone 40 years of decline. Partially a result of deindustrialisation and job destruction (Beatty and Fothergill, 2016), but also linked to explicit legislative attacks (Willis, 2015: 141), the introduction of qualifying periods for employment rights and the proliferation of stratified employment statuses. These processes have led to the replacement of strongly unionised sectors by a proliferation of precaritised work, marked by low pay, deskilling and irregular contract types. Sheffield in the North of England can be seen as emblematic of this transformation, from a city forged in the crucible of the steel industry to one that regularly tops list of UK cities with the largest proportion of its population on the minimum wage (Thomas et al, 2020). Challenges for unions include small workplaces concentrated in the hospitality, retail, logistics and social care sectors, with a rapid turnover of staff, and who employ young people with the lowest rates of unionisation (Tailby and Pollert, 2011) or other demographic groups with low levels of bargaining power – what Royle (2000) calls 'recruited acquiescence'. Nevertheless, the last decade has seen increasing efforts by trade unions (traditional or not) to take on the challenge of 'organising the unorganisable'. In this presentation we draw on 65+ interviews (25 conducted during the Covid-19 pandemic) to explore the barriers to, potentials and prospects of such work in Sheffield, synthesising insights on class composition from Autonomist Marxism (Wright, 2002), the Rancierian inspired concept of 'classificatory struggles' (Jeffery et al, 2020) and mobilisation theory (Kelly, 1998).

RN17_T06_03 | Health and safety at work

The Mark Of Mental Health Problems. A Field Experiment On Hiring Discrimination And The Impact Of COVID-19

Vegar Bjørnshagen

Norwegian Social Research, Oslo Metropolitan University, Norway

To what extent are persons who disclose (a history of) mental health problems subject to discrimination in hiring processes? While health selection contributes to the overrepresentation of mental health problems among the unemployed and the negative association between such problems and employment, less is known about the role played by employers' hiring behaviour in these processes. Based on data from a randomised field experiment, the present study provides direct evidence on this potential mechanism. Between September 2019 and December 2020, 1398 job applications from equally qualified applicants who randomly disclosed a history of mental health problems as an explanation for a past unemployment gap were sent in pairs to 699 Norwegian private-sector employers with advertised job openings in a broad selection of occupations. The results show that applicants with mental health problems are systematically discriminated against: Disclosure of mental health problems decreases the probability of receiving an invitation to a job interview by 28.0% and the probability of receiving any positive response from employers by 23.1%. These results do not seem to have been driven by the COVID-19 crisis that unfolded approximately halfway into the data collection. As such, the study provides indicative evidence that such uncertain economic times have little impact on the level of discrimination against applicants with mental health problems.

Workers' participation in OSH in Portugal

Paulo Alves

ISCTE-IUL, Portugal

The available statistical information shows that accidents at work continue to have a strong incidence in Portugal, which makes this country one of the European states with one of the highest incidence rates in this field.

Therefore, and notwithstanding the fact that matters related to OSH are legally regulated in detail, working continues to be an activity that involves numerous risks in Portugal, what happens in a context of a deep devaluation of work and of a growth in labour market deregulation.

This situation calls for the need to deepen the joint action of the social partners, implying the indispensable participation of workers, which is legally foreseen, and which arises as a central issue of prevention strategies, as stated by Menéndez et al. (2008: 5)

Participation can take place in two ways. The first is by the collective bargaining. The second is the election of health and safety representatives and their participation in specialised OSH committees.

With this paper we intend to make a review of the election of health and safety representatives since 2004, as well as to assess the regulation of OHS in collective bargaining in the last three years. We will highlight the scarce number of elections held, and that in the collective bargaining the contents negotiated are in general quite generic and follow strictly the legislation, although some provisions stand out. We conclude by stating that the Portuguese unions have not been able to obtain new rights in this field beyond those enshrined in the legislation.

Occupational Safety And Health And Power Resources: The Role Of The Social Partners In Combatting Undeclared Work In Sweden

Carin Helena Håkansta, Theo Bodin

Karolinska Institutet, Sweden

Background: EU's battle against undeclared work, i.e. paid activities that are lawful in nature but not declared to public authorities, includes abusive behaviour regarding working conditions and/or health and safety norms. The holistic response, which is recommended by the EU, includes not only different parts of government but also the social partners and other actors. Having a strategic proximity to workplaces, including those that go "under the radar" of governments, trade unions are important complements to the state enforcement of occupation al safety and health.

We will present results from a study of an on-going government programme in Sweden aimed to activate the social partners in tackling undeclared work. The study includes projects in the following sectors: Construction and infrastructure; Horeca; Forestry; and Musicians and stagehands. Similar to other countries, Swedish social partner organisations have different types and levels of resources and face different OSH problems depending on which sector they are active in.

Purpose: Our study will contribute with knowledge about the social partners' role in combatting undeclared work, with specific focus on OSH as well as obstacles and success factors.

Methods: Based on semi-structured interviews and documents, we use the following analytical dimensions of the power resource theory (Korpi, 1978): Sources of power: structural, associational, institutional, ideational and coalitional: Analytical level: workplace, sector, country; Character of power resource: attaining, maintaining, applying.

Contribution: This article will break new grounds by applying power resource theory to research on how governments and the social partners, together an separately, can contribute to improved health and safety among workers who are among those suffering from the worst working conditions today.

Pandemic and work

"If We Don't Die from Virus, We Will Starve to Death" Economic Struggles of Musicians in The Covid-19 Pandemic

Halime Ünal Reşitoğlu[1], Asiye Kemik[2]

[1]Ankara Yıldırım Beyazıt University, Turkey; [2]Muğla Sıtkı Kocman University, Turkey

To reduce the adverse health effects of the Covid-19 pandemic, the Turkish Government has implemented practices such as transition to distance education, closing local small businesses outside certain sectors in the economy, and imposing curfew restrictions on weekends. Although there have been changes in practices over time, restrictions on businesses in the night time economy have not been stretch much. In particular, musicians working in small entertainment venues are among the most heavily economically affected groups because they have not benefited from the economic aid package such as unemployment pension and temporary unemployment benefits provided by the government. It has become increasingly difficult for musicians, who work mostly on a daily wage basis, to protect themselves against the effects of the pandemic with their limited economic resources. Therefore, the aim of this study is to understand how these musicians cope with the difficulties experienced in the pandemic. In this study, data were collected through in-depth semi-structured interviews with 6 musicians and interviews will continue. Preliminary analysis of the data indicate that musicians have to develop strategies such as performing and teaching digitally, giving balcony concert, selling household goods and musical instruments or switching to other business branches in order to make a living. They have high debt to banks. Participants stated that their relations with family members, their mental health were negatively affected, and even among their musician friends, there were people who attempted suicide as a result of losing their income. They think that it is unfair that they are still unable to work while there are loosening restrictions in many lines of work.

Understanding International Inequalities in the Impact of the Covid-19 Pandemic on Work and Employment: A 17-country Study of Labor Market Participation

Danat Valizade, Mark Stuart, Manhal Ali

University of Leeds, United Kingdom

This paper reveals the extent of global disparities in the initial impact of COVID-19 on labor market participation. While the emerging employment relations literature on the impact of COVID-19 has largely focused on developed economies, analysis of how the pandemic is impacting work, employment and resultant international inequalities, is still in its infancy. Using a body of work influenced by world-systems theory as a default comparative framework, we integrate established theoretical insights from employment relations and political science to advance two explanatory drivers of variations in country response to COVID-19 and the subsequent outcomes of state action for working people: political populism – understood in terms of populist government or leaders; and institutional foundations of employment relations proxied by the strength of labor market policies and collective bargaining coverage. Our empirical analysis draws on nationally representative household panel surveys across 17 countries that represent three world systems (core, semi-periphery and periphery) supplemented by the daily data derived from the coronavirus government response tracker. Using a quasi-experimental econometric approach, we found a disproportionate immediate effect of COVID-19 on periphery and semi-periphery countries. This is because core countries have supplemented non-pharmaceutical interventions with generous income support measures. From a world systems perspective, delayed interventions combined with weak income support at the onset of the pandemic exacerbated the evolving crisis for workers. This was enabled by political populism but mitigated by labor market policies and collective bargaining. The findings of this study enrich our conceptual understanding of the evolving COVID-19 crisis and can illuminate policy response to the current and future pandemics.

Mountains May Depart: Sociomaterial Transformation of Russian Bureaucracy Due to the Pandemic

Anna Maria Filippova, Daria Shubina, Daria Rud, Anna Baryshnikova

Center for Advanced Governance (CAG), Russian Federation

Due to the COVID-19 government agencies in Russia were forced to work from home, and that has changed the way civil service operates dramatically. The phenomenological definition of "normal" working practices and everyday working environment of Russian civil servants may have changed with the shift to remote work. We aim to specify practices and attitudes which were modified by COVID-19 to the greatest or otherwise minimal extent. Research objects include the Ministry of Economic Development and several affiliated agencies, Accounts Chamber and Federal Tax Service. Drawing on the in-depth interviews with public servants (heads of the departments as well as regular workers) and online survey data, the study investigates how regular tasks, communication and productivity have changed during work from home and what difficulties, new formal and informal practices emerged during that process. Besides, the study explores the attitude shifts of the civil servants towards their work, document secrecy regimes, practices of distribution of power and emotional labour. The results show that the opportunity to work outside of the office initiated a change in collective representation of work that could be accomplished from home that seemed impossible for a significant amount of bureaucrats before. Departments and working teams successfully employed technologies to proceed with the established work practices in virtual environments, and what seemed a formal transfer at first became true sociomaterial shifts later on. As a part of the research focus, the paper also deals with effects that may be brought to bureaucracy in future by new practices born during remote work.

RN17_T07_02 | Conflicts around work

Teachers strike 2019 in Poland – bargaining power, dynamics, lessons

Katarzyna Rakowska

University of Warsaw, Poland

In my presentation I analyze various types of bargaining power of workers during teachers' strike 2019 in Poland and how this bargaining power changed due to the government's actions. I claim that some losses of bargaining power in this conflict were preventable with better strike preparation and organization, but others could not be avoided due to unprecedented legislative decisions and the abuse of power by the government.

In 2019 we faced the biggest strike in educational sector since 1989. It lasted 19 days and at the beginning engaged 14 thousand (70%) schools and kindergartens and 600 thousand of workers. At the beginning of the strike workers exercised very strong bargaining power, but as the strike lasted the power shifted due to internal union factors, strike dynamics, public opinion response and government actions. I focus especially on the latter, as government took unconventional actions immediately prior and during the strike, using arguments unprecedented during past 30 years of conflicts in Poland.

My presentation is based on a desk research of the news coverage, trade union's statements and interviews with strike participants that were conducted in the scope of three months after the strike. Interviews collection began a few weeks after the strike ended, what makes the data unique and valuable.

I will show how the strike leverage shifted with time due to government's gains of power. I also speculate whether some loses of bargaining power could be avoided by the unions that participated in this industrial conflict.

The Dynamics of Exploitation: Reconciling Marxist and Zemiological Accounts of Contemporary Working Conditions

Ben Ledger-Jessop

Sheffield Hallam University, United Kingdom

The zemiological concept of work-based harm has, over the past decade, developed a new framework that conceives of workplace dynamics, regulation and governance as contributing to the harm of workers (Davies, 2018 Davies, 2019; Lloyd, 2018; Scott, 2018). Nonetheless, I will argue that Scott's concept of work-based harm is limited in achieving the current aims of understanding workplace exploitation at a fundamental level due to his belief that work must inherently consist of an unequal relationship between worker and employer; and an assumption that societal norms and ontological security exist a priori to the capitalist system of employment rather than being borne of the system.

This paper aims to map out the processes within employment that can lead to the exploitation of the workforce by incorporating the work-based harm conceptualisation into a more recognisable Marxian framework through the concept of alienation (Marx, 1978), Marx's discussion of the struggles over the working day (Marx, 1990) and how the Capitalist state regulates the employment contract (Poulantzas; 1973; Althusser, 2014). Foregrounding the Marxist perspective highlights that all work under capitalism is predicated upon exploitation, but also allows us to better identify the processes through which exploitation occurs and is experienced. This both allows for a variegated analysis of the distribution of harm while also foregrounding the potential of workers to challenge the situations in which they find themselves.

Overqualification as Moderator for the Link Between Job Changes and Job Satisfaction Among Immigrants and Natives in Germany

Samir Khalil[1], Almuth Lietz[1], Sabrina Jasmin Mayer[1,2]

[1]German Center for Integration and Migration Research (DeZIM), Germany; [2]University of Duisburg-Essen

Job satisfaction is a major driver of an individual's subjective well-being and thus affects public health, societal prosperity, and organizations, as dissatisfied employees are less productive and more likely to change jobs. However, changing jobs does not necessarily lead to higher job satisfaction in the long run: instead, previous studies have shown that changing jobs only increases job satisfaction for a shorter period of time before it gradually falls back to similar levels as before. This phenomenon has been deemed the honeymoon-hangover pattern (Boswell et al., 2005), and several factors have been found to influence the patterns' characteristics. In our study, we identify an important new moderator of the relation between job changes and job satisfaction: the job-education match of job change. Previous studies found that overqualification (resp. overeducation) is a stressor that negatively affects individual well-being (Erdogan & Bauer, 2021). Based on relative deprivation theory, we argue that a job change out of overqualification lowers the likelihood of negative comparisons and thus increases job satisfaction. We analyze whether a change from an overqualified to a qualification-adequate position has a longer-lasting positive effect on job satisfaction. In addition, we investigate whether this moderating effect is weaker for immigrants, since the phenomenon of overqualification occurs more frequently among them. We use data from the Socio-Economic Panel ranging from 1994-2018 and focus specifically on individual-periods of employees before and after job changes (N=158,301). Preliminary results confirm that a change to a qualification-adequate job has a stronger and longer-lasting effect on job satisfaction which is lower for respondents born abroad.

The Role of Social Networks in Affecting the Informal Street Vendors' Daily Practices and Strategies of Resistance During the COVID-19 Period: the Case of Open-air Markets in Milan

Sara Recchi

University of Milano- Bicoca, Italy

Street vending represents one of the most visible manifestations of the informal economy and a niche of informality in which many migrants, in different European countries, often enter due to legal, economic, and cultural barriers that limit their access to the host country's formal labor market. The study aims to investigate which factors affect the permanency of migrants in this informal sector during the COVID-19 period. This contribution comes from the results of my Ph.D. case study research, which aims to investigate informal street vending characteristics, considering different open-air markets of the city of Milan. The empirical materials emerge from the conduction of 35 qualitative interviews, with both formal and informal street vendors, and from six months of non-participant observation on the field. The study shows how the social capital and community ties play a fundamental role in influencing the informal actors' working practices and strategies of resistance adopted to guarantee daily income from their irregular activities. Moreover, not only ethnic and informal networks affect the informal actors' daily strategies but their resilient presence in the open-air markets are also affected by specific dynamics of collaboration and interaction with regular street vendors. Studying the relations between the informal and formal segment of the sector allows us to highlight how irregular street vendors are not only embedded in ethnic and informal networks but also how, to resist in the urban spaces, they readapt their daily practices and negotiate their presence on the streets also with the regular segment of the sector.

RN17_T08_01 | Past and futures of work

Mars Exploration Program, Asteroid Mining & Mine Workers in Earth

Akın Bakioğlu

Erzincan Binali Yildirim University, Turkey

The historical capitalist process of formation illustrates live labor as the foundation of capital accumulation processes. In addition to this, it is clear that the exploitation of passive resources existing in nature is one of these processes. In the post-cold war era, other planets have become significant agenda items for the first time in history. As the number of countries that send humanless vehicles to the Moon increased, such vehicles were also sent to Mars. The most important one of these programs is NASA's Mars Exploration Program. These programs conducted with the collaboration of nation states and multinational companies have the aim of searching and extracting precious minerals on the moon and asteroids. It is expected that this operation will proceed with mining activities, primarily conducted by autonomous robots, the production of these robots, humans establishing compounds on the Moon and Mars in order to diversify mining activities, and these minerals being processed on Earth.

How the technological infrastructure developing in the mining industry, inspection mechanisms, and mechanisms of occupational health and safety affect the prevention of accidents must also be discussed. All of these developments show that the various exploitations of nature are incorporated into capitalist processes of capital formation as they progress.

The present study aims to theoretically discuss the future of the working class in light of developing technologies, by relating the "exploration" of other planets and mining activities on Earth, within the framework of digital capitalism debates. This theoretical discussion will be conducted by comparing quantitative data from the mining industry on Earth and other planets.

693

Two Strategies Of Purification: The Emergence Of Jewish Ultra-orthodox Labor Organizations In Israel

Gadi Nissim

Ruppin Academic Center, Israel

For decades, the calling of Israeli Jewish ultra-orthodox men has been Bible study. This included avoidance of labor and relying on their wives for economic support of the family as well as government benefits. However, this economic model has been undergoing a change in the last fifteen years. Contributions have been cut while the middle-class lifestyle has become more appealing. Therefore, men have been joining the labor market in growing numbers.

The new ultra-orthodox workers suffer from relatively low human capital and inexperience. Therefore, they have tended to endure violations of their labor rights, leading them to organize.

Drawing on in-depth interviews and data gathered from websites and digital networks, I ask what the new ultra-orthodox labor leaders' mindset is. The findings show that their mindset draws upon Jewish sacred texts. Reflecting Mary Douglas' classic observation that kashrut's Jewish rules reflect God's purity, the ultra-orthodox labor activists seek justice using two strategies. The first is the struggle for a fair and balanced economic transaction. The second is the more revolutionary ambition to create a just world. Both approaches assume that the world, in the character of God, must be pure. The first strategy implies that the road to this perfection means restoring, or fixing some problems, while the second suggests a more radical way of creating such a world. These findings attest to the importance of alternative moral economies that affect labor struggles in an era in which socialism is losing its place as a mass social movement.

"We Used To Work More Together For A Common Goal"- Solidarity, Nostalgia And Generations In The Finnish Paper Mill Industry

Sanna Aaltonen

University of Eastern Finland, Finland

This presentation discusses the levels, forms and limits of solidarity among blue-collar workers in the Finnish pulp and paper industry. Forestry sector has a long history in Finland and despite the substantial restructuring of the industry, leading to closings of paper mills from the year 2005 onwards, it still represents a central export trade as well as an important regional employer. The paper mill workers, supported by their strong trade union, are relatively well-paid, sometimes accused of being "industrial croesuses". Here I consider paper mill workers as industrial citizens (Strangleman 2015) whose sense of solidarity towards local communities, fellow paper mill workers and welfare society provides a moral framework that allows them to make sense of their position in society. The sense of solidarity has a temporal dimension and group loyalty is discussed within a continuum of nostalgic past and uncertain future. Generational differences regarding commitment to work and trade unions are put to work to evaluate the future of the industry and possible challenges for solidarity. The presentation draws upon qualitative interviews conducted among 41 pulp and paper mill industry workers from eight research sites in 2020. The paper is written as part of the research project 'BIBU – Tackling Biases and Bubbles in Participation' (SRC/AF).

694

Building Social Innovation and Emancipatory Social Sciences Through the Case Study Of The Mondragon Corporation

Liviu-Catalin Mara[1], Teresa Morlà-Folch[2]

[1]University of Barcelona, Spain; [2]University Rovira and Virgili, Spain

The Mondragon Cooperative (MC) is one of the most distinguished examples of worker cooperatives in the world. The last World Cooperative Monitoring (2019) specified that MC is the world's leading cooperative group in the industrial and utility sector. MC was founded in 1955 in the Basque country, and currently it is the largest business group in the Basque Country and one of the largest corporate groups in Spain. Thus, the long-standing trajectory of the MC demonstrates the success of non-capitalist alternatives. Flecha and Santa Cruz developed a research line on competitive cooperativism. This line of research focuses on the analysis of Successful Cooperative Actions (SCAs), which are based on scientific evidence, and when they are implemented, they lead to excellent results. Moreover, the SCAs are transferable to different environments. The analysis of these actions has been carried out through communicative methodology, by including the voices of different agents: workers, top managers and lower positions workers, temporary worker-owners, conventional employees, and retired worker-owners, among others. In this presentation we focus on the impact of the transferability of SCAs. In this analysis we emphasize the opportunities for transferability of existing experiences that promote the best economic results and lead to better working conditions for the workers. In this way, we contribute to the scientific literature on the social impact of scientific research in the areas of work and employment.

RN17_T08_02 | Job quality and work meaningfulness

A Longitudinal Study On Worker Voice: The Impact Of Supervisor Support Or Suppression

Arjuna Snoep, Agnes Akkerman, Katerina Manevska, Roderick Sluiter

Radboud University Nijmegen, Netherlands, The

This paper aims to study the effects of supervisor responses to worker voice, i.e. individual workers speaking up at work for their own interests (e.g. not being paid enough or too much work stress), on worker voice at a later time. We build on suggestions from the voice literature, which state that there has been a lack of attention for worker voice and a lack of longitudinal studies with regard to voice. We hypothesize that supervisor suppression of worker voice will decrease the likelihood of workers speaking up at a later time. Conversely, we expect that supervisor support of worker voice will have a positive long-term influence. Furthermore, we study whether the impact of the supervisor response to worker voice differs between workers based on their level of education. We presume that workers with a lower level education have had less opportunities to practice voice or voice related behavior compared to those with a higher level education and are thus less resilient after negative feedback. We therefore predict that supervisor suppression of worker voice will have a stronger negative long term effect for workers with a lower level education. The hypotheses are tested using our rich dataset, consisting of three waves of survey data collected via the Work and Politics Survey. This survey has been administered three times, between 2017 and 2020, among a representative sample of the Dutch labor force (first wave: N = 7599). This offers a unique overview of workers' voice behavior in the Netherlands.

695

The Meaningfulness Of Unfree Work

Anja Eleveld

Vu University, Netherlands, The

Meaningful work is considered a fundamental need in our society; it helps people to realize their personal agency, human dignity and self-respect. This paper aims to understand the meaningfulness of unfree work, such as work that is performed by recipients of social assistance benefits in sanction-backed mandatory work programmes.

The most influential meaningful work scholarship argues for the inclusion of a range of dimensions which are central to the subjective experience of meaningful work, such as craftsmanship, recognition, contribution and belonging. However, scholars in the philosophical meaningful work literature have argued that meaningfulness has also independent - normative - value beyond its value to individuals. These philosophical conceptualizations of 'objective meaningfulness' have in common that they emphasize the significance of freedom to meaningful work and suggest that people may not be able to engage in meaningful work where their autonomy is threatened, such as unfree work performed in mandatory work programmes. Based on an empirical case study on mandatory work programmes for recipients of social assistance benefits, this paper explores the relationship between objective and subjective dimensions of meaningful work.

Social Well-Being Of The Self-Employed In Russia (On The Example Of The Republic Of Bashkortostan)

Guzel Rimovna Baimurzina

Federal Center of Theoretical and Applied Sociology of the Russian Academy of Sciences, Russian Federation

The phenomenon of self-employment in Russia has an increasing relevance, both in connection with the expansion of non-standard forms of employment, and with the search for legalizing mechanisms for informal employment. January 1, 2019 Russia started a social experiment on the application of a special "professional income tax" regime, according to which individuals have the opportunity to conduct economic activities without registering as an individual entrepreneur and paying minimal tax. These tax payers are conditionally called "registered self-employed". According to a broader interpretation, the self-employed include persons who are not employees and independently sell goods/services produced by their own and may include both informal sector workers and individual entrepreneurs. Under the new conditions, this group may also include registered self-employed people who work in parallel as an employee, "fictitious self-employed" forced to go out of staff, or entrepreneurs striving to reduce taxes. The lack of generally accepted definition, unified identification and evaluation methodology of self-employed significantly complicates the study of this social group.

The study is funded by RFBR 20-011-00934 A «Human development under the conditions of socio-labour precarization».

The report highlights the results of sociological research "Quality of employment and human development" (October - December 2020) in which we specially selected a group of self-employed respondents (404 persons and individual entrepreneurs, who sell goods/services produced by their own and have no employees). Based on the sociological indicators of the quality of employment, quality of life and human development developed by the authors, the social status and well-being of the self-employed, the nature and conditions of their work, the level of income and education, social capital, attitudes to self-development and work values are analyzed.

What is a "good" Job? An Analysis of the Experiences of Unemployed Slovenians

Alizée Delpierre[1], Didier Demazière[2], Magnus Paulsen Hansen[3], Sabina Pultz[4]

[1]Sciences Po Paris, France; [2]Sciences Po Paris, France; [3]Roskilde University, Denmark; [4]Roskilde University, Denmark

In international institutions and in the academic world, the quality of jobs has become a key issue. The profusion of expressions ("good jobs", "decent work", "sustainable", "suitable", etc.) testifies to the liveliness of the debates, which nevertheless converge towards the objective of defining minimum quality standards. We contribute to these reflections starting from the experience of the unemployed: from the vantage point of the unemployed people, what do they consider to be a good or bad job? Based in in-depth interview with 15 unemployed people in Slovenia, we seek to explore ideas and visions about what a good job is, as well as we seek

to identify dynamics that shape such ideas. Our findings show that while searching for a job, unemployed people are directly confronted with the prospect of revising - and lowering - their professional expectations (in terms of professional field, salary, geography, etc.). This generates dilemmas as unemployed people are often not in a position to compare several job opportunities simultaneously, but have to choose in a situation of uncertainty (will a future offer be better?). Our analysis of these trade-offs considers the social characteristics of the unemployed interviewed and the Slovenian context shaping the unemployment experience and also what is conceived of as a good job. Finally, we discuss the implications of including concepts such as 'good jobs' in the unemployment research and point to potential ethical dilemmas involved in this. Is a job good, as long as an unemployed person thinks it is good?

RN17_T08_03 | Work prestige and fairness

Literacies Or Numeracies As Resources Of Occupational Prestige?

Maria de los Angeles Serrano Alfonso, Natxo Sorolla, Amado Alarcón

Universitat Rovira i Virgili, Spain

Informational capitalism makes of literacies a central issue of the production processes, demanding new skills to its workers. This communication aims to analyse the paper of literacies in the development of the socioeconomic status in the late capitalism. Main findings obtained from the cross-national empirical research developed highlight that language(s) have become crucial in the current classification of labour market, in terms of wages, educational level, and in summary, occupational prestige. Results highlight the centrality of literacies and language(s) in the development of occupational prestige, and locate numeracies and other new literacies (as communication, digital or professional and entrepreneurship literacies) or intellectual capacities in a secondary and/or restricted space. These are the conclusions obtained after conducting a multiple regression and partial least squares regression (PLS) analysis of a socioeconomic index where abilities, skills and knowledge variables related to occupations are compared. The analysis uses the 1.293 occupational equivalences coming from two big occupational data bases. The first one is the International Socio-Economic Index (ISEI) of occupational status, which estimates 436 occupations from the International Standard Classification of Occupations (ISCO) developed by the International Labour Organization (ILO). The second one comprises a wide range of the 240 abilities, skills and knowledge variables collected by the Occupational Information Network (O'Net) for the 967 occupations systematized by the Standard Occupational Classification (SOC) developed by the Bureau of Labor Statistics (USA).

Social Origin and Undereducation – Does the Intergenerational Transmission of Occupational Skills Compensate for Low Educational Performance?

Marvin Bürmann[1,2]

[1]Bielefeld University, Germany; [2]Bielefeld Graduate School in History and Sociology (BGHS), Germany

697

While much research on educational mismatches focused on overeducation – i.e. having more education than required for a job – Wiedner and Schaeffer (2020) recently show that undereducation – i.e. having less education than required – plays a more important role than the avoidance of overeducation when explaining the effect of social origin on wages. Hence, it is important to understand why employees with high status parents are more likely to access higher positions despite their lack of educational performance. Although access to vacancies via the parental social network seems to be an obvious explanation, Wiedner and Schaeffer do not find any evidence for such an effect. Although they were able to explain a part of the social origin effect by cognitive abilities, other underlying mechanisms of the effect remain unclear. I analyse one further possible explanation: The intergenerational transmission of occupational skills. As they are very specific and difficult to measure, occupational skills are usually unobserved in cognitive ability tests. However, if the effect of social origin can additionally be explained by the fact that undereducated employees from higher status parents often work in the same occupation like their parents, I assume this to be due to the intergenerational transmission of occupational skills. Analyses are based on the German Socio-Economic Panel Study (SOEP) from 2000 to 2018. Germany is chosen because of its highly occupationally stratified labor market, which makes it the

most likely case to observe an effect of intergenerational transmission of occupational skills on undereducation.

Fairness Perceptions of In-Work Benefit Regulations: Evidence From a Factorial Survey in Germany

Monika Senghaas[1], Christopher Osiander[1], Gesine Stephan[1,2], Olaf Struck[3]

[1]Institute for Employment Research, Germany; [2]Friedrich-Alexander-Universität Erlangen-Nürnberg, Germany; [3]University of Bamberg, Germany

In-work benefits are increasingly popular as a social policy programme. Their aims and effects are discussed controversially in the literature, with studies exploring their impact on alleviating poverty as well as their potential to 'normalise' precarious employment or contradictions associated with the division of unpaid caring responsibilities (e.g. Pronzato, 2015; Rooney & Gray, 2020; Rubery, 2018). Our paper presents results of a factorial survey examining fairness perceptions of in-work benefit regulations. We are particularly interested in how the social norm to work and health conditions of benefit recipients guide judgements with regard to fair benefit entitlement. The study refers to Germany's basic income support scheme ('Hartz IV'), a means-tested benefit programme that – being targeted at both unemployed and employed individuals – blurs the traditional employed/unemployed divide.
We invited a random sample of the German labour force to participate in an online-survey where we presented several short hypothetical scenarios ('vignettes') describing a fictitious recipient of in-work benefits with different attributes. Mirroring the German legislation, respondents consider higher benefit reduction rates for higher incomes as fair. The higher the income, however, the more the respondents' assessment deviate from the reduction rates set by the current legislation, suggesting that respondents reward compliance with the social norm to work and to make one's living. Physical and mental health conditions are associated with lower benefit reduction rates, confirming research on deservingness perceptions and illness. The findings contribute to the understanding of in-work benefit receipt as a specific labour market status between employment and unemployment.

The Unique Environment of Third-Age Entrepreneurs. Case Study of Family Businesses in Małopolska - Owners, Nestors and Their Successors in Pre-and Post-Pandemic Reality

Marzena Mamak-Zdanecka

AGH University of Science and Technology, Poland

698

The SME sector in Poland is dominated by family companies. Entrepreneurs do not operate in an economic or social vacuum. So far, the generational change in family businesses caused by the aging of the society was a very important condition for their continued business operation. Today there are more to these problems. For a year now, we have been looking at how small and medium-sized companies operating in Poland react to black swans. The problem is not only readiness for succession and intergenerational (a)symmetries. According to the data published by Forbes Polska (2021), the obstacles are labor costs, legal instability, tax rates and the uncertainty related to the COVID 19 pandemic crisis.
The aim of this presentation is to address the issue of third-age entrepreneurship which may become one of the significant determinants of ensuring a better future for the company and employees. The group of family-run company owners, senior entrepreneurs, is non-homogeneous and can be divided by the professional paths they have adopted. The group includes senior entrepreneurs who continue running their businesses and those who pass on business ownership but do not give up on the roles of advisers and mentors. In both cases, the strive to maintain the company's organizational culture can be observed. The crisis has verified the organizational culture of family businesses by enforcing rapid technological changes and remote work. How did the companies fare during the total lockdown and beyond? The presentation will attempt to answer this question on the basis of the signature qualitative research carried out between 2018 and 2021 in relation to the Małopolska family-run companies of the SME sector, in various industries.

Family Formation and Occupational Status: Penalties for Women

Maye Ehab Samy, Michael Gebel

University of Bamberg, Germany

Women suffer from wage and occupational penalties after main family formation events in industrialized countries. However, the situation might differ in developing countries that have different welfare systems and fertility rates. This paper evaluates the effect of family formation events on women's occupational status, which identifies their social mobility in a developing country context. Occupational mobility captures an assessment of social status change. Hence, it indicates women's vulnerability, particularly if they witness an occupational penalty after family formation events. This assessment is crucial, especially in Egypt, given the universality of marriage, high fertility rates, and women's low labor force participation. Various theories explain the penalties that women face in the labor market, namely human capital accumulation, the decline in work effort, and compensating differentials (choosing a more flexible job). This paper's research questions are: 1) How do women's careers develop after marriage and childbearing? 2) How does the effect of motherhood differ by the number of children (parity-wise effects)? 3) What is the effect of the career interruption and the experience years on the women's occupational mobility (human capital depreciation hypothesis)? We estimate fixed-effects panel models to identify the impact of marriage and childbearing on the International Socio-Economic Index of occupational status (ISEI-08) in the Egyptian labor market. The data used in the analysis is Egypt's Labor Market Panel Survey (ELMPS) for 2018, depending primarily on retrospective data. Preliminary results show that marriage and motherhood have a positive impact on women's occupational status in Egypt. This result is the opposite of the occupational penalty that women witness in industrialized countries.

Personal Assistant Of A Person With Disabilities As A Type Of New Labour Relations. Can The Trajectory Of Precarity Be Interrupted?

Dorota Szawarska, Ewa Giermanowska, Mariola Raclaw

Unversity of Warsaw, Poland

We focus on new labour relations that have emerged due to the development of personal assistance (PA) services for people with disabilities (PwD). This is a consequence of dissemination of the ideology and policy of independent living and adoption by the UN of the CRPD . In some countries (Norway), availability of PA services is a human right for certain categories of PwD. In Poland, these services are only in the initial phase of development. The development of PA is in line with the postulates of de-institutionalization, de-medicalization and de-professionalization of support services, as well as with demands of PwD fighting for subjectivity, dignity and equal rights. New employee relationships related to the provision of services have emerged (PA's employer may be a PwD, agency, commune, non-governmental organization). The work of an assistant is difficult, emotionally exhausting and relatively low-paid. Thus, even in countries with advanced services (Norway), assistants often belong to groups subject to various forms of exclusion. This is an occupation that is poorly represented in trade unions. However, in Norway, the Covid crisis revealed that these people are essential workers worthy of recognition.

We argue that empowerment of PwD (through PA service) without work related security for assistants leads to forms of precarious work, creates new hierarchies based on social inequalities. However, the Covid crisis might affect further trajectory of labour relations related to PA services. Conclusions are formulated on the basis of empirical research carried out in Poland and Norway, a project financed by Norway grant.

Quantified Self Apps: Performance, Datification, and Medicalization

Francesca Setiffi[1], Antonio Maturo[2]

[1]University of Padova, Italy; [2]University of Bologna, Italy

The aim of this study was to investigate whether features of neoliberal society are present in apps for diet and mental wellbeing. The four components identified were: 1) quantification (i.e., the growing trend of using numbers to describe phenomena), 2) medicalization (i.e., the transformation of normal conditions into pathological ones), 3) gamification (i.e., the ludification of boring activities), and 4) emphasis on performance (i.e., the dominance of strategic actions and competition in everyday life). We performed content analysis on the texts, the design, and a selection of reviews of three apps for dieting (which were the most downloaded ones at the time of the study) and two apps for mental wellbeing (which were selected for their specific content). Our analysis indicated that the four components were present in the studied apps. Therefore, these characteristics could become part of a framework for analysis and social research in the context of digital health, consumption, and neoliberalism. The study yielded the following main findings: a) the apps reduced social complexity, and the social determinants of health related to obesity and mental illness were hidden; b) the apps were particularly coherent when considering individual needs separate from the social context and when emphasizing the neoliberal characteristics of contemporary society; and c) the apps focused on people taking responsibility for their own health.

Epistemic Media: Their History and Relations to Subjectivity

Eran Fisher

The Open University of Israel, Israel

In this article I wish to offer the notion of epistemic media as a theoretical concept. This refers to media forms and media practices geared primarily not for communication but for rendering data and information into knowledge. Epistemic media is historically contingent as it emerges with modernity. As media were developed to serve as epistemic devices in an increasingly rationalized society, they also opened up a space to know not just objective reality but the self. Epistemic media became entwined with the emergence of subjectivity, the ability to use reason to form a free and authentic self. Exploring a few case-studies of epistemic media, in particular double-entry bookkeeping, and drawing on the notions of cultural techniques and media practice, the article offers a preliminary exploration into epistemic media and it relations to the emergence of subjectivity. Finally, the article explores the ramification of digital platforms, big data, and algorithms as epistemic media to subjectivity, arguing that algorithmic knowledge renders reflection redundant and so undermines the construction of subjectivity.

700

Agency In The Age Of Datafication

Riccardo Pronzato

IULM University, Italy

Recently, the relation between structures of datafication and the role of user agency has become a primary concern within the field of digital sociology (Bucher, 2018; Neff and Nagy, 2018; Ytre -Arne and Das, 2020). This issue is deeply intertwined with how to encompass user agency in a wider research framework regarding the study of algorithmic media (Lomborg and Kapsch, 2020; Siles et al., 2019), which remains a subject of intense debate (Livingstone, 2019). Drawing on a critical synthesis of recent literature focused on critiques of datafication and rooted in communication and media scholarship, this paper aims to critically discuss how agency can be taken into account in the study of the relationship between algorithmic media and individuals, and the ways in which user agency can be conceptualized and used to explore the unfolding of digital platforms in everyday life. Indeed, while algorithms have often been

considered as black boxes (Pasquale, 2015), recently scholars have argued for the merits of going beyond the epistemological limit of the black box metaphor (Bucher, 2016; Bonini and Gandini, 2020), and also for the necessity to include users and agency in wider analytical framework regarding algorithmic media (Risi et al, 2020). Given that to date there has been little agreement on how to do so, this paper ought to make an important contribution to the field of critical algorithm studies and provide an opportunity to advance our understanding of the relationship between users and algorithmic media, and of the unfolding of these technological structures within social reality.

Practical Sense and Algorithm: Embodying Algorithmic Imaginary, Incorporating Habituses in Technology

Francesco Bonifacio[1], Mario de Benedittis[2]

[1]Catholic University of the Sacred Heart, Italy; [2]University of Milan, Statale, Italy

Central to the reflection on algorithms in use (Aragona, et.al 2020) are concepts of experience and learning, and the link between them. Accordingly, algorithms constitute a history made thing – history of users' practices, developers, economic relationships underlying their development, forms of rationality. Likewise, experience and learning are central to the notion of habitus (Bourdieu 1998), that is the history made body expressing both the social agents "having experienced" and "making experience" of a practice. From this standpoint, the engine of social action lies in the encounter between these two histories, whose relationship modifies in turn both elements. The algorithm settles the user's "space of possibilities", structuring his experience and being incorporated in his practical sense. In turn, the user's dispositions orient his algorithm-based practices, being deposited in the "practical memory" of the algorithm itself.

Such theoretical discussion grounds on empirical results from a Milan-based enactive ethnography of app-mediated food-delivery work. Zooming on moments when the algorithm agency become manifest, such as the notification of the gig acceptance/refusal, the fieldwork stresses that riders' algorithmic imaginary (Bucher 2018) leads to specific ways to unfold the job. Yet, different algorithmic imaginaries have been observed in any groups of workers and not in others, resulting from a certain practical sense of the work and from different social trajectories. Addressing the heterogeneity of

riders' experience and learning, habitus and capitals, this contribute aims to dialogue with notions as entanglement (Introna 2016) and sociomateriality (Orlikowski, Scott 2008) to explore the way in which people experience algorithms.

RN18_T01_02 | Media, Pandemic and Crisis I

Critical Perspective on Brands' Communication in Advertising Campaigns during the Pandemic

Mădălina Buga-Moraru

University of Bucharest, Romania

During the pandemic, the worldwide society has faced not only an unexpected medical crisis, but also a media crisis. This happens in various areas of media industries, including journalism, advertising, public relations. This paper reveals the way brands trigger a collective movement in advertising to offer social and psychological solutions, by taking advantages of consumers' fears during the pandemic. Advertising discourse has been refined in order to deal with such pressure and encourage consumerism. In the middle of the medical and media crisis, brands anticipated consumers' reactions and their chaotic consumption. The usual emphasis on the relationship between brand, product and consumers turns into brand reconfiguration as an archetype of caregiver or saviour. Specifically, this paper focuses on brands' role in helping people to cope with the new situation briefly summarized as de-socialization, insecurity and lack of perspective. The present research underlines the extent to which brands reconsider their discourse during the pandemic in terms of topic, consumers' lifestyle changes, medical landmarks, needs. Moreover, this paper aims to reveal how brands manage their capital by discovering new added values, associations or adjustments of the initial image. Therefore, the analysis stands for the best research method meant to unfold tactics of brands' communication, their relationship with consumers and innovative techniques of conveying a powerful message. The research was conducted on a corpus of advertisements running between April 2020 and February 2021 on TV and Youtube. Commercials belonging to various product categories were selected

according to mandatory criteria for reconfigurating the advertising discourse. Subsequently, the main hypothesis is the following: exploiting fears of consumers, but also consumerism, brands portrayed as caregivers or saviour in their advertising discourse.

From the Field to the Desk: Collaborative Visual Research During a Pandemic

Kazimuddin Ahmed[1], Lara Bezzina[2], Andrea Butcher[1], Salla Sariola[1]

[1]University of Helsinki, Finland; [2]University of Malta

Participatory video (PV) is a tool, a method, a process and vehicle for change, depending on its use. For the development practitioner, PV is "a set of techniques to involve a group or community in shaping and creating their own film" (Lunch and Lunch, 2006:10). For the researcher, it provides the opportunity to "look alongside" instead of "looking at" research subjects (Kindon, 2003:143). Emerging from bottom-up frameworks of development communication for social change, PV has found its way into academia equally as a tool for social research as it is a subject of research.

This paper narrates how PV is employed in remotely training university based researchers in Benin and Burkina Faso. Exploring themes of public health, development as well as media and communications, the paper discusses dynamics of participatory and collaborative visual knowledge production during the Covid-19 pandemic that has brought on location workshops to a grinding halt.

Implicit in the idea of PV are deconstruction of hierarchies, demystification of technology and decolonisation of information regimes. Techniques of this action oriented process have, however, hitherto been designed for collaborative activities where participants, physically present together, collectively and methodically work towards democratising knowledge. Immobility during the pandemic has generated unprecedented and fundamental challenges for PV. But it has also provided opportunities to test new ways of designing and executing participatory research projects.

This paper highlights the challenges and opportunities of long distance learning that researchers from Finland, Malta, Benin and Burkina Faso face while collaborating in a participatory visual research project.

Sociality at a Distance: Understanding the Role of Digital Media During the Covid-19 Lockdown

Manuela Farinosi, Leopoldina Fortunati

University of Udine, Italy

The Covid-19 pandemic interrupted everyday life and forced national governments to implement a series of significant restrictions on movement outside the home. Affecting all social areas (education, work, entertainment, etc.), confinement has drastically reshaped the lives of many people around the world and intensified the presence of digital media in their domestic environment. In order to reflect on experiences of "being at home" and to fully understand the sociocultural implications of Covid-19, this paper focus on the usage of digital media among university students during the lockdown. In particular, it attempts to answer the following research questions: 1) What are the forms of social connections, mediated or not, developed during the lockdown?; 2) What is the role played by digital media in managing social relations in a time of quarantine? To this aim, we adopted a critical perspective and conducted a qualitative analysis of 150 solicited diaries written by Italian undergraduate students for a five-week period. The findings showed a frequent use of online platforms as a coping tool for overcoming the lockdown limits by maintaining contact with friends. Secondly, they indicated the presence of new forms of socializing, such as an online aperitif with friends or co-watching of movies and TV series. Thirdly, they highlighted the rediscovery of traditional forms of family conviviality, such as cooking together, supported by online video tutorials. Fourth, they showed no changes in terms of critical awareness of digital media social functions.

702

Political Polarization During the COVID-19 Crisis on Twitter. A Case of Spain.

Juan Antonio Guevara, José Manuel Robles

University Complutense of Madrid, Spain

The unexpected COVID-19 crisis forced the Spanish government to decree the state of alarm. This announcement, which was made by a newly formed coalition government consequence of a strong division of voting opinion, supposed the beginning of a strong debate on Twitter about the management of this new government. The aims of this study are the following: (1) to detect and measure the political polarization during the online debate on Twitter towards the Spanish government; (2) to identify bots according to their political affinity and to know their role in the development of this debate and polarization; (3) to detect and analyse the hot topics during the debate as well as their influence in the phenomenon of polarization. To accomplish that, we downloaded our dataset from the Twitter API and machine learning algorithms were applied in order to label all tweets as supporters, neutral or detractors towards the Spanish government. We applied the polarization measure JDJ (Guevara et al., 2020), the bot detection algorithm tweetbotornot (Kearny, 2020) and machine learning algorithms to detect the political communication style of those tweets produced by bots. Furthermore, to detect the hot-topics we applied the Latent Dirichlet Allocation (LDA) algorithm. Preliminary results show the presence of political polarization stressed by the role of bots during the debate on Twitter towards a few important topics such as economy, crisis or health.

RN18_T02_01 | Digital Networks, Drones and Digital Platforms

Drones, Citizens And The Abandoned City: Enquiring The Re-Appropriation Of Public Airspace

Gaia Casagrande

Sapienza University of Rome, Italy

The city of Rome presents many examples of dismissed buildings as well as geographical and territorial abuse - the so-called ecomostri but also abandoned buildings or unfinished architectural complexes – condemned, over the years, by many citizens' associations and grassroots activist groups.
In this context, this paper aims to enquire about the physical and cognitive re-appropriation of dismissed urban areas by citizens and/or grassroots movements (also) through the use of commercial drones.
This work is part of a larger on-going project concerning the analysis of drone technology in the public airspace. It intends to investigate the relationship between this technology and civic participation, i.e. the process of re-appropriation of the medium for collective purposes, starting from the perception of public space as an "intersection of air and ground" (Tuck 2018).
Following the analysis of Caren Kaplan and Lisa Parks, the theoretical premise is that drones contribute to the design and production of airspace and, consequently, to the production of different temporalities (Jackman 2019). Therefore, at this exploratory stage, the research will focus mainly on the use of a commercial drone in those dismissed urban areas, through auto-technography (Hildebrand 2019, 2020). In this sense, the researcher is both researcher and an active citizen, who experience the re-appropriation of the public airspace thanks to drone technology.
The data collected will be used to create a questionnaire, to be administered to participants (activists and citizen groups) in the second phase of the research.

703

Critical Analysis Of Russian Digital Environment: Between Global Platforms And Local Superapps

Vladislav Vladimirovich Dekalov, Stepan Vladimirovich Markov

Saint Petersburg State University, Russian Federation

The paper (with the support of Russian Foundation for Basic Research grant 20-011-00371) deals with the platformization of society and considers its different ways. The authors take the Russian internet environment as a case of conflation of globalization and localization tendencies.

The authors draw on critical theory of the internet. Owners of global platforms are considered as digital power actors implementing strategies to concentrate and convert «digital capital», which is symbolic and arbitrary, into economic one. These actors attract Internet users' attention and transform it into «digital labour» via exploiting various needs, some of which are artificially induced to encourage spending more time on the platform.

The authors pay attention to the phenomenon of «superapps», which have become widespread in the Asian market, as well as in Russia. Some major Russian Internet companies (Yandex, VK) and banks (Sber, Tinkoff) have already entered this market and claimed to compete with global platforms.

Superapps combine real (e.g. food delivery) and virtual (e.g. online movie watching) services in one application, so users don't have to switch between different platforms. The attention of users, thus, became the object of competition between the major local and global actors. And former ones have an advantage by applying a «one-window» approach and understanding of local habits.

Some crucial problems need to be critically analyzed. The first is that users are treated as digital labour power to be exploited. The second is small businesses have to enter these platforms and partly give up their independence so as not to lose their clients. The third is the dependence of Russian platforms on government power that poses risks of strengthening surveillance and censorship online.

From Incivility to Flaming in Digital Social Media: A Scientific Literature Review.

Belén Casas Mas

Universidad Complutense de Madrid, Spain

In the last two decades, digital networks have profoundly transformed social and political communication. The emergence of these technologies has enhanced the digitally mediated debate between citizens and other social and political agents. It is in these virtual spaces where the speeches seem to move further away from polarization, to become uncivil, according to some academics, hate speech, according to others, or inflammatory speech. The main goal of this presentation is to provide a conceptualization of these phenomena as well as their main characteristics. For this, the papers published in scientific journals have been selected based, on the one hand, on the highest number of citations obtained until 2021 and, secondly, on the highest impact index of the publication in the same year. The analysis points to the continuity of the lack of conceptual consensus among academics as indicated by Hughey and Daniels (2013). In addition, there is also a lack of agreement on who are the social agents (traditional, such as politicians and journalists- or citizens) who spread this type of discourse the most. Finally, various studies warn that the algorithms used in the analysis of social networks do not allow us to capture nuances, jokes and intentions of Internet users so that the final delimitation of the phenomenon depends on the intervention of the researcher.

RN18_T02_02 | Media, Pandemic and Crisis II

Informational Disorder and Pandemic Emergency. Offer and Demand of Health Communication in Italy

Antonia Cava[1], Assunta Penna[2]

[1]University of Messina, Italy; [2]University of Salerno, Italy

In the contemporary fragmentary media ecology, together with official health information, more visibility is given also to alternative information, to which the spread of the web and social media has guaranteed a wider audience. The radical changes caused by the Covid-19 pandemic have placed healthcare systems at the core of public debate. Our paper is aimed at analysing usage dynamics of digital technologies on two fronts: demand and offer of health information. Using data from several Reports on Italian citizens' informational needs (Ministry of Health, Censis-Centre of studies for Social Investments, Authority for Protection in Communication), our attempt will be to understand how both health institutions and users redefine their space in the Net. Do more opportunities to access information on one's health tangibly allow people to use this knowledge more effectively? Has digitalization in health communication transformed health professionals into 3.0 opinion leaders?

Data will show how the problem of sources is gaining a dimension that is central and critical at the same time. Easy and immediate access to information on the net risks to contribute increasing uncertainty in the field of health information. In the face of disintermediation as a resource, it is evident the need for re-intermediation as certainty. Disintermediation, infact, does not win when individual and collective needs become more demanding and pressing. In situations of emergency, in particular, people ask for certified information. The danger of information overload, felt by the audience, seems to have spontaneously oriented towards authoritative information channels. This renewed demand for hierarchy of the sources reveals a new economy of attention of the audience.

Getting Along With The Crisis? - The Impact Of Covid19 On Media Use

Jeffrey Wimmer, Lisa Waldenburger

University of Augsburg, Germany

The worldwide Covid19-pandemic necessitated government-mandated measures, which reduced physical activity and social contact. Social distancing has shifted communication with colleagues and friends to the digital realm which enlarged digital stress in everyday life to a certain degree.

As part of a panel study dealing with digital stress and ways to use digital media and technologies in a healthy fashion, the current effects of the German lockdown were examined qualitatively. We are investigating when users experience digital stress, how they deal with it, and what approaches they chose to circumvent it. The data were collected via media diaries, which were kept by the participants. Afterwards, semi-structured interviews and group discussions were conducted, for which the media diaries were the basis.

Our research shows that attitudes towards media, patterns of media use and contexts of communication changed drastically during the pandemic. Firstly, people are getting more comfortable with communicating with others by digital means. In lockdown mode things like video-calls and voice-messages resemble most closely established forms of face-to-face communication. This process reduces intentionally and unintentionally critical attitudes towards media. Secondly, selected dimensions of media literacy of previously less media-savvy people are increasing. Especially the elderly needed to adopt to new communication technologies in order to overcome isolation (e.g. digital tea parties). Lastly, the benefits of flexible working arrangements and related media repertoires became apparent for workers and employers. Because from the perspective of the users especially these occupational contexts help to get along communicatively with the consequences of the pandemic.

In our paper we would like to present our empirical findings and discuss their theoretical and practical implications when considering digital stress.

705

"Testing News Users' Ability to Detect and Tendency to Share Misinformation on Covid-19"

Nataly Buslón[1], Ramón Salaverría[2], Olivier Philippe[1], María José Rementeria[1], María Carmen Erviti[2]

[1]Barcelona Supercomputing Center; [2]Universidad de Navarra

The Covid-19 pandemic has multiplied the public dissemination of false content on a global scale. Over the last few years, mis- and disinformation phenomena and the so-called "fake news" (Tandoc Jr et al., 2018) have been widely studied in the framework of different news contexts, such as the U.S. presidential elections, the Brexit referendum, and the world summit on climate change, so on. However, none of these cases is comparable in dimension to the mis- and disinformation detected during the Covid-19 pandemic (Brennen et al., 2020). This presentation deepens the existing theory on information disorders by providing, through an experimental methodology, new empirical evidence on the dynamics of spreading health-related hoaxes and false content in the context of the Covid-19 pandemic. Our research shows an experiment about actions and decisions of digital media users when verifying news about the pandemic and, eventually, sharing them on their social media profiles. It presents the results of our RRSSalud project, based on a diversified sample of digital news users in Spain (n = 1000). The study focuses on exploring the ability to distinguish false and true content from 20 publications about health issues of Covid-19. These results are analyzed in light of the different socio-demographic profiles of participants. Finally, based on a dataset of hoaxes about Covid-19 in Spain developed by the same research team (Salaverría et al., 2020), this study examines the correlation between actions, participants and the hoaxes about Covid-19.

Infodemic Or Public Interest? Italian Newspapers And The Simplification Of Messages On Covid-19

Luca Serafini

Lumsa University of Rome, Italy

The aim of this talk is to study news narratives on the COVID-19 pandemic in Italy, taking as my point of departure the accusation against media outlets worldwide—made by scholars and institutions such as the WHO—for causing a drift defined as "infodemia": an overabundance of news items in circulation that are not properly verified or are deliberately misleading. In the context of the pandemic, media in Italy as elsewhere were consequently accused of oversimplifying messages coming from the scientific community and experts, creating effects such as undue alarmism in the population. I will assess the accuracy of this accusation by analyzing articles published in Italian news outlets, focusing specifically on elements in news narratives that lend themselves, by their very conformation, to the highest degree of simplification: namely, headlines and ancillary content such as teasers appearing in social networks. As I will show, even in the context of the pandemic, distinctions must be made between illicit journalistic simplifications, which border on unfounded news, and simplifications that, on the contrary, allow content in the public interest to reach a higher number of readers, thus heightening the level of awareness of pandemic-related issues. My thesis is that in the context of the public digital sphere, linguistic and conceptual simplification is sometimes necessary, and that it is therefore appropriate to distinguish between cases that produce beneficial effects for the public understanding of a phenomenon such as COVID-19 from those that can be classified as infodemia.

RN18_T03_01 | Digital Labour

Riders: The Role Of Media In The Labour Regulation Of The Food Delivery Collective

David Moral-Martín[1], Maria de los Angeles Serrano Alfonso[2]

[1]Universidad de Zaragoza, Spain; [2]Universitat Rovira i Virgili, Spain

This communication analyses the media thesis expounded by different Spanish media in the labour regulation of the food delivery collective -known as "riders" in Spain- taking into consideration their respective ideological positions. The so-called "Rider Law" force digital platforms such as Glovo, Deliveroo or Just Eat –among others- to hire their workers, proposing an alternative model to their current condition of self-employed workers. The treatment of such labour regulation is generating a deep debate among the social agents involved, which is transcending to society thanks to the media coverage and becoming a topic of interest for the public opinion (Noelle-Neuman, 2003). This communication summarizes the main results obtained after conducting a critical discourse analysis (CDA) (Van Dijk, 2004, 2011) in a selection of new items collected from the three main Spanish newspapers with a national scope and which confront an opposite ideology: ABC (right), El País (left) and El Confidencial (liberal) for the period comprised among 2018-2020. The analysis shows the ideological polarization of media in evaluating the different solutions given by the social agents in the resolution of this particular labour conflict.

Free but Precarious As a Butterfly: Delivery Workers' Attachment to Motorcycles and Search for Respect at Work

Adem Yesilyurt[1], Ergin Bulut[2]

[1]EHESS; [2]Koç University

Particularly with Covid-19, motorcycle couriers have become more visible as they deliver online grocery shopping for those who can stay at home. Based on a field study with delivery workers in Istanbul, we investigate what drives delivery workers and how they evaluate their labour conditions. Our findings suggest that delivery workers love their motorcycles as vehicles of power and freedom in an alienating social context. In a worsening economy with high national unemployment rates and youth unemployment, delivery work becomes a viable option, especially for young male persons. This type of work is relatively easy-to-find, providing an income higher than the minimum wage. Yet, the illusion of freedom is shattered with the couriers' encounters with employers, customers and other drivers on the road. Motorcycle couriers are regularly subjected to different types of violence, such as disrespect and intentional misbehaviour from customers, are stigmatized by other drivers, and are left unprotected by their employers who fail to provide the necessary protective equipment such as helmets. Employers also fail to provide adequate insurance, leading to precarity. Although they are digitally tracked second by second, algorithmic surveillance does not seem to be the main problem for delivery workers. The quest for respect and recognition overwhelms the increasing time pressure, poor physical conditions and high bodily risks. Workers' practices to game the algorithms, informal practices of solidarity in the workplace and the recent unionization attempts suggest hints of resistance and reform in this sector.

Entering the Hidden Abode: the Labour Process in four Slovene Digital Newsrooms

Sašo Slaček Brlek, Jernej Kaluža

Social Communications Research Centre, University of Ljubljana, Slovenia

Our study explores the changing labour process in Slovene digital newsrooms. We focus on the role of digital technologies in the following aspects of the labour process: separating conception and execution, differentiation of the labour process and shifting division of labour, techniques to increase labour productivity, degree of autonomy of newsworkers vs. management control as well as changing skill requirements.

To explore these questions we use two methods: the first is analysis of news media annual reports and other equivalent forms of publicly available documents. The second are interviews with 38 newsworkers and management staff online news media organisations in Slovenia. In addition to journalists and editors, our study includes representatives of marketing and sales, IT, analytics and social media departments within news media.

Some of the main findings of our research are:

1. Division of labour is becoming more flexible. Journalists have been burdened with additional tasks while the number of technical and support staff has been reduced.

2. New profiles of newsworkers are emerging in the digital environment to perform tasks related to social media and analytics.

3. Diversification of products in some media is leading to new skill requirements and is further blurring the divide between the business and editorial aspect of news media.

4. Journalists are being individualised in the digital environment, especially through the use of social media. Acknowledging the precarious nature of their employment many of them see social media as a way to promote their personal "brand".

5. Metrics have been incorporated into the labour process to a significant degree and are impacting daily routines of news selection and categorization.

Idealistic Rejection Vs. Curated Intimacy. Freelance Creative Labour and Digital Networking

Lou Therese Brandner

Sapienza University of Rome, Italy

My contribution focuses on the relationship between creative freelancers and digital platforms regarding networking practices. An emphasis on self-reliance, flexibility and entrepreneurialism renders freelance creative workers "pioneers of the new economy" (Boltanski & Chiapello, 2005; McRobbie, 2004). In highly relational, project-based environments, their main way to find professional opportunities are social relationships. Inside a network sociality (Wittel, 2001), digital platforms present an essential tool for success as self-branding has become an explicit form of labour (Gandini, 2016; Hearn, 2008).

The analysis of 31 interviews with creative freelancers in Rome and Berlin shows that some respondents reject digital networking, as in their perception it does not create "real", "authentic" relationships. They hold highly idealistic views of their professional relationships. The rejection of digital technology becomes part of a "romantic", "against the current" self-identity they actively construct (cf. Giddens, 1991). Other respondents embrace digital networking specifically as an instrument to bond on a more intimate level with potential clients and collaborators. They utilise their social media profiles to 1) convey an artistic, professional persona, marketing an entrepreneurial ethos (Bandinelli & Arvidsson, 2012) and to 2) generate a form of curated intimacy, concealing the networking purpose of their profiles with seemingly private insights.

Both perspectives ultimately illustrate how deeply intertwined the personalities and private lives of creative freelancers are with their professional practices. The relationship between digital space and social capital appears to be shifting, with social media platforms explicitly serving the purpose of "bonding" (cf. Putnam, 2000) with professionally valuable contacts.

Understanding Public Distrust in Legacy Media in Time of Crisis. Results From One Qualitative and Two Quantitative Surveys in Belgium

Grégoire Lits

Université catholique de Louvain, Belgium

Drawing on two multiwave quantitative surveys realized among representative samples of the Belgian populations between March 2020 and November 2020 (N=2977;2565;2162) & N=1014;1016) and on 30 qualitative interviews realized with Belgians who openly distrust legacy media and believe in constipations theories about the Covid-19 pandemics, this paper will analyze the way in which French-speaking Belgians informed themselves throughout the first year of the COVID-19 crisis and their assessment of the role of traditional media in the fight against the epidemic.

Different variables were questioned within the quantitative surveys (level of confidence in the different sources of information, frequency of consultation of traditional media and social media, adherence to pandemic control measures and vaccination, belief in conspiracy theories, level of anxiety) making it possible to identify four different informational vulnerability profiles (Kleis Nielsen et al.2020). The quantitative multi-wave analysis also revealed a significant increase in mistrust of the traditional news media growing through the pandemic. This mistrust was also illustrated in Belgium by a controversy on the complacency of the media towards political and economic power launched by the diffusion of a critical documentary which had a very important diffusion in Belgium on different social media (more than 1 million views out of 4 million inhabitants). The results of the qualitative survey will allow us to develop a comprehensive analysis of this phenomenon of mistrust towards traditional media. It will also allow us to critically asses how the role of information legacy media in society has evolve at a time when the circulation of information in society has been profoundly modified by the massification of the use of social networks.

Micro-targeting and Content Tailoring rather than a Public Agenda of Governance; on the electoral success of the low-budget extremist AUR Party in Romania

Raluca Petre, Mariana Bafană

Ovidius University of Constanta, Romania

The aim of this paper is to analyze the online content regime of message tailoring based on micro-targeting; that contributed to the unexpected success of the new extremist political party AUR in Romania. This political party came into being just two years prior to the parliamentary elections and had the smallest budget from all the political parties running. We hypothesize that by means of tailoring contents to expectations, AUR has groomed the fears and fantasies of their community. The messages, tailored to fears related to the Covid 19 context, managed to mobilize enough people and win them ten percent of the seats in the Romanian Parliament. In this presentation we analyze the very process of tailoring messages to expectations, rather than to a public agenda of governance.We employ content analysis of political messages of AUR party in the pre-electoral as well as the electoral period. We corroborate this analysis with a critical discourse analysis of the statements of the party leaders on their aims and strategies. We draw attention to the similarities of practice between the AUR party and the Veles Macedonia fake-news internet marketing enterprises. We conclude that the most problematic development of this content regime is the lack of a public service governance project amid these emerging political communication practices.

Managing Political Pressure as a form of Expertise: El País journalists during the Catalan Crisis

Zoltan Dujisin

Universite Catholique de Louvain, Belgium

Using multiple interviews with current and former journalists at El País, this article adopts a field theory approach to reconstructs how the Catalan crisis became a challenge to one of Europe's legacy papers, hampering journalists' ability to maintain and project their status as experts and professionals. Traditionally a center-left daily, El País positioned itself as a strong and uncompromising voice against Catalan secessionism, mirroring the official position of the Spanish conservative government and Monarchy and surprising many observers. This article shows that much of the El País newsroom saw this uncompromising line as incompatible with the tradition of the paper, in both substantive and professional terms, and as creating serious challenges to their professional credibility. The article shows that a) journalists expect having to deal with political pressure and view this as an integral part of their job, that is, it is an aspect of their journalistic expertise built in interaction with colleagues, sources, superiors and subordinates; b) editors emerge as mediators between the field of power and the field of journalism, translating external pressure into professional advice in the newsroom; c) In times of political crisis this pressure can become too overt, resulting in a breakdown of journalist's ability to preserve their professional identity and project it to the public.

How Did the Far-fight Coopt a Controversial Therapy Against Covid-19: a Discourse and Network Analysis on Twitter

Nikos Smyrnaios, Panos Tsimboukis, Lucie Loubère

University of Toulouse, France

We propose to trace and analyze both the networks of actors and the discourses mobilized in the controversy on Twitter around French Professor Didier Raoult and his failed treatment against Covid-19 based on the use of Hydroxychloroquine (HCQ). We implemented a sophisticated and innovative research method that consists in applying a network analysis combined with a lexicometric analysis to a corpus of 1.2 million tweets. We show that the controversy on Twitter was rhythmed by the dominant media that offered Professor Raoult a platform for his dubious proposal. In addition, a multitude of political actors were involved in the discussion promoting their own agenda. This is the case of the French government, that aimed to justify its management of the crisis, but also groups on the far right of the political spectrum. Indeed, we observed that the positioning of the different Twitter user groups was strongly polarized politically: on the one hand the supporters of Professor Raoult were grouped around accounts of extreme right-wing political figures, while the critics tend to mention personalities from the centre or the left. This also explains the presence of Trump and Bolsonaro's groups of supporters who were connected with French-speaking pro-Raoult, thereby illustrating the fact that the proposal to use HCQ to cure Covid-19 became a political issue of primary importance in the US and in Brazil in order to justify the non-interventionist policy on the face of the pandemic. Nevertheless, the arguments of some pro-Raoult addressed a real problem, the unchecked power of Big Pharma, and as such constituted a critique of the political economy of liberalism and its impasses and not simply an anti-science conspiracy theory.

Far-Right Social Media: Exploring Political And Cultural Activism

Karolos Iosif Kavoulakos[1], Alexandros Afouxenidis[2], Petros Petridis[1], Michalis Petrou[2]

[1]Aristotle University of Thessaloniki, Greece; [2]National Centre of Social Research, Greece

The proposed presentation will address two main interconnected research questions. The first refers to the content of far-right discourses and their relation to mainstream politics. This part is based on an in-depth analysis of the socio-political & cultural dimensions of such discourses as they appear on far-right websites in Greece. Emphasis is given on three interlocking systems of power indicating how social & cultural identities are (re)constructed: nation, gender, and sexuality. Attention is given to posts concerning the phenomenon of migration and therefore the reinforcement of nationalist narratives addressing the ideal national identity and national construction, the social representations of gendered identities, and the role of biological reproduction in the establishment of the nation.

The second research question refers to the examination of how the above discourses shift from the online political space to the real world. In many cases, such websites and blogs are the basis of the constitution of 'communities', which are active via social networking and the Internet. Some of these 'communities' may not exist offline in real space. The movement between the online and offline world(s) proves, however, to be particularly difficult to detect. Therefore, this research looks into the broader social and political context which (re)defines 'civil society' and 'civic space' via the online world which may be indicative of various types of transformations in political culture(s) and cultural politics.

Emotions Of Alt-right. The Affective And Neoliberal Dimension Of Platforms

Giovanni Boccia Artieri[1], Manolo Farci[2]

[1]University of Urbino, Italy; [2]University of Urbino, Italy

This research investigates the role digital platforms play in defining a model of neoliberal subjectivity. On the one hand, these platforms produce a sociotechnical system that guides users towards self-management complying with neoliberal doctrine; on the other hand, they create a conflictual environment with a high rate of emotional involvement which serves to convert the values traditionally identified with neoliberalism into an aggressive attack on democracy.

The alt-right offers an example of this mode of subjectification that exploits the algorithmic logic driving digital platforms to mobilize feelings such as hate, anger or frustration and to use them to reaffirm the neoliberal discourse.

Gendered Nostalgia: Neo-Ottomanism in Islamist Women's Magazines in Turkey

Petek Onur

University of Copenhagen

Neo-Ottomanism as a political ideology and vision has been a major component of the ruling Justice and Development Party (AKP) in Turkey, particularly since 2007. It aims to revitalize the glory of the Ottoman Empire in contemporary Turkey with a nationalist, Islamist, and predominantly patriarchal reinterpretation of history and has ultimately become a legitimation ground for authoritarian politics. Cultural reflections of neo-Ottomanism have also been widely seen in daily life, popular culture, and media, primarily in TV series and Islamist news media, newspapers, and magazines. This paper is based on the research project, which studies how neo-Ottomanism is reproduced in different Islamist women's magazines, which reach pious women from various religious, cultural, and economic backgrounds.

The research aims to understand and emphasize the creative agencies of the women editors and authors of the publications in reproducing, aestheticizing, and popularizing neo-Ottomanism. Particularly, the study asks how authors and editors of these publications visually and rhetorically mediatize nationalist historical narratives by interlacing them with Islamic nostalgia, and what the production of the discourse and mediatization process tell us about the gendered nature of neo-Ottomanism and its cultural manifestations. The first set of data is obtained from the archive research covering the period 2007-2021 of five journals representing different Islamic groups, communities, and life-styles. The paper will present and discuss a comparative textual and visual analysis of this data by means of a theoretical focus on the concepts of restorative nostalgia, aestheticization, and authenticity.

Smart Women? Consequences of The Pan/Info-demic on Female Professionals.

Silvia Pezzoli, Carlotta Bizzarri

Florence University, Italy

Starting from the answers to the questionnaire Stress, Dealing with Stress, and Experiencing Changes in Social Life during the Covid-19 Pandemic, carried out by the IPHS - Bulgaria for ISA rc36 already presented at the IVth ISA Forum of Sociology, in this contribution we widen the focus of our interest to possible future development of some women professional categories: journalists, social workers, show-workers and teachers, who answered to our questionnaire. Through in depth-interviews we investigate 4 macro Items: relation between private and work life, attitude towards technologies, changing of professional and social identity, relation to media, institution and information. Putting at the forefront both the study of the role of the information and of the mandatory usage of media technologies, we highlight 4 emerging topics from our interviews:
-if and how information has played a key role in tracing new professional and personal agencies;
-If and how media have been responsible to regulate the relation between citizens and institutions or, on the contrary, have been responsible to generate uncertainty and factionalism;
-if and how the use of media technologies for smart working lead to a higher degree of entrepreneurship or to a passive acceptance or, also, to a reluctance position;
- if and how in smart working prevails a domestification of work or a burocratization of the domestic dimension.

As sociologists, we underline tracks of empowerment developed by those women, envisioning an integrated role of the "Onlife" (Florindi, 2014) new technologies for professionals, and on the contrary, in accordance with Stéphane Haber, we evaluate if the digital revolution has absorbed capitalism and its alienation consequences, requiring us a more accurate and critical view on those phenomena.

Football, Football And More Football? What Children "Read" In The French "Youth" Written Press

Oumaya Hidri Neys, Collectif MédiSJeu

Université d'Artois, France

During the 2019 Women's Football World Cup, French officials have expressed the wish to see this event and its media coverage positively influence the development of "women's" football. Laura Flessel, then Minister of Sports, even hoped "that this World Cup will make many French women, especially young girls, want to put on their cleats and join the boys on the field". It must be said that French football, in spite of a federal plan of feminisation, which will be launched in 2011, has a feminisation rate of 7.4%.
The gendered marking of sporting practices raises the question of inequalities of access and practice (Davisse and Louveau, 1991). Among the resistances to the feminisation of a sport, the weight of differentiated media coverage and treatment has been identified: invisibilisation, trivialisation and sexualisation (Mennesson, 2005; Montanola, 2012). The MédiSJeu collective, which brings together historians, sociologists and linguists, has set itself the objective of analysing the dissemination and reception of differentiated models of sports among children.
This paper firstly demonstrates the relevance of using the sociology of socialisation to analyse the diffusion of models, embodied here by the French football elite, during the last six "female" and "male" World Cups (from 2010 to 2019). By focusing on the media as socialising agents, but also on the content disseminated (Darmon, 2006), we then present our methodological framework based on the quantitative analysis of a corpus made up of one title (Le Petit Quotidien (6-10 years old)) and the qualitative analysis of semi-directive interviews conducted with the editors and journalists concerned (n=6). Finally, we present the main results obtained.

"Innocent" Hashtags? A Cautionary Tale. The #IStandWithGreece as a Network Of Intolerance In Twitter During a Land Border Crisis.

Maria Avraamidou[1], Maria Ioannou[2], Eftychios Eftychiou[3]

[1]University of Cyprus, Cyprus; [2]University College Groningen; [3]Georgia Institute of Technology

This study explores the hashtag #IStandWithGreece as part of meaning making processes on Twitter around a border crisis at Europe's periphery, the Greek-Turkish land-border. Adopting a network perspective, we located the most influential twitter accounts using #IStandWithGreece, the communities they formed in the micro-bloc and what other hashtags they used to communicate their views in relation to the unfolding events. This allowed the scanning of the broader ideological character of these influencers and their respective communities and by extent that of the debate around the said hashtag. The study exposes the strategic use of a seemingly innocent hashtag by certain influential actors to disseminate anti-migrant stances and restrictive ideologies that cut across national contexts of the Global North.

Free Press Under Pressure? An Empirical Look at Right-Wing Hate Targeting Journalists in Germany

Yann Paul Mattis Rees, Michael Papendick, Andreas Zick

Bielefeld University, Germany

While Germany generally reaches relatively high spots in press freedom indices, with the rise of right-wing populism in Europe, and Germany in particular, devaluating attitudes and narratives toward the free press, e.g., Lügenpresse ('lying press'), have become widespread among the German public. Additionally, various violent attacks on journalists made headlines and topics of nationwide political discourse. However, systematic empirical research on this issue is scarce. Thus, to shine a light on hate targeting journalists, particularly taking into account the perspective of those affected, we held a survey (n=322) among active journalists in Germany. For our questionnaire, combining standardized closed as well as open questions, we focused on experienced hate, including the ways through which hate is transported and whether hate can be politically attributed: 82, 4 % of respondents report that perpetrators of hate targeting journalists are of the right-wing political spectrum. In addition to verbal hate (60 %), 16, 2 % of responding journalists report having been physically attacked or having received death threats (15, 8 %). The severity of experienced hate is illustrated by personal accounts which reveal the threat and intimidation journalists face. A majority of respondents fear that due to the quantity of hate the freedom of the press in Germany is in danger (62 %), another 52, 3 % consider self-censorship to avoid becoming targets of right-wing hate. We discuss our results in light of free press's role in modern democracies as well as recent research on devaluating attitudes toward the free press in Germany.

The Privileging of Mass Media Discourse: The Refugee "Crisis" in Slovenia from the Hybrid Media System Perspective

Rok Smrdelj

University of Ljubljana, Faculty of Arts, Slovenia

The prevalence of negative and stereotypical media discourse on contemporary migration—associated with the portrayal of refugees and migrants as Others, criminals and undesirables—has long been known and corroborated by most studies. However, the question of how exactly these discourses exist in the contemporary media landscape, which is determined by the online digital context and the hybrid nature of contemporary media, is mostly overlooked. In this paper, I focus on the interaction of mass media and social media in relation to the (re)production, circulation, and reception of the prevailing media discourse on the refugee "crisis" in Slovenia. Using selected case studies related to the "hybridisation" of mass media and social media from September 2015 to February 2016, when the arrival of refugees and migrants in Slovenia peaked, I find that social media content is driven by the hostile reaction to arriving refugees and migrants, legitimised by the prevailing political rhetoric, which in turn guides mass media coverage. From this perspective, social media reinforces the dominant mass media discourse privileging the voice of MPs and other politicians while marginalising other voices (e.g. NGO representatives, academics, refugees, and migrants). I argue that the contemporary online digital context does not seem to have undermined the hierarchy of traditional mass media, despite earlier overly optimistic predictions about its democratic potential.

RN18_T05_02 | New Organisations, Media Coverage and Digital Inequalities

Exploring Traffic Flows in the News Media Ecosystem: From Diversity Utopias to Legacy Media Domination

Paschalia {Lia} Spyridou, Vasilis Manavopoulos

Cyprus University of Technology, Cyprus

For more than two decades the news industry is faced with instability and confusion. Within a fluid and hyper-competitive news media ecosystem (Anderson, Bell & Shirky, 2012) news organizations face dwindling revenue and declining journalistic authority -in terms of both trust and impact (Nielsen & Selva, 2019). Significant worries about the future of journalism are often mitigated by the proliferation of (non-profit) web natives which experiment with forms of civic journalism (Harlow & Salaverría, 2016; Nelson, 2019). On the other hand, research suggests that news consumption patterns reveal legacy-related benefits for well-established outlets (Arrese & Kaufmann, 2016), while algorithmic recommendations by the platforms tend to decrease diversity to news exposure (Carlson, 2017; Diakopoulos, Trielli, Stark & Mussenden, 2018).

Employing data from similarWeb (similarWeb.com), we investigate the flow of user internet traffic related to the Greek news organisations ecosystem between March – May 2019. Using the top 100 news sites by traffic as the unit of analysis, we attempt to map the relative size of attention different types of news organisations attract, as measured by clicks. Subsequently, treating the various websites as nodes forming a network, we employ Social Network Analysis to explore the connections, in terms of traffic flow exchanges, between the various sites, as well as the flows from outside toward the media ecosystem (e.g. through direct traffic, searches, social media etc.). The study contributes to the broader discussion on evolving attention patterns of news consumption and power balances between media outlets as well as between platforms and news companies.

Abstract Book | 15th ESA Conference | Sociological Knowledges for Alternative Futures | 31 August - 3 September 2021 | Barcelona (Online)

Themes In Media Coverage of Forced Labour

Romina Surugiu, Adriana Stefanel

Faculty of Journalism and Communication Studies, University of Bucharest, Romania

The goal of this paper is to reflect on the themes of media coverage of forced labour (mainly modern slavery) during 2020, in Romania. It is based on a exploratory research, which focused on the online edition of main Romanian national newspapers.

The research is based on the theoretical background of Glasgow University Media School's representatives who argued that news stories tend to report the dominant social and economic interpretation, and do not challenge the logic and priorities of the social and economic order.

The main themes in the coverage of forced labour are: (1) the necessity of condemning slavery (marked by the occurrence of the word "must"); (2) slaves and workers as victims; (3) the ugly aspects of modern slavery (abominable psychical abuses, death of workers); (4) the appeal to emotion; (5) police officers and prosecutors as the main intervenient in the case of slavery and forced labour.

The word occurrence analysis leads to the conclusion that slaves are portrayed as victims rescued by the authorities. The perpetrators are not seen. Slavery is mostly associated to labour, although there are also mentions of sexual slavery and human trafficking. The component of workers' rights is present, but mainly in the case of temporary agricultural workers in Western countries, and in the case of medical workers' trade unions.

The coverage of forced labour (mainly of modern slavery) in Romanian media rely mainly on two sources of information: the press releases of national authorities and the files of police officers or prosecutors. The findings are consistent with the understanding of media as following the dominant interpretative framework of the society.

Digital Inequality, Gender and Smart Working during the First Lockdown in Italy

Tatiana Mazali1, Luisa De Vita[2], Giovanna Campanella[3]

[1]Politecnico di Torino, Italy; [2]Università degli Studi di Roma La Sapienza, Italy; [3]Università degli Studi Guglielmo Marconi, Italy

Agile working, or "smart working" in common parlance, is a peculiar way of carrying out the subordinate employment relationship introduced in Italy in 2017 (Law no. 81/2017). As is now known, the Covid-19 health emergency (and the consequent measures adopted by the Italian government, see PCM of 25 February and 1 March 2020 – article 1, paragraph 1, point 7, letter a) accelerated a process that since 2017 had struggled to spread within companies.

Observing the impact of this acceleration on women's lives and in particular on conciliatory, structural and subjectively perceived aspects, was the goal of the interdisciplinary study conducted by the authors on women in smart working, through an online survey carried out from April to May 2020 (the first Italian lockdown phase).

Interesting critical evidence emerges from the research findings. Among the consequences, there is an increase in a psychophysical malaise in many respondents. The digital-driven flexible working mode seems to have simply translated into working from home, with all the difficulties that a family coexistence and the related care needs entail.

During the pandemic the great leap in digitization took place, flanked by the development of unprecedented inequalities between lives that can protect themselves and not, between the spread of fear and the demand for security, between experiences of loneliness and the demand for community support. The paper discusses some research results within the broader debate on flexible work and their relationship with digital culture and new forms of digital-driven inequality.

RN18 | Sociology of Communications and Media Research

Coping In The Culture of Connectivity: How Older People Make Sense of Living with Digital Ageism

Magdalena Kania-Lundholm

Dalarna University, Sweden

Based on the material from focus group interviews with thirty older (65+) non- and seldom users of digital mobile technologies between the ages of 68 and 88, this paper applies a cultural sociological lens to explore and understand how older people cope with their everyday life in the culture of connectivity (van Dijck, 2013). Culture of connectivity is understood here not only in terms of altered nature of connections and sociality and organization of social exchange based on neoliberal economic principles, but also as a profoundly ageist culture. Ageism is a form of discrimination in which individuals are judged according to age-based stereotypes or views (Rosales & Fernandez-Ardevol, 2020) that, similarly to other forms of discriminations such as racism and/or sexism, perpetuates and takes new forms in the networked information society. The paper departs from an idea that both cultural and structural forms of ageism are embedded in digital technologies and their ideological underpinnings. It applies a cultural sociological perspective that investigates the processes of meaning-making and meanings people attach to their groups and interactions (Spillman, 2020). Older people are often portrayed as digitally illiterate or technophobic and consequently marginalized targets of several digital inclusion policies. This paper explores how older (non-)users themselves navigate and negotiate everyday life in this culture, how they make sense of embedded power relations and the fact that social world in digitally networked societies is often discriminating against older people and their use and understanding of digital technologies.

RN18_T06_01 | Academia and Public Sociology

To the Happy Few: The Limits of Solidarity in the Political Economy of Scholarly Communication

Marcel Knöchelmann

UCL, United Kingdom

The notion of solidarity insinuates that all involved in the production of knowledge are geared towards a collective endeavour: the advancement of knowledge. In this sense, produced knowledge is to be shared freely among all. The idea of open access to scholarly publications (OA) builds upon this by being founded on the charitable ideal of a democratisation of knowledge. However, the large-scale OA manifestation such as Plan S or Projekt DEAL narrow the possibility of such solidarity. The principle underlying them is to allow for a sharing of established knowledge only to the high price of buying access to the means of establishing knowledge—a commercial market of OA for which only a few have the financial means for participation. OA, in this manifestation, embodies the cultural hegemony, allowing for a continuation of capitalist self-reward through the sharing of knowledge while ridiculing the efforts of bottom-up approaches.

I present a critical analysis of dominant and radical OA reasonings by showcasing opposing manifestations, ranging from bottom-up, small-scaling to top-down, large-scale. These cases illustrate defining culture principles underlying the different assumptions of subjects engaged in the political economy of scholarly communication. By combining theory and cases, I show that, though academia is said to be a global institution, the sharing of knowledge still operates on imperialist centre-periphery structures which disadvantage especially scholars from the Global South. The injustice found in this structure is solidified by the large-scale approach to OA which, ultimately, diminishes the capacity to reach a global sustainable information society.

Pandemic (Side) Effects Datification of Everyday Life and Mediatization of Science

Giuseppina Pellegrino

University of Calabria, Italy

Covid-19 pandemic can be framed as a powerful sociomaterial mixer, in which long term, 'structural' processes such as datification and mediatization produce peculiar side effects and consequences in both everyday life and the media.

This contribution proposes a theoretical convergence between STS and Media Studies. Focusing on Latour's Actor-Network, Bokwer and Star's ecological approach of Information Infrastructures and Couldry's myth of the mediated centre, a critical approach to both data and the media in the pandemic will be presented.

Covid-19 makes evident more than ever how crucial data construction, accuracy and accountability are to political and policy decision making. Datification is ambivalent and pandemic data are framed as a media ritual and a relevant background of individuals' daily routine. Classification systems and data are so openly part of ontological security that to reflect on them is very urgent. On other hand, pandemic exacerbated mediatization of science: scientists, especially virologists and epidemiologists, become media celebrities, pop icons on tv and characters of social media memes. The media logic (devoted to produce and consume celebrities) and the science logic (focused on controversy and organized skepticism) hybridize each other with unexpected consequences. Both data and science (namely, scientists) are absorbed by the logic of mediatization which configures a new media primacy in the pandemic world. New alliances between humans and non-humans are, therefore, needed to counter disinformation, conspiracy theories and re-configure ethical-informed and more inclusive sociotechnical assemblages of data and media in society.

How Does Sociology Get into Press? Exploring The Presence Of Sociological Contents In Newspapers

Luis Navarro Ardoy[1], Manuel Fernández Esquinas[2]

[1]Universidad Pablo de Olavide, Spain; [2]CSIC, Spain

This paper analyses the presence of sociology in newspapers. The main goal is to describe how the discipline appears in the press and to explore the main channels that facilitate the publication of sociological contents. We depart from the discussion on the nature of the public communication of sociology and the role of sociologists in the media. Our empirical study is based on information published by the seven newspapers with the widest circulation in Spain (both in press and online). After a detailed searching, we have created a strategic sample of 800 contents. Qualitative observations have been used for coding the contents in order to identify the main characteristics associated to sociology. We considered the format of publication (both news and opinion articles), the social issue addressed, the identification of specific projects, and the appearance of persons that are identified as sociologists. As methodological tools we have used descriptive statistics and visual maps.

Our findings show that sociology is related mostly to politics, sociocultural and religious issues. Opinions articles and columns are an important channel, not only news. The initiative of newspapers to work on projects and publications of sociological contexts is scarce. Most of the appearance of sociology in news can be attributed to the participation of individual sociologists through dissemination activities directed to the press, such us interviews and public events. Projects, publications and discussions about social issues are brought to the press by sociology professionals. The paper discusses the implications of the findings regarding the strengths and weaknesses of the discipline in mass-media and the possible channels that enhances the visibility of sociology.

RN18_T06_02 | Populism, Conspiracy Theories and Fake News

Catalysing Dissent Against the "health Dictatorship". An Online Ethnography on Refused Knowledge Groups and Science-related Populism in Italy

Paolo Bory[1], Paolo Giardullo[2], Simone Tosoni[3], Valentina Turrini[3]

[1]Politecnico di Milano, Italy; [2]University of Padova, Italy; [3]Università Cattolica del Sacro Cuore, Italy

The analysis of the relationship between populism and science is a key topic within the contemproary sociological and media research agenda. Recently, Mede and Schafer (2020) have described science-related populism as a form of antagonism between ordinary people and allegedly unvirtuous academic and scientific elites. This narrative supports the adoption of an alternative epistemology where true knowledge stems from the first-hand experience of common people. Concomitantly, science-related populism often includes among its "'post-truth' repertoires of contesting epistemic authorities" (Ylä-Anttila 2018), the selection of alternative epistemic authorities.

Drawing on a 1 year digital ethnography (December 2019 – November 2020), we aim to contribute to the current debate on this emerging form of populism from a twofold perspective. First we describe the role and the relevance - triggered by the pandemic crisis (Lasco and Curato 2019) - of an understudied figure in the diffusion of science-related populism that we named "catalyst of dissent" (CoD). CoDs are public influencers (politicians or media professional) gaining the status of a reference point within a vast and heterogeneous media-ecosystem of resistance to institutional science.

Second, we will shed light on how some key resources produced, detained and disseminated by the CoDs have been appropriated by 3 Italian online Refused Scientific Knowledge Groups (RSKGs)leading to different outcomes at organizational and narrative level within these groups, and more specifically: to a populist turn in one of them

(the no 5G scene); to determinate an internal division in others (the no vax scene); and to foster the role and epistemic authority in still others (5 biological laws groups).

Information Vulnerability in Lithuania

Arvydas Grišinas

Kaunas University of Technology, Lithuania

In a contemporary democratic society, information has not only become a "currency" that is used daily, but also the very foundation of the democratic system itself. In knowledge society, peoples's acceptance of disinformation can rapidly accumulate into a systemic vulnerability, which on its turn complicates relations between the government and the people and weakens the capacity to react to arising threats like a pandemic or foreign interference.

Information vulnerability is understood as an increased risk for people to fall victim to fake news and conspiracy theories. In times of internet trolling and social media bubbles, and after incidents like the Capitol Riots, this vulnerability, which had previously seemed obscure or trivial, is becoming ever more serious.

The presentation introduces a theoretical framework and initial findings of a research project "INFOVULN: Information Vulnerability in Lithuania", funded by the Research Council of Lithuania (grant no. S-GEV-21-7). This project aims to distinct social factors that are related to information vulnerability in Lithuania, and to prepare a tool for diagnosing it.

The presentation will introduce the conceptual framework that this research is based on, as well as the findings of a literature review concerning international studies on the topic. Finally, it will discuss the choices made while designing the questionnaire for the purposes of this study, contextualizing them in the broader context of the Lithuanian case.

Picturing A Conspiracy: How Conspiracy Theorists Reconstruct Audio-Visual Materials Into Oppositional Youtube Videos

Kamile Grusauskaite, Jaron Harambam, Stef Aupers

KU Leuven, Belgium

Conspiracy theories were once perceived as delusions of individuals on the fringes of society, but have become commonplace in mainstream culture. Today, they are produced, consumed and circulated on various online media environments. From memes on 4chan, QAnon influencers on Instagram, to flat earth or anti-vaxx videos on YouTube ,- modern-day conspiracy culture embodies compelling mediated images and narratives that are composed of various audio-visual materials. Building on Stuart Hall's encoding/decoding model (1980), and Henry Jenkins' (2012) notion of "participatory culture", we analyze these audio-visual conspiracy theories as "oppositional readings" of hegemonic truths. More concretely, we analyze how conspiracy theorists reconstruct various audio-visual (mass-media) materials into streamlined narratives on YouTube videos. Based on an in-depth qualitative analysis of 24 conspiracy theory videos, strategically selected from a larger sample of 200, we present three major categories of audio-visual narrative construction in conspiracy videos on YouTube. 1) Simulating: using fiction, religious and cultural images and narratives to render images of events otherwise invisible; 2) Deciphering: decoding hidden messages by 'closely reading' images and looking for hidden symbolism; 3) Exhibiting: exposing information, research, and images that are "hidden in plain sight" but point to conspiracy. The paper contributes to the growing body of literature on conspiracy theories by showing how they are not just texts, but should better be seen as media practices involving the recontextualizing of (mass)media material into new audio-visual conspiracy theory narratives. This shapes not just their content and form, but also their popular place in public discourse.

Transmedia Newsfaking. A Transmedia Approach to Information Disorder

Silvia Leonzi, Giovanni Ciofalo, Lorenzo Ugolini

Sapienza University of Rome, Italy

The aim of the paper is to better understand how contents that cause information disorder (Wardle, Derakhshan 2017), more generally called "fake news" (Zimdars, McLeod 2020), are created, structured and spread in order to share a false and/or harmful content first, and then to build and progressively reinforce a "fake transmedia franchise" able to allow false contents to survive denials.

The research starts from the analysis of theories and processes of newsmaking and their possible interpretation/corruption into the processes of "newsfaking" (authors 2018). Crossing the traditional journalistic tasks and news values, we identified the way in which newsfaking imitates and usurps the newsmaking process.

We analysed then the whole process of newsfaking through the lens of transmedia storytelling (Jenkins, 2006). What results is that the main goal of newsfaking is to activate a transmedia circuit related to fake contents (authors 2019). We identified a three stage model of "transmedia newsfaking": single/limited fake contents; fake imaginaries; fake transmedia franchise. In this last case, newsfakers launch a true "hostile takeover" to the role of mediator, which is historically a prerogative of journalists and which is one of the bastions of democracy itself.

The Covid-19 crisis reinforced on one side the strict relationship between scientific and medical communication fields and some the most well-known fake transmedia franchises (as for example the conspiracy theory concerning vaccines); on the other side it represented a plain and tragical exemplification concerning how information disorder can pollute the roots of democratic social coexistence.

RN18_T07_01 | Media, Climate Change and Environmental Crisis

Ecoinfluencers on Instagram; Visual Activism and the Environmental Crisis

Elisenda Ardèvol[1], Sandra Martorell[2], Gemma San Cornelio[1]

1Universitat Oberta de Catalunya, Spain; 2Universitat Politècnica de València

This paper presents an ongoing digital ethnography based research among environmental activists on social media. Particularly, our focus is on Instagram accounts related to climate change, and sustainable and ecologically responsible consumption in order to analise the interwoven of personal narratives and visual imagery in these forms of digital activism.

One the one hand, we suggest that there is a hybridization between activism, consumption and lifestyle based on an emerging figure that we call 'environmental influencer' or 'ecoinfluencer'. Then, we discuss how this figure can be controversial as it merges personal concern with collective action and an emergent market, challenging prior conceptions of social movements. On the other hand, we focus on the increasing importance of visual activism in social media. Far for considering visual activism refer to concrete artistic practices in favor of certain causes, and contrary to a negative perception of the image as a banalisation of political action, our proposal, based on our observation and in-depth interviews, is that imagery plays a pedagogical role for mobilizing and engaging people in social changing processes. We conclude that ecoinfluencers represent a new form of digital activism that use Instagram visual aesthetics as part of their personal choice to contribute to the environmental cause by exposing one's own experience and example to promote a sustainable lifestyle as a political action.

Climate Change as a Present-Future Crisis Topic. The Italian Case.

Antonella Mascio

University of Bologna, Italy

In the media sphere, the discourse on Climate Change has taken on different connotations, taking shape today as a transmedia trend topic. In recent years, the articles and services dedicated to it, often combined with the idea of "imminent catastrophe", are important items in the media agenda.

The use in the news of particular terminology and of specific frames - both in the narration of non-standard atmospheric events and in the description of protests connected with Climate Change - has determined the construction of a form of narrative seriality. The representation of the phenomenon has thus gradually acquired more and more value. It first occupied the pages of scientific discourse, progressing into the political sphere, then embracing the widespread and popular protest. "Friday for Future" is at the moment its most significant representation.

In our report we present a specific cultural context, the Italian one, in which the media have actively worked in the construction of a complex narrative linked to Climate Change. In particular, for this study, we used a specific corpus with three newspapers, analyzed in two different periods: five months in 2019 and five month in 2020.

In many cases the narrative framework that accompanies the articles contains emotional aspects linked to anxiety, fears and concerns for the future, defining a storytelling with dystopian tones, underlining the ongoing crisis.

The questions that guide our analysis are:
•What kind of narration accompanies news on Climate Change?
•What kind of terminology is used?
•What are the reference frames?
•How is the topic linked to the future?

RN18_T07_02 | Digital Identities, Communities and Social Capital

Being Public as a Cooperative Effort. Digital Identities between Discursive Spaces

Marcin Deutschmann[1], Michał Wanke[2]

[1]University of Opole, Poland; [2]University of Opole, Poland

This paper engages in the discussion about the ongoing shifts towards digital connectivity (van Dijk, 2015) of mass self communication (Castells 2009) of individual users and attempts to frame the digital communication sphere using the conceptual adjustment of Henri Lefebvre's (1991) theory of the production of space and the humanist materialism applied to communication practices (Fuchs 2019). Drawing on the qualitative data from three research projects of the authors' that deal with deliberation practices among different progressive and liberal bloggers debating current political topics in Poland, alternative discourses of drug users in the Polish deep webs, and vernacular media production of migrants to EU, we seek to demonstrate how individuals use discursive repertoires to cooperate with their audiences in effort to build their personal identities amid different discursive spaces and social media platforms affordances (Davis 2020).

This paper attempts to theorize participation in digital spaces as social performance and explores the creative component of digitally mediated being of individuals amid the constraints of the social media platforms. The digital identities are produced on the continuum of two dynamics: creation and unveiling. Both of them involve complicated relationships to the non-digital parts of identities and social functioning of the individual. We argue that the creative component of individual digital identity facilitates open participation in public spaces.

Does Proxy Internet Use Foster Digital Inclusion?: How Internet Skills Affect Engagement in Proxy Use, Internet Uses and Outcomes

Andraž Petrovčič[1], Darja Grošelj[1], Katja Prevodnik[1], Bianca C. Reisdorf[2]

[1]University of Ljubljana, Slovenia; [2]The University of North Carolina at Charlotte, USA

The COVID-19 pandemic has underscored the importance of digital inclusion, as participation in society is dependent on internet technologies, especially during the pandemic. This sudden transition has widened the gap between internet users and non-users, and it has accentuated the differences between users in terms of internet skills, uses, and outcomes. In this context, proxy internet use becomes particularly relevant. It encompasses practices in which users perform online activities on behalf of others, where we distinguish between proxy internet users (who perform online activities for others) and users-by-proxy (for whom activities are performed). We examine how proxy use fits into the sequential model of digital inequalities (van Deursen et al., 2017) by conducting a path analysis that tests whether proxy use mediates the effects of internet skills on internet uses and outcomes. Using nationally representative survey data (N=1,047) from Slovenia, we found positive pathways between operational and creative skills, proxy use, uses, and outcomes. Internet users with high operational and creative skills who are proxy users expand their own online engagement and associated outcomes. Conversely, creative skills are negatively associated with use-by-proxy, which, in turn, has no effect on and individual's internet uses and outcomes. The limited benefits of use-by-proxy are an important finding, especially during a pandemic: not only does physical distancing make relying on proxy users more difficult, but individuals who lack internet skills might get only limited advantages from having others perform online tasks on their behalf.

Building Predictive Models of the Dynamics of the Development of Internet Communities

Yulia Y. Estrina

Udmurt State University, Russian Federation

In order to analyze the integration processes of online communities as a phenomenon that has its own nature and to reveal the immanent mechanisms of their functioning, there was conducted a study using a mix methodology based on the principles of "grounded-theory"
To collect empirical data, previously it was conducted a direct continuous observation of the interactions of participants in 12 online communities in the social networks "Facebook" and "VKontakte" for two months. For data collection there were selected the mobilizing type groups. The selection criterion was the systematic reproduction of collective agreed offline actions by the participants. After the open and axis coding procedures were implemented the full list of possible integration dynamic features was prepared.
Further, using mathematical analysis, it was obtained a hierarchical model of the indicators of the state of communities with differentiation of the levels of integrative dynamics. It was revealed that among the factors of online integration, the target and value aspects of the association come to the fore, and the degree of "hybridity" of groups (the share of offline communications in relation to online interactions of participants) was also a significant factor for integration. Presumably, the dynamics of group integration can significantly depending on the severity of this trait.

The Relationship between Political Efficacy and Offline and Online Social Capital: Results from a General Population Survey of Internet Users.

Stelios Stylianou

Cyprus University of Technology, Cyprus

In the era of digital communications, the relationship between political efficacy (generally defined as the belief that citizens can understand and influence politics) and social capital (generally defined as networks of relationships that sustain a sense of belonging and offer support in achieving common goals) has been studied in terms of offline and online processes. I present a study of this relationship using data from the 2016 wave of the World Internet Project in Cyprus, a general population survey of representative samples from the Greek-Cypriot and the Turkish-Cypriot communities (N=1926). A latent variable representing perceived internet-mediated political efficacy is regressed on three dimensions of offline social capital—specifically, offline bonding (spending time with relatives, friends and acquaintances), offline bridging (spending time with colleagues) and offline linking (membership in organized groups)—and three dimensions of online social capital—specifically, online bonding (using the internet to conserve relationships with family or friends), online bridging (using the internet to expand professional ties or to meet people from other occupations, lifestyles or cultures) and online linking (using the internet to connect with political parties, NGO's, public officials or social movement organizations)—in multivariate models with trust in people and institutions, digital literacy and a digital generation effect variable as key theoretical covariates. The analysis shows that different dimensions of social capital have different effects on political efficacy. Online linking social capital is the most consistent positive predictor of perceived efficacy in both communities, while measures of offline and online bridging social capital behave similarly, albeit less consistently. These findings are discussed in the context of the increasingly important role of online communications and networking in political participation.

RN18_T08_01 | Digital Capitalism and Platform Cooperatives

Is There Any Alternative To Digital Capitalism?: The Barcelona Data Commons

Aitor Jimenez

The University of Melbourne, Australia

For some, data has become a form of capital, a commodity to be traded and exploited. For others, private data is undetachable from the dignity of the person, a fundamental right, and, in the words of the European Data Protection Supervisor, a social value. However, in the practise, data has become both, something to be rightfully protected by authorities, and a raw resource, necessary for the development of avant-garde technologies. Despite its technological character, data is also a social, political, historical and ideological product, and hence irreducible to a one single meaning. The way data is defined, conceptualised and instrumentalised is determining the kind of policies, technical instruments and socioeconomic solutions that are being provided to the citizens. In this paper I will explore the theoretical and sociological background underlying Barcelona's data governance strategy. For that, I will articulate this paper around two main questions: What are the genealogies, ideas, theories and concepts behind the Barcelona's distinctive model of data governance? How are the concepts of data, data rights, data ownership and data commons being defined and implemented in Barcelona? These two questions will help me to navigate and map the plethora of discussions, theories and vivid debates currently discussed in the broader academic and professional ecosystem of this representative metropolis.

Cybernetic Capitalism/Informational Politics: Rethinking the 'Neoliberal Critique' of Human Rights in the Digital Age

Josh Bowsher

Brunel University, United Kingdom

How might we conceptualise the politics of human rights? In recent critical debates, scholars have argued that the contemporary human rights movement and neoliberal globalisation emerged together in the 1970s as socially and politically intertwined projects. The new human rights movement, it is argued, provided a 'narrow', individualised politics that fit neatly within neoliberalism's own atomistic imaginary.

Challenging this perspective, I suggest that the interrelations between human rights and neoliberalism might be better understood by resituating them within the so-called "information revolution" that took shape in the same decade. To do so, this paper reconceptualises the "neoliberal turn" of the 1970s as a crucial moment in the advent of cybernetic capitalism, which combines the self-regulating political economy of neoliberalism with the permeation of information technologies into capitalism's infrastructure. The value of this framework is that it foregrounds the emergence of a cybernetic conception of information – one oriented to standardisation and the fetishization of narrowly conceived but apparently objective facts – as an increasingly pervasive social and cultural logic in the contemporary world.

Drawing from the archives of Amnesty International and other human rights organisations, the paper argues that it is precisely this informational logic that the contemporary movement has embraced as it appeared, rather self-consciously, within the information age. Indeed, the human rights movement has emerged primarily as an informational project that functions by transmitting human rights information through media networks to influence elites. At the heart of this project lies a distinctive concept of information organised around reifying empirical facts about violations as 'signal' and, conversely, the exclusion of politics as 'noise.' The result, I conclude, has been the depoliticisation of human rights.

Perspectives on Value and their Implications for Understanding Digital Monopolies

Paško Bilić[1], Toni Prug[2], Mislav Žitko[3]

[1]Institute for Development and International Relations, Croatia; [2]Independent researcher, Croatia; [3]Faculty of Humanities and Social Sciences, University of Zagreb, Croatia

Explaining digital platforms in Marxian terms has had its challenges, especially in the realm of free-of-charge online platforms such as Google and Facebook. The use value and exchange value, commodity and price seem to have no direct association. This sparked many theoretical discussions on how value is created and extracted, with contending perspectives looking at profit from exploited labour, rent from intellectual property or financial speculation as the ultimate sources of value. Perhaps the most popular and widespread has been the (digital) labour theory of value arguing that time spent on digital platforms creates value for platform owners. This approach sharpens our ability to comprehend commodification of user activities but it also hinders theorising circulation and financialization. While close textual reading of Marx's work provides plenty of evidence that he discussed value in subtly different ways, his theoretical project remained unfinished making integration of digital platforms within that framework difficult. The complexity of value is evident in renewed interest towards re-defining what value is (e.g. Mazzucato, 2018; Pitts, 2021). We argue that value-form approaches (e.g. Bonefeld, 2014; Heinrich, 2009; Murray, 2016) enable us to understand digital capitalist monopolies best. Within this framework, labour is still the source of value, but the association of value with price cannot be explained directly with labour time. Instead, money and determination of social forms play a more prominent role. Such an approach is better equipped for developing a Marxian theory of the unity of production and circulation on digital platforms that leads to (financialised) monopolies.

Scaling Platform Cooperatives: Alternative Pathways and Structure?

Vera Vidal

UOC, Spain

Platform cooperativism has emerged as a response to "Sharing economy" platforms. Against models that extract data, value, and resources, emerging platform cooperatives are trying to reconcile economic viability with social, political and environmental values. They do so through mutualistic practices and alliances by blending horizontal organizational models coming from the Social and Solidarity Economy—the collective ownership and decision-making of the members of the cooperative— with the use of FLOSS from the digital commons. Previous research has shown that platform cooperatives usually opt for democratic governance and sustainable economic models compared to "unicorn" platforms. Unlike those, they do not follow a "growth-before-profit" strategy backed by venture-capital investments to gain as many users as quickly as possible and thus try to benefit from network effects. Nonetheless they still need to achieve a critical mass to be operating in the long-term. What does scaling entail for a platform without market dominance as the ultimate goal? To answer this question, I conducted an ethnography of two platform cooperatives deployed in Catalonia.

One of the findings of this research is the importance of the territorial approach of platform cooperatives embedded in open structures. With the help of member-users deciding where and how to deploy the activity, they acquire a nuanced understanding of the different needs and patterns of use depending on the locations. Being part of an umbrella organization through which they mutualize the software and knowledge, these platform cooperatives may opt for combining different pathways towards scaling, looking not only at their viabilty but also their impact.

RN18_T08_02 | Digital Activism and Social Movements

Digital Collective Action on Facebook by the Unions, Associations and Social Movements in the Sector of Arts and Culture in Pandemic Times in Portugal

Carlos Levezinho[1], Paulo Marques Alves[2]

[1]Direção-Geral das Artes, Portugal; [2]ISCTE-Instituto Universitário de Lisboa

Times have been tough for the sector of arts and culture throughout the current century in Portugal. Some years ago, it was the financial crisis and the troika's intervention. Now, with the pandemic. Inclusively, this is the sector where we found the highest levels of precariousness.

With the pandemic, the weak working conditions, labour rights, and social protection of these workers became evident (Quintela e Rodrigues, 2020; Borges, 2020). In this context, the Internet gained prominence for the dissemination and sharing of artistic contents, as an act of collective solidarity, but also as a field of reflection, struggle and claims on the Revision of the Arts Support Model, the Statute of Professionals in the Cultural Field and the need of a Social Protection System.

This communication aims to understand how all the actors in the sector – classical unions, which have undergone a major process of restructuration in recent years, other organisations, like professional associations and co-ops, and social movements – use Facebook according to four axes: the objective(s) that underlie this Internet presence; if it is a way to foster (new) forms of social participation and networked unionism (Marques Alves and Levezinho, 2014); if there is an increasingly articulated cooperation between the different actors; and if this presence explores the potential of the web 2.0 (O'Reilly, 2005) as a way to reach the traditional media space and recover the "old" forms of struggle and social mobilisation. For these purposes, we analysed their publications in this social media in the last year.

The Other Side of the Story: Unravelling Activists' Experiences with Media Covering Grassroots Collectives

Lambrini Papadopoulou[1], Karolos Kavoulakos[2], Chris Avramidis[1]

[1]Panteion University of Social and Political Studies; [2]Aristotle University of Thessaloniki

This article presents findings from an empirical study aimed at recording activists' own experiences, understandings and critiques of the way that Greek mainstream media covered the grassroots collectives they participated. Despite their important role, activists' own accounts of their experiences with media rarely find a place in academic research. On the contrary, research on this complex relationship focuses, almost exclusively, on the media side of the story, analyzing their content, frames, biases and practices when reporting on grassroots collectives.

Drawing on 12 in depth interviews with activists participating in six grassroots collectives that were active in different fields ranging from work and health, to food markets, culture, and environment, this study brings together social movement and critical communications theoretical frameworks.

Our main goal is to research whether there is a specific pattern adopted by the majority of domestic media when it comes to covering grassroots collectives.

After analyzing our participants' side of the story, we recorded the existence of a specific repertoire comprised of four stages (1) Indifference, (2) Foreign media as catalysts (3) Distortion and censorship (4) Back to where it all started. This repertoire constitutes a new theoretical understanding that opens new pathways to research into the complex relationship between media and grassroots. Moreover, our research recorded the catalytic and under searched role that elite media with global recognition played in changing domestic media's attitude towards grassroots collectives. Both findings are crucial to better understanding the way media approach and present society's massive and bottom-up reactions to the draconian austerity policies and multiple compound inequalities.

725

Internet and its Effect on the Political Function of the Media System: Case Study about the Role of the Digital Press in the Student Movement of 2011 in Chile

Nicolas Ignacio Marticorena

University of Barcelona, Spain

This article analyzes the impact of the internet and digitization in the configuration of the Chilean media system by studying the political function of the written press, which plays a fundamental role in the public sphere as the guiding instrument of political communication in the society. With that objective, this work compares the information treatment generated by the two largest national newspapers (El Mercurio and La Tercera) and the leading online news services (El Mercurio Online "Emol", Latercera.com, El Mostrador and Biobiochile.cl) about the "Student Movement of 2011", one of the largest social movements of the post-transition period in Chile. The study examines the news production processes of these media through the composition of the sources, types of articles published, and the frames used in the news headlines to create a sense of the situation. The results reflect significant differences between online and print media, which adds valuable background in discussing how the internet is interfering with the development dynamics of the Chilean media system, whose characteristics for years have eroded the diversity of media and generated a process of monopolization in the written press.

Transmedia Activism and Co-Creation Practices in Storytelling Through Web Platforms: the Case of Baobab Experience

Fabio Ciammella, Giovanni Ciofalo, Silvia Leonzi

Sapienza University of Rome, Italy

The paper presents the communication and activism experience of the Baobab Experience association through a transmedia framework (Ciofalo 2020). The association carries out activities of migrant reception in the city of Rome, triggering narratives that fit into the cultural frames and practices of social activism and media. Through a reconstruction of the principal scholarly contributions, had been highlighted the dynamics of conflict that move the association, the identity and the informal network from which they generate actions (Della Porta, Diani 2006; Dutta 2011; Mattoni 2012, Costanza-Chock 2014). To this purpose, transmedia activism, based on practices of content co-creation founded on participatory culture (Jenkins et al 2020), was defined as an approach to analyze the communicative and narrative modes implemented by the association. A digital ethnographic analysis was set up (Hine 2015; Pink et al 2016), followed by key informant interviews (Della Porta 2014), the aim being to investigate the practices of medial activism (Mattoni 2020), associative organization, content creation and levels of bottom-up participation with respect to the hybrid media system in that context (Treré 2019). Among the main results, it emerges how transmedia activism favors and enhances the multi-level participation of people and the civic engagement (Dahlgren 2009; Bartoletti, Faccioli 2013), helps to legitimize the policies and ideologies that fuel the conflict and the identity of the association in local action, compared to movements at the international level. In addition, it emerged how the civic imaginary creates forms of resistance through the co-creation of narratives also based on the affordances of web platforms, in this case reaching forms of digital platform squatting.

RN19 | Sociology of Professions

RN19_T01_01 | Professions and the Crisis

Changes to Professional Regulation During the Pandemic

Tracey L. Adams

Western University, Canada

The COVID-19 pandemic has impacted professionals' work profoundly. It also appears to be altering how professionals are governed, especially in the field of healthcare, where countries have begun to re-evaluate which professionals provide which healthcare services, to meet surging and shifting healthcare demands. In Canada, as elsewhere, there have been changes to professionals' scopes of practice, and there is evidence that some professional organizations may be seeking to use the pandemic as an opportunity to expand their professional privileges. At the same time there is also evidence that some governments have found that pandemic offers an opportunity to make more sweeping changes to how professionals are regulated.

This paper explores regulatory changes during the pandemic in several Canadian provinces, with an eye to what is being changed, who is driving change, and how the pandemic informs the changes being made. While some regulatory changes impacting scope of practice may not have long-lasting impacts, professionals taking advantage of opportunities the pandemic has offered may be able to emerge post-pandemic with more influence than before. At the same time, regulatory change made by governments pursuing a political agenda that is hostile to professions may completely alter the regulatory landscape for professions in some regions. Implications for theorizing profession-state relations and regulatory change will be discussed.

Will Social Work Use The COVID Momentum To Enhance Itself As A Profession?

Tetyana Semigina

Academy of Labour, Social Relations and Tourism, Ukraine

Social work through its existence undergoes critical debates on its professional status. Numerous concepts of social work mission and core values, key stages of professionalization, categorizations of social work as 'a professional project' co-exist in epistemic communities' discourse. The COVID pandemic exposed the weakening of social cohesion in societies, greater demand for social services and thus is an apposite moment to explore the current state of social work. This study – based on desk review and personal professional reflections – aims to discuss the ongoing challenges and future development of social work as a global profession.

In 2014, the revised global definition of social work was adopted by global professional organisations. It states that 'principles of social justice, human rights, collective responsibility and respect for diversities are central to social work'. The transnational vision of the profession stressed a collective approach that works to dismantle the structural roots of social problems. At the same time in many countries, advocative roles turning social workers into agents of social changes coincide with remedial, statutory and social control roles (associated with a helping, 'semi-professional' status of social work). The Corona crisis reinforces erosion of social solidarity and strengthes the tension between (1) expectations of more controlling functions and better care in times of lockdowns; and (2) the professional autonomy of social work in advocating for more equal and socially interconnected society.

The comprehensive reflections of social work principles might be pivotal to enhance an autonomous form of profession and to deepen self-understanding of a professional mandate. The revitalisation of the enabling nature of social work activities for re-shaping the future has to be considered.

727

How Has The Pandemic Affected Teleassitance Professionals? A Comparative Approach Across Public Services.

Amado Alarcón, Joanna Andraszak

Universitat Rovira i Virgili, Spain

Massive restriction, slowdown or suspension of certain activities in the public sector resulted in consequences for everyone, both service users and public service employees. And as everywhere - there are entities that do very well, as well as those that face greater difficulties. Everywhere where "dealing with the matter" requires direct contact and presence (e.g. social services, healthcare, education, emergency services, etc.), disruptions in functioning must have occurred. However, the so far slowly developing provision of public services by electronic means has become much more dynamic as a result of the pandemic; therefore, we can expect their significant development in the future. These issues will be further developed based on detailed analysis of in-depth interviews with public servants providing telephone assistance in order to compare two perspectives. On one hand, we want to understand how remote work and teleassistance have changed during the Covid-19 pandemic for those professionals who already worked in this mode. On the other hand, we want to know how people who have never telecommuted and had worked only face-to-face, managed to work through the phone and how did it affect their work. The paper aims at investigating how the pandemic affected certain work areas, such as work performance, organizational commitment, job satisfaction, irritation and burnout as a consequence of the emergency situation, etc. The paper will discuss a direct effect of the current situation on a certain change in the area of the telephone assistance.

Resolving Prior Issues In A Crisis Context: Interpreting Innovations Among Regulated Professions

Jean-Luc Bédard[1], Julien Prud'homme[2]

[1]Université TÉLUQ, Canada; [2]UQTR (Université du Québec à Trois-Rivières)

Our presentation uses results from an ongoing study looking at how regulated professions in Quebec and Canada reacted to the pandemic since March 2020. We collected data through a web raking technique, forming three datasets: parliamentary debates, online media, and publications from various regulating bodies. As expected, reactions were most prevalent among health sectors, but also from law and science (notably, lawyers, notaries and engineers' regulating bodies).

Content analysis shows how results need to be interpreted with a historical and ecological perspective (Abbott, 1988). This is mostly apparent with medical doctors' case, through recent relations with other health professions. Other cases also point to the pandemic as an opportunity allowing long-standing issues to be resolved, leading to new scopes of practices and collaborations among other health professions. Recent developments among regulated professions and their oversight suggest a turning point, shown by recent legislative innovations towards reforming modes and governance of regulation, through bill adoptions in Quebec, and the Cayton report for British Columbia (2019), spurring discussions across Canada. Such new modes of regulation could halt (at least in the short term) an ever-increasing number of regulating bodies and could play a structuring role among smaller, unregulated professions who, for years, have been advocating for admission among regulated professions.

The pandemic context has facilitated evolution in various regulating issues, such as initial and continuous training requirements, admission of foreign-trained professionals, professional acts allowed, and acceleration of already existing claims of expertise. The crisis has allowed for an exchange between powerful and less powerful professions.

RN19_T01_02 | Changes in Careers and Education

Changing Recruitments of the University Professors - Unintentional Consequences to the Academic Profession?

Taru Siekkinen[1], Elias Pekkola[2]

[1]University of Jyväskylä, Finland; [2]University of Tampere, Finland

Universities' human resource management (HRM) practices have changed to be more strategic as universities have been influenced by New Public Management (NPM) and managerialism, and as they are pursuing to become "complete organisations"; more rational, autonomous and "real" employers. With this development, they have come closer to the private sector organisations and their practices. Many European universities have implemented a tenure track -career model, which is based on cyclic evaluations of the academic performance. The meritocratic practices can enhance equality goals of organisations. However, they include problems, as they can be "good for some but bad for many", creating an academic elite. As traditionally, in professorial recruitments, research and teaching merits were both evaluated and emphasised. In tenure tracks, mainly research merits are significant with the evaluation of the "potential". It has been questioned, whether the "potential" can be evaluated with an objective manner at all. In addition, the new tenure track recruitments have transformed the professorial recruitments and evaluations already to be conducted already in a phase of an early career (assistant professor). These issues might have consequences to the equality on academic careers, because these changes have benefit men and international candidates in the tenure track recruitments, as the project from the Finnish universities showed (Pekkola et al. 2020). The changes in the professorial recruitments of universities can have unintentional consequences on the future of the academic profession and its diversity.

Career and Profession. A Theoretical and Methodological Approach to an Intraprofessional Field.

Paul Stefan Mikael Bengtsson

Linneaus University, Sweden

Societal reforms and the development within the Swedish public sector have reframed the prerequisites for social workers, and other professionals, and changed the area of work practice. This occupational group has also expanded by numbers since late 90´s, which could mean increased differentiation between subgroups and new incentives for career mobility. For example, work possibilities in organizational administration and private sector seem more common among social workers under new condition, even if the individual response is unclear. Moreover, organizational and occupational professionalism has developed as distinct forms.

Changes in the work area and differentiation affect both occupational careers and the profession, but also the work force and competence supply of organizations. Times of political and social change accentuate a need to develop theoretical and methodological ways to explore a profession's development and intra-professional organizing by the dynamics between careers, profession and organizations.

In this paper and with reference to my dissertation, I will discuss the career concept as a conceptual lens to explore and analyze the interplay between external and internal forces in a profession´s development and intra-professional organizing through the dynamic between careers, profession and organizations. To make use of this lens, I included three degree cohorts of social workers in a survey study, as conditions vary with time-bound contexts, and broke up the professional group by functions. The results show significance of societal changes and inner organizing with eight positions in a bipartite status hierarchical order, when positions were analyzed by factors at different levels. Upward mobility to the organization- and profession-oriented side respectively strengthens the order. The study shows that the model could be developed and applied to other professions and contexts.

Continuities and Changes in Legal Training: a Study of Professionalization of Law Teaching in São Paulo.

Jessica Ronconi

Federal University of São Paulo, Brazil

Throughout Brazilian history, legal training has enjoyed a preeminent position in both higher education and bureaucratic fields. Nowadays, although legal training still reproduces a system in which teachers hold other legal-related occupations (such as lawyers, judges, prosecutors, public defenders, etc.), the professionalization of higher education compelled Law teachers to invest in further academic titles, internationalization, and scientific research.

In this context, a new figure emerges in Brazilian legal education: that of the exclusively academic professor. Whereas legal education was previously practiced exclusively by Law professionals, and the dispute over the definition of legal excellence took place between the "traditional jurists" (with professional heredity), and the "critics of the law" (newcomers who owe their social ascension to school investments). Today, the exclusively academic professor appears as a new agent in this dispute, creating tension between an established professional pole and an emerging academic pole in legal training. This study analyzes ongoing transformations along with the reproduction of traditional features by observing coexisting patterns of teaching career in law. For that, we take into consideration the recommendations of the Ministry of Education and the Brazilian Bar Association - which attests to the quality of law courses - and current trends in global higher education, such as academic expansion, the demand for higher qualifications, and the promotion of diversity and international mobility. In terms of methodology, we look at some of the most renowned Law schools in São Paulo in order to study their curriculum and the academic trajectory of their teachers.

Flexibilisation of Dual Vocational Education and Training? The Role of Occupational Associations and their Occupational Identity

Sonja Engelage, Carmen Baumeler

Swiss Federal Institute for Vocational Education and Training, Switzerland

Context: Dual VET systems are praised for their proximity to the labour market because of the involvement of economic stakeholders. However, they have recurrently been attributed to a lack of flexibility when requirements in the labour market change rapidly. When the 2002 VET reform was implemented, the aim was to reduce the number of occupations in Switzerland by merging similar occupations into occupational fields or dissolving individual occupations. However, little is known about the actual establishment of occupational fields.

Approach: Based on a qualitative case study (Patton 2005), we conduct an in-depth analysis adressing the research question: How did the piano makers' association, as one of the first occupations that needed to merge, deal with the flexibilisation of their occupation? Since Switzerland attempted to merge occupations more than a decade ago, we investigate such a process in retrospect using method triangulation, expert interviews and document analysis.

Findings: We contribute to the understanding of VET flexibilization, detail processes and identify opportunities and challenges. Here, we pay special attention to the institutional work (Lawrence and Suddaby 2006; Lawrence, Suddaby and Leca 2009; 2011; Lawrence, Suddaby and Zilber 2013) of the affected occupational association and identify the importance of preserving its collective occupational identity. Regulatory changes disrupted the piano makers' occupation, but they reinstitutionalised it as part of the musical instrument makers' occupational field. More than a decade later, the piano makers are reintroducing their former occupational title, which is deeply connected to their occupational identity.

Conclusion: The results indicate that VET reforms cannot be decided purely based on pedagogical-conceptual considerations. Rather, it is a question of taking into account the governance structure of the respective VET system.

RN19_T02 | Protection and Connectivity

Adapted Agency: How Connective Police Professionals Rework their Professional Capabilities

Teun Meurs[1], Mirko Noordegraaf[2]

[1]Dutch Police Academy, Netherlands, The Netherlands; [2]Utrecht University School of Governance, The Netherlands

In contemporary professional practices, professionals deal with complex issues, stakeholders and publics . So-called 'protective' notions of professionalism no longer seem sufficient and are being reconfigured into new, more 'connective' forms (cf. Noordegraaf, 2020). The practical nature of this reconfiguration is often highlighted through the conceptual lenses of 'identity work' (e.g. McGivern et al., 2013) and 'institutional work' (Greenwood, 2011). But professionals will also have to work on their abilities to act, when they rework professionalism. They will have to work on their ways of working, standards and routines, on their repertoires. On the basis of an extensive action-oriented research project aimed at understanding the rise of connective police professionalism in the Dutch police (Meurs, 2021), we analyze how police professionals work on their ways of working, or more specifically: How do police professionals construe 'connective repertoires', whilst working? We introduce the term agency work to capture this. We focus on the field of policing, as this field experiences a transition from 'craft' to 'science' (e.g., Willis, 2013). We have studied the work practices of higher educated police professionals. We conclude that they cannot simply apply a body of scientific police knowledge to practice. Rather, they gradually try to develop certain capabilities (situational, analytical and normative capabilities) to combine different forms of professional knowledge in real-life situations. Our research shows this takes place within a broader professionalization project aimed at reworking identities and institutional arrangements. At the end, we argue these conclusions might have broader relevance. Other professional fields are also searching for 'adapted agency' in order to work towards more connective forms of professionalism.

Moving Closer to the Citizens or Simply Maintaining Professionalism in Daily Collaboration with Others? – The Case of the Swedish Police.

Bertil Rolandsson

University of Gothenburg, Sweden

Recent research identifies how new forms of professionalism dependent on wider environments of others emerges in the public sector. These studies focus on teams or projects designed to facilitate collaboration across occupational boundaries. Findings in these studies frequently describe how public professionals encounter negotiations with increasing numbers of collaborators demanding their ability to tackle an increasing 'coordinative complexity'. This analysis adds to this research by investigating the type of responsive professionalism that emerge in local collaboration across organizational boundaries introduced into police officers daily work practices by the Swedish police reform. By introducing cross-organizational collaboration with other local actors that may enable the police to move their services "closer to the citizens", the reform explicitly set out to tackle the flipsides of NPM-reforms. In this context, this study examine how the police officers conceptualize themselves as agents aware of how to maintain professionalism in daily collaboration with others. The empirical material comprise semi-structured interviews with 39 police officers, and the analysis draw on the work of Noordegraaf (2020) and Anteby et al. (2016). The findings show how the police officers critically reflect on the implications of the reform, but also how they transform themselves and their occupational awareness, while navigating normative concerns involving both the citizens and organizational constrains. Keywords: responsive professionalism, public reforms, the police, occupational awareness, post-NPM

731

How Is The Child's Right To Family-Life Conditioned in Child Protection Services (CPS): A Preliminary Theoretical Framework For Dissecting The Structure Of Discretion in CPS.

Simen Mørstad Johansen

OsloMet, Norway

The importance of the family for the protection and development of children is essential for understanding the UN Convention on the Rights of the Child (CRC). Children carry a catalog of human rights that lay claim upon cosmopolitan citizenship; the right to family-life is central to how such a catalog of rights works in practice. However, the implementation and enforcement of rights are dependent on nation-states: from legal framework through social policies implemented on street-level where social workers deal with children and their families presumably in a professional sound manner. In the last decade, European CPS has witnessed legal and normative conflicts over what a principle rights-norm of family life contains. Yet, little is known about how CPS and their caseworkers' professional judgments are informed and are supposed to be informed by the right to family-life. Research finds huge variation within and between countries as to how child protection professionals assess equal cases, suggesting that the national application of the fundamental right to family-life could be a relevant explanatory factor. Therefore, to inform a discussion on what the right to family-life should entail from a cosmopolitan perspective there is a need for a better understanding of how the right to family-life is interpreted and weighed in decision-making structures across different socio-cultural contexts. Building upon the work of Dworkin, Lipsky, Goodin, and Molander the poster will present a synthesized preliminary theoretical framework addressing how the right to family-life is incorporated in the discretional structure of CPS and its area of decisional autonomy.

RN19_T03 | Sustainability and Diversity

How Diversity Managers And Sustainability Experts Shape Our Future

Raimund Hasse, Hannah Mormann

University of Lucerne, Switzerland

Equal opportunities and sustainability are major social challenges of our time. In this contribution, we reflect on the role of organizational experts, such as diversity and sustainability managers, in addressing and co-creating a more diverse and sustainable future. We are interested in the emergence of related professions and in differences from traditional professions who initially claimed a mandate for societal concerns (e.g., legal security in the case of lawyers, health concerns in the case of physicians, and knowledge provision or truth in the case of scientists). We show that many of these new professions primarily advocate for organizational interests. At the same time, however, references to the societal value of individuality are a characteristic feature of these organizational professions. Against this background, we are interested in the societal effects and implications of the organizational management of social challenges. We focus, in a first step, on the significance of individuality in contemporary society and show that individuality is a basic frame of reference for many new organizational professions. Secondly, we show that the enactment of this value by organizational experts has the potential to transform it into procedural variables: individuality becomes individualization. Finally, possible research questions and study designs are considered that focus on societal effects of professional knowledge, creating a fruitful link between sociology of profession and the sociology of organizations.

732

Working Towards an Inclusive Future for STEM Professions: Systemic Challenges and Anti-change Agents, Findings from the STEM Equals Project

Jessica Gagnon, Marco Reggiani

University of Strathclyde, United Kingdom

This presentation explores findings from the first phase of the STEM Equals project, particularly the role of systemic challenges and anti-change agents as barriers for creating inclusive futures for STEM professions.

STEM professionals play a vital role in responding to global challenges, such as those created by the pandemic or by climate change. Studies have shown that increased diversity and inclusion in the workforce has a positive impact on innovation and economic growth (Hofstra et al. 2020).

Funded by EPSRC, STEM Equals is a four-year, mixed-methods, multi-disciplinary project focused on working cultures, including systemic inequalities faced by women and LGBT+ people in STEM. The data includes interviews and focus groups with and reflective writing from 82 women and LGBT+ academic staff and PhD students in STEM. The data has been thematically analysed and is theoretically framed by intersectionality theory (Crenshaw, 1989), taking a critical approach to understand working cultures in STEM as conceptualised by Metcalf, Russell, and Hill (2018).

In addition to systemic inequalities and normative expectations about the profession, the data reveals the ways internalised stereotypes contribute to some individuals within marginalised groups serving as anti-change agents against their own interests, reifying and maintaining status quos within STEM professions.

We will conclude with two visual models developed through the findings: the Slippery Slope to Discrimination, which signifies the dynamics of exclusionary working cultures, and the Path to Inclusion, highlighting the need for a multi-faceted approach to addressing inequalities across organisations in order to fully embed inclusive practices in STEM.

Bridging Social Distance in Times of Superdiversity: Professional Boundary Work in Home Care

Monique Kremer

University of Amsterdam, Netherlands, The

Home care workers, who not only have different backgrounds themselves, are increasingly working in the frontline of the superdiverse society (2007; Meisner and Vertovec 2015). Home care workers, often considered as 'semi-professionals' do the care work in the private sphere of people, their homes. How do care professionals get along in contexts where almost everyone comes from elsewhere and they themselves have various backgrounds too?

This paper will show that home care workers in super diverse societies are doing two types of boundary work. Firstly, they try to bridge social boundaries, not only based on ethnicity but also on class, as care giving is built on trust and getting closer (Lamont & Molnár 2002). Secondly, they try to maintain professional boundaries, also by distancing themselves. This paper, which will contribute to theories of boundary work, will also show there is sometimes a trade-off between these two types of boundary work.

The paper is based on over 100 hours of shadowing home care workers in a big city in The Netherlands, 4 focus groups and 36 interviews with home care clients of various backgrounds.

733

RN19_T04 | Legitimation and Responsibility

Going off Course? Framing Legitimate and Illegitimate Action in Swedish Climate Institutions.

Benedict E. Singleton[1], Gunnhildur Lily Magnusdottir[2]

[1]University of Gothenburg, Sweden; [2]Malmö University, Sweden

Climate institutions such as government agencies are important sites for climate change action. However, the type of action available to any institution will relate to the historical experiences of the institution and those embedded within it. Thus, institutions may exhibit path-dependency, based on previous experiences, such as gender-blindness. This may make the inclusion of gender and other climate relevant social factors appear less appropriate in comparison to technical and economic solutions. This has direct consequences for the types of climate action undertaken and how climate change is framed, thus often as a scientific, technical problem rather than a societal problem with intersectional dimensions. This paper focuses upon four climate institutions; the Swedish Environmental Protection Agency, the Swedish Energy Agency, the Swedish Transport Administration and Vinnova, Sweden's innovation agency. Based on interview data, it explores how civil servants frame possibilities for institutional action and changes in climate policy-making. It highlights that respondents would alternatively see change resulting from government direction and from self-generated civil servant action. Respondents often asserted that their identities as civil meant they should aspire to remain apolitical and serve the will of the democratically elected government. Drawing on an intersectionality-inspired feminist institutionalism and organisational studies literature, we suggest several ways for civil servants to take action without damaging their institutional legitimacy. This will increase the possibility of increased intersectional understanding and recognition of climate relevant social differences in climate policy-making.

The Linking of Professional and Civic Responsibility of the Risk Society

Magdaléna Stovickova Jantulova

Charles University, Czech Republic

At a time of pandemic covid 19, which has brought uncertainty and new risks to society, not only professionals but also volunteers are becoming important actors in the field of social care. The first studies map a significant increase in the number of volunteers (both formal and informal) in the field of social work . Our research focuses on the question, what do we learn about helping professions in times of crisis and insecurity from volunteers who work with them? What are the advantages and, conversely, the limits of professional work (in helping professions) in times of crisis? Data was produced through narrative and informal interviews with volunteers who engaged in social service activities during the pandemic alongside professionals. One of the key topic - addressed by the volunteers -was the possibilities and limits of linking professional and civic responsibility. This topic will be discussed in the paper on the basis of empirical data and with reference to the theoretical literature.

734

The Responsibility of Being an Architect. Rules of Access to Practice

Cristian Pop

Babes-Bolyai University, Cluj-Napoca, Romania

Much of the current international literature and research on professions follow two streams of topics: the professional regulation and the challenges of the organizational life for professionals. Adding empirical evidence to the existing research, my analysis follows the professionalization trajectory of young architects in Romania in the last decade, in the aftermath of the 2008 Global Economic Crisis. The research is based on 138 questionnaires and 22 interviews with young professionals that apply for a permit to practice architecture, issued by The Romanian Order of Architects. To enter the profession as an independent architect a candidate must pass a formal interview after a period of at least two years of internship in a public or private company. The results show that interns of prestigious companies and from cities with universities of architecture are more likely to obtain their permits than

interns in less known companies or from other types of cities. The prestige, as such, is not the self-reported cause candidates give for passing the exam, but the organizational skills the candidate acquires in the well-connected companies and from the more prestigious faculties. Moreover, in relation with the organizational life, they feel well prepared for the technical part of the job, but not with the non-technical one that requires soft skills, and these are not evenly distributed. For example, obtaining building permits means navigating through a highly regulated building market, therefore organizational skills are needed, and these are difficult to obtain if the intern comes from a poorly connected business and a less prestigious faculty.

Designing Future during Social Changes: Urban Professionals and City Planning Ideas after State Socialism

Natalia Otrishchenko

Center for Urban History of East Central Europe, Ukraine

Urban planning is one of the venues for designing the future. It sets up priorities, proposes a toolbox of tactics, and includes a certain inherent vision of what should be achieved. It is also a field for negotiations and conflicts, when different actors and institutions started to combat over a power to make a claim and implement it as policies. Urban planning gives the image of the future either fixed and stable or constantly reevaluated.

With an emphasis on specific professional milieu my research traces the legacies of Soviet urban planning imaginations and institutional settings – the ones existed during decades and still observed in the present-day Ukraine. It also outlines the alternative visions developed under the state socialism and beyond, which were mobilized by different actors after 1990s. Based on twenty in-depth biographic interviews with Lviv architects and planners I am going to discuss the continuances and ruptures in the imaginary related to urban future during decades after the collapse of the USSR.

My arguments contribute to the debates about the sources of stability during times of social changes, locations (both in space and time) for discussing the future, repertoires of actions, which could be mobilized in order to strengthen positions within the field. They emphasize that in any social context urban planning faces uncertainty; therefore, urban planners have developed a number of strategies in order to navigate through it.

Finally, I will reflect on the challenges connected to the use of biographic interviews as a primarily method.

RN19_T05 | Purpose, Jurisdiction and Accountability

Beyond Mono-professional Jurisdiction? Revisiting the Concept of Epistemic Communities.

Christiane Schnell

Institute for Social Research at the Goethe-University Frankfurt, Germany

During the last decades we observed a structural transformation of professional work, which concerned the sociological debate quite a lot. New concepts of welfare state regulation are most often hold responsible for these changes. Otherwise, societal problems and crises to solve by professions might have altered, too. Therefore, the idea of a mono-professional jurisdiction is questioned quite substantially: Interdisciplinary tumour boards in cancer medicine, close collaboration between teachers and social pedagogues in schools, journalism and IT-specialists in online media – there are many examples for a new extend and depth of collaborative structures in contemporary professionalism. On this backdrop the concept of the epistemic community will be revisited in this paper. Empirical examples will be analysed and interpreted and reconnected to the question of professional knowledge for alternative futures.

A sociological inquiry into professions: The case of Civil Engineering in Chile

Francisco Javier Salinas

Universidad Adolfo Ibáñez, Chile

In this presentation, I do some theoretical and methodological remarks concerning sociological research about professions and share some initial results of an ongoing project about civil engineers in Chile. Essentially, I propose that we can have a better understanding of the complex and dynamic relationships between agency and structure going on inside a profession by attending to three levels of observation: (1) the biographical level accounting for the experiences of individuals who choose, live and face the certifications of a professional career; (2) the institutional sedimentation level showing the historical coupling of professions with certain institutions defining criteria and areas of disciplinary control; and (3) the socialization of expertise level exploring how individuals certified by their profession present to others in society as 'experts' and incarnate the actual status of their profession in society. I consider these three analytical levels for the case of civil engineering in Chile, a profession that is interesting because it is studied in massively attended higher education programs, is one of the highest-earning professions in the country and their practitioners hold status as successful and indispensable for both the private and public sectors. What ideological and practical elements consolidate this situation of educational anonymity and high social praise? Moreover, how do trajectories, normative codes of professionalism and social imaginaries shape the particular mode of existence of a civil engineer in Chile? What intersectional factors mediate this experience? The idea of research of this kind is to provide insights and empirical evidence regarding the many tensions between expectations and reality involved in professional practice.

Climate Change and Rediscovering the Sense of Public Purpose in Architecture – the 'Social' Turn?

Melahat Sahin-Dikmen

University of Westminster, United Kingdom

This paper discusses the implications of climate change for the architectural profession. The built environment is the target of major green transition policies in the EU and the UK. 'Green' buildings call for changes in resource use, technical specifications, building materials and design practices, with fundamental consequences for architectural knowledge and practice. Drawing on an evaluation of architects' responses to climate change in the UK, the paper argues that the climate emergency has prompted a shift in the self-definitions of the profession to give greater emphasis to architecture's social role. However, the meaning of public purpose is far from uniform, ranging from technocratic interpretations to radical appraisals of the construction industry and government policies. Climate interventions proposed include: revising professional definitions of ethical practice; embedding climate change in architectural education; incorporating technical measures in design to improve the energy efficiency of buildings; and more political gestures such as refusal to work on carbon-intensive projects and calls to rebuild local authority/municipal architecture departments. Yet, these ambitions to use architectural knowledge in the interests of public good are undermined by architects' marginalisation in the building production process, a deregulated construction industry and continuing intra-professional conflicts between disparate visions of architecture, raising questions about professional autonomy, power, and the possibilities to affect social change.

736

Economic Responsibilization of the Medical Profession: A History of Office-based Accountability in Danish Healthcare

Sarah Wadmann[1], Kirstine Zinck Pedersen[2]

[1]The Danish Center for Social Science Research - VIVE;
[2]Copenhagen Business School, Department of Organization

In times of austerity, professional expertise is often mobilized by state authorities to device solutions that ultimately may alter both state and professions. Contributing to debates on the reconfiguration of professional roles against institutional reforms, this paper explores the economic responsibilization of the medical profession in the Danish welfare state. Combining a governmentality approach with a Weberian understanding of office-based virtues and duties of professionals, we investigate how medical professionals respond to and are involved in the negotiations of new forms of knowledge, regulatory limits and procedural standards in the historical expansion of the welfare state. These analytical perspectives allow us to study the relationship between state and profession without taking an assumed opposition or power struggle between professional autonomy and state regulation as our starting point. Empirically, we attend to the 1930s and 1970s as two historical 'switch points' where economic crises and social reform contributed to a renegotiation of physicians' economic responsibilities. Based on our analysis of national policy documents and debates in professional journals, we demonstrate how new duties and virtues are integrated into the role of the medical profession over time. While the medical professionals expressed some role tension, it is striking how they accepted the role as public resource custodians and adopted new calculative practices and thinking as part of their professional duties. We discuss these findings in light of contemporary challenges of healthcare rationing.

RN19_T06 | New Perspectives on Healthcare and Social Services

Care Workers' Professional Discretion And Group-based Instant Messaging: Taming The Technology Or Vice Versa?

Helena Hirvonen[1], Tammelin Mia[2], Taipale Sakari[3], Hämäläinen Antti[3]

[1]University of Eastern Finland; [2]Jyväskylä University of Applied Sciences; [3]University of Jyväskylä

This presentation is based on a study on the use of digital technologies in residential care service work in Finland. The presentation analyses group-based mobile instant messaging (IM) in residential elder care work, based on a qualitative interview study of care workers and nurses (n=25). It asks (i) how care workers use group-based messaging for work; and (ii) how they negotiate the rules for its use. Theoretically, the article draws on studies on temporalisation of work (Wajcman 2008), and the metaphors of taming and unleashing, deriving from science and technology studies (Pols 2017). The results showed group-based instant messaging was typically initiated by the employees, reporting that it allowed them to 'tame the technology' and unleash new communication practices to help carry out meta- and articulation work. However, employees were also constantly connected to their work and so reciprocally 'tamed by the technology', pointing to the disruption new technologies can cause to work-life balance and to the need to understand the temporal complexities of care work. The presentation discusses the implications of bottom-up implementation of digital tools from the point of view of care workers' professional discretion.

737

Professionalization and Competence Development in Social Services: Designing a Competence-Performance Theory to Overcome Social Inequality

Thomas Prescher[1], Nina Weimann-Sandig[2]

[1]FH Münster - University of Applied Sciences, Germany; [2]Evangelische Hochschule Dresden (ehs) University of

Applied Sciences for Social Work, Education and Nursing Since the beginning of the Corona-Pandemic, the awareness of Social Services has changed in Germany: parents caring for their smaller children because of closed childcare institutions realize the meaning of real Early Childhood Education done by professionals. People who are not able to visit elder relatives living in nursing homes have to rely on highly qualified staff. Even the growing number of online services provided by child guidance offices gives evidence to the increased meaning of Social Services. Nevertheless, Social Services have long been no central part or topic in the Sociology of Professions. Moreover they do not fit into the traditional definitions of professions. The paper wants to highlight the importance of discussing Social Services as new professions, by identifying new concepts of professionalization. At the same time it gives evidence to the fact that professionalization, defined as high professional performance based on professional competencies, is still no general standard in Social Services. On the contrary, professionals in Social Services are often not working as "reflective practitioners" but are instead reproducing Social Inequality. Therefore, the authors try to develop the need for a new competence-performance Theory, based on a praxeological approach.

Self-casting and Alter-casting: Healthcare Professionals' Boundary Work in Response to Peer Workers

Malene Lue Kessing, Margaretha Järvinen

University of Copenhagen, Denmark

Within mental health services, the recovery model has been a guiding philosophy over the past decades. This model stresses 'person-centred care' and focuses on assisting service-users to live a meaningful and hopeful life even in cases when their illness has not been cured. As part of the recovery orientation, 'peer workers' (PWs), i.e. people with lived experiences of mental illness, are increasingly employed within mental health services. In this paper, we explore how these changes within mental health services open up frontiers and set in motion boundary work and identity discussions among healthcare professionals. Empirically, the paper draws on qualitative interviews with healthcare professionals who have a PW colleague, and on observations from meetings, where the PW position is discussed. Theoretically, we combine literature on professional boundary work, theories on self-casting and alter-casting and 'othering' in human services. Analysing two sets of demarcations – those between healthcare professionals and PWs, and those between professionals and patients – we show how the recovery model leads to defensive boundary work as well as an opening up of boundaries.

738

Changes In The Attractiveness Of Helping Professions Through The Eyes Of Students

Olga Dvořáčková, Hana Konečná, Vlastimila Ptáčníková, Olga Shivairová

University of South Bohemia, Czech Republic

Introduction: Most of the countries cope with the long-term shortage of quality specialists in helping professions (i.e., health and social workers). The pandemic showed the professions in an unexpected light - as the key, first-line pandemic fighting profession. If the crisis led to the decrease of interest in this study field or the decrease of quality of the applicants, it would send the health and social systems into a critical state.
Methodology: A mixed research was started during the first pandemic wave in spring 2020, with the goal of

describing the motifs of helping profession selection and evaluating the psychological impact on the process of selection and subsequent work in the field. The data were collected in three groups according to the time of choice - before the pandemic, during the first and the second wave. The methods include a questionnaire with closed and open questions, interviews, focus groups, and unstructured essays on the theme "study, COVID, and I". Presently, we have the opinions of cca 800 students.
Results: We will present our first results. For example, we know that the students were mainly unaffected (68%) by the pandemic in the study field selection. 16% of the respondents was reassured of their choice, 8% as well after some previous doubts. Only 9% of the respondents are actually questioning their choice of field.

RN19_T07 | Re-Positioning Professionalism in Changing Societies

Professional as Political: Medical Practitioners Struggling for Their Autonomy in Russia

Anna Temkina, Daria Litvina, Anastasia Novkunskaya

European University at St.Petesburg, Russian Federation

We analyze the civic struggle of professionals with the neoliberal and paternalistic tendencies that make professional issues become political ones (in ways similar to the feminist "personal as political" agenda) in Russia. We can observe emerging initiatives or single individuals who contribute to the improvement of medical care, professional autonomy and the empowerment of both medical professionals and patients on a local level (of their ward or hospital), as their influence on healthcare at the national level is very limited. We are especially interested in the ongoing struggles of midwives and nurses for professional autonomy and in the growing status of professional associations, new educational projects, networking and online debates conducted by professionals of different profiles. We consider that nowadays, and especially in this Covidian era, the professional issues in Russia are becoming a field of

political actions, as medical practitioners are trying to influence the change in their profession

From Women's Cause To Doctors' Cause : gynaecologists opposition to the further liberalization of abortion.

Raphaël Perrin

Ecole Normale Supérieure de Paris, France

Why does the liberalization of abortion still meet resistance from french healthcare workers, when the right to access abortion in itself is widely accepted ? The 20 in-depth interviews with french gyneacologists and a quantitative research among 150 medical residents I have led bring out the gap between opinion towards abortion, and medical practice. Many french gyneacologists, though supportive of abortion right in principle, consider that abortion is « taking a live », and find ways to avoid dealing with it. Gyneacologist professional rhetoric - both in the discourse of the individuals I interviewed and in the officials' statements - put forward in a very paradoxical yet barely questioned way that refusing further liberalization is in the very interest of women, drawing on technical observations that are contradicted by scientific literature. Relying on the fieldwork I have done, I argue that this contradiction is the result of professional interest to resist liberalization, combined with concern for the fetus (even among atheists), both being hardly acceptable to express in french public debate on abortion. Women's cause as a rhetoric, therefore, became a disguise for doctors' cause and the concern for the fetus.

739

Types of Professional Behavior and Social Practices of Legal Interpreters in Contemporary Russia

Elena Maslovskaya

Sociological Institute of FCTAS RAS, Russian Federation

The paper presents the results of a study of professional activities of interpreters in the process of investigation of criminal cases involving migrants from post-Soviet states in today's Russia. The empirical research methods that have been used in the study include semi-structured interviews and non-participant observation in criminal and administrative trials in several Russian cities. Special attention is devoted to the functions of legal interpreters, their formal and informal interactions with detainees/arrestees, lawyers and investigators. The boundaries of competence of legal interpreters are blurred and depend on a broad range of factors – from legality of their status to their ability to resist pressure from the investigators and lawyers. As a result, different types of professional behavior are being practiced. A classification of types of professional behavior of legal interpreters is proposed. It has been found that the type of professional behavior adopted by an interpreter is defined first of all by his/her level of education, legal status and also social characteristics. The paper singles out the models of behavior of interpreters which depend on the size of a diaspora, the degree of ethnic solidarity and the density of social ties. Since legal interpreting is included into asymmetrical power relations within the juridical field, special attention has been devoted to revealing the strategies and tactics used by legal interpreters and jurists. It is demonstrated that the current structure of the juridical field predetermines reproduction of a homologous system of stratification of the legal interpreters' community.

Reproduction Strategies of Professional Dynasties in the Academic, Medical and Business Environment in Russian Society

Oxana Posukhova, Ludmila Klimenko, Anait Akopyan

Southern federal university, Russian Federation

In the reproduction of academic and medical dynasties, educational strategies play an important role (early introduction of the younger generation to professional knowledge, choice of an educational institution and postgraduate education, obtaining academic degrees as the institutionalization of cultural capital); social investment strategies, when dynastic micro-networks are formed, connections are accumulated, administrative resources are mobilised to support and promote family members (admission to university, graduate/doctoral studies, employment and career advancement, mentoring and partnerships in research and/or clinical activities, and etc.); strategies of symbolic investment (accumulation and transmission of dynastic capital of recognition, increased importance of the name and professional reputation of the dynasty family).

Dynastic transmission is associated with low gender sensitivity in the field of professional activity. In general, attitudes towards deconstructing the traditional gender display are more common in the female subgroup. In academic dynasties compared to medical ones, gender roles are more often egalitarised. The stereotypes that men should occupy high-status positions are more pronounced in medical and business dynasties. Women are more likely to benefit from the social capital of the dynasty in the case of academic career including medical. In the emerging business dynasties in small and medium-sized enterprises, educational strategies play a secondary role. Succession relies primarily on work experience (usually from a grassroots position) and mentoring from the older generation. The strategies of social (informal business experience and business connections) and symbolic (reputation among clients, recognition of the family brand and customer focus) investment are common in dynastic reproduction.

740

Social Effects of Professional Dynasties in Health Service

Oksana Nor-Arevyan, Alena Cherevkova

Southern Federal university, Russian Federation

Professional dynasties are widespread in health service. The study of the professional dynasties' potential, carried out by the research team of the Southern Federal University from 2018 to the present, revealed the ambivalent nature of the social effects of medical dynasties in Russia at the societal, institutional and sociocultural levels.

The constructive effects of medical dynasties include:

-the intrafamilial transmission of knowledge, skills, professional ethos;

-early professional socialization of the young generation of the dynasty, ease of learning from the standpoint of starting opportunities for gaining knowledge and experience, familiarity with the negative aspects of professional activity before it starting;

-pride in belonging to a dynasty, the formation of a positive professional identity;

-family reputation in the professional community, recognition by patients ("family brand");

-the presence of the family's social capital, which allows them to support the professional development of members through connections, patronage in employment.

However, professional dynasties in health service can also have destructive effects:

However, professional dynasties in health service can also have destructive effects:

-forced reproduction of a profession contrary to interests and professional preferences;

-pressure of the family surname;

-a barrier to the development of an administrative career in the same organization where other representatives of the dynasty work;

-social monopolization, limiting entry into the profession and making it difficult for non-dynastic members to gain access to high professional status.

At the same time, medical dynasties need to be popularized and supported not only by the family, but also by government agencies, and the described constructive social effects of professional dynasties can play an important role in solving the problem of labor shortages in the health service.

RN19_T08 | Similarities and Differences in Professionalization

Becoming A Young Farmer In The Digital Age: An Island Perspective

Ilkay Unay-Gailhard[1], Francisco Simoes[2]

[1]Leibniz Institute of Agricultural Development in Transition Economies (IAMO), Germany; [2]Unversity Institue of Lisbon, Centre for Social Research and Intervention (CIS-IUL)

This study investigates the career construction paths of young farmers and aims to contribute to the literature on the "young farmer problem". Of particular relevance is this study's focus on the potential of islands as a new career landscape in the digital age. Young farmers' subjective experiences towards careers were analyzed based on narrative interviews and quantitative surveys (N=23) and expert interviews (N=15) from two EU islands: Crete and the Azores. Firstly, study provides insights on the behavioral and cognitive dimensions of the career construction model by identifying followed career paths. Secondly, we turn our focus to the role of digital communications on career construction and, thirdly, study examines the geographical dimension of the model. We find that involvement with farming entails complex career patterns that evolve into passion. Whether their involvement follows planned or unplanned paths, protean career attitudes, desire to experiment, and a strong sense of career self-concept play significant roles in shaping the career narratives. "Experience" and "management" dimensions of online communication drive the construction of careers as a part of a professional identity mechanism. Our results reveal that the "island effect" (maintaining a part-time farming culture) plays a role in cohesive singular and multiple career self-concepts.

741

Journalism Was Like A Giant Caterpillar Consuming All My Time«: Examining Work-Life Balance And Career Paths Of Precarious Millennial Journalists

Tinca Lukan, Jožica Čehovin Zajc

University of Ljubljana, Slovenia

Journalism is a fundamental part of democracy with journalists as watchdogs playing a crucial role as the fourth estate by keeping the public informed, shaping public debate and revealing issues in the public interest. Drawing on the theories of sociology of work and boundary management, the present study examines career paths and work-life balance strategies of precariously employed millennial journalists. The longitudinal study was first conducted in 2017 with nine prominent journalists who worked back then in precarious working arrangements from seven to fourteen years in Slovenian national news media. The study was up-dated in 2020 to examine their trajectories and career paths changes. The argument made herein is that when it comes to work-life balance, work comes first. In the first years of their career, journalists accept long working hours, work-life unbalance, and inadequate working conditions. They are willing to work more for less to obtain experiences and sacrifice their free time to gain access to the desired profession. To earn a decent living, precarious journalists also need to work overtime as their payment is mainly based on quantity, not quality. Whereas in the long term, the same working conditions contribute to dissatisfaction, leading them to fight for their rights and/or leave the journalistic profession.

The Table Is My Stage: Emotional and Aesthetical Labour in Portuguese Casinos

João Gomes

Institute of Social and Political Sciences, Lisbon University, Portugal

In casinos, like in the majority of the service economy, production and consumption take place simultaneously and in the same space. As such, the labor process derives from the encounter of workers and customers subjectivities. This presentation, based on an ethnographic research, seeks to analyze the labor process of dealers in a Portuguese casino, particularly, the interactive dynamics between workers and customers. Dealers, although structurally and hierarchically subordinated, are active agents in these micro-interactions. In this way, they reject the interactive subordination that normally accompanies the structural one, employing a set of performative strategies that, symbolically and temporarily, subvert the social hierarchies. Framing their service labour as serious, sober and formal, closely related to the specific history of the profession and to the production regime that frames their activity, dealers act in a very different manner, managing momentary situations. They overstate their agency on the tables and take active involvement in the course of the game if the player concedes tips, acting, in practice, against the house, or they take refuge in their formal procedures to relieve the pressure of an angry player, acting against him. Selectively managing their aesthetical and emotional labor, dealers constitute themselves as non-subordinate agents. However, by creating dignity in subordination, virtue in necessity, these strategies tend to produce consent not emancipation.

742

The Public Relations Profession In Russian Context: Special Knowledge, Ethical And Technological Challenges

Roman Abramov

National Reserach University Higher School of Economics, Russian Federation

My presentation will be about the professional project (M.Larson) of the Public Relations in the Russia from 1991 to nowadays. I will pay special attention ways of the professionalization on the influence of deep economical, political and cultural changes in my country after the USSR collapse. Between 1991 and 1996 private agencies for the provision of PR advertising, marketing and business communications services are being created and are becoming active. In general, by 2008, the «industry segment» of the PR influence industry in the political and commercial sector was well established - major corporate players began to define the professional and market space of this part of the influence industry.

The owners of these companies were also actively present in the educational field and contributed to the institutionalization of the community through the development of a system of professional competitions and awards, the organization of professional associations and unions, and publications in professional media. The challenge to the existing professionalism and structure of the leaders of the region came from the other side: the 2005-2015 laid the foundations of the media and information revolution that took place in the following years – Facebook to Youtube and Twitter. In the same year, the first mass social network Odnoklassniki opened in Russia. At the end of 2006, the social network Vkontakte is created, which has become the most massive social network in the Russian segment of the Internet. Social tools in Russia became real PR tools and advertisements only after 2010-11 but the very creation and growth of popularity among users took place several years earlier.

Plant Sociologists in the USSR. A Dead-end Branch of Professionalization?

Elena N. Rassolova[1], Konstantin Galkin[2]

[1]Kazan Federal University, Russian Federation; [2]Sociological Institute of RAS, a Branch of the Federal Center of Theoretical and Applied Sociology of the Russian Academy of Sciences; Russian Federation

Using a specific example of the work of the sociological service of the Kama Automobile Plant, the report examines in a historical perspective the role of the profession of a plant sociologist in the context of personnel management at a plant and the development of the profession of a sociologist at a plant in Soviet times and the lack of a profession of a plant sociologist in modern Russia.

The main methods are semi-structured interviews and work with history materials, the activities of the sociological service, as well as an analysis of the current state of the personnel management department of the Kama Automobile Plant. In the course of the analysis, we have shown that the role of a plant sociologist is the professionalization of two directions at once - an academic and research worker and a specialist in human resources management, which during the Soviet Union allowed plant sociologists to manage and influence the policy of a plant using social engineering methods, and also by conducting sociological research to increase the motivation of employees of the enterprise.

The lack of professionalization and development of plant sociologists in Russia creates, first of all, a deficit associated with the opportunity to study employee motivations and analyze the specifics of the work of enterprises using both research and management components. The report will also consider the prospects for the professionalization of plant sociologists in Russia and their role in the activities of modern enterprises.

On the Sensuality of Making Music in String Ensembles - A Videographic Research

Theresa Vollmer

TU Berlin, Germany

In my current research, I am investigating how classically trained musicians in string ensembles make and experience music together. The focus is on analysing the situational joint music making, which is investigated with the help of videography. Within the framework of this investigation, methods of micro- or 'nano-' sociology as well as autoethnography (my own cello ensemble is part of the sampling) are systematically placed in connection with analyses of the institutional and organisational orders of the research field. In this way, central aspects such as training and the knowledge of the musicians are systematically brought into view, so that the research is not limited to situational music-making, but enables an integrated perspective of micro- and macro-levels.

A particularly relevant phenomenon of the research that emerges is the sensuality, of the musical sounds produced. It not only fundamentally shapes the situational coordination and synchronisation of the musicians' interaction (1). They also experience the produced sounds in different sensual ways. Some of the sounds they can not only hear, but also feel in their own bodies (2). Finally, the subjective perception of the musical sounds produced is also linked to the training and knowledge of the musicians (3).

This paper will present and discuss the dimensions of sensuality of making music together in string ensembles by presenting exemplary video analyses. In this context, the potential of videography will be discussed not only to focus on 'micro-sociological' interactions, but also to address 'macro-sociological' phenomena. In this way, the paper will also open a horizon for discussing the connection between the methodology of videography and the congress theme "Sociological Knowledges for Alternative Futures".

Street Violence In Online Video Data: Function And Alignment Of Bodies With Multiple Contexts

Ulrike T. Kissmann, Christine Krauskopf

University of Kassel, Germany

Hermeneutic video analysis of interactions is a method originally developed on the basis of Wilhelm Dilthey and Hans-Georg Soeffner that pays particular attention to thought experiments. The paper shows that Merleau-Ponty's "fungierende or latent intentionality" (Merleau-Ponty 1964/1968: 244) makes it possible to go beyond the classical concept of intentionality. As flesh – that of self and that of the world – constitutes an anonymous and pre-personal tissue, an individual subject's intentional act is no longer considered. Instead, an intentionality is established that refers to bodies and things in the context of functioning. With fungierende or latent intentionality, the body is perceived in its function and alignment with the world. This already occurs at a pre-reflexive and pre-verbal level. It is argued that fleshly intentionality is of particular importance for group violence where actors react to each other's bodily behavior. In contrast to current video analyses of conflicts and violent situations that follow Randall Collins' "Violence. A Micro-Sociological Theory" (2008), the inclusion of fleshly meaning also covers behavioral expressions that are not initiated as a result of the specific interaction but have their origin in the past history of the subject. Not all behavioral reactions in a particular situation can be explained by the situation. In contrast to Randall Collins' work, flesh also opens up contexts from the past. In a final step, the article illustrates how the methodological considerations can be put into practice by way of example.

Collins, Randall (2008): Violence. A Micro-Sociological Theory. Princeton: Princeton University Press.

Merleau-Ponty, Maurice (1964/1968): The Visible and the Invisible. Edited by Claude Lefort and translated by Alphonso Lingis. Evanston: Northwestern University Press.

Filmmaking as Method: Exploring Creative Possibilities for Studying Performance, Race, Gender and Sexual Orientation in the Queer-of-Color Space of the Ballroom Scene

Muriel Bruttin

University of Lausanne, Switzerland

In this paper, I explore the following question: how can filmmaking be used as a creative method to study embodied issues of performance, race, gender and sexual orientation within ethnographic research? In order to address this question, I consider the opportunities and constraints offered by the three phases of filmmaking (pre-production, production, and postproduction) in the specific context of my ethnographic research on the Ballroom scene in Switzerland. In particular, I explore how planning the production of a film requires a somewhat different process compared to planning ethngoraphic research, while at the same time being innextricably interconnected with it. I explore some of the differences and similarities between semi-structured qualitative audio interviews and interviews filmed for a documentary film, especially looking at the differences in the ways one can set up the conversation and the differences in the types of responses which one tries to elicit from interviewees. I also consider what creative visual forms of representation and creative performances film can allow for and which ethnographic fieldwork and ethnograhpic fieldnotes might not. Finally, I explore how the process of editing a film is a form of analysis that brings out different findings compared to more classic methods of data analysis. I explore these questions of filmmaking as methods in the context of research on the space of the Ballroom scene. By "Ballroom scene," I make reference to the underground black and latinx LGBTQ+ scene created in NYC around the 1970s, which includes performance forms such as voguing and runway (this is not the ballroom scene of foxtrot or salsa). My ethnographic fieldwork focuses on the small and recently emerging Ballroom scene in Switzerland.

Voices of the silent City. A visual and qualitative research in Rome.

Marina Ciampi1, Anna Maria Paola Toti2, Tito Marci3

1Sapienza - University of Rome, Italy; 2Sapienza - University of Rome, Italy; 3Sapienza - University of Rome, Italy

This paper aims to present the results of a qualitative and visual research carried out during the epidemiological emergency, when the lockdown, governed by institutional decrees, imposed measures to contain the COVID-19 pandemic at the national level. The investigation documents the social, economic, and urban paralysis in the urban context of Rome and it was conducted through video-photographic exploration of the places of public and social life in the city of Rome and through qualitative interviews with privileged witnesses from different fields (institutional, religious, welfare, cultural, educational, commercial, etc.). The field exploration represented a privileged moment of observation and analysis, building on the methods of visual research. The study analyzes the main categories that emerged from observation in the field: de-humanized urban spaces; the altered perception of security in desertified spaces; the emphasized visibility of the devices of protection and social distancing; the hegemony of the new "actors of urban space" (outsiders, runners, carriers etc.); the de-functionalization of public spaces; the emphasized monumentality of the city.

The analysis of the visual content was combined with that of the interviews, making it possible to draw a balance of phase 1 of the lockdown, in its managerial and organizational aspects, in the innovative and creative choices that were inspired by the emergency and in forecasts of the future. The investigation was completed by the realization of a sociological documentary, supported by the participation of Franco Ferrarotti and identifiable as a "sociology with images": an audiovisual product resulting from the double gaze of the sociologist and the photographer, simultaneously close and distant, a prerequisite of an authentic "participatory objectification".

745

RN20_T01_02 | Critically Engaged Methodologies

Indigenous Research (IR) And Scholarly Conundrums.

Anne Ryen

University of Agder, Norway

According to Appadurai the key issue of globalization was "the tension between cultural homogenization and cultural heterogenization". It also made Mazzarella argue that "it opened a conceptual space that encouraged critically minded anthropologists to move beyond an earlier fixation on cultural imperialism contra the resilience of local cultural worlds". I argue that contemporary IR appears hesitant to this move and that this rather calls for exploring into practices of boundary maintenance and category-work by their appeals to imagined boundaries of inclusion and exclusion. Max Weber`s term "corporate groups" works to describe IR and their revitalisation of decent based indigeneity by presenting themselves as "one person" with a joint history despite internally differentiated. This makes contemporary politics of indigeneity and their surrender to celebration incompatible with critically oriented research. In this paper I argue for replacing celebration with empirically grounded research. I will do so by exploring into theorisations about development, the traditional/modern and the ontology intricacies. To do so, I will illustrate by ethnographic studies on plastic boys in Kenya, and the human/non-human in rituals. Such studies uncover both emergent forms of belonging and complex tensions as well as the non-universal of western distinctions. This knowledge offers more viable pathways in respect of alternative ways of being and living.

Objective and Inclusive Research? The Incorporation of Critical Methodologies for the Improvement of Social Policy Research

Maria Luce Sijpenhof, Leen Sterckx

The Netherlands Institute for Social Research

The Netherlands Institute for Social Research is an independent institute that conducts research for government policy and aims to improve society through scientific knowledge. To do so, the institute has a responsibility to conduct inclusive research and to accurately portray citizens' perspectives. Researchers' objectivity is of key importance throughout the research process. However, social justice movements (e.g. BLM) and critical paradigms (e.g. critical race theory, decolonial theory) demonstrate that dominant assumptions of objectivity and neutrality should be challenged. In this paper, we address if and how critical methodologies can be incorporated to improve research in the institute. The purpose of the study is thus to reflect on the ways in which methodologies help create alternative futures through inclusive research in relation to race and ethnicity and in effect counter bias in policymaking. Using a critical approach, this theoretical study includes a literature review and a discursive analysis of internal documents (e.g. protocols, designs, conducted research). The preliminary results show that the institute's use of seemingly neutral description, is insufficient for racially and ethnically inclusive research and that there is room for improvement. Improvement requires the use of critical methodologies by researchers to (self-)reflect on their scientific views, assumptions, biases, (normative) concepts and positioning, to incorporate counter-narratives of those with experiential knowledge, and to use tailored (participatory) methods: ways to counter the idea that there is an objective, universal human experience. Based on the results additional research will be conducted to find how these results can be operationalized and structurally embedded.

746

Participatory Research Meets Citizen Science: A New Discourse for an Engaged Social Science Perspective

Stefan Thomas, David Scheller

University of Applied Science, Germany

The paper aims to contribute to the debate on participatory research by exploring new methodological perspectives that are brought up and discussed by citizen science. Citizen science has previously been conducted primarily in the natural sciences. An integration into social sciences is still in its infancy. Citizen science initiated a few decades ago a renegotiation of the relationship between science and technology on the one hand, and society and the public on the other hand (Irwin, 1995). 'The main purpose of most citizen science projects is for volunteers to make a contribution to a scientific endeavour' (Straub, 2016, § 1). Concepts such as citizen engagement, open science, democratization of science, social impact have become relevant. While citizen science is more about doing science together with citizens, participatory research is more about doing research with co-researchers. Citizen social science brings both strands together: citizen science addresses the enthusiasm in being involved in open science projects, participatory research initiate projects with co-researchers which have a direct research interest in those topics that are highly relevant for their social life. In the paper, we want to discuss contributions from both sides— participatory methods and citizen science— that converge in a 'participatory citizen social science'. This could enlarge our understanding of an engaged involvement of citizens as co-researchers and of different forms of social impact as a result of research.

RN20_T02_01 | Ethnography of Communities and Organizations

A Total Welcome: Processes of Socialization in South African Student Residences

Niklaus Reichle[1], Florian Elliker[1], Soldaat Leza[2]

[1]Institute of Sociology, University of St. Gallen, Switzerland; [2]Stellenbosch University, South Africa

Student residences in South Africa have a history of being strongly bounded groups that are managed autonomously by students. Particularly male student residences value notions such as brotherhood and unity and foster the development of lifelong bonds and friendship networks. Being notoriously off-limits to outsiders, these fraternity-like residences shroud themselves in mystery and pride themselves in being portrayed as rather secretive organizations in the mass media and popular fiction.

Drawing on ethnographic observations and in-depth interviews with male students in two major, historically Afrikaans-speaking universities in South Africa, conducted in 2020, we study from the inside how the students maintain and reproduce these communities and how they are affected and 'changed' by spending an extended period of time in these closely bounded groups. An analysis of these processes and the corresponding dynamics benefits from understanding this type of student residences as reinventive institutions, places to which individuals retreat for periods of intense self-reflection, education, enrichment, or reform. (Scott 2010) We demonstrate how students reinvent their selves as they undergo a process of resocialization in settings characterized by both coercion and voluntary actions. While student residences as communities can be understood as reinventive institutions in which students to some extent voluntarily participate, they exhibit features such as the introductory phase during the first year that are characterized by a high degree of peer pressure and informal coercion, re-sembling what Goffman has described as total institutions (Goffman 1961). We demonstrate how this intense introductory phase – ranging from a few days to several weeks and

747

historically shaped by initiation rituals – lays the fundament for membership in the residence community as well as for later friendship networks.

Cultural Precarity and the Anxieties of Transformation: An Ethnographic Exploration of the Challenge of Integrating Male Student Residences in South African Universities

Florian Elliker[1,2,3], Niklaus Reichle[1], Abraham Joubert[2]

[1]University of St.Gallen, Switzerland; [2]University of the Free State, South Africa; [3]Stellenbosch University, South Africa

Why do people resist and withdraw from ethnic integration? Current social research mainly theorizes this as ethnic or racial homophily manifest in individual acts and institutional structures. Based on two ethnographic case studies of how white students experience ethnic diversity in student residences, we describe that a perception and avoidance of 'cultural precariousness' motivates much of the resistance against and withdrawal from ethnic integration. In this paper, we develop the notion of 'cultural precariousness' (and 'cultural precarity') and describe the associated action strategies to avoid the experience thereof. We conceive of cultural precariousness and precarity as uncertainties related to enacting cultural practices, including the exposure to others who control the relevant social setting in terms of defining acceptable and appreciated practices. The setting in which we empirically study cultural precariousness is additionally characterized by different forms of economic precarity: by family histories of chronic economic precarity of many students from low-income groups and by an increasing economic precarity of students from historically privileged groups. When in situated numerical minority positions, these students perceive cultural precariousness and act thereupon in similar yet different ways. The residences are situated in a social context of historically constituted racial inequalities that is characterized by a slow and partial levelling of the playing field. The paper thus contributes to the study of the situation of the 'previously privileged' and their process of becoming a minority. In terms of ethnography as research approach, we discuss the challenges of studying local contexts 'pars-pro-toto' to describe and analyse social phenomena that are relevant beyond the context under study.

Interviewing Ex-mafias Members. Methodological Challenges And Opportunities

Ombretta Ingrascì

University of Milan, Italy

The Mafia is a research field that for its inner characteristics, including secrecy, illegality and dangerousness, cannot be directly 'observed'. For this reason a valuable and indispensable techniques to study it are in-depth interviews with ex-mafia members.
On the ground of a lengthy research activity based on in-depth interviews with criminals who turned state's evidence (Ingrascì O., Gender and Organized Crime in Italy. Women's Agency in Italian Mafias, IB Tauris, London, forthcoming in April 2021), the paper will address the main methodological challenges and opportunities posed by this kind of sources. On the one hand, it will deal with - and show how to face - the logistical and relational difficulties posed by meeting subjects, who are under state protection programmes and show a traumatic life experience. On the other hand, it will emphasise the epistemological advantages of oral sources in understanding the Mafia, stressing in particular that they allow researchers to move from a criminological outlook, focussed on criminal modus operandi, to a sociological perspective, able to explore also the socio-cultural dimension of the phenomenon.
The paper will offer a chance of discussing merits and limitations of interviews, starting from a specific field of enquiry. Thus, it intends to bring an innovative contribution on reflecting upon one of the most (ab)used techniques of research in social sciences. Mention will be made also to the recent challenges posed by the mobility restrictions, established by anti-pandemic measures, that have compelled researchers to shift to online interviews.

748

RN20_T02_02 | Qualitative Research and Collaboration

Discussions on the Fieldwork Experiences with the Disadvantageous Groups based on Convict Narratives

Meral Timurturkan[1], Gonul Demez[2], Damla Tanal Tata[r2]

[1]Burdur Mehmet Akif Ersoy University, Turkey; [2]Akdeniz University, Turkey

This study is based on the discussion of the field experience and data analysis stages of a qualitative research project which was conducted with individuals who are substance users and convicted of a crime. This research project is numbered as 21K151 and titled as Socio-Cultural, Economic and Spatial Dynamics of Substance Abuse in Convict Narratives supported by TÜBİTAK (The Scientific and Technological Research Council of Turkey). The focus of this study is to analyze the experience of conviction by concentrating on observation and interview notes. This study, which also includes the notes of the social scientists in the field, is based on in-depth face to face interviews and group interviews in relation to the research topic. Based on this experience, it is possible to say that coming together with the disadvantageous groups during the field research involves a process that makes researchers question their own positions. In conclusion, starting from this qualitative study example conducted with the substance users convicts that can be defined as a disadvantageous group, positioning of the researchers themselves in the field, researcher-participant interaction and data collection and evaluation stages are discussed methodically.

Ethnography Of Relationship: A Qualitative Approach For Research On Youth At The Margins

Ingmar Zalewski

University of Kassel, Germany

Although the researcher-participant-relationship is at the core of long standing debates on the ethnographic method, seldom it is made a major investigation itself. In my project on unaccompanied Syrian refugee youth, ethnography not only allowed me to gain insights from an insider's point of view, but the research-relationship turned out to be of interest in its own right – and eventually became the actual phenomena of the ethnographic study. I decided for a highly engaging fieldwork incorporating ethics based on reciprocity, accountability and virtues of care. This way – and within four years time – the relationships between Syrian refugee youth and myself moved on from acquaintances to more complex forms of friendships in a safe, continuous and trustworthy setting. Researching these relationships as they developed shortly after their arrival in Germany in 2016 lasting up to today, touches upon an ethical issue surrounding the ethnographic method ever since. That is the still debated question of how to do research "about the other" in appropriate and responsible ways.
Set against this backdrop, I will present the methodology for an ethnography of relationship that I have developed in a long-term fieldwork as part of my PhD-project. I will show why it is appropriate – specifically in the case of research on youth at the margins.

749

Sociology Meets Art: Discovering Collaborative Poetics Approach

Ance Kristāla

Latvian Academy of Culture, Latvia

Nowadays traditional qualitative research methods can be seen as limiting, reducing subjective experiences to generalized themes and categories, especially, when dealing with deeply personal experiences as discrimination. In opposition, art is a medium, channeling individual's most innate and intimate thoughts and emotions. Therefore, art, more specifically poetry, can be

seen not only as an aesthetic and intellectual expression, but also as a source of sociological knowledge. This assumption underpins arts-based research approach.

The research elaborates application of collaborative poetics approach in discrimination studies, based on Johnson's (2018) model. It combines the principles of collaborative research and poetry approach. Collaborative research is interdisciplinary and ensures horizontal collaboration between the researcher and the study participants. In pursuit of individual and social change, the main emphasis is on the mutual transfer of knowledge and skills. In the poetic approach, poetry is used as a tool for data collection, analysis and dissemination. Poetry helps to emphasize an individual's emotional and social experience, illuminating new perspectives and hidden narratives.

The research focuses on identifying various aspects of discrimination and privilege as a social experience and reflection of it in poetry by research participants - young Latvian poets. In a course of four months they followed assignments, given by the researcher, and created poems about discrimination based on sexuality, social status, ethnicity and mental health. The reflection of these experiences in poetry allowed to broaden the boundaries of sociological analysis, highlighting invisible contemporary phenomena. Thus emphasizing the importance of interdisciplinarity between art and sociology in future research.

Johnson, H. X.-R.-A. (2018). A Rose by Any Other Name? Developing a Method of Collaborative Poetics. Qualitative Research in Psychology

RN20_T03_01 | Ethnographic Reflexivity and Identity

Observing the Observers: Doing Reflexivity in a Team Ethnography on Italian Psychiatric Wards

Valeria Quaglia

University of Milan Bicocca, Italy

Reflexivity is widely recognized to be a crucial element in ethnographic research: it allows to establish the degree of certainty of inferential procedures and, by scrutinizing the empirical conditions under which empirical material is produced, it allows to increase the robustness of results. Although it is usually perceived to be an individual activity, a team ethnography research requires both individual and group reflexivity, as well as a dialogue among those two levels. Drawing upon the author's own experience as an "ethnographer of the team" during two years of an (ongoing) ethnographic research, this paper aims to discuss the role of reflexivity in the specific context of a team ethnography that involved an interdisciplinary group of scholars (sociologists, psychiatrists, and jurists) and consisted of a quantitative and a qualitative part; the latter, on which this paper focuses, was conducted by four ethnographers, and aimed to explore coercive practices and involuntary admission and treatment in six acute psychiatric wards in Piedmont (Italy). The author, who held a non-fieldwork role, has accompanied the team of ethnographers throughout the journey of the research: she attended all the meetings almost from the very beginning and participated at all group discussions, taking notes and "observing" the interpretive process in its making and fostered the production of a collective reflexive account through discussion and back talk, that constituted her "fieldwork". The reflexive practices adopted in this innovative research experience will thus be discussed with the purpose of contributing to the advancement of qualitative methods.

750

Doing Team Ethnography Dialectically. Challenging the Lone Ranger Approach in the Study of Acute Psychiatric Care

Luigi Gariglio, Mario Cardano, Raffaella Ferrero Camoletto, Eleonora Rossero

Università di Torino, Italy

The paper illustrates the pro and cons of designing and conducting a team-ethnography by reconsidering critically a three-year experience of a team-ethnography in six Italian psychiatric wards. This presentation highlights a few key characteristics of this approach that challenge solo ethnographies. Four sociologists did the team-ethnography inside the psychiatric units doing participant observation, in-depth interviews and documentary analysis; yet, larger interdisciplinary research - a group including law scholars, psychiatrists, and nurses – have dialogued monthly about ongoing issues and interpretations. The research was designed in three main parts: i) the ethnographic selection of cases which occurred by doing 25 "quick ethnographies"

adopting the criteria of the most different system's design; ii) the "team-ethnography" in which each member of the team was working (alone or with one colleague) concurrently in her or his own field. Therefore, all team members had "the big picture"; iii) the ethnography of the ethnography in which a fifth sociologist not involved in the psychiatric field did participant observation at all the monthly meetings of the ethnographic team and of the larger interdisciplinary research group.

The paper will tackle in particular the role of subjectivity and intersubjectivity as well as reflexivity in the construction of plausible results and the ethical issues that imbued this experience.

The Unmirrored Field: Doing Ethnographic Research In Prison

Serena Franchi

University of Florence, Italy

The paper discusses the epistemological assumptions and operational strategies of undergoing ethnographical research in the prison system. The main objective of the paper is presenting the results of a fieldwork in an Italian prison, which took place over the course of five months (May 2019 - November 2019). The research aim was to understand how a prison works by observing the practices of correctional officers, and if they act applying preconceptions on gender roles reproducing specific forms of social control through gendered practices, and how merit informs them. Thus, given these questions, the ethnographical methods perfectly fitted to the purpose of actually seeing such practices. Nevertheless, approaching the field as a white woman in her early thirties with an academic background and past (and present) experience on prison system within no profit associations and local institutions, had a repercussion on the interactions with the persons under study (correctional officers) and influenced the way we approached each other and behaved in the setting I researched on. Consistently, the paper aims at identifying and discussing the subjective and normative choices that guided the research and related methodological issues, presenting the coping strategies developed during the fieldwork.

RN20_T03_02 | Validity and Comparison

Contemporary Cross-language Research in Social Sciences: Theory vs. Practice

Katarzyna Sepielak, Dawid Wladyka, William Yaworsky

The University of Texas Rio Grande Valley, United States of America

In the contemporary world, very few societies can be considered linguistically homogenous. Thus, scholars who conduct fieldwork—even in their native countries—are de facto involved in cross-language research. Still, only some explicitly acknowledge methodological challenges and implications of the issues related to language and translation in their research process. To explore how researchers handle cross-language research, we conducted the largest-to-date survey on the subject and analyzed 913 responses from faculty from 94 sociology and 85 anthropology programs in the United States listed among the 1000 highest ranked universities worldwide by the QS World University Rankings. In this paper, we explore researchers' linguistic proficiency and extent of collaboration with translators, their perspectives on the importance of vernacular's knowledge, and their opinions on the admissibility of translators and liability of using English during the fieldwork. We compare experiences of scholars who used interpreters with those that did not, additionally contrasting the perspectives of anthropologists and sociologists.

Process and Outcomes Of A Member Checking Procedure Conducted In A Qualitative Project Studying Urban Health Inequalities

Ignacio de Loyola González-Salgado[1], Jesús Rivera-Navarro[1], Marta Gutiérrez-Sastre[1], Paloma Conde[2], Manuel Franco[2]

[1]Sociology and Communication Department, University of Salamanca, Salamanca, Spain; [2]Public Health and Epidemiology Research Group, School of Medicine, University of Alcalá, Alcalá de Henares, Madrid, Spain

Lincoln & Guba described credibility as the extent to which the research findings are accurately interpreted by researchers. They defined member checking as an optimal technique to appraise credibility of qualitative research findings. In the qualitative case study (type 2) where this research is included, health inequalities were studied based on four dimensions (diet, physical activity, alcohol consumption and smoking). The aim of this study was to share the process and outcomes of conducting a member checking procedure to validate findings from a large qualitative study.

Researchers selected three neighbourhoods with different socioeconomic status (low, medium and high). 37 semi-structured interviews and 29 focus groups were conducted across all three neighbourhoods. Study findings were presented to participants in member checking sessions (one per neighbourhood), which were conducted when the fieldwork was finished.

Participation in the member checking sessions was slightly fewer than that expected by researchers (especially in the low and the medium-SES neighbourhoods considering the number of study participants). As preliminary findings researchers highlighted that member checking procedures is useful to validating perceptions (i.e., participants felt represented in the findings), although also contributed to perpetuating differences in power relationships between researchers and participants. Participants from the medium-SES became aware of neighbourhood issues and expressed the need to change their reality (transformational validity). Social cohesion was enhanced in participants from the low-SES neighbourhood as they were able to talk about common issues from their neighbourhood in a neutral space. Finally, considering results from the high-SES neighbourhood we added to our findings that residents were using urban vegetable gardens.

RN20_T04 | Biographies and Narratives

Multi-stage Interview in the Biographical Research Approach

Carlo De Rose, Francesca Falcone, Antonio Sama

Universita' della Calabria, Italy

The interview is well appreciated by researchers working on people's attitudes and individual life cycles. This method, in most of its uses, consists of a single conversation, which length and depth depend on a series of factors, including the quality of the interaction between interviewer and interviewee. It is not unusual for the interviewer to realise that the ideas and the attitudes of the interviewee may deserved further in-depth analysis that the single interview did not allow. This paper pays attention to the so-called long interview and to the advantages gained from breaking up the interview in more sessions (such a solution is already adopted in the life stories).Moving from the theoretical assumptions of the biographical narrative interview, the paper intends exploring the implications of a non-conventional model of interview that is based on a strategy of various stimuli and that aims at overcoming the usual framework "question-and-answer" in favour of a more involving "show-and-tell". Using a long interview paced on more than one session is also useful in varying the perspective of the narrative as a new session is held. The single sessions of the interview should not be intended as episodes of one single narrative (like in the life stories), rather as opportunities for introducing new questions and new stimuli; allowing new interpretation to the diverse situations to emerge, the ex post re-elaboration of experiences, ideal and reality checks, emotional states and processes of rationalising, the time modulation of past, present and (potential) future the interviewees do.

752

"How could I be responsible?" A Narrative Study of Homicide Perpetrators

Martín Hernán Di Marco[1], Henrik Schwarze[2]

[1]CONICET/IIGG Buenos Aires University, Argentina; [2]Georg-August-University Göttingen, Germany

Academic literature on homicide has a long tradition of focusing on socio-demographic and crimino-logical data of both perpetrators and victims. Critical hermeneutic studies have stressed the need to link homicide trends with in-depth knowledge of perpetrators and their social contexts. Howev-er, little attention has been paid to emic interpretations of homicide itself. In the context of two research projects on life stories of young men who have committed intentional homicide in Buenos Aires City (Argentina) and its outskirts, the objective of this paper is to analyse the accounts given by the perpetrators about their homicides.

The main interest in this paper is to reconstruct the stories (or explanatory narratives) used by male perpetrators of homicide and, furthermore, to identify the symbolic resources employed to ration-alise the event. We frame our analysis in two main questions: which elements are used by male perpetrators to explain male-male homicides? How do they position themselves (and the main characters of their stories) in relation to the event and, more generally, violence?

A hermeneutic biographical approach was employed, conducting open-ended interviews, which were carried out in prisons. For this paper, 20 cases (62 interviews) were reconstructed and ana-lysed using an inter-testimonial approach. We identify two dimensions (locus of explanation and notions of agency) to typify eight different narratives.

RN20_T05 | Digital and Visual Research

A Visual Semiotic Approach for Unravelling the Social Representations of Alternative Proteins Online

Claudia Laviolette, Laurence Godin

Laval University, Canada

Meat consumption is a major contributor to greenhouse gas emissions and, in an effort to slow down climate change, appeals to reduce its consumption are getting more and more insistent. To address this challenge, a myriad of actors have proposed solutions to increase the share of alternative proteins in our diets, pushing forward already existing foods – such as pulses or tofu – or prioritizing social innovation, such as cellular agriculture and in vitro meat. In Western societies, reducing meat consumption is a highly controversial issue and the object of heated debates. Each of the products put forward to reduce meat consumption tends to be surrounded by moral discourses that pertain to our lifestyles, our shared values, or what type of food is considered good and bad. This communication will focus on the ways by which qualitative approach, digital ethnography, and visual methodologies may help investigate the social representations surrounding alternatives to meat along with the conflicting meanings they carry, their moral content, and the actors involved in the process. More specifically, the communication will focus on one particular approach, namely visual social semiotics, which we will use to emphasise how visual meaning systems are constructed and perpetuated online, via social interactions. Through concrete examples of the ways by which digital images, and indeed many types of visual artefacts, can be analysed by utilising a visual social semiotics approach, we will explore the meaning of different products to understand what they say about our societies, and what the way forward should be.

753

Digitizing Life At Home: Using The Internet-Of-Things And Mobile Applications In Qualitative Research

Alex van der Zeeuw, Alexander van Deursen, Giedo Jansen

University of Twente, Netherlands, The

The internet-of-things (IoT), where everyday devices become connected to the internet, has digitized our most seemingly mundane everyday lives at home. We followed 30 IoT households for 15-months with five rounds of interviews and two novel types of data to study the digitized home and its digital technologies. First, data enabled by IoT technology itself through logged button-press events of the everyday interactions with digital devices, either physically, digitally, or by algorithmic intervention. This data is used to illustrate the factual and precise ethnographies of household practices. Secondly, we combine IoT data with a newly developed diary-app to measure metaphorical parameters of social distance and social warmth for household members and their IoT devices. By utilizing the drag & drop features of a touchscreen, we asked participants to chart pictograms of people and devices in their household figurations for six months. We found that charting socio-sensical dimensions of distance and warmth utilizes a linguistic simplicity that induces confidence while participating. Using a device they already use daily is less demanding in a practical sense, push-notifications make it easier to remember, and metadata automatically registers additional information. Participants found using an app intuitive to use, but technical- or operator errors radically break any sense of intuition. The combined data helped us to cluster participants based on their phenomenological experiences that are otherwise hidden from interview data alone. Moreover, it gives us qualitative access to digital realities otherwise overlooked.

Live Blogging And Legal Trials: An Exploration Of The Ethnographic Challenges And Solutions Faced During A Pandemic

Lisa Flower

Lund University, Sweden

Live blogging from legal trials has become one of the most accessible ways in which the public can gain direct insight into legal proceedings. Whilst live blogging constitutes an important way of ensuring open justice – a key component of many democratic societies – how this immediate and detailed surveillance impacts on the legal professionals being depicted is currently unknown. This paper looks at how to qualitatively study this new phenomenon and depicts the challenges ethnographic studies can encounter during a pandemic as well as presenting possible solutions.

Qualitative Social Science Illustrated: Reflections on art/science cooperation in sociology

754

Heta Tarkkala[1], Annerose Böhrer[2,] Marie-Kristin Döbler[2]

[1]University of Helsinki, Finland; [2]Friedrich-Alexander-Universität Erlangen-Nürnberg, Germany

There are multiple ways science and images, figures, and illustrations are entangled. First, scientific results are often presented in tables, diagrams and figures in both natural and social sciences. As a historical example, the botanical or bird illustrations from the preceding centuries are familiar to many. Second, images can be powerful tools in science communication, as we have seen, for example, in the case of the spikey figure of Corona-virus that circulates widely in the media and has become familiar to the lay public. Third, drawings and illustrations are often utilized as part of the research data and methodology. For example, researchers can ask their informants to produce drawings, photographs or footage to be analyzed, or scientists produce such visual data themselves.

There is also a fourth way how visual data can be produced and utilized in social science research: collaboration with illustrator. In our project that aims to analyse contexts of masking during Covid-19 pandemic in Finland and Germany, we explore alternative formats of gaining and presenting scientific results by using visual arts. In order to present our findings visually and to gain impacts from illustrations, we collaborate with the visual artist already during the analytical process.

In this presentation, we will present and discuss our collaboration with visual artist. Our aim is to contextualize this kind of collaboration in the landscape of scientific representations and illustrations. Then, we are going to discuss the interplay of the analysis and visualisations. Last, we are going to highlight the potential this kind of collaboration offers for social sciences and for alternative formats of writing and presenting scientific data.

RN20_T06 | Digital Interviewing and Narratives

Game Changer Covid19? – Insights From Doing Qualitative Interviews Online

Lisa Waldenburger, Jeffrey Wimmer

University of Augsburg

While the on-going digitalization of life-worlds may raise new questions in terms of epistemology and research strategies, it seems somewhat misguided to ignore the proven track record of established qualitative methods. The digital is not juxtaposed with the analogue. Instead, 'digital' and 'analogue' praxis are intertwined in the life-worlds of individuals – like checking your bank account when waiting for the bus. It is a truism that traditional qualitative research with its foundations in intimacy, openness and trust might not be the right methodological choice for every research interest. Nonetheless, one should not underestimate the insights, which can for example be gained through interviewing people about their everyday use of technology (via different media) qualitatively.

As we are all aware, the Corona pandemic has severely limited the possibilities of face-to-face interactions and has therefore made qualitative interviews more challenging. And yet, amongst all the drawbacks it does

present some new possibilities for methodological progress. Social distancing, the shift towards home office and the extensive use of technical equipment has made video calling a viable and accepted form of communication for a lot of people. We have taken this as an opportunity to transfer a panel study to the digital realm. Since November 2020 we have conducted several qualitative interviews and group discussions via video calling, as part of a multi-layered panel study on digital stress. Going beyond the viewpoint "digital is cheaper, analogue is more insightful", we want to critically systematize our methodological insights regarding online data collection and interpretation, contrast them with a more traditional face-to-face setting and put our findings up for discussion.

Join With(out) Video: Online Interviewing During COVID-19

Mukaddes Uzbay Ülgen[1], Cansu Okan[2]

[1]Ankara University, Turkey; [2]Ankara University, Turkey

Discussions on the benefits and drawbacks of online interviewing began long before the COVID-19. Yet, since the pandemic conditions excessively obstructed the predominant traditional (face-to-face) interviewing, the adoption of relatively marginal online tools may have accelerated and deemed inevitable due to the possibility of future long-term "social distancing" practices. In such a time when the digitalization of qualitative methods might appear as a simpler solution, have interviewers moved their research to digital platforms or searched for ways to carry out face-to-face interviews? Do they plan on carrying out online interviews after the pandemic? Do researchers think online interviewing affects their research in any way? Deriving from such an inquiry, this study aims to gain insights into the personal, interpersonal, and structural dynamics of online interviewing during COVID-19.

Based on the online in-depth interviews carried out with 15 graduate students, academics, or researchers in the area of sociology who have used – or are still using – online interviewing methods in their research during COVID-19, this study discusses whether technical skills (of both interviewers and interviewees), spatial distance, lack of spatial control, limitations of sampling and consent issues in online interviewing have impacts on the content and/or outcomes of their research. Hence, the main question in this study is not only whether cam-to-cam can substitute for, or replace, face-to-face interviewing, but more importantly, whether online interviewing affects the processes of sociological knowledge production.

755

Narrative in Digital Contexts: a New Methodological Challenge?

Maria Carmela Catone[1], Paolo Diana[2]

[1]University of Barcelona, Spain; [2]University of Salerno, Italy

The development of the Web have opened up new channels, environments and ways through which individuals express the narratives of their everyday lives by textualizing and visualizing it (for example, writing status updates, commenting, liking content and posting photos). In other words, people often use the digital spaces and tools to build their identities and the social dimension of the Self through sharing experiences, opinions, symbolic artefacts, relationships and activities. This multifaceted configuration gives rise to the need to investigate the narratives underpinning the digital environments and, at the same time, is opening up new issues and changes in narrative approaches that have different peculiarities from those traditionally recognized in the methodological literature. In this presentation, after having carried out a theoretical overview of the role of narrative in contemporary digital society, we will present the main methodological challenges on the use of the narrative approach in digital contexts such as: the characteristics of the platforms that shape the social contexts in which the actors act and structure the process of building the empirical material, the nature of the data which weave together images, texts and videos, the role of the social actor as a "device" capable of producing different types of information as metadata, the value of interpretation of new digital semantic units.

WhatsApp? Opportunities and Challenges in the Use of a Messaging App as a Qualitative Research Tool

Rocio Bueno-Roldan[1], Antje Röder[2]

[1]Philipps-Marburg Universität in co-tutelle with Universitat de Barcelona; [2]Philipps-Marburg Universität

On this paper we aim to evaluate the use of the popular VoIP WhatsApp as a way to conduct qualitative research interviews within geographically dispersed samples. Through the use of a case study of Latino expat-wives around the globe, we exemplify how we manage adapt traditional methods of qualitative data collection while establishing rapport. Our findings suggest WhatsApp to be a valuable tool for conducting qualitative research with specific advantages over other similar applications (apps). By portraying the interviewer as a peer, especially among groups who already use the App on daily basis (such as Latinos); in addition to WhatsApp's flexibility and informality, and the portability of mobile phones, the App endured a service that went beyond a regular face to face interview allowing quasi-ethnographic insights. What on one hand seamed a gain, hastily arose new issues on veracity, non-verbal cues and on-line ethics which are also reflected here.

RN20_T07 | Qualitative Methods in analogue and Digital Worlds

Assessing The Quality Of Qualitative Online Research: A Review Of Current Quality Criteria

Marlene Schuster[1], Melanie Hense[1], Julia Stranz[l1,2]

1FH Wiener Neustadt, Austria; 2Universität Wien, Austria

The transformation to the online context under the COVID-19 pandemic strengthens the academic debate about standards of online research work. Qualitative research in the online context is not a new phenomenon but is expected to increase since shutdowns limit traditional fieldwork of qualitative researchers. Hence, the aim of the present study is to identify whether new quality criteria should be developed or whether existing ones are transferable from the offline to the online context. The study is based on a systematic literature analysis of English and German academic publications found in the data bases Springer-Link, Ebsco, Science Direct, Emerald Insight and Google Scholar between the years 2000 and 2020. Initial results confirm the assumption that the discussion about new standards for qualitative online research is limited and slowly growing. Furthermore, this review figures out that some criteria such as the documentation of the research process have the same relevance for both offline and online contexts. More difficult to realise in an online context is the exchange about research results and interpretation in the group. Moreover, the criteria closeness to the subject is limited due to social distancing; likewise, social distancing restricts the triangulation of methods as, e.g., the (participant) observation is not possible. The present study contributes to the academic debate on quality criteria in two ways: First, it provides an overview on different standards in the online and offline context. Second, this project highlights the possible transferability of offline criteria to the virtual context.

Exploring Challenges and Opportunities of Qualitative Methodologies in a Digital World: An Interdisciplinary Approach to the Invisible Black Community in Porto, Portugal

Lígia Ferro[1], Beatriz Lacerda[2], Lydia Matthews[3], Susan Meiselas[4]

[1]Institute of Sociology, University of Porto, Portugal; [2]Master's in Sociology, University of Porto, Portugal; [3]Curatorial Design Research Lab, Parsons School of Design/The New School, New York, USA; [4]Magnum Photos Cooperative, New York, USA

Qualitative research has been breaking disciplinary borders and building alternative futures by providing and promoting solid methodological tools to study closely and from within the social reality. Alternative ways of envisioning the future also flourish from small groups and communities. Knowing the practices, meanings and motivations of those involved in small groups is a condition to define other ways of building society. Starting from a collaborative project, promoted by Ci.CLO, between professionals acting in the fields of sociology and socially-engaged curatorial and contemporary art practices, an experimental approach was developed to map, analyze and co-create with the Black community in the city of Porto, Portugal. Drawing from the ethnographic methodology, where participant observation is key, along with techniques of exploration from documentary photography, we developed a work process involving simultaneously co-presence and at-distance research. By using digital tools while collecting, analyzing and sharing data, the team collaborated with social actors from the Black community in Porto, Portugal, a marginalized population characterized by social invisibility. The exchange between diverse disciplinary knowledges and between "various subject positions," with all participants engaging in an exploration of how to begin decolonizing the city through those tools, made possible the exploration of a hidden reality in the city of Porto. We will explore the main challenges and opportunities of applying such a methodological framework in the particular context of the Black community of Porto, hoping to feed the debate on digital technologies and their potential to overcome constraints posed in a digitalized world reconfigured by the ongoing pandemic.

Online Action As Any Action? Old-school Ethnography In Studies of Digital Crime Case Communities

David Wästerfors

Lund University, Sweden

Ethnographic inquires of digital spaces and technologies are sometimes portrayed as requiring exclusive approaches and vocabularies, since digital practices in many ways are distinct from other practices. Still there also are overlapping and highly recognizable features, which might point to the value of trying out recognizable approaches as a researcher. This presentation draws on a project on online crime discussions on the Swedish platform Flashback and aims at exploring the benefit of "old-school" elements of ethnography when investigating quite controversial and heated digital gatherings. It is argued that ideas like pursuing members' meanings, studying categories in use and bracketing one's ethical concerns can generate more vivid and original knowledge compared to approaches seemingly more congenial and receptive to the digital issues. Online crime case discussions are often studied with reference to their information-crowdsourcing or potentially penalizing functions, but such approaches can easily cloud more basic and widespread patterns. They cannot account for the more constitutive characteristic of members' mundane, messy and yet routine interactions. We may therefore be helped by not cultivating a too specialized view of digital practices, demanding special approaches and unique terms, but rather look upon them as social actions within a particular social world.

The Social Interaction of Online Gaming

Lars Fynbo, Tea T. Bengtsson

VIVE - Danish Center for Social Science Research, Denmark

What happens to social interaction when it goes online? As video gaming becomes readily available on several different platforms and the gaming industry continues to refine games with new features, young people increasingly participate in online gaming. While gaming online, gamers continue to interact with each other (using apps like discord or in-game communication facilities) thereby pushing the boundaries for social interaction. Based on online qualitative interviews with 100 young people (12-19 years), this study analyses how young people interact with each other while gaming online and discuss how online interaction complies with or disengage from social life more generally. In the analysis we consider gender roles and social positioning in relation to types of games to focus on a) how young gamers construct selves through interactions with others while gaming, b) how they construct, maintain and reconstruct social hierarchies during gaming time, and c) how the online interactions overlap with the young gamers' selves and social life outside the digital world. By applying classic and modern theories based in the tradition of symbolic interaction, the study finds that in relation to self-construction, social life and power, the differences in interactions between the physical and digital worlds are diminishing. While this development may indeed present young people with new challenges (such as the risk of developing gaming disorders), the dynamic relationship between digital and social interaction allows young people to maintain high levels of sociability – even while being "socially distant".

RN20_T08 | Mind, Understanding, Practice 758

The Power Of Phenomenology

Mel Duffy, Maria Feeney, Tanya Ní Mhuirthile

Dublin City University, Ireland

Hermeneutic phenomenology's aim is to bring forth that which needs to be thought about. It is an invitation to think. To articulate the thinking one needs to listen in the corners and the shadows of the lived experience(s) of the phenomenon being investigated. The method "embraces multi-perspectival, embodied and experiential ways of knowing" (Dibley et al. 2020: 7). This paper explores the power of hermeneutical phenomenology, as a methodological approach for understanding what it means to be intersex.
Intersex people have bodies that are born different to typical male-female ones. Intersex is an umbrella term that includes more than thirty ways the human body may differ according to its sex characteristics (i.e. genitalia, hormones, chromosomes, sex organs).
Law and policy do not benefit intersex people to the same extent that the non-intersex population benefit. Issues arise relating to: the rights of the child, bodily autonomy and integrity, and discrimination. By understanding the lived experience of being intersex, our study seeks to

contribute towards creating an alternative future for the intersex community whereby improved law and policy will ensure equal rights and protections

From interviews with intersex people, we confirm that hermeneutical phenomenology did not just answer our research questions, but also became a powerful and empowering means through which some participants were effectively able to navigate, share and 'own' their personal story. Indeed, the method's person-centred and ethical underpinnings, permitted some to engage in the research in ways that became empowering and transformational.

Researching on Trash as an Object of Multiple Locations

Anna Maria Kacperczyk

University of Lodz, Poland

In the paper, I refer to the study on the social practices of waste production, processing, and management. The substantive area of my research comprises human activities related to trash. But I am also interested in the waste itself as the material objects, which particular features, physical presence, and geographical locations substantially impact the environment. Treating the object of my study as "ultimately mobile and multiply situated" (Marcus 1995), I employ a multi-sited research approach that embraces: visual analysis, ethnography (interviews, observations), research walks, autoethnography with elements of transformative phenomenology, and analysis of extant data sources (historical documents, reports, statistics). The methodological axis of these "fuzzy fields," which provides consistency to the whole inquiry, is grounded theory. This way, I try to delineate boundaries, identify "adequate sites and informants across multiple locations" (Nadai and Maeder 2005) of trash. The theoretical foundation of my study is symbolic interactionism. I ask how concepts, ideas, and ways of thinking about waste and litter translate into particular actions and practices that ultimately produce specific patterns and effects in the natural environment. My commitment goes in the direction to show these emerging dependency systems, networks of connections that have led and still lead to the pervasiveness of trash and rubbish on the planet, to contamination of the most distant and wildest corners of the world with a mass of waste with no chance for recycling.

Thinking Of The Military From Bottom To Top: The Importance Of Micro Perspective And Subjective Observation

Dana Grosswirth Kachtan

The Open University of Israel, Israel

The aim of this paper is to examine the part of individuals in constructing, maintaining and even challenging perceptions, images, practices and processes. The paper will highlight the contribution of micro perspective by demonstrating the way social categories (for example gender and ethnicity) are constructed, preserved and perpetuated not just through institutional mechanisms, policies and structures, but also by individuals' performance. Furthermore, the paper will show how individuals' performance can challenge structures, conceptions and images.

By using qualitative methods based on interpretative phenomenological analysis of interviews with soldiers who served in the Israeli military (IDF), the paper examines the subjective point of view. Military research in general and critical military research in particular tend to focus on macro viewpoint and examine the social, economic and political processes and mechanisms, and the way they influence, construct and change the military and civil-military relationship. In recent years more and more researcher recognizes the importance of micro research and focus on the agents' performance and their subjective experience and understanding the military and civil-military relations.

By researching the military the paper will reveal the fluidity and the potential for change in mechanisms, structures and social conceptions from bottom to top in social institutions. By emphasizing the active part of agents in creating, maintaining and challenging meaning and perceptions the paper underlines the connection between micro and macro research and the importance of micro perspective analysis.

Towards Contemplative Grounded Theory. Constructing categories and the researcher's mind.

Krzysztof Tomasz Konecki

Uniwersytet Łódzki, Poland

In the paper, I concentrate on the Grounded Theory Methodology (GTM) from the point of view of the contemplative social sciences. It will analyze how the mind is engaged in the construction of concepts and the role of consciousness of the mind's work in creating a theory based on empirical data analysis. I will review the research and analytical methods that could be inspirations for GTM, starting from constructivist grounded theory and ending at the mindful inquiry and transformational phenomenology, and contemplative qualitative investigations. Then, I will use these inspirations for formulating the concept of Contemplative Grounded Theory (CGT).

We can find some seeds of contemplative thinking in many classical books from grounded theory. I want to reconstruct and develop them more and perhaps change the sense of grounded theory after the contemplative turn. The contemplative turn connects with research on experience emerging from contemplative practices that overcome the body-mind divide. I state that methodological and epistemological self-consciousness is needed in social research, but the more profound insight into the researcher's mind and relation to body and situation of embeddedness is equally essential.

RN20_T09 | Participatory Methodologies

Qualitatively Analysing Co-Creation (Mass Participatory Action) Among Youth In Five Countries.

Gerben Moerman, Sherria Ayuandini, Evelyne Baillergeau, Gerlieke Veltkamp, Rein de Sauvage Nolting, Christian Bröer

University of Amsterdam, Netherlands, The

CO-CREATE is a large project funded by the European Union's Horizon 2020 research and innovation programme as part of the response to tackle the childhood obesity epidemic. Among the plural methodologies used in this project, youth participatory action research forms the basis of this paper. Youth alliances in 5 European countries were set up and produced (policy) plans to change the obesogenic system (and through this improve healthy living among youth). In order to study the success of these alliances and the different initiatives developed, hundreds of fieldnotes, logs and alliance proposals were analysed.

Where such a large amount of data seems to suggest a choice for content analysis or even big data-like approach, the focus on the local context and dynamics of the emergence of policy ideas and youth empowerment, the ethnographic detail and the diversity of the data, demande an iterative interpretative approach. However, working in large teams such as we do in CO-CREATE, iterative approaches lead to serious collaboration issues when wanting to produce a single report and not a multitude of interpretations.

In this paper we show how we have tried to combine the flexibility and creativity of abductive interpretation of iterative approaches, but at the same time work rigorously as in more sequential approaches, such as deductive content analysis. We suggest a novel approach to combine large amounts of semi-structured data with scholarly collaboration in interpretation and personal ideographic understanding.

Reflection Labs: Digital Spaces for Researcher Reflexivity in Participatory Collaborations

Hella von Unger[1], Anna Huber[1], Angela Kühner[2], Dennis Odukoya[1], Herwig Reiter[3]

[1]Ludwig-Maximilians-University (LMU), Institute of Sociology, Munich, Germany; [2]International University of Applied Sciences (IUBH) Munich, Germany; [3]German Youth Institute (DJI), Munich, Germany

Our contribution introduces the concept and practice of reflection labs as a novel tool for participatory research. When researchers engage in participatory collaborations, a lot of learning and 'unlearning' is required. Qualitative research constitutes a valuable preparation as constructivist epistemologies imply situated knowledges, methods training sensitizes to the intricacies of interpretation and fieldwork experience involves engaging with people in their life worlds. However, as participatory research strives for equal partnerships, co-production of knowledge and empowerment processes, it comes with a new set of opportunities and challenges. Reflexivity becomes key - not only for analytical reasons, but also to address power inequalities and ethical issues. In this paper, we describe the methodological underpinnings and empirical practice of a digital space we call "reflection lab." In a three-year participatory study with refugees (EMPOW) funded by the German Research Foundation, various online and offline spaces were created for reflexivity among community and academic partners. Reflections labs are digital spaces (via zoom) for academic partners. The term "lab" (short hand for laboratory) points to the somewhat experimental nature of this space. Combining different approaches to reflexivity in creative ways, reflection labs offer a safe space to explore researcher subjectivities. Using field notes and analytical notes as a starting point, in-depth, online discussions foster critical self-reflexivity, peer feedback and support concerning the role of academic researchers in participatory collaborations. Examples illustrate how this benefits an engaged and critical research practice while pursuing participatory goals and striving for ethical conduct and accountability.

Facilitators' Experience From The Participatory Research – Reflections From Public Consultations In Poland

Aneta Krzewińska, Małgorzata Dzimińska, Izabela Warwas

University of Lodz, Poland

The H2020 project entitled CONCISE: "Communication role on perception and beliefs of EU Citizens about Science" aimed to analyze: the sources from which the inhabitants of the EU gain knowledge on scientific topics, the level of trust in the sources and the postulated ways of communicating scientific knowledge. Public consultations were conducted in five countries with 497 participants. Under the supervision of facilitators, the following topics were discussed in four rounds: climate change, vaccination, GMOs and alternative medicine. In the paper, we will focus on facilitators conducting discussions in Poland and their opinions on their own work, participants' behavior, participatory research procedure. Particular emphasis will be placed on the assessment of the rules pertaining to group discussion, elements of the consultation procedure facilitating and hindering the care of the debaters, as well as assessing the adequacy of the consultation formula used to consult on scientific topics. It is worth emphasizing that the level of implementation of the adopted rules of group discussion was high, according to the facilitators. The panelists acquired and followed the rules of conducting the discussion. The facilitators admitted that the organization of public consultations is a valuable experience and has a chance to really contribute to increasing the willingness of citizens to participate in research. All the participants of the consultations found that such meetings were the right way of examining views on the scientific topics and were generally satisfied with the results achieved.

RN20_T10 | Qualitative Research and Mixed Methods

Exploring Team Cohesion and Leadership Style Through Wearable Sensors. A Mixed Methods Approach.

Jörg Müller, Sergi Fàbregues

Universitat Oberta de Catalunya, Spain

While Big Data has become popular as a research approach in the social sciences, very few published studies clearly report this research in a mixed methods framework — a significant lack since such an approach to Big Data could provide researchers with important analytical insights into many complex social phenomena. This methodological article reports a convergent mixed methods study on team functioning in two Spanish R&D teams. In the quantitative strand, we collected Big time-stamped accelerometer data using wearable sensors, used by team members for one week, to allow us to record their forms of body movement (e.g. walking or sitting) and analyze overlapping patterns of movement. The accelerometer data provided a preliminary account of the cohesion and leadership styles of each team. However, while both precise and systematic, this data failed to provide a complete understanding of the dynamics of team functioning. To address this shortcoming, in the qualitative strand we used semi-structured interviews with team members to collect small qualitative data that would add important context — helping us more accurately interpret the accelerometer data — by examining aspects such as working conditions in the team, how group collaboration is organized, and social climate in the team. In the course of this article, we will report the following: (1) steps in integrating Big quantitative, large-scale, data (from the accelerometers) with small qualitative data (from interviews); (2) how using mixed methods allowed us to generate a holistic understanding of R&D team functioning while enhancing the ability of accelerometer data to provide a meaningful account of social interaction; (3) the challenges involved in generating meta-inferences from data of different granularity.

Integrating Multi-Causal Attribution Network Analysis In Participatory Appraisals: Methodological Opportunities And Challenges

José Javier Mañas-Navarro, Emilio Climent-Gil, Iker Jimeno, Antonio Aledo, Guadalupe Ortiz

Universidad de Alicante, España

This proposal offers a critical and constructive view of participatory methodologies, taking as a case study the participatory diagnosis of the residential tourism sector in Torrevieja (Alicante, Spain). Starting from a constructivist epistemolology, the participatory methodology that has guided this research is based on the premise that decision-making processes should be democratic and transparent. With this objective in mind, an iterative qualitative methodology has been selected, using semi-structured interviews and participatory workshops for the elaboration of Collaborative Causal Maps. This procedure has made it possible to generate a heterogeneous stakeholder matrix with 97 actors, to enrich the analytical categories and to identify the different problem areas affecting the municipality. A multi-causal attribution network analysis was carried out using Atlas.ti and Gephi software with the intention of identifying the problem network structure. The aim of this participatory methodological proposal is to incorporate the new social demands and to resolve the obstacles and difficulties that appear in participatory processes, which have been previously identified in the literature review. The main conclusion of this research finds that the methodological proposal allows to face both the pragmatic and democratic challenges of participation.

Exploring Alternative Futures through Mixed Methods Literature Reviews

Paulette Carien Flore, Suzanne Roggeveen

The Netherlands Institute for Social Research, The Netherlands

At the Netherlands Institute for Social Research we like to investigate whether we can work with prospective studies. One of the first approaches we are experimenting with is the use of systematic reviews. The use of systematic reviews, however, comes with several challenges. First, there are many different systematic reviews available which makes it difficult to choose a fitting method. Second, qualitative and quantitative studies use different designs, methods and ways to analyze data. These studies can be analyzed and presented separately, for instance by using meta-ethnography and meta-analysis sequentially, but ideally they are combined to form a single synthesis. This might, however, create difficulties when trying to mix the methods. Third, it is not always easy to extrapolate findings from the past and the present to an exploration of the future. In our paper we will address the following questions: What "flavors" of mixed methods reviews are out there? Are there any straightforward ways to mix the results of the identified studies? How can we extrapolate findings from the past and the present to an exploration of the future? In answering these questions we will discuss the upsides and downsides of different methods regarding mixed methods systematic reviews and reflect on our best practices. We will guide you through this methodological quest using one of our recent studies on the future of the Dutch labor market as an example.

RN20_T11 | Qualitative Research Ethics

Sexualized Violence Leaves Its Mark - Also on Researchers. Reflections on Research Ethics for the Protection of Researchers.

Katharina Kärgel, Frederic Vobbe

SRH University, Germany

Issues of research ethics have long been understood as an inherent part of empirical research practice (e.g., Iphofen & Tolich, 2018). They become particularly important in research projects that involve an increased risk of stress for participants. Examples include research on trauma, violence, or stressful life events. In contrast, effects that the research process can have on researchers are poorly reflected. Discussions rarely go beyond questions of the methodological-methodological relevance of such psychosocial burdens on researchers. Not least for this reason, as part of a participatory teaching research project on sexualized violence, the authors decided to focus attention on research ethical implications of psychosocial burdens on the research group together with master's students in social work. In doing so, we used autoethnography as a tool for research ethics reflexivity (von Unger, 2018). Reflective ethnographies (Ellis, 2004) and layered accounts (Ellis, 2008) revealed personal and shared stressors, including their power to affect subjective well-being as well as the research process. Ethically significant moments emerged early in the research process that transcended any form of teachable basic research ethical principles. On a psychosocial level, the research process resembled a roller coaster ride dominated by subjective anxiety and subjective feelings of being overwhelmed. This in turn raises questions of professional (personal) responsibility and duties of care as well as their limits. The direct contact with victims of sexualized violence in a participatory research setting as well as the (simultaneous) responsibility for the research group made the necessity of a research ethics discourse on questions of protection of researchers within the scientific community clear.

Qualitative Research With Social Researchers. Knowledge For Alternative Future?

Adrianna Danuta Surmiak

University of Warsaw, Poland

In recent years, the literature has seen a growing number of qualitative studies focusing on social researchers. These studies address either the difficulties and challenges faced by researchers or specific ethical and methodological issues. In both cases, the aim of these studies was to analyse the experiences and opinions of the researchers, especially in the context of sensitive topics and research with vulnerable participants. However, the authors of these studies relatively rarely explain why they conduct this type of research at all. Why do we need such studies? After all, researchers often publish their ethical and methodological reflections, why conduct research with them on this topic? The purpose of my presentation is to discuss the usefulness of knowledge from such research with researchers on ethical issues. I intend to answer the questions: can and how can such knowledge influence the future practices of researchers and/or the decisions of ethics committees? Will it make qualitative researchers behave more ethically than before? During the presentation, I will try to answer this question by considering three aspects of such knowledge: ethical, epistemological and practical. In doing so, I will refer to the literature on the subject as well as my own qualitative research with researchers on ethical-methodological issues and ethical problems experienced by researchers during research.

Strategies And Discourses On Social Research Transparency

Daniel de Gracia

Universidad Complutense de Madrid, Spain

This research identifies, upon the analysis of thirty-four in-depth interviews with social researchers, fifteen transparency strategies, Those strategies are grouped into six different types and articulate within two discourses: the open science discourse and the research backstage and archive discourse. Open science supports the possibility of reaching objective results and conclusions, placing emphasis on strategies that allow the replicability of studies. The discourse of the research backstage and archive conceives research as a subjective craft, so it prioritizes strategies that bring the reality of the research process closer together. Finally, some possible relationships between these two discourses and two other variables, the main methodology used and the main goal of transparency, are exposed.

Value vs. Risk Perception: Which Contributes More to COVID-19 Vaccine Hesitancy?

Yi-Hui Christine Huang, Qinxian Cai, Jie Sun, Yue Zhang, Yufei Li, Shu Ki Jennifer Lau

City University of Hong Kong, Hong Kong S.A.R. (China)

COVID-19 poses an unprecedented health risk worldwide. The COVID-19 vaccine is regarded as the solution to achieve herd immunity and thus eradicate this threat. Vaccine hesitancy, however, is a considerable barrier.

Past research suggested the decision about vaccination is not a mere risk issue, but a socially constructed issue. Compared to Western countries, COVID-19 vaccine hesitancy in East Asia is unique due to social and cultural traditions. In particular, East Asia's authoritarian orientation emphasizes the public's obedience to authorities. In the current study, we aimed to investigate whether the risk perception or authoritarian orientation matters more to the public's intention to get vaccinated. We surveyed 3,190 Hong Kong respondents based on the distribution of gender, age, and residence drawn from Hong Kong's 2016 population census. Preliminarily, we found that vaccination intentions varied by demographic. Moreover, authoritarian orientation showed more predictability on willingness for vaccination than on risk perception. Specifically, individuals with stronger authoritarian orientations are less willing to get vaccinated than those who perceive less risk towards COVID-19.

Faced with such a health crisis, people's authoritarian orientation could be seen as a socially constructed value that the authorities must consider when communicating with the public. Past literature mainly emphasized the importance of risk communication and how to improve the public's science literacy. However, our study indicated that considering the socio-political context is more important. Hence, developing culture- or value-based communication strategies to improve the public's

vaccination intention is suggested, which could also be a direction for future studies.

Coronavirus Pandemic Resilience and its Meaning for Everyday Student Life and Academic Success - Empirical Analyses and Organizational Deductions Based on the Student Panel of the University of Magdeburg

Nadine Syring, Sarah Berndt, Annika Felix, Philipp Pohlenz

Otto-von-Guericke-Universität Magdeburg, Germany

Due to the coronavirus pandemic, students are confronted with an unprecedented situation: studying alone from home instead of group-wise on campus. The individual implications of the new situation are addressed by the proposed paper: We will examine the relationship between coronavirus pandemic resilience and determinants of social inequality and its relevance to everyday student life and academic success. Specifically, the following questions will be addressed:
• Which student types of coronavirus pandemic resilience can be identified based on perceptions of the social and personal situation, and study-related consequences? How are these distributed across sociodemographic and personality traits, and study-related characteristics?
• To what extent is corona pandemic resilience (also controlling for determinants of social inequality), related to intra-individual changes in everyday study (integration, level of knowledge, self-efficacy, and learning attitudes) and study success (experience of competence, study satisfaction, and propensity to drop out and change)?
The findings are discussed with regard to their significance for educational equity and the organization of higher education. The data basis is the student panel of the University of Magdeburg (Germany). Students were surveyed longitudinally, firstly at the end of the summer semester 2020 on study-related aspects as well as on their perception of the coronavirus pandemic (N 1.172, response rate: 15.1%). Secondly additional data from the winter semester 2019/2020 are available for a

765

subsample (N 614). Data analysis is performed using latent class analysis and longitudinal panel data methods.

Early Days Of The Pandemic - The Role Of Economy, Globalization, Health System And Demography In The Development Of The Death Toll By COVID-19 Infections

Manuel Holz, Jochen Mayerl

Chemnitz University of Technology, Germany

This article examines cross-national differences in growth of deaths by COVID-19 over time during the time period of 31st December 2019 to 2nd April 2020. We explore socio-economic and socio-political country characteristics as determinants of deaths per day and we examine whether country characteristics act as moderating factors for different growth patterns of deaths per day over time. The country characteristics include variables about economy, globalisation, health care and demography. We examine data published by the European Center of Disease Prevention and Control (ECDC) in combination with World Bank data and webscraping approach. Using a conditional growth model specified as a multilevel regression model with deaths by COVID-19 per day as outcome variable, we show that economic variables are not significantly associated with decrease or increase of deaths by COVID-19. In contrast, variables about national health care (hospital beds and national health expenditures) mitigate the impact of the pandemic. Demography shows expected effects with an increase of growth of deaths in countries with a higher percentage of people older than 65 years. Globalisation has predicting qualities for the death toll as well: The social interaction between people is deadly on a short-term scale (in the form of tourism).

RN21_T01_02 | Measuring social class and current inequalities in European societies

Tell Me Your Class And I Tell You ... What Exactly?

Oscar Smallenbroek[1], Carlo Barone[1], Florian Rolf Hertel[2]

[1]Sciences Po, France; [2]Universität Hamburg, Germany

766

We present current methodological work on the construct validity of six different class schemes from an international perspective. Most construct validation studies usually investigate the validity of social class for one country or restrict themselves to one class scheme or one outcome. To overcome these restrictions, we compare the explanatory power of six different class schemes – two based on employment relations, two based on tasks and two disaggregated class schemes – for objective positional outcomes and measurements of political attitudes and decisions. Drawing on a wide range of international survey programmes (ESS, EVS, ISSP), we study the schemes' construct validity in 20 or more countries. To judge each scheme's explanatory power, we investigate overall goodness-of-fit (GoF) statistics and the kappa and lambda index (known from the class voting literature). While GoF statistics are informative regarding each class scheme's overall explanatory power, the two indices help to understand how well classes discriminate substantially between social groups concerning the outcomes. The main point of this work is the presentation of the statistics and its application to class as an example of a detailed construct validation analyses.

Investigating peoples' perceptions of their social class: Evidence from the 7th wave of the World Values Survey, 2017-2020

Aggeliki Yfanti[1], Catherine Michalopoulou[2]

[1]Panteion University of Social and Political Sciences, Greece; [2]Panteion University of Social and Political Sciences, Greece

In social sample survey research, socio-economic classifications have been developed for the study of social structures, social change and socio-economic inequalities, such as among others the Erikson-Goldthorpe-Portocarero (EGP) Schema and the European socio-economic classification (ESeC). Most of these classifications are hierarchical categorical schemas, using the occupation, education and income variables to define mutually exclusive categories to be treated in the analysis as social positions. However, many social researchers prefer to consider these variables "as separate dimensions relating to social stratification". In this respect, the purpose of this paper is to investigate the demographic and social "profile" of people's perceptions of their social class. The analysis is based on the 2017-2020 World Values Survey datasets for eight countries: Germany, Greece, Romania, Russian Federation, Serbia, Turkey, Ukraine and USA. The findings showed that people perceive themselves as belonging mainly to the lower middle class (Germany, Serbia, Turkey, Ukraine and USA) and working class (Greece, Romania, and Russian Federation). For all countries, statistically significant results were obtained for the following variables: marital status, level of educational attainment, employment status and income. Also, statistically significant results were obtained for age in all countries except Germany and Turkey and for gender only in the case of the USA.

Estimating Poverty in Uncertainty Times: A Tool for Monitoring the Socioeconomic Effects of the Covid-19 Pandemic

Irene Cruz-Gómez[1], Lara Navarro-Varas[1], Sergio Porcel1, Sebastià Sarasa[2]

[1]Institut d'Estudis Regionals i Metropolitans de Barcelona, Spain; [2]Universitat Pompeu Fabra

Changing macroeconomic conditions, such as those experienced under the current crisis, require timely access to information in order for policymakers to assess the fluctuations in poverty, inequality, and to monitor the impact of redistributive policies. Timely social statistics on poverty and inequality are deemed a priority by the Commission of the European Statistical System. However, official data sources on disposable income often suffer an 18-to-24-month lag, due to their dependence on tax registries. The official European data source on living conditions, EU-SILC, is affected by such lag. Other data sources are collected and published on a more regular basis, but do not offer the same amount and quality of information.

This presentation discusses a novel microdata simulation method for nowcasting disposable income at the individual, household and equivalized levels. Drawing from EU-SILC data, it re-informs employment status projecting probabilities from the LFS. Individual and household income is recalculated taking into account the main policies set by the state. The process is then iterated in a Monte Carlo simulation, generating a probabilistic distribution of income results. The method allows estimating all the key inequality indicators, such as the at-risk-of-poverty rates, the Gini Index, or the QIR, as well as the counter-factual scenario where public policies where not set into place. The method is illustrated on an example on Spanish data, but could be replicated to all EU-27 countries conducting EU-SILC and LFS. The flexibility and capacity of being periodically updated of this method is compared vis-à-vis alternative existing or developing solutions.

767

RN21_T02_01 | Quantitative methods and Applications for Studying the Covid 19 pandemic II

A Method For Assessing Fact-checking Sites

Ida Anthonj Nissen, Jessica Gabriele Walter, Marina Charquero-Ballester, Anja Bechmann

Aarhus University, Denmark

"We're not just fighting an epidemic; we're fighting an infodemic", the director-general of the WHO declared under the COVID-19 pandemic, highlighting facts instead of fear. With a gaining influence of digital media on everyday life under the pandemic, online misinformation has been a focal point for health institutions and governments alike. Despite the large number of general fact-checking tools, very little documentation exists for these tools and how they classify misinformation; leaving debunking a black boxed endeavor.

Focusing on COVID-19 related misinformation, we aim to develop a methodological approach to understand the potential result biases in fact-checking sites.

To assess our method we compare two sites in an in-depth investigation – the database of the #CoronavirusFactAlliance from the Poynter institute and the database from the Google Fact Check Explorer. The chosen sites differ regarding funding, which potentially could influence how Covid-19 misinformation is handled. Inspired by Lim's work on political fact-checking, we test the inter-rater reliability between COVID-19 misinformation sites. Additionally, we apply a new approach based on machine learning methods to test whether the sites' result on COVID-19 debunked stories are biased towards: a. platforms/sources, b. topics, c. content creators, d. active debunkers and e. types of misinformation as e.g. outlined by disinfo.eu. To contextualize the results we use a mixed-method approach, including tool documentation and interviews with administrators of the fact checking tools. This will provide us with a deeper understanding of the potential site biases that we might find.

Hence, our new method to assess fact-checking services will benefit the field by further advancing tool clarity and transparency in important initiatives by fact-checkers.

#No-mask. Refusing to be safe

Simona Gozzo1,2, Rosario D'Agata2

1AIS Associazione Italiana di Sociologia, Italy; 2Department of Political and Social Sciences, University of Catania

This study focuses on the analysis of contacts and communications on Twitter and it aims to describe the possible uses of large data-sets obtained through web scraping. In particular, we analyse the web communication by monitoring the tweets that include the word "nomask", posted from November 2020 until February 2021. The goal is to propose a three-step procedure that allows extracting only the relevant information on a large data set.

1-First of all, we carry out an in-depth study on the content of main tweets. Ten main tweets are selected for each extraction, taking as a reference the number of re-tweets in the network. The result is an in-depth analysis of the content for this sample of comments;

2-then we focus on the analysis of the relational structures. The presence of small groups and the fragmentation of communication on several specific topics indicates a lack of cohesion and therefore of community (even virtual). The centrality of large groups shows the structuring of strong arguments and the aggregation on thematic points. The analysis is conducted for each extraction, in order to evaluate how the structure of the network changes (if it changes)

3- the last proposed strategy selects the main vertices, that is the most important sources of news, weighted by means of the page-rank (a network analysis index that detects the centrality of each node by considering its weight in relation to the communication between hubs of the network).

768

What Do You Think Right Now? Surveying Psychosocial Characteristics During the Covid-19 Pandemic Using An App-based Mobile Experience Sampling Method.

Sebastian Sterl[1], Lars Gerhold[1], Hannes Restel[2], Eridy Lukau[2]

[1]Freie Universität Berlin, Germany; [2]Fraunhofer FOKUS Berlin, Germany

During the Corona pandemic, social-science research has identified considerable psychosocial effects within the German population. The methods used in these studies mainly include retrospective procedures such as online and telephone surveys. Although retrospective methods are commonly used in social science, studies demonstrate that this approach leads to response bias, particularly for psychological states.

For this reason, we developed an approach to measure psychosocial states in the moment they occur. The mobile experience sampling method (MESM) allows us to survey psychosocial outcomes in currently experienced situations (in-situ) and provides insights into the psychosocial resources being expressed in specific situations. Since the pandemic affects various dimensions of our lives, it seems necessary to measure psychosocial resources depending on different situations (e.g., during shopping or various events or while using public transportation).

Therefore, this paper presents a new methodological approach to assess psychosocial resources in different situations by using the innovative method of mobile experience sampling. In doing so, participants will be asked about both their social characteristics and psychosocial resources (e.g., risk perception) based on either time, location or event via a self-developed smartphone app.

On one hand, the results provide deeper insights into the measurement of social and psychological characteristics in specific situations related to the Corona pandemic in a more accurate way. One the other hand, they advance the development of new quantitative methods and applications for studying the Covid-19 pandemic by collecting and handling survey data in real-time, producing a complex as well as a large-N longitudinal data set. (Keywords: quantitative survey methods, Covid-19 pandemic, psychosocial resources, in-situ MESM, smartphone app)

RN21 | Quantitative Methods

Different Types of COVID-19 Misinformation Have Different Emotional Valence on Twitter

Marina Charquero-Ballester, Jessica Gabriele Walter, Ida Anthonj Nissen, Anja Bechmann

Aarhus University, Denmark

The spreading of COVID-19 misinformation on social media could have severe consequences on people's behavior. In this paper, we investigated the emotional landscape of misinformation related to the COVID-19 crisis on Twitter and whether this emotional valence differed depending on the type of misinformation. We collected 17,463,220 English tweets with 76 COVID-19 related hashtags for March 2020. Using Google Fact Check Explorer API we identified 226 unique COVID-19 false stories for March 2020. These were clustered into six types of misinformation (cures, virus, vaccine, politics, conspiracy theories, and other). Applying the 226 classifiers to the Twitter sample we identified 690,006 tweets. Instead of running the sentiment on all tweets we manually coded a random subset of 100 tweets for each classifier to increase the validity, reducing the dataset to 2,029 tweets. We found that only a minor part of the entire dataset was related to misinformation. Also, misinformation in general does not lean towards a certain emotional valence. However, looking at comparisons of emotional valences for different types of misinformation uncovered that misinformation related to 'virus' and 'conspiracy' had a more negative valence than 'cures', 'vaccine', 'politics', and 'other'. Knowing from existing studies that negative misinformation spreads faster, it demonstrates that filtering for misinformation type is fruitful and here 'virus' and 'conspiracy' should therefore be focused on when combating misinformation. As emotional contexts affect misinformation spreading, the knowledge about emotional valence for different types of misinformation will help to understand the spreading and consequences of misinformation.

769

RN21_T02_02 | Survey Modes and Response Styles

When They Work, When They Sleep, and When They Procrastinate. An Investigation of Response Times in the German Scientist Web-survey

Jens Ambrasat

German Centre for Higher Education Research and Science Studies (DZHW), Germany

Studies on response behaviour are an ongoing topic in survey methodological research. Various aspects should be taken into account in order to achieve a high response rate and thus ensure data quality. Little research has been done on the question of how a mass mailing should be scheduled in order to meet a time that is favourable for answering the questionnaire. However, in the case of web surveys the exact time when the invitation reaches the respondent can be decisive for the response rate. Data of the German scientist survey offer the possibility for a detailed analyses of the response behaviour of about 10.000 scientists. Linked sending protocols and start times of the web-survey build the basis for calculating exact response times for each (anonymized) individual. Using descriptive methods, event history analysis, and simulation, we investigate the following questions: How is participation distributed over the course of the day and the days of the week? When is it particularly worthwhile to send a mail and when is it not at all? How quickly do respondents react and when do they stop responding? How much does an "unfavourable" mail scheduling affect the aggregated response rate? And not at least, can subgroups be identified with different response behaviour? The results will be critically discussed with regard to recommendations for other studies.

Effects of Single- and Mixed-Mode Designs on Establishment Survey Participation and Costs

Benjamin Küfner[1], Joseph W. Sakshaug[1,2,3], Stefan Zins[1]

[1]Institute for Employment Research (IAB), Germany; [2]University of Mannheim; 3Ludwig-Maximilians-Universität München

The IAB-Job Vacancy Survey is a voluntary nationally-representative establishment survey that quantifies the size and structure of job vacancies and other worker flows in Germany. Since 2011, it has been carried out using a concurrent mixed-mode design, with establishments receiving paper questionnaires and the option of online completion. This mode design is facing increasing costs and declining response rates. To counteract these trends, a more pronounced push-to-web strategy offers a promising alternative. However, a change of mode design might affect nonresponse bias and data quality. To test an implementation of a mode design switch, a large-scale experiment comparing four self-administered mode designs was conducted with 155,000 establishments in the 4th quarter of 2020: Just Online, Just Paper, Sequential Mixed Mode with online invitation followed by paper questionnaire for nonrespondents, and the standard concurrent mixed-mode design. Further, we experimented with a pre-due-date reminder as an additional response enhancement measure motivating establishments to respond earlier. In this paper, we present first results of these experiments on response rates and costs.

Coverage Rate and Coverage Bias in Web Surveys in Europe

Emanuela Sala, Alessandra Gaia, Chiara Respi

University of Milano Bicocca, Italy

Drawing on the total survey error (TSE) framework, this paper analyses coverage bias in web surveys. Coverage error arises in Internet surveys that exclude the population that lacks the equipment and the skills to access the Internet but nonetheless aim to generalise results to the general population. If the internet population and the non-internet population differ in variables of interest for research purposes, then coverage bias arises. While, in Europe, Internet penetration has

770

increased over time and, especially in areas where it is still low, it may increase further over the next years, researchers have argued that, over time, the non-Internet population might become more and more different from the rest of the population, and this phenomenon might increase coverage bias. Indeed, both the literature on the "digital divide" as well as the survey methodology literature has shown marked socio-demographic differences in Internet use. Applying multilevel analysis to Eurobarometer data (2010-2018) we replicate an empirical study (Mohorko, de Leeuw, & Hox, 2013) to analyse coverage rate and bias in web surveys in Europe, and monitor its evolution over time. Specifically, we answer the following research questions: what is the Internet coverage rate? Are there socio-economic and demographic differences between individuals having access to the internet and individuals without internet access? Does coverage error in web surveys lead to coverage bias in key social indicators such as political participation, health, and organisation of leisure time? Are there differences across European Countries in the coverage rate and coverage bias in key social indicators? The implication of research findings on survey practice will be discussed.

RN21_T03_01 | Advances in quantitative methods, simulation studies and modelling techniques I

Interactive Network Graphs To Analyze Public Opinion Polls.

Modesto Escobar

Universidad de Salamanca, Spain

Network graphs have been used not only to solve topographic problems and to represent structures of social ties, but also to study the relationship between variables. Path analysis and structural equation models are well known. Both, however, were initially restricted to be used with quantitative variables. In this presentation, we'll discuss how relationships between qualitative variables can also be represented, as correspondence analysis already does, but using the technical resources of network analysis and other well-known multivariate techniques such as linear regressions, logistic and log-linear models. The proposed analysis can also be based on the realization of simultaneous regression equations and the automatic selection of those relationships with a positive and statistically significant relationship.

To enhance their analytical potential, these graphs are endowed with an interactive potential. The graphic interface includes the selection of various attributes for the recognition of the elements analyzed, and the modification of parameters to focus on stronger relationships.

In the first part of the presentation, I'll address the mathematical and statistical foundations of these representations. In the second part, I'll propose programs to make them possible and, finally, I'll show an example of analyzing the European Social Survey.

A Simulation Model For The Postdiction Of The Failure Of The French "Gilets Jaunes" Movement

Georg P. Mueller

University of Fribourg, Switzerland

771

In terms of the participation dynamics there are many forms of political protest: some conflicts escalate till the regime breaks down, others fluctuate chaotically around an equilibrium, or de-escalate until the protest movement collapses. This paper proposes a contagion model, which encompasses by the variation of its main parameters all these protest dynamics. The mentioned model is based on the interaction of three groups: (a) already mobilized citizens, who are protesting against the government and its policies, (b) non-rebellious but frustrated groups, which may become mobilized by imitating the rebels, and (c) repressive governmental forces, which attempt to reduce the number of mobilized citizens. The integration of these processes results in a logistic growth model. By formal reasoning and computer simulation, it can be shown that for many parameter configurations the modelled protest participation steadily grows or declines to stable shares of mobilized citizens, including the possibility of final zero-participation. However, for other parameter configurations the time-discrete logistic process may also result in chaotic fluctuations of protest. The proposed model is tested with participation data of the French protest movement of the "Gilets jaunes", which is exceptionally well documented. It started in November 2018 as a reaction to the planned increase of fuel prices, led to regular protests during weekends, and finally vanished in the middle of 2019. In this paper, its steady decline and rather long life are explained by its particular model parameters, empirically extracted from the mentioned participation data.

Development Of Sleep Difficulties Around Retirement: Analyses Comparing B-spline And Polynomial Group-Based Trajectory Models

Paraskevi Peristera[1], Anna Nyberg[2], Linda Magnusson Hanson[1], Hugo Westerlund[1], Loretta Platts[1]

[1]Stockholm University, Sweden; [2]Uppsala University, Sweden

Retiring from paid work is associated, at least in the short-term, with reductions in sleep difficulties and with sleep becoming more restorative. Despite the substantial sizes of these retirement-related changes it is still not known how universal these improvements are, how long they last, which factors may cause them, and how to best model time in the study of abrupt changes such as retirement.

To answer these questions, we studied trajectories of sleep difficulties for 2148 individuals from the Swedish Longitudinal Occupational Survey of Health, over a period of 22 years across retirement, and compared B-spline and polynomial group-based trajectory modelling approaches.

Reductions in sleep difficulties were sudden and lasted up to 11 years for non-restorative sleep, early awakening and restless sleep. However, average patterns masked distinct patterns of change during the retirement transition. Compared to polynomial models, B-splines modelled the trajectories more flexibly and accurately. Retirement was found to have differential effects for groups of retirees such that those experiencing greatest pre-retirement sleep difficulties benefitted most. Reduced need to sleep at fixed times and removal of work-related stressors were found to explain these retirement-related improvements.

These findings have implications for policy and practice, indicating that retirement has differential effects for groups of retirees and highlighting the importance of removal of work stress for sleep quality. We recommend that researchers seeking to understand the dynamics of symptoms-based data consider B-spline modelling rather than polynomial functions to estimate group-based trajectories and always examine the fidelity between observed and estimated trajectories.

RN21_T03_02 | Factorial survey experiments

Social Desirability Bias in Factorial Survey Experiments – Vignette-based vs. Item-based Measurements of Social Norms in Consuming Internet Pornography

Knut Petzold, David Strauß

Zittau/Görlitz - University of Applied Sciences, Germany

When examining attitudes and norms on sensitive topics, factorial survey experiments are often considered to be advantageous over item-based measurements because the social desirability bias might be reduced. Sensitive dimensions are assumed to be less obvious for respondents when presenting multi-dimensional vignettes as compared to more direct item-based measurements. As a result, injunctive norms are less activated thus less biasing responses. However, there are few methodological studies that address this assumption. In our study, we use the sensitive topic of "Pornography Consumption on the Internet" and compare vignette-based measurements with item-based measurements to investigate under which conditions pornography consumption appears to be acceptable. In a randomized within-subjects design, situational conditions were systematically varied in vignettes and it was measured in terms of personal and social injunctive norms to what extent respondents consider pornography consumption acceptable in the situation presented. The vignette dimensions are consumer's gender, relationship status, reason for consumption, usage, a handicap and the pornographic content. The full factorial (n = 144) was used to keep level balance and orthogonality. In addition, respondents' acceptance of pornography consumption under the same situational conditions was measured using a set of single items. The study was carried out with a homogeneous student sample (n = 105).

The analysis reveals hardly substantial differences between item-based and vignette-based measurements regarding normative judgments. This also applies to sensitive dimensions such as a stable relationship or a handicap of the consumer. The results are critically discussed especially in the light of the assumed advantage of factorial survey experiments over item-

based measurements in investigations on sensitive topics.

Career Sacrifice For A LGBTQI* Friendly Work Environment? A Choice Experiment To Analyze Job Attribute Preferences.

Zaza Zindel, Lisa de Vries

Bielefeld University, Germany

Social acceptance of LGBTQI* people has improved greatly in many European countries in recent decades, and equal legal treatment in the labor market has been improved. Still, a not inconsiderable amount of LGBTQI* people report experiencing discrimination in their work lives, and several studies suggest that significant differences in labor market outcomes, as well as tendencies toward occupational segregation, exist by sexual orientation and gender identity. The inequalities have not been sufficiently theorized or empirically studied.

This contribution discusses the extent to which the job attribute preferences of outed and non-outed LGBTQI* individuals differ and how experiences of discrimination influence career decisions. For analysis, we rely on the results of a large non-probability online-convenience sample recruited via social media (LGBielefeld 2021). As part of the survey, we conducted a factorial survey model to interrogate a job-decision experimentally. By evaluating the distribution of preferences across different job attributes, we thus approach the question of whether certain career options are abandoned in favor of a low-discrimination work environment.

Stimulus Presentation in Factorial Surveys: Advancements in Designing Vignette Experiments for Measuring Online Civil Courage among Adolescents

Christiane Atzmüller

University of Vienna / Austria, Austria

Vignette experiments that are implemented in quantitative surveys, i.e. Factorial Surveys, have a high potential for studying sensitive and emotional topics, such as violence perception and criminal behavior, as vignettes can serve as valid and context sensitive proxies for real world settings. However, there is a considerable risk of biases in the vignette ratings if the presented vignettes are not able to evoke emotions that correspond to real settings. These shortcomings have been largely neglected in the scientific discussion.

This contribution highlights the importance of a critical awareness of the vignette design in order to increase both the realism of the presented vignette setting and the involvement of respondents. We demonstrate design features of a study on online civil courage among adolescents dealing with perceived violence on the internet. The empirical findings are based on a representative survey among 1,868 students aged 14 to 19 years in Vienna, Austria. We present (1) the selection procedure of youth-appropriate vignette scenarios, (2) the construction of the experimental vignette design, (3) the creation of the vignette stimulus content in collaboration with adolescents, (4) design decisions for the presentation mode considering experimental design conditions and (5) the implementation of the constructed scenarios within an online survey with simulated social media profiles. Results show significant main- and interactions effects for both vignette and respondent level. This result was also supported by the high attractiveness of the survey setting for the young respondents, leading to an increased attention and subsequently less measurement errors.

Advances in quantitative methods, simulation studies and modelling techniques II

Selective Mobility Contributes to Immigrants' Higher Exposure to Air Pollution A Panel Analysis Spatially Linking Objective Pollution Data and Micro-Level Survey Data for Germany

Henning Best[1], Tobias Rüttenauer[2], Felix Bader[1], Ingmar Ehler[1]

[1]TU Kaiserslautern, Germany; [2]Nuffield College, University of Oxford, UK

The debate on environmental justice has reached Germany decades ago, but limited data availability has hindered a detailed account of the processes leading to the unequal exposure to environmental pollution. This study provides the first longitudinal analysis on the mechanism of selective mobility leading to environmental inequality in Germany based on objective pollution data.

We link geo-referenced longitudinal household-level data from the German Socio-Economic Panel (GSOEP) for 2008-2016 with 2x2 km estimates of annual air pollution by the German Environment Agency, including nitrogen dioxide, particulate matter, and sulphur dioxide. We show that first- and second-generation immigrants are exposed to higher levels of air pollution around their place of residence. On the one hand, this might be due to selective siting of pollution sources like factories or roads close to places where minorities reside. On the other hand, environmental inequality might result from selective residential sorting: households experience different improvements in air quality when relocating. Using fixed effects models, we find that, on average, relocating households move to places with cleaner air, but this improvement for non-immigrants is about twice as large as for immigrants.

Selective mobility contributes to environmental inequality in Germany, thereby aggravating the disadvantage of immigrants. Interestingly, we find a similar pattern and mechanism for lower income groups, but effect magnitudes are much weaker. This indicates that lower income is not the driving force behind immigrants' environmental disadvantage.

How Do Subjective Researchers' Decisions Affect Automatic Text Classification? Use of Artificial Neural Networks to Classify Political Beliefs Expressed on Twitter.

Paweł Matuszewski

Collegium Civitas, Poland

Nowadays, social scientists have unprecedented access to enormous quantities of socially relevant data. One of the sources of such data is Twitter, which can be used to collect textual data of volume that is impossible to read by any research team. Advances in natural language processing and machine learning opened possibilities to use large volumes of data in sociological research. However, automatic text classification is not a universal technique that can be applied to every text no matter the nature of the task. Generally, the more open to various interpretations a given document is, the harder it is for an algorithm to predict the correct outcome.

This paper aims to verify how subjective researchers' decisions – regarding data preprocessing, number of coders per tweet, the total number of annotated tweets, number of categories of analysis – affect the accuracy of supervised methods for text classification (an artificial neural network approach). The deep neural network classifier had two objectives with increasing difficulty. First, it was supposed to classify politically related tweets in terms of their subject matter. Second, the algorithm was supposed to classify tweets according to the author's stance towards the subject being discussed.

The study used a random sample of 100,000 tweets collected from the most frequently followed Polish accounts that had more than 5,000 followers and regularly published tweets about politics in 2019. Seven research assistants manually coded the tweets. The data was used to simulate the outcomes of various methodological decisions.

Sociology And The Replication Crisis

Samuel Coavoux[1,2], Anton Perdoncin[3,4]

[1]Orange Labs; [2]Cerlis (Paris University, CNRS); [3]ERC Lubartworld (EHESS, CNRS); [4]Cens (Nantes University, CNRS)

Since the early 2000s, a movement encouraging the replication of research results has emerged in the experimental sciences. It grew out of a disturbing observation: most scientific findings are "false" (Ioannidis, 2005). In disciplines as diverse as social and cognitive psychology (Open Science Collaboration, 2015), political economy (Dafoe, 2014), experimental social sciences (Camerer et al., 2018), oncology (Begley et Ellis, 2012) or pharmacology (Prinz, Schlange et Asadullah, 2011), large scale replication studies have only managed to replicate a part, sometimes rather small, of prominent published results.

Sociology and the "historical sciences" (Passeron, 2013) have, so far, been little affected. Is it because they are immune to this problem, due to a regime of evidence based on observations rather than experimentations? Or because the difficulties of replication go unnoticed – as it has been the case, for a long time, in other disciplines? Whatever the answer, questioning the status of replication in the historical sciences allows us to grasp the methodological and epistemological vulnerabilities and debates in our disciplines (Abbott, 2007 ; Firebaugh, 2007 ; Freese, 2007 ; (Gelman & Loken, 2014).

We will first describe the developments of the "replication crisis" in the experimental sciences and its relationship with the null hypothesis statistical paradigm, now in crisis. Our paper will then examine the dimensions of this crisis, related in particular to statistical methods and the social organization of scientific work, notably the pressure to publish. Finally, we will discuss the relevance of the recommendations discussed in the literature on the crisis of replication for social science research practices (hypothesis testing and p-values, meta-analysis, valorization of "null results", and production and availability of original data as a scientific production).

A Phantom Menace: Counterfactuals and Boolean Minimization in Qualitative Comparative Analysis (QCA)

Alrik Thiem, Lusine Mkrtchyan, Zuzana Sebechlebska

University of Lucerne, Switzerland

A considerable part of the literature on methodological aspects of Qualitative Comparative Analysis (QCA) is concerned with logical remainders and the possible counterfactual assumptions that may result as part of the process of Boolean minimization. Most importantly, the conservative and intermediate solution types of QCA only exist because of fears of problematic counterfactuals, auxiliary procedures such as T/ESA have been developed for filtering out problematic counterfactuals, and applied users of QCA have been warned of contradictory counterfactuals in analyzing outcomes and their negation. If there is a topic in QCA that has widely and continuously dominated the method's agenda, it is counterfactuals. The fear of introducing problematic counterfactuals has a single source: the Quine-McCluskey algorithm (QMC), which Ragin imported in the 1980s for operationalising QCA. More specifically, QMC draws on positive min-terms and so-called "don't cares" - the term electrical engineers use for what QCA researchers refer to as "logical remainders" - in identifying prime implicants. However, while don't cares have never worried electrical engineers, they have led to deep concerns in the QCA community. As we will demonstrate, such a concern is a phantom menace. There are many other algorithms, which can be given exactly the same search target as QMC and produce exactly the same solutions, that do not rely on don't cares. In fact, McCluskey himself proposed one of these algorithms (McCluskey, 1962), but not because don't cares could be problematic for inference, but because other approaches are simply more algorithmically efficient under some conditions. The entire literature on counterfactuals in QCA is, therefore, a mere artefact of Ragin's uncommented choice of an algorithm that just happened to use don't cares.

Harmonising the Survey Data of the Global Values in Crisis Survey – a Challenging Endeavour

Wolfgang Aschauer[1], Alexander Seymer[1], Otto Bodi-Fernandez[2,3], Manfred Herzog[3]

[1]University of Salzburg, Department of Political Science and Sociology; [2]University of Graz, Institute for Sociology; [3]University of Vienna, AUSSDA - The Austrian Social Science Data Archive

The Covid-19 crisis is manifold and poses major health, economic and social challenges for current societies. Long-term monitoring of central values and attitudes of citizens in times of crises help to grasp current social and political tensions. Taking this ambition to the global scale was the main aim of the Values in Crisis Study (VIC). Christian Welzel, together with well-known researchers in Germany, UK and Sweden initiated the study and finally more than 15 countries collaborated in this project. All partner countries decided to start an online-panel with roughly 2000 respondents, analyzing how the current corona pandemic affects fundamental values and how people's attitudes change during times of crises.

In our contribution, we focus solely on the process of data harmonisation, which was undertaken by the Austrian survey team. This was a challenging endeavour, because potential biases appear at various stages of the survey process. Concerning the selection of respondents, most countries had to rely on online-access panels and tried to grasp the population with different quota sampling strategies. In addition to potential deviations in the structure of the sample, it was a particular challenge to harmonise measures on income and education accordingly. Furthermore, we faced differing questions and indicators due to translation and cultural sensitive adaptations to the questionnaire. Different periods of fieldwork adopted in the countries further complicate the comparability of the data.

These insights into the harmonisation process are intended to show that comparative studies at the global scale should always be interpreted with caution. However, with an adequate documentation of potential bias and careful analysis, survey research has still a great potential to enable valuable findings in exceptional times.

Can we Believe the Survey Data on the Arab Countries: Comparing the Arab Barometer and the World Values Survey Data on Gender Equality and Trust

Veronica Kostenko[1], Saskia Glas[2]

[1]European University at St.Petersburg, Russian Federation; [2]Radboud University, the Netherlands

The attitudes of Muslims, and Arabs in particular, have recently sparked the interest of sociologists, particularly following 9/11, the Arab Spring, and the Syrian refugee crisis. That interest led to higher coverage of Arab countries in the international survey research projects, such as the World Values Survey and the Arab Barometer. However, we know remarkably little about the quality of these data, which means that the validity of the conclusions of sociologists remains ambiguous. Our contribution aims to shed light on the quality of the two surveys that are most often used to study Arab Muslims' attitudes, namely the Arab Barometer and the World Values Survey. Ultimately, we provide comparative sociologists with greater insights into what their results mean and when caution is warranted.

Empirically, we assess whether the two surveys provide similar insights in four attitudes (concerning gender equality, institutionalized and generalized trust) for countries surveyed in (approximately) the same year. We find that there are not only huge discrepancies in the descriptive distributions of trust and gender equality between the AB and the WVS, but also that their predictors differ depending on the data source. This implies that, in certain cases, the conclusions of substantive comparative researchers may wholly depend on the survey they used. We pinpoint problematic cases and suggest what sociologists can do to tackle these to further our insights into Muslims' support for gender equality and general and institutional trust, as well as underline the country samples that are too problematic to build conclusions on.

Growing Up in Digital Europe / EuroCohort: developing a comparative longitudinal survey of child well-being in Europe

Gary Pollock, Jessica Ozan, Haridhan Goswami, Aleksandra Szymczyk

Manchester Metropolitan University, United Kingdom

Growing Up in Digital Europe (GUIDE/EuroCohort) will be Europe's first comparative birth cohort survey, an important source of high quality longitudinal statistical evidence to support the development of social policies which will enhance the wellbeing of children, young people and their families across Europe for many years to come. Drawing on two previous EU funded projects (MYWEB, and the European Cohort Development Project), this paper argues that there is a need for an input harmonised comparative birth cohort survey. Using an accelerated design, including a sample of new-born infants as well as a sample of school age children, GUIDE/EuroCohort will quickly build an impressive data archive for analysts. Both cohorts will be surveyed using a common questionnaire and data collection methodology at regular intervals until the age of 24 years. Preparatory work for GUIDE/EuroCohort has already begun and will continue from 2021 in a H2020 "Starting Communities" project which includes piloting elements.

Within-country Survey Harmonization: Building a Strategy for German Large-scale Surveys

Silke Schneider, Verena Ortmanns

GESIS - Leibniz Institute for the Social Sciences, Germany

Researchers increasingly rely on data from different surveys. Pooling surveys allows more robust conclusions, extending time series, increasing the resolution for georeferencing, examining smaller subpopulations, or extending the population for international comparisons. However, even within countries, the combination of different surveys is hindered by the use of different measurement instruments for identical concepts. This is even true for 'standard' socio-demographic variables (such as age, gender, education, and employment) which are collected in all large-scale surveys and widely used in empirical analyses. This results in lacking interoperability of data - i.e. one of the FAIR data principles (Wilkinson et al. 2016, https://www.go-fair.org/) not being fulfilled - and thereby in extra work for those combining the data, information loss, and potentially even biased or spurious findings.

This presentation gives an overview of the strategy followed by current efforts to improve comparability of socio-demographic measures across large-scale German surveys. As a starting point, a systematic overview of measurement instruments and variables was produced for a core set of sociodemographic variables across several substantive domains, including labour market involvement, cultural diversity and private living arrangements, for a number of large-scale German surveys. This overview served as a knowledge base for discussing potential avenues for cross-survey harmonization for every single socio-demographic variable with stakeholders: ex-post harmonization, ex-ante harmonization and standardization. Each of these strategies has advantages and disadvantages and requires more or less commitment by the surveys themselves, a coordinating infrastructure, and data users. These will be examined in detail, resulting in a harmonization roadmap for German large-scale surveys.

Uses of Hierarchical Segmentation Analysis to measure Bourdieu's theoretical concepts

Victor Fabian Climent Peredo

Univarsidad de Alicante, Spain

In this paper we present a case study where we use an innovative techcninc of analysis to study the Bourdieu's concept of capital reconversion.

To model the Bourdieusian capital system and measure its volume and configuration, as well as the predispositions and practical sense they exercise in the field, we use, in addition to the modeming based on the ACM (Multiple Correspondence Analysis), well known in the Bourdieusian inspirations, the ASJ (Hierarchical Segmentation Analysis) technique, using decision trees.

We consider this technique innovative and highly useful, since from the growth algorithms CHAID (Chi-Square Automatic Interaction Detection), and CART (Classification and Regression Tree), we have been able to determine how, as the symbolic capitals are added, the value of flexible and deregulated labour-economic capital is transformed.

This technique is progressive, therefore the symbolic capitals that have the greatest effect on the growth of the value of flexible or unregulated work are selected through the application of improvement indices. Both techniques (CHAID and CART) seem little explored for the empirical analysis of Bourdieu's theoretical conceptualisations.

We believe that their use makes sense for the study of capital reconversion processes, since, through growth algorithms, we have been able to determine the combinations of symbols that add economic value to capital.

As it is a segmentation technique, it also provides us with a result with which we can define a social space, which we consider should be deepened through other types of more explored techniques, such as MCA (Multiple Correspondence Analysis), which we have also incorporated providing with good results.

New Racism Inventory

Mara Katharina Simon[1], Ralf Wölfer[1,2]

[1]DeZIM, Germany; [2]University of Oxford, England

Only recently German society and politics are starting to acknowledge that racism still exists in Germany. Up until know euphemisms like "hostility towards foreigners (Ausländerfeindlichkeit)" or "xenophobia (Fremdenfeindlichkeit)" were used to describe the phenomenon, ignoring theories and findings of international racism research.

The idea that racism merely happened in the past and the phenomenon described as "hostility towards foreigners " or "xenophobia" were something completely different and furthermore less severe is still common in the German (quantitative) social science research as well as the public discourse. The measurements used to survey racist beliefs in Germany are, therefore, outdated, methodologically limited and bear little relation to current and critical theory of racism (e.g. common scales hardly meet the adaptation of racist beliefs to changing societal norms).

To gap the bridge between theory and empirical research as well as quantitative and qualitative research, we developed measurements for racist attitudes and ideologies based on a sequential qualitative-quantitative research design: starting with a systematic qualitative discourse analysis, we identified relevant recent narratives related to racism and discrimination, which served as a basis for generating more recent and theoretically adequate items; thereafter, we quantitatively validated the resulting scales that capture different aspects of racists attitudes and ideologies (e.g., denial, defensiveness, awareness) in two large-scale surveys (Study 1: N = 600, Study 2: N = 5000). Using CFA and SEM, results confirmed (a) the hypothesized factorial structure and (b) the expected associations with related constructs. The new racism inventory seems to appropriately, empirically and theoretically, measure racists attitudes and ideologies in Germany; something that is urgently needed in order to better understand and tackle this phenomenon in the future.

Testing the measurement qualities of the Need for Social Approval Scale: A multitrait-multimethod approach

Axel Franzen, Sebastian Mader

University of Bern, Switzerland

A basic assumption in the social sciences is that humans are motivated by two very fundamental needs, the interest in material well-being and the need for social approval (Smith 1759, 1776). Adam Smith also assumes that the pursuit of material well-being finally serves the higher need for social approbation. Surprisingly, there are only very few and only meagerly tested instruments in the literature that measure the need for social approval: The most well-known suggestion is the Crowne-Marlowe-Scale (CM) (Crowne & Marlowe 1960). However, the CM scale was designed to measure respondents' over- or underreporting in surveys, i.e. their susceptibility towards social desirability. There is a comprehensive discussion in the literature whether the CM scale is also suitable to measure the need for social approval (e.g. Martin 1984). Hence, Larson et al. (1976) proposed an alternative instrument to measure the need for social approval, the MLAM scale, which was later revised by Martin (1984). However, inspection of the items reveals that the MLAM measures social conformity rather than social approval. Hence, in this paper we suggest a new and short scale to measure social approval. Furthermore, we test the construct validity of the new Need for Social Approval Scale (NSAS) and compare its performance to the well-known CM scale as well as to the MLAM scale. We use a multitrait-multimethod design (Campbell & Fiske 1959) to test the convergent and discriminant validity of the different scales. Moreover, we conduct various tests to compare the external validity of the different instruments.

Investigating Functioning as a Determinant of Wellbeing and its Relation to Employment Status: Evidence from the European Social Survey, 2006

Anastasia Charalampi, Catherine Michalopoulou, Clive Richardson

Panteion University of Social and Political Sciences, Greece

779

Purpose: To investigate the structure and assess the psychometric properties of the functioning scale defined as a determinant of the personal and social wellbeing module included in the 2006 European Social Survey (ESS) questionnaire. To evaluate the resulting scale (or subscales) by examining its relation to employment status.

Method: The analysis was based on the ESS datasets of Ireland, Netherlands and Sweden. First, Exploratory factor analysis (EFA) was performed on the first half-sample in order to assess the construct validity of the scale. Secondly, the structure was validated by carrying out Confirmatory factor analysis (CFA) on the second half-sample. Then, based on the full sample, the psychometric properties of the resulting scale (or subscales) were assessed. Employment status is measured in the ESS by a perception question, as is the case in all large-scale social sample surveys.

Results: In all three countries, EFA resulted in a unidimensional solution and CFA showed an adequate fit to the data. Reliable scales were produced with problematic convergent validity. In all cases, the comparison of scores on the functioning scale between categories of employment status showed that the mean scores of the unemployed were lower than both the employed and the inactive.

Conclusions: This methodological study demonstrates the need for first validating a construct and then evaluating the resulting scale (or subscales) by investigating its relation to known social characteristics. Although the analysis provided the same structure for three countries, based on EFA results, this was not the case for other datasets that were tested (Belgium, Denmark, Finland, France, Germany, Hungary, Norway, Poland, Portugal, Russian Federation, Slovenia, Spain, Switzerland and the UK) and therefore further research is necessary.

RN21_T06 | Concept development and scale evaluation II

Automating and Standardizing Reproduction of Schwartz's Two-dimensional Value Space using Multi-dimensional Scaling, Goodness-of-Fit Test Procedures and S2-D Software

Jacques De Wet[1], Daniela Wetzelhütter[2], Johann Bacher[3]

[1]University of Cape Town, South Africa; [2]University of Applied Sciences Upper Austria, Austria; 3Johannes Kepler University Linz, Austria

Numerous empirical studies based on Schwartz's famous Theory of Basic Values also use his Portrait Values Questionnaire (PVQ) to collect data. Many of these follow Schwartz by using Multi-dimensional Scaling (MDS) and Goodness-of-Fit (GoF) tests to ascertain the extent to which their empirical results reproduce his two-dimensional model and visually represent the results. A small number report their analytical procedures in some detail, however, most mention MDS and accompanying measures of GoF without providing sufficient detail. This omission creates problems for researchers wanting to undertake comparative work across these values studies that use MDS together with GoF tests. Bilsky, Janik, and Schwartz (2011) advocate careful description of MDS methods, which allows easy reproduction by others. This is an important step towards consistency and transparency that promote rigorous scientific practice. However, these procedural steps could be more detailed, standardised and even automated. In this paper we argue for the standardisation of Schwartz et al.'s MDS and GoF procedures. To this end, we methodically describe and introduce our computer programme (S2-D) to automate almost all the steps. We also introduce two new ways of measuring the GoF.

Cross-National Invariance Of Morally Debatable Behavior Scale: A Test Across 35 Countries

Anastasiia Volkova

University of Helsinki, Finland

The comparative quantitative research of cultural differences in morality tends to define what is the moral issue and what is not a priori. One of the most widely used instruments to investigate them is the Morally Debatable Behavior Scale (MDBS), which was updated and adjusted to fit in the cross-national longitudinal surveys such as World Values Survey (WVS) and European Values Study (EVS). Since then, MDBS has been used to measure moral values and attitudes, but surprisingly, its validity for usage in cross-cultural comparisons has not been rigorously tested. Therefore, I examine the MDBS empirically in the latest EVS wave (2017) using various statistical methods. Results of multi-group confirmatory factor analysis followed by validity tests give evidence that the MDBS measures the leniency of moral judgments rather than the respondents' behavior. Also, because the Morally Debatable Behavior Scale consists of questions on sensitive topics, it is prone to social desirability and non-response biases, with items having highly non-normal distribution. Hence, full measurement invariance cannot be reached for all 35 countries. Therefore, MDBS should be handled carefully and thoughtfully in cross-cultural research. Several suggestions on how to achieve partial measurement equivalence are proposed.

780

An Item Response Theory Analysis and Psychometric Properties of the Czech Version of the SWLS

Radka Hanzlová

Charles University, Czech Republic

The Satisfaction with Life Scale (SWLS; Diener et al., 1985) is one of the most commonly used tools for measuring life satisfaction and subjective well-being. Many studies using Classical Test Theory have confirmed its good psychometric properties including validity, internal consistency, test-retest reliability (Pavot et al., 1991; Lucas et al., 1996; Pavot & Diener, 1993), however results regarding its dimensionality are varied (for an overview, Emerson et al., 2017). Furthermore, only few studies testing their modification (e.g. Kjell & Diener, 2020; Vittersø et al., 2005). In the Czech Republic except for one old study testing its psychometrics properties on a small sample of university students (Lewis et al., 1999) the SWLS has not been tested yet. The aim of this article is to test the psychometric properties of the Czech version of the traditional SWLS consists of five items and compare the results with their abbreviated version with four (SWLS-4) and three items (SWLS-3) by using Item Response Theory Analysis. Application of IRT can also reveal if a shorter response scale can be applied. For analysis, data from a representative sample of the Czech population older than 18 years are used (N = 1,000). The results showed that both abbreviated versions of the SWLS demonstrate very good psychometric properties as well as a shorter response scale and therefore can be used interchangeably without affecting its psychometric qualities. This research is very beneficial for all researcher in this area because using short scales can be useful especially in online surveys. Moreover, in the Czech Republic, this is the first testing the SWLS using IRT, which is not widely used method here.

RN21_T07 | Experimental methods in sociology

Experimental Research in Sociology: Enthusiasm and Caution Learned from the Italian Experience

Giovanni Abbiati[1], Gianluca Argentin[2], Davide Azzolini[3], Gabriele Ballarino[1], Loris Vergolini[3]

[1]University of Milan (Italy); [2]University of Milan Bicocca, Milan (Italy); [3]FBK-IRVAPP (Italy)

781

In this contribution, we provide a systematic review of the Italian experimental literature in the field of sociology, a research stream that has grown in the last decade. This work is motivated by the observation that Sociology incorporated experimental research only recently and awareness of the conceptual and methodological pitfalls surrounding this type of research still needs to be built within the discipline. Hence, our review is aimed at evaluating experimental literature from a methodological perspective.

We develop a systematic review aimed at collecting and analyzing all the RCTs conducted in Italy, mainly in the field of education. Our review includes 25 RCTs completed between 2009 and 2020. We analyze each study by verifying its alignment to the CONSORT (CONsolidated Standards Of Reporting Trials) guidelines and checklist.

Our findings show that the majority of studies fails to provide technical reports in full accordance with international standards. This makes it hard, at times, to evaluate the robustness of the causal evidence produced. Frequently, the randomization process is vaguely reported, pre-registration lacks and primary and secondary outcomes are not pre-specified.

All these weaknesses risk to undermine the contribution of experimental research to sociology, not allowing rigorous causal inference. In addition, reliability issues risk to be even more severe, due to the fact that RCTs frequently assess interventions designed and implemented by researchers themselves.

We suggest viable solutions, aimed at improving the robustness of experimental research in sociology, taking advantage from consolidated rigorous praxis developed in other disciplines.

On Average, a False Conclusion: How to Deal With Heterogenous Average Treatment Null Effects.

Sandra Jaworeck[1], Stephan Poppe[2]

[1]Chemnitz University of Technology, Germany; [2]Leipzig University, Germany

Many experimental studies aim on estimating whether a treatment makes a difference or not in a particular population. Despite the fact that these individuals can be quite heterogeneous to the extent that strong heterogeneity in the individual treatments occurs, many studies still report only average treatment effects, which most often implicitly assumes a homogenous treatment effect. This can in particular lead to the harmful ecological fallacy that by observing an average null effect we also conclude that there are no effects on the individual level as well.

We demonstrate for experimental data investigating the so-called ''Watching Eye" effect such an average null effect can be observed, while on an individual level a considerable heterogeneity of treatment effects is observable. In particular, we employ a non-parametric model in form of random forest and model agnostic methods such as partial dependencies or individual conditional expectations. We also argue that the latter methods, recently popularized by the interpretable machine learning community, provide a genuine and convenient way for our community to deal with the problem of inspecting treatment heterogeneity.

RN21_T08 | Application of digital methods in the big data era

Applying Text Mining to Explain Students' Educational and Professional Choices

Léon Marbach[1], Agnès van Zanten[3,2,1], Alice Olivier[2,4]

[1]Sciences Po, LIEPP; [2]Sciences Po, OSC; [3]CNRS; [4]Université de Lille, Clersé, Inspé Lille-HDF

While the present availability of documents stored digitally constitutes a formidable opportunity for new analyses, they remain underutilized in sociology. In this paper, we will show that text mining – a set of computerized methods for extracting and quantifying information from large textual databases – offers promising prospects for studying students' aspirations. Drawing from a corpus of 16,000 admission essays from applicants to medical studies at a French university in 2020 and data on inequalities in the health labour market, we will argue that the application of various techniques like word clouds, bag-of-words and document classification is particularly effective for highlighting key differences in study and work aspirations (Alvero et al., 2020). Using administrative data as well as data from a survey and interviews with students, we will show how these differences relate to students' gender, SES and feeder high school (Jones, 2014), and emphasize the role of socialization processes, access to information and cultural beliefs in explaining students' perceptions of medical studies' prestige and economic returns.

782

Misogyny And Xenophobic Hate Language Online: A Matter Of Anonymity.

Emma von Essen[1], Joakim Jansson[2]

[1]Stockholm University, Sweden; [2]Linnaeus University, Sweden

Social media provides opportunities to express political opinions to a large audience without publishers or editors. Some of these forums are associated with a vast amount of often anonymous, hateful content that remains readable online. This abundance of hateful language threatens to silence certain groups' voices in the public debate since the hate often is connected to established stereotypes. Unexpectedly, in September 2014, a group of journalists announced that they had access to the identities of early registered users at a well-known Swedish online forum Flashback – similar to U.S. based Reddit. Anonymity is a requirement of this forum, and suddenly some writers experienced less anonymity than other users – by an increased risk of their identities and writings being exposed. The event created a quasi-experimental setting. First, we used a machine-learning model (logistic lasso) to predict misogyny and xenophobic hate on this forum. Then we used these predictions to estimate the causal link between writer anonymity and hate with a difference-in-difference model. We find that decreasing anonymity causes less hate. The effect, however, depends on the type of hate or target group of the hateful comments. We show that while transparency lowers the share of xenophobic hate, the share of misogyny increases. The effect seems to be a combination of a decrease in general activity (writing) on the forum among users that produced xenophobic content before the event and substitution of xenophobic hate for misogynistic hate. Our findings corroborate that high social costs can deter xenophobic writing, but not misogynic. Still, it also emphasizes that, for example, requiring users to expose their legal names might also decrease non-hateful writing among specific groups.

What Can and What Cannot Natural Language Processing Offer Compared to Surveys in Public Discourse Analysis?

Árpád Knap, Ildikó Barna

Eötvös Loránd University, Faculty of Social Sciences, Hungary

In the past two decades, our life has dramatically changed with the data revolution and the spread of the internet. The way we work, communicate, and connect have all been affected by the logic of this global network. We can learn more and more about our increasingly online lives by analysing data from the internet, however, such analyses require a new set of tools compared to the traditional methods of sociological research. An emerging discipline aimed to do just that is Computational Social Science (CSS), which employs text and data mining, network analysis and data visualization to analyse data available online from born-digital or digitalized sources. CSS also incorporates methodologies of Natural Language Processing (NLP), found in the intersection of computational linguistics, artificial intelligence, and computer science, designed to enable the analysis of vast amounts of textual data.

In our presentation, we reveal how well these new methods and those from the traditional toolbox can complement each other on examples from our research projects concerning the analysis of public discourse. In these projects, we have been researching online antisemitism, the political framing of important historical events and most recently, coronavirus-related online antisemitism. We demonstrate how algorithms and methods like topic modelling, sentiment analysis, word embedding models or human annotation of documents can contribute to our knowledge when used in symbiosis with surveys and more conventional methodology.

Mining Everyday Texts for Sociologically Relevant Phenomena – Evidence from Online Market Exchanges

Ana Macanovic[1,2], Wojtek Przepiorka[1,2]

[1]Utrecht University, Department of Sociology; [2]ICS

The emergence of big data introduced amounts of information that elude conventional sociological text analysis approaches. Addressing these new developments, sociologists have started to utilize capabilities of text mining in exploring narratives and discourses from texts in public spheres. However, less has been done to explore the potential of text mining methods in tracing the complexities of the world underlying communication of individuals in less formal, everyday settings.

We use textual data from illegal online markets to explore motives and norms behind individuals' writing of feedback on their market transactions. This feedback is essential in sustaining market reputation systems. To do so, we build on work exploring individual psychological states, opinions, meanings, values, and motives in text. We evaluate the performance of three families of text mining approaches – dictionary, supervised, and unsupervised machine learning methods – in replicating the work of trained human coders coding for complex phenomena of motives and norms in short texts. We introduce several methods that approach the success of human coders and address some challenges practitioners face in adapting methods from natural language processing and computer science to social scientific applications. Our research not only contributes to sociological understanding of the functioning of markets, but also showcases that text mining methods can help sociologists utilize streams of everyday, informal textual data written by "ordinary" individuals to draw conclusions on sociologically relevant phenomena.

RN21_T09 |The application of quantitative studies in different sociological research areas

What Comes First, Institutions Or Values? The Effect Of Gay Marriage Laws On The Attitudes Toward Homosexuals

Boris Sokolov[1], Veronika Kostenko[2]

[1]National Research University Higher School of Economics, Russian Federation; [2]European Univeristy at St. Petersburg, Russian Federation

This research aims at contributing to the theoretical debate on causal relations of values and institutions which is vibrant in contemporary social science. We use adoption of the same-sex-marriage/legal recognition of gay civil unions as a quasi-treatment variable that allows estimating the effect of institutional change on mass perceptions of homosexuality. To measure individual tolerance towards homosexuality we use two dependent variables: a 10-point scale on whether homosexuality can be justified, and a binary variable on whether a respondent would like to have homosexuals as neighbors. We conduct two types of analysis. First, we compute country-mean scores on these two items for all countries participating in the two latest waves of the World Values Survey and the European Values Study. Then we regress those aggregated values on the treatment variable, controlling for pre-adoption level of the Emancipative Values Index (EVI) and a set of relevant political and economic indicators, such as GDP and Polity IV, as well as their lagged values (for years 1960 and 1980). Second, we utilize all available EVS/WVS data and the combined matching + difference-in-difference estimator, in order to obtain estimates for the effect of law adoption on the attitudes towards homosexuals We find that the estimated causal effect of the law enactment is small and non-robust, in contrast to the strong and stable effect of the pre-adoption level of emancipative values. We also observe a strong lagged

effect of GDP in 1960 and 1980 on the current level of tolerance towards homosexuals in the baseline cross-sectional models. Thus, our empirical results support theories which stress the role of societal, not institutional, change in the transformations of mass attitudes.

The Discursive Framing of Syrian Immigration in Turkish Twittersphere

Huseyin Zeyd Koytak[1], Muhammed Hasan Celik[2]

[1]Syracuse University, NY, United States; [2]University of California Irvine, CA, United States

This study uses cutting-edge computational methods to analyze the framing of the recent Syrian immigration to Turkey since no previous research has investigated the attitude towards immigrants in the largest refugee-hosting society in the world to such a depth and extend using novel computational methods. Our analysis identified five main topics in the framing of Syrian immigration in Turkish Twittersphere. In this research, we demonstrate correlational links between the timing of landmark events and proportional trends in those topics across the span of time. We highlight two important findings: (a) increasing public social expenditure in immigrant-hosting societies of the post-pandemic world could be associated with ever more widespread sentiments of welfare chauvinism, (b) patriotic feelings and the implementation of an ambitious and interventionist foreign policy agenda in immigrants' country of origin could create a relatively tolerant yet patronizing atmosphere for migrants. Although this study focused on the relationship between Turkish public and immigrants, this paper has international appeal, as the COVID-19 pandemic and immigration frequently take the center stage in politics of immigrant-hosting societies.

Educational Attainment and New Age Digital Entertainment: are Video Games a Determining Factor in the Academic Achievement of High School Students?

Luis Eduardo Andrade Silva

Universidad de Salamanca, Spain

Video games, as they are popularly known today, have their origin in the 1950s. However, they only became popular in the mid 1980s with the advent of their own platforms that had drivers in lever format and graphic reproduction on the screens of personal computers and gaming consoles. The literature about video games and their implications in education and in social sciences is starting to emerge. Hence the importance of the study of video games and how they have become an important determinant to be taken into account to understand how individuals reproduce in different strata of society.

The factors that determine the academic achievement of high school students had been studied through a dense literature over the decades. But new paradigms and types of entertainment such as video games have appeared and consolidated, forming part of the lives of every living strata of the contemporary society.

Using a sample of over 5 million EEUU students that covers the years between 1995 and 2008, during this presentation I will show the results obtained through advanced quantitative methods that confirms a statistically significant relationship between the hours expended playing video games and a better academic performance, therefore confronting the previous literature on the topic and opening a space for interesting theories and hypothesis.

785

Evaluation of Refugees' Targeted Allocation to Language Courses

Giuseppe Pietrantuono[1], Salwan Saif[2], Pia Homrighausen[2]

[1]University of Göttingen, Germany; [2]Federal Office for Migration and Refugees, Germany

Successful integration of refugees has become a fundamental policy challenge for European governments. One of the critical facets of integration policy is to facilitate refugees' acquisition of the destination country's language. Germany has created a unique, publicly funded language training system for individuals with insufficient German language skills to improve their language acquisition and subsequent participation in society. The system provides different language courses varying in their curricula to meet different groups' needs (e.g., language training for individuals with no or low literacy skills). While initially intended for labor migrants from European countries, the system gradually opened up to low-skilled asylum seekers leading to a reduction in the proportion of successful course graduates and in increased length of time spent in the courses. In this context, since mid-2017, the German Federal Office for Migration and Refugees (BAMF) started testing refugees' targeted allocation to language courses to match participants to its different language courses more effectively.

We evaluate this policy intervention by leveraging register data on the entire population of asylum seekers who are committed for participation in a language course. We exploit regional and temporal variation in the targeted allocation of participants using a difference-in-differences design. We find that allocated refugees take up a language course more quickly and complete the language training in a shorter period of time with a higher attained language level. These findings have important implications for the design of effective language training programs and help to improve refugees' successful language acquisition and integration.

RN21_T10 | Cognition in Surveys

Simplified Question Wording in Surveys and Its Effects on Data Quality

Tobias Gummer, Irina Bauer, Tanja Kunz

GESIS Leibniz Institute for the Social Sciences, Germany

General population surveys frequently struggle with recruiting respondents of low education and literacy. Even if low literate persons can be motivated to participate in a survey, they face challenges when answering questions in academic surveys. Comprehending survey questions is an essential step in the cognitive response process that respondents go through when answering questions. Respondents who have difficulties understanding survey questions may not answer at all, drop out of the survey, give random answers, or take shortcuts in the cognitive response process – all of which can decrease data quality. Comprehension problems are especially likely among respondents with low literacy skills. 'Simple Language' in terms of clear, concise, and uncomplicated language for survey questions may help mitigate comprehension problems and thus increase data quality. 'Simple Language' is a linguistically simplified version of standard language. It is characterized by short and concise sentences with a simple syntax avoiding foreign words, metaphors, or abstract concepts. To investigate the impact of 'Simple Language' on data quality, we conducted an experiment in a web survey of 10 minutes length among 4,000 respondents of an online access panel in Germany. Respondents were randomly assigned either a questionnaire that used either 'Simple Language' or 'Standard Language'. We examined differences between the experimental group with respect to various indicators of data quality, including "don't know" responses and nondifferentiation, as well as different aspects of respondents' survey assessment.

786

The Multimodal Assessment Of Respondent's Cognitive Load: A Methodological Experiment Comparing CASI And P&PSI Modes

Inna Deviatko[1,2], Mikhail Bogdanov[1], Daniil Lebedev[1]

[1]National research university "Higher school of economics", Russia; [2]Institute of Sociology of FCTAS RAS

In recent years, along with a general increase in interest in the use of various measures of cognitive load and subjectively perceived mental effort measurement, there has also been an increase in the interest regarding the possibilities of multimodal cognitive load assessment using objective and subjective indicators, including paradata and webcam data, in order to optimize its impact on the quality of survey data. At the same time, the possibilities of relatively new approaches to measuring cognitive load using neurophysiological methods, such as oculography (eye tracking and pupillometry) remain underestimated. Existing quantitative studies of the cognitive load in the course of survey completion and its possible impact on the quality of survey data focused mainly on computer-assisted (CAPI) or paper-based (PAPI) interviewing, while the specificity of the cognitive load which arises in the process of self-completion by respondents with computerized (CASI) and paper (P&PSI) questionnaires remained understudied. The article presents the results of a methodological experiment in which a modified version of the previously used multimodal approach to the comparative assessment of the cognitive load including subjective, neurological and paradata measures of interviewers when filling out paper and computerized versions of the questionnaire was used to assess the respondents' burden. Results of the experiment confirm the hypothesis about the approximate equivalence of the two modes in terms of cognitive load. It also helped to conduct an initial assessment of the technical and metrological capabilities and limitations associated with the use of pupil diameter dynamics' indicators measured using a wearable oculographic device for scrutinizing respondents' cognitive load.

Does Undirected Learning Affect the Accuracy of Ordinary Forecasts: An Experiment in Social Metacognition

Ilya S. Andreev[1], Inna F. Deviatko[1,2]

[1]NRU HSE, Moscow, Russia; [2]Institute of Sociology FCTAS RAS, Moscow, Russia

Can people monitor the errors and correct their lay factual judgments concerning social world when presented with some feedback from their environment? The study touches upon some questions concerning the problem of the reflexivity of ordinary social knowledge which has been at the heart of a recent discussion in cognitive science and sociological research. We present the results of an experiment (n=95) that made it possible to preliminarily clarify to what degree people are able to learn to estimate parameters and, ultimately, to learn probabilistic generative models of the social environment in the process of undirected learning which takes place in everyday life. The detailed analysis of repeated lay estimates obtained for two data sets of mean wages of a few occupational groups – Russian and American – reveals that the observed effects of incidental learning can be influenced by background knowledge about local, in our particular case, Russian realities. In addition, our findings show that the effects of learning might be influenced by other factors: urban (vs. rural) residence and familiarity of format used for presenting examples. Improvement in the accuracy of forecasts can also be a consequence of the ability to extrapolate easily remembered data. The data obtained allow us to conclude that the "illusion of knowledgeability", demonstrated in the earlier study (Deviatko 2012), is not associated with the metacognitive ability to correct one's judgments based on the feedback imitating the episodic "everyday experience".

RN22 | Sociology of Risk and Uncertainty

RN22_T01 | Managing uncertainty amid disaster – insights from comparative approaches

Managing Uncertainty In The Floods Of The Turbulent Mondego River (Portugal): A Comparative Study Of The Causes And Effects Of The 2000/2001 And 2016 Floods And the Lessons Learned.

Noémia Cunha

Miguel Torga Superior Institute, Portugal

Through the comparative study of how it was perceived and managed by the management systems, this communication compares the causes and effects of the 2000/2001 and 2016 floods in Baixo Mondego (Portugal), based on semi-structured interviews conducted. As part of the project to regulate the Mondego River planned in 1962, there was a series of works since the rectification of this river, which was restarted in 1977, to the construction of the Aguieira dam completed in 1981, which, due to the absence of high floods until 2000/2001, gave rise to a false security in these artifacts. With a greater perception of the uncertainty and unpredictability of the risk to be managed in real time, the causes of both floods, and their consecutive episodes, despite common denominators such as high rainfall and discharge from the dam, demonstrate distinctions of interest. Such as the rupture of the dike that supports the river or the inoperability of its fuses in the January 2001 floods or the reverse in 2016, when the causes of January and February in that year differ. Despite the causal differences, any of the floods of these years had similar

socioeconomic impacts with the particularity of the communities more and less affected in 2000/2001, having reversed this order in 2016. Evidencing, on the one hand, learning of the systems with the floods of 2000/2001 and on the other hand, differences in the perception of risk with the greater investment in mitigation in the most affected communities in that year. This communication also aims to describe other lessons, which sought to reduce future loss in the unexpected flood of 2019.

Risk and Gender Roles After a Natural Disaster: the Comparative Analysis of Earthquakes in Chile (2010) and Spain (2011)

Sandra Dema Moreno[1], Ana Gabriela Fernández Saavedra[2], Virginia Cocina Díaz1, Yolanda Fontanil Gómez[1]

[1]Universidad de Oviedo, Spain; [2]FLACSO, Uruguay

788

Recent decades have seen increasing scientific evidence, most of it from English-speaking and Asian contexts, that demonstrates that despite a natural disaster endangering all those who experience it, its impact is not neutral in terms of gender. Gender-roles are present in the lived experience of a catastrophe and may influence the ways in which men and women confront the risk.

This communication is aimed at analysing this issue in a comparative manner in both the Spanish and the Latin-American arena, a geographic space where there is scarcely any scientific production on the subject. To this end, within the framework of the R&D project GENDER (Gender, Disasters and Risks), funded through the Spanish Research Agency (FEM2017-86852-P), eight focus groups were carried out in the localities of Dichato and Coliumo (province of Concepción, Chile) and Lorca (autonomous community of Murcia, Spain) with people who lived through the earthquakes of, respectively, 2010 and 2011.

Preliminary results of the qualitative and comparative analyses of the focus groups suggest that in both scenarios men discourses concentrate on risk more than women, both during and after the earthquake. In addition, the influence of traditional gender roles was observed in terms of the way each gender assumes risk. And finally, when it is women who engage in risky behaviour, there is greater visibility of those acts which

go against social conventions, which may even be censured.

Handling False Information In Emergency Management: A Cross-national Comparative Study Of European Practices

Sten Torpan[1], Sten Hansson[1], Mark Rhinard[2], Austeja Kazemekaityte[3], Pirjo Jukarainen[4], Sunniva Frislid Meyer[5], Abriel Schieffelers[6], Gabriella Lovasz[7], Kati Orru[1]

[1]University of Tartu, Estonia; [2]Stockholm University, Sweden; [3]University of Trento, Italy; [4]Police University College, Finland; 5Institute of Transport Economics, Norway; [6]Salvation Army, Belgium; [7]Geonardo, Hungary

During emergencies, exposure to false information can increase individual vulnerability. More research is needed on how emergency management institutions understand the effects of false information and what are the various approaches to handling it. Our document analysis and 95 expert interviews in eight European countries – Germany, Italy, Belgium, Sweden, Hungary, Norway, Finland, and Estonia – show that approaches vary considerably: some have instituted central management of identifying and tackling false information while others prioritise the spreading of accurate information. A review of national practices and an analysis of recent crisis cases show that both approaches may be necessary. The diffusion of false information is strongly affected by the lack of timely and verifiable information from governments. We also find that in several countries, the emergence of false information is often associated with malicious foreign influence activities. Our study contributes to a better understanding of how the effects of false information are mitigated by the emergency management systems in Europe.

RN22_T03 | Healthcare professionals' negotiating of novelty, uncertainty and risk

Categorizing a Crisis: the Collective Governance of Risk and Uncertainty Through Categorization and Valuation During the COVID-19 Pandemic in the Netherlands.

Bert de Graaff, Sabrina Huizenga, Jenske Bal, Syb Kuijper, Hester van de Bovenkamp, Iris Wallenburg, Roland Bal

Erasmus University Rotterdam, Netherlands, The

789

The COVID-19 pandemic has brought risk and uncertainties to acute care delivery of immense proportion, underscoring the need for the collective governance of healthcare in crisis. Little is known however how collective action is achieved in crisis-situations. Literature points to different logics of crisis decision-making and valuations of what is at stake, questioning (a.o.) the relation between action and cognition. In this paper we aim to discern how concrete practices of decision-making both constrained and enabled collective action of acute care delivery in the Netherlands during the COVID-19 outbreak. We focus on the evolving practices of categorizing and classifying the COVID-19 pandemic, and build on our ongoing action-research of the national and decentral crisis management. We combine multi-sited (both digital and physical) ethnography on the regional level, interviews with key-actors, document-analysis and ongoing reflection with participants. Our analysis focuses on the concrete efforts that our participants put into working with the uncertainties their organization faces, using 'uncertainty work' as sensitizing concept. We discuss how feasible categories and classifications are produced, stabilized or questioned to facilitate (in)action (Moreira, May & Bond 2009), such as the constant (re)modeling of the virus' reproduction number (R), and the phases of the crisis compared to hospital capacity, while participants are confronted with high emotional and temporal

pressures. We point to the need for reflexive and adaptive modes of governance to deal with the high risks and uncertainties posited by the enduring pandemic.

Following Dutch Healthcare Professionals During COVID-19: Risk, Trust And Rituals In Everyday Practices And Coping

Maartje van der Molen, Patrick Brown

University of Amsterdam, Netherlands, The

While the limits of rational-calculative approaches for healthcare decision-making, alongside institutional forms of ritual, routines and hope employed used to deal with these limits, were already described in the 1950s, healthcare professionals' syncretism of rational and non-rational approaches in their everyday work remains a neglected topic in Northern Europe. Using COVID-19 as an urgent problem for healthcare policy and practice, and a natural 'breaching experiment' which disrupts everyday work in ways which help professionals to critically reflect, this article explores how a small, purposive sample of young healthcare professionals in the Netherlands dealt with the uncertainties and risks posed by continued healthcare work amid the pandemic. Analysing qualitative data, collected via online longitudinal interviews among young healthcare professionals, the analysis pays particular attention to: evolving concerns, anxieties and risks faced by professionals; understandings and ways of working with(out) protocols; different logics for handling uncertainty in different situations; how different logics (rational, non-rational and 'in between' rationalities) are combined in different aspects of their work. A key feature of the analysis is the tensions which emerge within these combined strategies and how these relate to broader tensions in terms of the limits of rationality, economic scarcity, work-life experiences, and evidence versus emotions.

Navigating the uncertainties of Next Generation Sequencing in the genetics clinic

Janneke M.L. Kuiper[1], Pascal Borry[2], Danya F. Vears[3,4], Ine Van Hoyweghen[1]

[1]Centre for Sociological Research, KU Leuven, Belgium; [2]Centre for Biomedical Ethics and Law, Department of Public Health and Primary Care, KU Leuven, Belgium; [3]Melbourne Law School, University of Melbourne, Australia; 4Murdoch Children's Research Institute, Australia

Although medicine might be characterised as a quest for certainty, uncertainty too is an integral part of everyday medical practice. This may be even more so in the case of genetic medical practice, especially with the recent implementation of Next Generation Sequencing (NGS) techniques that look at several genes or even the whole exome or genome at once. NGS results often require a complex interpretation and negotiation process involving both healthcare professionals (HCPs) and patients, leaving room for significant levels of uncertainty in several aspects of the diagnostic process. Drawing upon extensive ethnographic research conducted in a Belgian genetics centre, we demonstrate how uncertainty changes in salience and is shaped in response to the various scenarios encountered in the different rooms of the genetics clinic: rooms that are filled with different assemblages utilising different strategies to deal with uncertainty related to NGS. We analyse how uncertainty is experienced and navigated by HCPs during multidisciplinary case discussions, between patients and HCPs in the consultation rooms, and in personal reflections of HCPs when interviewed in their offices. We examine how structure and practice mutually shape each other, for instance by looking at how standards and guidelines (are made to) fit everyday diagnostic practice. We show the impact of uncertainty on communication and decision-making related to diagnostic NGS and highlight the resources that are used to manage uncertainty. In doing so, we seek to further the understanding of the multifaceted process of navigating uncertainty when dealing with complex emerging technologies such as NGS.

790

RN22_T04 | Conceptualising everyday practices in the face of risk and uncertainty

Theorising the Tension Between Habitual and Innovative Risk Taking

Jens O. Zinn

University of Melbourne, Australia

Risk taking has been neglected in the mainstream societal approaches to risk such as the risk society, governmentality, and risk culture while the edgework approach to voluntary risk taking provides only a narrow perspective that neglects the tensions and inequalities in people's everyday life engagement with risk and uncertainty. This presentation further explores theoretical opportunities to conceptualise the (unequal) conditions and motivations of people's risk taking. This presentation explores conceptual opportunities to work towards a theory of risk taking (Zinn 2020). For this purpose it revisits the debate about Pierre Bourdieu's habitus theory and Mary Archer's work on critical realism to explain social change. To overcome limits of these approaches for understanding risk taking the presentation suggests an differentiated approach that acknowledges the reality of different forms of risk taking, and to re-connects risk taking to both the social conditions of risk taking and the varying individual responses to social challenges.

How To Use The Concept Of Practical Wisdom For Empirical Research

Florent Champy

CNRS, France

The Aristotelian concept of practical wisdom (or prudentiality) designates a way of thinking appropriate to face situations of irreducible uncertainty. It aims at avoiding damages. Former research on professional work (health, social work, architecture…), on the precautionary principle and on climate change has shown that obstacles to practical wisdom are widely spread in industrial societies. Actually, practical wisdom's weakness can be documented at very different scales. Two scales will be considered in this presentation. First, based on former research, the presentation will be devoted to explaining what practical wisdom is and how rationalization (in weberian terms) has weakened prudential activities: this is the societal level, at which the difficulties to act prudentially appear as a total social fact. Yet this first use of the concept of practical wisdom is not suitable for empirical research on very precise objects. Secondly, the presentation will propose a way of using the concept of practical wisdom as a tool for further empirical research on various objects. This method is based on the idea that social conditions favorable or unfavorable to practical wisdom are distributed among a large number of objects. Specific research questions and examples of implementations will be presented for several of these objects, notably rules, division of labour and professional training. Finally, I will argue that the benefits in using the concept of practical wisdom for empirical research lie precisely on this ability it gives to make the link between various levels at which obstacles can be seen.

791

Values Of Voluntary Firefighters For (Or Against?) Alternative Futures

Fabienne Seifert

University of Siegen, Germany

In my contribution, I present findings from my qualitative research on voluntary firefighters' routines, situational awareness and social practices. Using the methodology of Grounded Theory, I explore volunteer fire departments in and around a large city in Germany. With a special focus on firefighters' grasp of the underline concepts, I want to approach and reveal the topic of risk and uncertainty. One interesting result from my analysis is their special understanding of the risk they face. They perceive it as very low. I investigate how firefighters experience, deconstruct and downplay various kinds of risks and uncertainties. It is about their subjective views, interpretive patterns, and evaluative strategies which have a certain sense of corporeal-oriented aspects like confidence in comradeship, protective equipment, and operational experience in common which turn out to influence how they deal with risks. I highlight that perceptions of risk change with length of affiliation: Vulnerability changes into a certain untouchability. I reflect on insights from a study with participant observation and qualitative interviews focused on experiences with crises, their dealing with extreme events such as plane crashes, forest fires, floods and their awareness of particular threats. The voluntary engagement, the collective feeling of this social group and the represented values, such as mutual support and help, are key aspects to the question: why do the voluntary firefighters hold on to their community as much as they do? This is why I want to strengthen these virtues for an alternative future in my contribution.

RN22_T05 | Working amid uncertain futures

Russian Youth in the Labor Market: Strategies and Risks for Individuals and Society

Galina P. Gvozdeva, Nina Arsentyeva, Irina I. Kharchenko

Institute of Economics and Industrial Engineering of the Siberian Branch of the Russian Academy of Sciences (IEIE SB RAS), Russian Federation

Drawing up trajectories of behavior in the labor market by the younger generation is largely occurring under the influence of uncertainty of scenarios for the future development of the economy and society both in Russia and in the world. Now we can already establish that for a significant part of Russian youth their hopes for higher education as a guarantee of life success, and future well-being are far from reality. Neoliberal changes in the economy led to a degradation of the social state and to major changes in the structure and characteristics of the labor market that cannot be called development yet.

In conditions of considerable uncertainty, turbulence in society and the economy, the problem of professional self-determination of young people is actualized in terms of minimizing the risks lurking in this process at its various stages. Researchers such as R. Dingwall (2004; 2008) emphasize great importance of well-grounded choice of profession.

In the absence of a clear vector of social policy of state institutions in the field of interaction between the educational system and the labor market, young people (and partially the adult population) build their own strategies of choosing a profession some of which carry considerable risks as opposed to the plans being built. The study of such risks for young people and for society (their classification, social base, assessment of influencing factors, social consequences of their implementation, etc.) formed the frame of our research. The empirical basis of the study is the materials of sample sociological surveys, case-studies, focus-groups obtained with the participation of authors, as well as data from official statistics.

Risk Privatization, Precarization And Lack Of Time

Ieva Dryžaitė

Vytautas Magnus University, Lithuania

The change in work conditions expressed by flexible, less formalized market relationships and growing social insecurity and the decrease in work based social guarantees and support networks affect individuals' relationship to their work. These capitalist developments affected people's private lives including family practices. Precarity that families experience increasingly clash with the idea of good and secure life to which people are still attached. This clash creates both frustrations and new ways of coping with increasingly precarious lives. Because of the shrinking of welfare state and public services every social risk becomes privatized and each family are forced to deal with it individually within the confines of its own resources and capabilities. Families as independent, autonomous and free organizations have to have more inner resources to maintain their needs amidst the conditions and instability and insecurity. One of these essential resources is time which plays an important role in families' precarious lives because it becomes a means of their management and control. At the same time, it is a value unit that generates economic, social and emotional profits. In the era of the expansion of non-traditional work forms, "work time" merges with the time of personal life making individuals to perform a variety of work and family tasks at the same time. It results in individuals' overwork, disappointment, concentration deficit and deteriorating relationships.

In this presentation, author will examine (by analizing national survey and 88 biographical interviews) Lithuanian family lives by using time and risk privatization as a central organizing concept that points to both the ways that family lives become increasingly precarious as well as the ways precarious lives become normalized.

Social Uncertainty and Risk in Work Life in Turkey

Ilknur Ekiz Ataser

KTO Karatay University, Turkey

This research focuses on social, political and economic uncertainties and risks in work life. Based on a field research in industrial companies in Konya/Turkey, I focus on how patterns of work develop on the basis of capital, labor and employment. The central issue in this attempt is to ascertain how industrial workers are influenced by social, political and economic uncertainties and risks. In other words, this study explores how these uncertainties and risks, real or imagined, are reflected in the work life of individuals and shape their agencies in work life. Based on quantitative and qualitative data, the interplay between work life –understood within the context of social relations, class, status, daily life, opinions, attitudes and world views that embody it, and uncertainties and risks– is analyzed. Accordingly, these perceptions and attitudes tend to vary on the basis of gender, marital status, level of education, age, corporate identity, being a blue or white collar worker. Especially, blue collar workers in companies with low corporate identity demonstrate a fatalistic approach to risks and uncertainties. They also tend to engage risks less, like changing job, using bank credit or borrow money. These findings point to the strong persistence of a strong traditional culture and lack of an understanding of risk as a calculable phenomenon. In a broader context, however, perceptions of uncertainty and risk stand out as an important parameter affecting work relations.

RN22_T06 | Risk perceptions and practives -1

Rest on the Verge of Infection: Changes in Tourist Behaviour in Summer 2020 (The Case of Russian Black Sea Coast)

Elizaveta Chefanova, Maksim Markin, Evgeniya Nadezhdina

HSE University, Russian Federation

The research examines the socioeconomic transformations of leisure under the Covid-19 pandemic. Zenker and Kock (2020) suggest many changes in tourist behaviour after the coronavirus appeared. For instance, people may avoid crowdedness because visiting less populated places minimizes the risk of infection. In the same time the reduction in social contacts does not match mass-tourism as a socioeconomic phenomenon (Lash and Urry, 1994). Besides, people are waiting for vacations after the Covid-19 lockdowns that took place in the first part of 2020 in many countries all over the world. The research question is devoted to analyzing how tourists minimize the risk of infection in densely populated sea coasts. The empirical data were collected in August 2020. More than 25 in-depth interviews were conducted with tourists in Russian Black Sea Coast. The results demonstrate that Russians selected domestic over foreign destinations in summer 2020. Although it was possible to have vacations abroad tourists feared to get sick in other countries. The uncertainty of treatments for Covid-19 led to the rise of domestic tourism. Elite resorts attracted people with high socioeconomic status. They were interested in individual tours to get good services and to minimize the risk of infection. In the same time people with middle and low socioeconomic status did not follow the coronavirus restrictions and relaxed after the lockdown. They had been trying to minimize the risk of infection during the previous four months and they wanted to feel free in the summer.

The Relation of Cyber Risks to Traditional Risks: An Experience of Using the Psychometric Paradigm

Kirill Gavrilov[1,2], Maria Butynko[3]

[1]HSE University, Russia; [2]Institute of Sociology FCTAS RAS, Russia; [3]KGU Infogorod, Russia

Our study was based on the "psychometric paradigm" methodology (Slovic, 1987; Slovic, 2000) to analyze the perception of cyber risks. There were studies that had already used psychometric scales to examine the perception of cyber risks (van Schaik et al. 2017; Huang et al. 2010; Garg & Camp 2012). Unlike these studies, we included traditional risks used in "psychometric paradigm" research. Our list of "traditional" risks was related to previous study conducted in Russia (Mechitov & Rebrik 1990; Rodionova et al. 2009) and consisted of 65 items (from natural catastrophes to terrorism). We added the following cyber risks: communication technologies, Internet fraud, identity theft, cyberbullying, hackers, computer games and viruses (Bassarak et. al 2017; van Schaik et al. 2017; Oliveira & Baldi 2019; Huang et al. 2010)

We also made an adaptation of the methodology for online survey with small or absent financial incentive: we applied a split questionnaire design – each participant responded to a subset of the measures, i.e. all risks were evaluated by a subset of scales (see Bronfman & Cifuentes (2003) for similar design).

We collected more than 2000 completed questionnaires. The analysis using PCA technique and cluster analysis showed that computer games were perceived differently compared to other cyber risks. The latter were localized in the area of "unknown" and moderately "dread" risks. Based on the two-dimensional space of risk perception we made a conclusion that cyber risks were perceived in the same way as genetic engineering, radiation therapy, herbicides and pesticides.

Fearless Russian Men: Perceived Safety and Fear of Crime in Russia

Arseny Verkeev

National Research University Higher School of Economics, Russian Federation

Imagine you are walking alone after dark in your local area. How safe do you feel? The response will differ depending on social status, with some groups being more exposed to unsafety than others. This study addresses social inequality in perceived safety and fear of crime in Russia – an area that remains largely understudied. The existing research in Russia is either based on unrepresentative samples or weak question wording. I overcome these limitations by relying on high-quality survey data: ESS and RLMS. Despite the decline of perceived unsafety, the regression analysis shows persisting social inequality: (1) women are more likely to report that they feel unsafe at night in their local area, compared to men; (2) older respondents tend to report higher unsafety than the younger; (3) those who perceive their health as bad, report higher unsafety; (4) recent victimization experience corresponds to higher unsafety; (5) respondents from cities report more unsafety than those from villages, although violent behavior is more prevalent in villages; (6) interaction effects of age and gender provide evidence that while older men feel less safe than young men, there is no such difference for women. This suggests that, all other things being equal, women experience the same level of unsafety at all ages, and that young males are the most privileged in perceived safety. The results favor the vulnerability hypothesis – people who tend to think of themselves as of vulnerable, tend to report higher unsafety.

Multilevel Analysis Of Complex Risk Perceptions In Lithuania

José M. Echavarren[1,2], Aistė Balžekienė[2], Agnė Budžytė[2], Eimantė Zolubienė[2]

[1]University Pablo Olavide, Spain; [2]Kaunas University of Technology

This paper presents a major research attempt for mapping risk perceptions in Lithuania paying special attention to social and spatial factors. Based on World Economic Forum Risk Reports, we analyse public risk perception in five main dimensions: economic, environmental, geopolitical, societal and technological.
Using the data from national representative survey, conducted with 2007 respondents from 60 municipalities (September – October, 2020), we analyse the significance and inter-correlation of macro factors (at the municipality level) and individual level factors explaining the differences in public risk perceptions based on living place of respondents. We introduce the traditional socio-demographic variables considered in the scientific literature: gender, age, education, marital status, number of children, income, and urban/rural place of settlement. Also, we include psychological distance to living place, trust in municipality (Houston et al., 2019) and general social trust (Siegrist, Gutscher and Earle, 2005) as individual level factors. For second level variables we use macro data from municipalities, such as unemployment rate, air pollution, municipality corruption index, Covid-19 statistics, and municipality debt amongst other. As a result, we present and compare multilevel regressions for five risk dimensions.

Examining the Association Between Health Worries and Cannabis-related Risk Perceptions and Protective Cannabis Use Behavior During the COVID-19 Outbreak

Dennis Rosenberg, Sharon Sznitman

University of Haifa, Israel

Purpose: This study examined whether COVID-19-related cannabis use risk perception and health worries are related to reduced sharing of cannabis smoking products in two different periods of the pandemic and lockdown measures imposed.
Methods: The study is based on a sample of Israeli adult cannabis users (N = 759) who completed two online cross-sectional surveys in distinct time periods, six weeks apart. Linear regression was used for the multivariate analysis.
Results: The analysis shows that COVID-19 cannabis-related risk perception was associated with reduced sharing of cannabis products only in the period of strict lockdown. In contrast, COVID-19 health worries were related to reduced sharing of cannabis products in both periods.
Conclusions: The results suggest that health worries represent a constant mechanism by which cannabis users may engage in protective behavior during the current pandemic. Risk communication for cannabis users should be directed towards mitigating the COVID-19 related anxiety and risks.

Exploring the Changing Risk Perceptions of Climate Change Through Threat Multiplier Effects

Bengu Celenk

PhD Candidate at Kadir Has University, Istanbul; Research Assistant at Kirsehir Ahi Evran University,Turkey

Climate is a very complex system consisting of the complicated links between the atmosphere, oceans, lands and their sub-dynamics. In this context, any change in this system brings with it many uncertainties and risks that create security concerns through direct or indirect threats in scientific and social terms. Apart from the direct effects of it in security studies, climate-related threats are generally studied as "threat multiplier" as due to worsening the existing problems. In this context, by using a multilevel security approach, I problematize how security problems and related risks arising from the threat multiplier effect of climate change are interpreted by each referent object levels by establishing the causal chains. In other words, I argue that climate change, which is described as a "threat multiplier" in security studies, creates very different but interconnected risk perceptions for each referent objects. In this regard, I will examine the impact of the climate itself on human security as a security issue in the first stage then I will discuss how basic human security needs that could not be solved at the national level turn into an international security problems. I plan to develop this study within the framework of the risk society approach by addressing the '' Kiribatian Ioane Teitiota case'' which has attracted attention as an international issue from 2013 to the UN's decision on climate refugees in 2020. I chose this country as a case because I consider that Kiribati will contribute relatively more to a comprehensive understanding of climate-related security and risk studies.

796

Locus of Control and Anxiety About Life in Lithuania as a Generational Uncertainty

Apolonijus Žilys

Vytautas Magnus University, Lithuania

Transitions of life events have a well-established tradition in sociology to be researched as sequencing of a life course. Numerous empirical studies showcased how structural and cultural factors come into play with life course phasing and family events throughout a personal life cycle. According to how events happened, they can be normatively classified into disruptive or unplanned, unanticipated, but manageable, or compliant with a personal plan. Hence, a life course can be defined as linked to separate but highly interrelated life domains, and a personal timetable is shaped by multidimensional factors: from individual to structural, from cultural and generational to demographical factors (Huinink, Feldhaus 2009). However, individualization and normative flexibilization of a personal life proposes new ways constructing our life course (regardless of social norms or institutional factors). Individuals are promised to become their own life's masters by composing their own original sequence of life events. Choice biography becomes a desired outcome in comparison to a standardized one, as long as we choose consciously and reflectively. While social institutions transformed into more flexible too, uncertainty and anxiety are associated with biographical choices and timing of those choices. The study operationalizes locus of control as a distinctive variable which can serve as a measurement of uncertainty about life, to whether an individual views internal or external factors as causing anxiety and stress in the events of their life. By employing data of 18–50-year-old Lithuanians (N=3000), data analysis results suggest that [1] certain timings of life events (choice vs. standard biography) are more apparent to certain cohorts, [2] the degree of uncertainty (internal vs. external locus of control) varies across intra-cohort and inter-cohort patterns of life events.

Quantifying Vaccination Risks: A Case Study Of An Unlikely Death

Sorina Vasile[1], Cosima Rughinis[2]

[1]University of Bucharest, Interdisciplinary School of Doctoral Studies; [2]University of Bucharest

The Covid-19 vaccination campaign has brought into the spotlight the importance of government and scientific trust in fighting this pandemic. Risk perception and - more specifically - how people quantify different factors to amplify or reduce the risk experience are essential in the trust/mistrust dynamic.

Individuals perceive risk through socially created lenses that are linked to, but not necessarily defined by the official technical approach that measures risk on the probability and on the magnitude of the unwanted event (Freudenburg, 1988). Risk is experienced through shared processes of interpretation based on values, attitudes, social influences and cultural identity (Renn et al, 1992; Berger & Luckmann, 1966), in which quantification, as production and communication of numbers (Espeland & Stevens, 2008), plays an important role.

Using quantification and social amplification of risk framework (Kasperson et al, 1987) we analyze how vaccination-skeptical and vaccination-trusting discourses commensurate risk and create diverging realities. Our research is based on a case study of media reports covering the death of dr. Gregory Michael following his Covid-19 vaccination. This tragic event set in motion two lines of investigations: one performed behind closed-doors by the authorities, and another one performed publicly by the anti-vaccination activists. Both investigations looked for and counted other adverse effects, and came back with different conclusions based on numbers that are partly shared, partly divergent. While authorities claim that the risk of dying from the vaccine is extremely low, the anti-vaccination groups view the risk as significant.

In this paper, we propose a conceptual framework to analyze how risk is built, quantified and amplified by the anti-vaccination actors in an effort to justify their beliefs and influence public policy.

RN22_T08 | Risk, responsibility and reflexivity amid the pandemic

Is Anyone Responsible? Science and Politics in Times of Pandemic

Maria Grazia Galantino

Sapienza University of Rome, Italy

The complex relationship between science and politics is at the core of the sociological debate on risk and uncertainty. Many authors have emphasized the emergence of a shift from political arenas of decision making to technocratic arenas, leading to the de-politicization of risks. Others have maintained that the opposite trend is also visible, marking a hyper-politicization of inherently contested issues such as risks. This contribution aims to discuss these contradictory but coexistent processes – and their implications in terms of responsibility – in the light of the current pandemic. Undisputedly, scientific and experts' communities play a leading role in dealing with multiple risks generated by Covid-19, earning renewed trust among citizens around the world. Rather than a widespread conversion to a radical empiricist view, though, this process indicates a shift of responsibility towards a scientific arena which is portrayed as neutral if not apolitical. At the same time, the continuous "staging" of science-in-the-making is conducive to the re-politicization of pandemic risks. In the face of uncertain, plural or conflicting knowledge, politicians instrumentally use scientific evidence (or one particular piece of evidence) to back up their political preferences without assuming responsibility for the chosen path of action. Alternatively, as the concept of 'post-truth politics' suggests, they outrightly dismiss scientific knowledge and encourage systematic skepticism or complete indifference to factual arguments.

The continuous fluctuation between de-politicization and hyper-politicization of decision-making to handle risk and uncertainty may produce relations of 'organized irresponsibility', where the Weberian ethic of responsibility for the (foreseeable) consequences of action becomes not only impossible but also obsolete.

The Sources of Uncertainty Communication in the Public Sphere during the COVID-19 Crisis in British and German News Media

Marcus Müller[1], Jens Zinn[2], Sabine Bartsch[1]

[1]Technical University Darmstadt, Germany; [2]University of Melbourne, Australia

At times of crisis such as the COVID-19 pandemic, high quality risk communication is crucial for managing the risks and uncertainties of a little-known threat. Risk communication, however, is not a one-way, top-down activity but a social process. Different social agents including the media and the public are part of it by raising concerns, debating knowledge, highlighting interests, thus negotiating, and constructing social reality.

This presentation reports from a comparative study which uses corpus linguistic tools to examine changes in uncertainty markers in news coverage on the corona crisis and connects them to social conditions and events to better understand which forces have shaped the communication of uncertainty in the public sphere in British and German print news media.

Results show amongst others that communication of disagreement is continuously increasing in the German news in contrast to British news coverage, indicating that reporting on disagreement is much more emphasised in the German press than the British even though the response to the pandemic might be considered more efficient in Germany with lower fatality rates than in the UK. This raises questions such as to what degree public dispute is shaped by institutional context rather than good performance during a social crisis.

An Explorative Study Regarding The Individual Response To COVID-19 Risk Perception - A Social-Cognitive Perspective

Dan Florin Stanescu, Marius Constantin Romascanu

National University of Political Studies and Public Administration, Romania

In January 2020 the World Health Organization (WHO) declared the outbreak of a new coronavirus disease, COVID-19, to be a Public Health Emergency of International Concern. A few weeks later, WHO stated that there is an increased risk of COVID-19 spreading around the world and that it is likely to affect people from many countries.

We aimed to evaluate COVID-19 risk perception through a series of hypotheses drawn from a social cognitive model of individual response to terrorism threat developed by Lee and Lemyre (2009). Perception of COVID-19 on the dimensions of probability, seriousness, personal impact, and coping efficacy was examined as specific cognitive factors, while perceptions of institutional preparedness for COVID-19 were examined as social–contextual factors.

In the current study, data from 127 participants (54 males and 73 females) were used. Results demonstrated that cognitive factors such as probability, seriousness, or personal impact strongly correlates with the affective response, namely worry about COVID-19 infection. Moreover, worry about COVID-19 infection independently contributed to the prediction of behavioral responses, although it is not related to social-contextual factors.

RN22_T09 | Navigating risk discourses in the pursuit of health

Structure and Agency in Health-Related Behavior: Local Rationality of Muscovites Concerning Environmental Risks

Daria Lebedeva

National Research University Higher School of Economics, Russian Federation

799

Over the past decades, the problem of environmental health has gained significant attention in public discussions. Particularly, a significant number of cases of cancer are linked to environmental factors. Some carcinogenic risks associated with environmental factors can be reduced by individuals at the level of everyday behavioral practices, which is actively embedded in the public discourse. Individual's self-care lifestyle is promoted in the rhetoric of the responsible and conscious citizen. Contrary to this discourse, among Russians there is limited reflexivity about environmental health and low proactivity towards minimizations of oncological risks. This is understood and publicly framed as irrationality and irresponsibility of citizens in relation to their health, cancer, as well as the environment.

The given research aims to challenge this claim in the 'structure and agency' framework and show suggest that in the Russian context, the lack of concern about environmental health risks should be considered not as ignorance or illiteracy but as a deliberate strategy, local rationality of individuals in the setting of unresolved systemic basis for proactive risk management, such as the functionality of infrastructure, the orientation of institutions to promote and support agency, socio-political relations of responsibilization rather than control. Based on the data of in-depth interviews with Muscovites, we suggest that individuals evaluate costs and benefits of engaging in personal health-preserving and environmental practices – primarily, efforts and sacrifices needed versus benefits of economic growth and urbanization, time frame and the likelihood of the carcinogenic risks – and make the argued decision to de-problematize environmental health risks.

Online Risk Communication Strategies: Interpreting Governmental Crisis Regulation Measures (The Case of COVID-19 Pandemic).

Efim Fidrya, Olga Fidrya

INSOMAR (Institute for Social Marketing), Russian Federation

This research was aimed at examination of main communication strategies used by those involved into risk communication on the governmental regulations on the management of the adverse aftermaths of COVID-19 pandemics.

We examined the online communication drawing on two theoretical approaches, the encoding/decoding model by Stuart Hall and the concept of the "second order observation" by Niklas Luhmann. From the "encoding/decoding" model point we use to address the structural side of the communication the state bodies produce 'text' (in the form of regulative act or official statement), then informational platforms (like websites or mass media) allow it to circulate and during the online communication this text subjected to decoding and interpretation. In our research we examined how informational platforms code and interpret these regulations (from the 'dominant', 'oppositional' or 'negotiated' standpoint). The way how people interpret online the governmental regulations we studied using the Luhmann's concept of the functionally differentiated subsystems in order to reveal what rationales (e.g. medical, economic, political, social or moral) people use to justify their standpoints during debates.

The dataset of the online comments from the websites and social media was collected and analysed, main communication strategies was determined and classified, and finally the possible corrections to the dominant position assertion strategies were offered.

Following the analysis of the structural and semantic features of the risk communication on the governmental regulations there were main communication strategies in the online communication defined and efficiency of the justification rationales was assessed (assertion of the 'dominant' text decoding position).

Social Inequality, Vulnerability and Sustainability in the Coverage of the Covid-19 Pandemic in Swedish Mass Media 2020

Katarina Giritli Nygren, Maja Klinga, Anna Olofsson, Susanna Öhman

Mid Sweden University, Sweden

The Covid-19 pandemic is a multi-hazardous risk with disastrous consequences, considering that the pandemic has compounding effects on climate-related, economic and social domains, and we are now witnessing the pandemic widening socioeconomic inequalities around the world with unprecedented consequences (UNDRR, October, 2020). Compared to many other countries, Sweden has managed the COVID-19 pandemic with less regulation and more voluntary action expected of citizens and organizations based on recommendations. In this article we discuss the implications of this risk management strategy from the perspective of who is defined (or not) as vulnerable and with what consequences for the moralization and normalization of everyday-life. As an empirical example we use crisis narratives in news articles. Crisis narratives are seen here as performative and governing to the extent that at the same time as a narrative is expressed, for example that Swedish preparedness is poor, this crisis is also created. We investigate media coverage of Covid-19 by three Swedish newspapers; Aftonbladet, a national tabloid, Svenska dagbladet, a national morning newspaper, and Dalademokraten, a regional morning newspaper, during 2020. We combine descriptive analyses of the development of the crisis narratives with analyses of how these narratives become performative, targeting the effects of the narratives and the forms of governance they promote.

RN22_T10 | Agency and (not) coping amid risk and marginalisation

Socio-Cultural, Economic and Spatial Dynamics of Substance Abuse in Convict Narratives

Gönül Demez[1], Meral Timurturkan[2], Tuğçe Tunca[1], Bahar Özkan[1], Selim Cankurtaran[3], Damla Tanal Tatar[1]

[1]Akdeniz University,Turkey; [2]Burdur Mehmet Akif Ersoy University,Turkey; [3]Minister of Justice,Turkey

The aim of this study is to reveal sociological dynamics related to substance abuse on the basis of the narratives of the sentenced individuals involved in crime because of substance abuse in Antalya Probation Office, Turkey. Associating the crime in Antalya especially with the certain regions of the city and the existence of urban spaces stigmatized in connection with deprivation and poverty make the debate meaningful. This situation makes it necessary to discuss addiction together with its socio-cultural, economic and spatial dynamics and to offer solutions related to these dynamics. The study in question has been prepared based on the first evaluation of the field notes and findings of the research project numbered 218K151 and titled as Socio-Cultural, Economic and Spatial Dynamics of Substance Abuse in Convict Narratives supported by TÜBİTAK (The Scientific and Technological Research Council of Turkey).

The subject will be discussed paying regard to perceptions and definitions of the individuals about social integration and social exclusion, being stigmatized and social norms. Thereby, addiction experiences of the individuals who turned into crime due to addiction, their ways of interpreting these experiences and their approaches to crime and criminality will be taken as a basis. From this point of view, this study aims to reveal their ways of positioning themselves in the society, their relations and perceptions regarding the rest of the society and institutions. These descriptions and findings will also help reveal the social meanings attributed by the individuals to their actions, and legitimization processes.

(Non)Agentic Refugees in the Mirror of Supporting Institutions: the Role of Agency in the Functioning of Refugees from Chechnya in Poland

Patrycja Ziółkowska

University of Warsaw, Poland

Refugees face many difficulties in receiving countries. Therefore, it is important to understand what psychological and social factors influence their functioning and what helps to improve their situation. Hence, the main goals of presented research are: answering the question on the role of a sense of agency in the functioning of refugees, on the example of Chechens in Poland; identification of effective methods of enhancing refugees' agency; integration of psychological and sociological theories of agency (Margaret Archer's theory of agency and structures and the Dual Perspective Model of Agency and Communion of Wojciszke and Abele). The research includes semi-structured expert interviews with people who professionally work with refugees. Data collected in interviews so far, indicate that, by supporting organizations and public administration, refugees from Chechnya are being perceived as non-agentic migrants, who form closed groups that are socially inactive. At the same time, the system of admitting refugees firstly deprives them of agency and then requires it, which makes refugees helpless and strengthens the psychological barriers of agency. Also, analysis suggest that a sense of agency may increase as a cause of obtaining help, refugee status or helping someone else and may be strengthened by education and support.

In general, the interviews conducted so far, indicate the key role of agency in the functioning of refugees, but also the existence of a loop of the lack of agency: refugees are perceived as non-agentic individuals who need help, the state deprives them and then demands the agency, such situation increases helplessness, and, as a result, refugees hand over agency to more agentic and experienced people, which makes them even more non-agentic and perceived as being such.

801

Achieving Certainty Through Higher Education: The Case Of The Golan Druze

Yasmin Barselai-Shaham[1,2], Orr Levental[1], Anat Kidron[1]

[1]Tel Hai College, Israel; [2]Shamir Research Institute, Haifa University

The series of civil uprisings known as the "Arab Spring", which created instability in the Arab regions of the Middle East, had also affected the internal dynamics of Israeli Arabs. One of the Arab communities that have hardly been studied so far is the Druze community of the northern Golan Heights. Their isolated location within Israel, adjacent to Syria their country until 1967, placed them at a strategic junction, when both countries are fighting for their civic loyalty.

One of the levers that Syria used in its struggle for loyalty was higher education, which was given to members of the community for free and with almost no admission requirements. However, since the outbreak of the Syrian civil war on 2011, there's been an increase in the number of students studying in Israel.

This study argues that the community's current educational preferences constitute a pragmatic attempt to produce certainty within a reality characterized by uncertainty and lack of control, both at the political-national level and at the personal level. The basis for the proposed presentation is an empirical study that included 30 semi-structured interviews with members of the community who had acquired their academic education at nearby Israeli academic institutions. The interviews, which dealt with the considerations that led to that educational decision, reveal a strong desire to achieve personal, social and economic certainty and safety, which the members of the community seek to achieve through the acquisition of higher education.

RN22_T11 | Exploring young people's responses to risk and uncertainty

Greek University Male and Female Students During the Pandemic: a Sociological Approach of Their Interpretations Within a Game of Constructions, Refutations and Re-adaptations.

Evaggelia Kalerante[2], Lela Gogou[1]

[1]Western Macedonia, Greece; [2]Western Attica, Greece

802

This qualitative research aims to highlight, interpret and develop deep understanding about the views of male and female university students regarding the Pandemic effects on their social self. The capacity of male – female student is directly related to the concept of structure – University in terms of knowledge acquisition, social action, occupational choices and social definitions. At a fist level, the socio-political and educational thematic units are classified in six categories that seek to answer crucial questions about: a) everyday life – habits, b) the University space, c) distance education, d) interpersonal relations, e) policy and f) occupational goals. At a second level, certain issues of juvenile culture are showcased in which the University is defined as the place where the action – structure relation is formulated. The student sample consists of freshmen, sophomores, underclassmen, undergraduate and postgraduate students. Their selection was based on the different socio-cultural background in which the male and female students' relations with the University space are evolving. Hence, the differentiations can be approached in a compositional manner. The key notion is the comparison of University life prior to and during the Pandemic. This way, the changes, transformations into new facts and processes of internalizing the new conditions can be underlined. This research also provides the possibility to criticize political systems, social structures and broader choices of the acting social subjects of our sample from a different perspective. Studying the University space can also be conducive to showcasing broader issues of

functions – dysfunctions, actions and reactions amid a transitional period for University education.

Young People's Narratives Of The Lockdown In Italy: Strategies To Cope With Uncertainty

Daniela Cherubini, Sveva Magaraggia, Stefania Voli

University of Milano-Bicocca, Italy

The Covid-19 pandemic can be read as a moment of materialization of global risks (Beck 1999), which as such makes evident - to the subjects' eyes as well as in the public discourse - the interdependent character of our lives and the condition of vulnerability that binds us to others on a global scale (Butler 2003). In this paper we explore the responses to this situation among young people living in Italy (23-29 years old), based on the analysis of 62 semi-narrative interviews which are part of the first wave of the longitudinal study on life courses "ITA.LI - Italian Lives". The interviews were collected during the first lockdown set by the Italian government and in the following weeks of partial re-opening of the social and economic activities (March - June 2020). We focus on the subjective experience and the strategies elaborated by young people with different profiles, to cope with the condition of extreme uncertainty that accompanied the first months of the pandemic. These coping strategies speak of the agentic capacity of young people and their ability to handle the crisis, and at the same time they also reveal the unequal distribution of cultural, material and personal resources that young people may mobilize to face what constitutes a "turning point" (Thompson 2011) in their biographies.

Trust in Communicative Action: Co-creating Policies Addressing Health Risks with Youth in the Netherlands and Norway

Gerlieke Veltkamp, Evelyne Baillergeau, Christian Bröer, Patrick Brown

University of Amsterdam, Netherlands, The

The use of participatory methods and action research with politically underrepresented groups, in our case young people, when addressing social and health risks is increasingly valued in social sciences as well as in policy domains. In this article, the co-creation of health policies with young people is approached as 'communicative action', following Habermas. We analyse communicative action between young people and actors of different proximity: peers, young co-facilitators and researchers facilitating young people in doing participatory action research. Our analysis first explores to what extent levels of trust, solidarity and 'being on the same page' develop, between whom, and under which circumstances. We then ask if and how communicative action and trust serve as a basis for youth engagement and the development and dissemination of health policy ideas by young people. This analytical approach sensitises us to forms of strategic action and instrumental organisational logics which may impede, warp or colonise these communicative processes. Our research is based on structured field notes from observations of 6 youth alliances, involving 75 young people in total, in the Netherlands and Norway, who were facilitated by our research teams over a period of 10 months in 2019-2020.

RN23_T01 | Sexuality, gender and education

Sexual Education, Sexual Pleasure and Sexual Violence: A Case for Considering how a Focus on Gender and Queer Theory can Aid Understandings of the Hidden Inequalities and Challenges Faced by Individuals with Learning Difficulties

Louise Couceiro

University of Glasgow, United Kingdom

Historically, 'people with learning difficulties have been ascribed many different identities […] They have been portrayed as asexual and as sexually promiscuous; as dangerous/innocent; in league with the devil/a gift from the angels and so on' (Stalker 2012: 127). This paper focuses specifically on infantilising discourses, predicated on the notion of childhood innocence. These pervasive discourses are bound up with some of the most oppressive, under-researched inequalities and challenges that individuals with learning difficulties face within the sphere of sexual experience. Discussing inequalities within three distinct areas: sexual education, pleasure and violence, I suggest that a focus on gender is vital to understanding these hidden inequalities and challenges. Further, that drawing on a particular body of work within Queer Theory – queer theorising about the Child (Stockton, 2009) – provides a clear and comprehensible platform for exposing and confronting these inequalities. Stockton explains how, from adult perspectives, children are often 'seen as normative [as straight] but also not like us, [as asexual and innocent] at the same time' (2009: 30-31). Her theory of 'normative strangeness' provides a lens for understanding how individuals with learning difficulties are considered to be simultaneously asexual and heterosexual. This can have horrifying consequences, including surveillance and regulation of individuals' sexual desires and practises, lack of education on reproductive and sexual health, and higher risks of sexual exploitation and abuse.

A Discussion of Findings From a Discourse Analysis of the New Relationships and Sex Education Guidance.

Rosie Macpherson

University of Surrey, United Kingdom

In September 2020, Relationships and Sex Education (RSE) became a compulsory component of the National Curriculum for secondary schools in England. To support schools in this change, the Department for Education issued schools with an updated version of RSE guidance. The new guidance has made attempts to include topics dismissed in previous versions, such as more detailed advice on incorporating gender and sexuality in RSE. My doctoral research is focussed on examining this change and the bridge between policy and practice using multiple methods. As well as a discourse analysis, data will also be collected using and online survey and interviews, with a sample of secondary school faculty and independent RSE company staff. This research is grounded in Foucault's knowledge/power theory as well as considering the theories of liberating education put forward by Paolo Freire and bell hooks. This presentation concentrates on findings form the discourse analysis, that aims to understand how the current RSE guidance has made attempts to include LGBT topics and how the language used in the guidance allows for this change to occur. The analysis will also examine how the language used may create variances in RSE delivery across England. The discourse analysis is important to understanding what RSE looks like in policy. The survey and interviews will develop an understanding of RSE in practice. Using these methods will shape an idea of how policy and practice come together to create effective and inclusive RSE provision moving forward.

804

Is Learning About Sexuality In Secondary School Important For Young Trans People?

Sophie Jane Atherton

The University of Manchester, United Kingdom

In the UK, legislation states that pupils must learn 'about LGBT' as part of their relationships and sex education (RSE) (Department for Education, 2019). However, as Formby and Donovan (2020) state, the Department for Education gives little guidance on how exactly this should be taught. Drawing on recent fieldwork conducted in 2020, I consider if and how transgender students learned about sexuality in school and what this may have meant for their school experience overall. This research was conducted as part of my doctoral project which investigates transgender individuals experiences of UK secondary schools and involved research with both teachers and young trans people themselves. Although some young trans people had left school before the UK legislation regarding relationships and sex education came into effect, I nevertheless draw on their accounts to discuss why learning about sexuality is particularly important for transgender students and the risks of not offering this education. I also consider how the 'T' (transgender identities) are represented at school in order to argue the case that LGBT education in school should be inclusive of all sexualities and genders.

RN23_T02 | Queer Lifespan: Life Course Inequalities amongst LGTBIQ+ citizens in Europe

Queer Lifespan: Life Course Inequalities amongst LGBTQI+ citizens in Europe

805

Queer Lifespan: Life Course Inequalities amongst LGBTQI+ citizens in Europe

The CILIA LGBTQI+ Lives project explores what structurally produced and subjectively experienced in/equalities impact upon LGBTQI+ citizens in four European countries (England, Scotland, Portugal and Germany) focusing especially at three key points of transition in the life course: school to work; mid-life; and the transition into retirement and later life. In this Panel session we discuss key themes emerging from over 150 qualitative interviews, focusing particularly on the complexity of in/equalities in a range of relationships and contexts as well as their intersectional and negotiated qualities.

The Panel includes 4 presentations:

1.Legacies, tensions and trajectories in educational policy and practice: From Section 28 to LGBTQ+ Inclusions? By Yvette Taylor and Matson Lawrence, Strathclyde University, Scotland

2.Queer(y)ing working lives –policies, practices, and the complexities of identity management. By Andrew King and Matthew Hall, University of Surrey, UK

3. Mind the gap: Ageing, diversity and equality amongst LGBTQI+ older adults. By Ana Cristina Santos, Centre for Social Studies, University of Coimbra, Portugal

4.Fragile Citizenship: LGBTIQ citizens growing old in (un-)certain times. By María do Mar Castro Varela and Yener

Bayramoğlu, Alice Salomon University of Applied Science, Berlin, Germany

RN23_T03_01 | Intimacy, Sexual Identities and Social Attitudes

Holding Hands: Queer Relationships and Experience of Pride, Shame and Protest in Everyday Spaces

Roisin Ryan-Flood, Rohleder Poul

University of Essex

Many LGBTQ individuals grow up with a sense of being 'other' in a heteronormative society. This is not just an internal psychological experience, as many LGBTQ individuals report being recipients of hostility, victimisation and harassment. Interpersonally, homophobia and transphobia (both actual and fear of) may play out between partners and inhibit partners from commonplace displays of affection (e.g. holding hands in public). Holding hands in public, a taken-for-granted act of interpersonal affection for many heterosexual couples, may carry particular anxieties and/or significance for LGBTQ partners. Holding hands may be experienced with feelings of anxiety, shame and fear, or, conversely, may be regarded as a significant and meaningful act of pride and/or resistance. To explore participants' personal experiences of this, the project is utilising a participatory, creative research approach. The project involves the following components: Study participants are invited to produce images (e.g. photographs or drawings) that symbolise and represent their experiences, and to use these images as a point of discussion in individual interviews. Further data is also being collected by inviting participants to conduct audio-recorded friendship conversations with a close friend about this topic. This seminar will present some preliminary findings from this research, which is funded by the British Academy.

Workplace Social Inclusion of Lesbian, Gay and Bisexual Employees: Approaching Professional Image Construction Through Voice and Silence

Christiana Ierodiakonou, Andria Christofidou

University of Cyprus, Cyprus

We focus on the workplace social inclusion of lesbian, gay and bisexual (LGB) employees and on the professional image construction strategies they use in order to feel included in everyday organisational life. We propose analysing professional image construction over one's career through the concepts of voice and silence to move towards deeper interpretations of the inclusion of 'Others' in the workplace.

Membership in a stigmatised social group may mark individuals as 'Others', with all the personal and organisational consequences that come from such exclusion. When socially marked as 'different,' individuals are more likely to engage in professional image construction, trying to present themselves in 'appropriate' ways to affect others' impressions. The growing literature on professional image construction suggests that this is a continuous experimental process (e.g., Ibarra, 1999; Pratt et al., 2006), but offers limited insights to understand how (stigmatized) social identities affect it. Research on the strategies that LGB employees use to affect others' impressions of them at work is useful towards this respect, but also has shortcomings.

We rely on qualitative life-course interviews with LGB individuals working in Cyprus. So far, we have analysed the trajectories of 20 individuals, involving a total of 61 work settings, through the concepts of voice and silence. We conceptualise different types of voice and silence that are fluid and can coexist, offering thus a complex understanding of LGB image management strategies. Based on these, we contemplate on the associations among voice, silence, inclusion and exclusion and frame our discussion within theories of agency and structure, helping move relevant research from surface to deeper interpretations that relate to the critical analysis of underlying processes and normative assumptions.

806

LGB People Doing Gender and Sexuality (At) Work: Reflexivity, Habitus and The Body

Andria Christofidou, Chrstiana Ierodiakonou

University of Cyprus

In heteronormative, traditional, and religious settings, lesbian, gay and bisexual (LGB) individuals are often at disadvantage, negotiating their position as professionals vis-à-vis their non-heterosexual identities (Rumens and Kerfoot, 2009). Despite the growing body of research focusing on LGB employees, the ways they manage their presentation of self, and their inclusion in organizational life, little attention has been given on bodies, habitual acts, and the ways these may restrict the conscious management of gender and sexuality at work. With this work we contribute to this literature, as well as debates concerning habitus, reflexivity, embodiment, and the ability to actively manage gender and sexual orientation acts in the workplace.

We rely on data, which emerged through interviews with LGB people working in Cyprus, a context that remains controlled by religious discourses and is strongly oriented towards family formation and marriage, thus Othering non-heterosexual people. We draw on Adams' (2006) notion of 'reflexive habitus', which we expand to argue that said Otherness encourages LGB people to consciously reflect on, and scrutinise aspects of themselves in the professional sphere, where notions of professionalism dictate how people should look and act like. We approach self-reflexivity as part of LGB people's habitus. Yet, we argue that gender and sexuality are also embodied, and demonstrate how this restricts individualized opportunities for conscious control and active management of gender and sexuality acts.

This analysis emphasizes the multi-dimensional functioning of human agency and the complexity entailed in understanding how conscious reflexivity may be used towards transgressive acts alongside the effects of habitus, which can set limits to transgression.

Social Attitudes Towards Gays and Lesbians Measured in the Latest ESS Rounds

Gregory Alexander Swart[1], Judit Takács[2], Ivett Szalma[2]

[1]University of Glasgow, United Kingdom; [2]Centre for Social Sciences

Our study examines social attitudes towards lesbians and gays, using data from the 8th and 9th rounds of the European Social Survey, focussing primarily on three relevant variables. Since 2002 for the first seven ESS rounds, the core module of the main questionnaires included only one general acceptance question. However, it was increasingly difficult to measure manifestations of 'modern homonegativity' – especially in European societies characterized by relatively high levels of social inclusion – with only one variable. Introducing two additional variables (If a close family member was a gay man or a lesbian, I would feel ashamed; Gay male and lesbian couples should have the same rights to adopt children as straight couples) to the ESS core module in the 8th round made it possible to construct a more complex and reliable picture on different dimensions of social attitudes towards gays and lesbians in Europe.

Our empirical analyses are based on descriptive statistics and linear as well as multilevel logistic regression models, using data from 20 countries that took part in both the 8th and 9th ESS rounds.

Our aim is to contribute to the European literature on the social acceptance of lesbian women and gay men by comparing all three variables (B34-35-36) not only on the basis of the usual socio-demographic variables (such as age, gender, education, religiosity etc.) used in previous empirical analyses but also the institutionalized possibilities for family formation by same-sex couples in the 20 examined societies.

RN23_T03_02 | Activism, Rights and Sexuality

"We Are Talking About A Branch Of The Tree" – Transcending Identity-Related Sexuality Discourse In Positioning Consensual Non-Monogamies' Activism Through Intersectionality

Christian Werner Klesse[1], Daniel Cardoso[1,2]

[1]Manchester Metropolitan University, United Kingdom; [2]ECATI, LUSOFONA University

Over the past decade new identities and intimacies related to Consensual Non-Monogamies (CNMs) have garnered particular social attention, but still remain under-researched. In the context of the EU-funded CNM-MOVES research project, we explore to what extent these "fraught intimacies" (Rambukkana, 2015) articulate themselves within established sociopolitical frameworks (such as for example "LGBT rights" or intimate citizenship (Plummer, 1995)) through interviews and focus groups with CNM activists, and materials produced by activist groups, in Portugal and the UK.

As we will show, no singular discourse underpins CNM activism in these countries. We suggest that there is a multiplicity of approaches and trends that are all marked by an integrative effort to inscribe CNMs and relationship orientations and configurations in the field of either sexual politics or – alternatively – more holistic political frameworks. On the one hand, we can see that CNM activism seeks to normalize itself as an unremarkable element within a frame of relational and sexual diversity. This approach mirrors LGBT and other identity-based citizenship-focused approaches. On the other hand, CNM activists frame their own issues as part of a much wider system of power imbalances, which are intrinsically connected – not just to sexuality, but also to race, class and especially to questions about ecological and environmental justice.

In these cases, CNM activism is then heavily reliant on an intersectionality-based framework that encompasses the human and the non-human in imagining possible new worlds, inscribing itself into broader counterhegemonic struggles, rather than emphasizing its own autonomous importance. We can thus identify a potential of CNM activism to bring to the fore new alliances and to destabilize identity-based conceptualisation of the sexual and the political.

Conservative And Proud: How Right-Wing Gay Activists Are Rethinking Gay Identity In Contemporary Brazil

Rodrigo Cruz

Universidade Nova de Lisboa, Portugal

This paper is supported by an ongoing thesis research, which investigates the political activism of individuals who simultaneously identify as homosexuals and right-wing in contemporary Brazil. By examining the case study of three activists, I analyze how these individuals reconcile, between public and private spheres, these apparently contradictory political and sexual identities. My central hypothesis is that political engagement in conservative circles allows actors to reframe a multiplicity of incongruous socializing experiences such as the discovery of homosexual orientation, class belonging, religious practice, their relationship with the family, isolation from peers, and an individual de-identification with both a proud gay identity and the political rhetoric of LGBTQI + movements. Thus, the "political coming out" and the entry into a moral community guided by values such as family, tradition, and nationalism does not imply a return to the sexual closet, but an elaboration of new political definitions around gay identity, with implications both to the public (activist practice) and private sphere (production of subjectivities, interpersonal relationships, and life projects).

The Wave Of Activism: A Comparative Study Of Sex Work Activists Of Dublin and Delhi

Akangshya Bordoloi

Maynooth University, Ireland

How women tell their stories is changing. Women deemed sexually transgressive from the Magdalene Laundries to the metoo movement have struggled to let their voices heard and believed in the public sphere. A 'third wave' of feminist activism is changing that. This new wave is less reliant on non-governmental organisations, journalists or academics to mediate women's stories, and are now told directly, often through digital media. Using this framework, this project tells the stories of one group of women-sex work activists in two jurisdictions, Dublin and Delhi. The project explores how they navigate this climate of storytelling. Often infantilised as objects of rescue, this project explores the impact of this stigma on their access to health and justice by providing alternative strategies. This comparative study will provide an opportunity to explore the two cities with a shared sexual colonial legal history where stigma and precocity (migration, economic and morality) remain important impediments to feminist mobilisations. The primary research method will be ethnographic and biographical. The project focuses on the biographies of activists while documenting encounters with key stakeholders (politicians, law, health service agencies) in promoting equal access of harm reduction, health and protection under the law in both jurisdictions. The research will contribute to understanding the relationships between sex work activists and key actors in civil society under a regime of criminalisation, as progress is made in developing initiatives towards peer-led health services and police liaison. This might eventually lead into the possibility of a global solidarity of sex work activists through the digital space and contribute towards existing literature and assist in the development of new strategies to address the issue.

New Skin for an Old Ceremony - The Gay Revolution and the Formation of Israeli Heteroactivism

Leehee Rothschild

Manchester Metropolitan University

Heteroactivism is a term that refers to new forms of resistances to sexual and gender reforms that move from the vilification and pathologizing of past anti-gay activism to the promotion of heteronormativities as morally superior to other gender and sexual identities and consequently as best for society (Browne & Nash, 2017). In this presentation I argue that heteroactivism is a useful prism to analyse recent changes in the resistance to sexual and gender rights and reforms in Israel. I show how several new organisations – LIBA (Jewish Core in the Holy Land), Boharim Bamishpacha (Choosing the Family), Shovrut Shivion (Women Smashing Equality) - of the Religious Zionist right have started to employ heteroactivst discourses and practices. I attribute this to the increasing acceptance of LGBTQ people in Israel, especially within the right wing and religious publics, in light of heteronormative and homonationalist trends.

In order to do so, I am examining as case studies the resistances to two academic conferences 'Issues in Therapy with Polyamory' and 'It was the Best of Times, It Was the Worst of Times – Queer Utopias in Israel', both of whom had taken place in Bar Ilan University, in February and December 2019, accordingly. My analysis is based on participant observation, field notes and textual analysis of media and social media publications.

As a Jewish country, Israel serves as an interesting case in the study of heteroactivism, which has thus far only been examined in Christian contexts. Thus, I also address the intersection between heteroactivst terminology and Jewish religious terminologies that continue to exist alongside them.

RN23_T04_01 | Sexuality and Desire during the Pandemic

Illegitimate Intimacies: How the COVID-19 Pandemic Regulations Shaped Alternative Sexual Ways of Being

Barbara Rothmüller, Emelie Rack

Sigmund Freud University Vienna, Austria

Be it the syphilis pandemic, AIDS, or COVID-19, people have regularly pointed towards irresponsible sexual behaviour to explain viral outbreaks and attached stigma to sexual minorities. To mitigate the COVID-19 pandemic, Austria and Germany imposed distancing regulations that privileged the cohabiting couple and delegitimised non-hegemonic sexual and romantic arrangements. Yet, despite the extensive biopolitical intervention of distancing regulations targeting the intimate life of populations in the past year, the sociological study of these transformations remains under-explored.

Collaborating with researchers from the Kinsey Institute, Indiana University, US, and the Meiji University, Japan, the interdisciplinary research project „Intimacy, Sexuality and Solidarity in the COVID-19-pandemic" applies a mixed methods approach towards the study of sexual practices, social isolation, concealment, and pandemic moralities. Two online surveys were conducted in Germany and Austria in April 2020 (N=4706) and November 2020 (N=2569). Additionally, 15 qualitative interviews are conducted in 2021.

Results show that skin hunger was a widespread experience during the lockdown. Coping with touch deprivation, some participants started to develop alternative ways of lived sexuality, such as enhancing varieties of cybersex, changing routines of dating, and monogamising relationships. Polysexual and polyamorous respondents suffered from an intensified moral labour of stigma management. 14 percent of sexual minority respondents experienced exclusion during the pandemic, at a time when they were increasingly isolated from their communities.

The presentation contributes to the discussion of biopolitics by providing insights into how the pandemic norms of distancing, sexual restraint and mono-normativity are redistributing privilege in the context of state-sanctioned heteronormativity.

Shifting the 'normal' in Sexual Regimes: On De-/dramatizations and Re-/normalizations of Sexuality in a Pandemic (the German Case)

Paula Irene Villa[1], Elisabeth Tuider[2]

[1]LMU Munich, Germany; [2]University Kassel, Germany

Our paper questions contemporary (corona-related) reconfigurations of the sexual in order to explore the shifts within the sexual normality continuum.

In recent years, gender, queer and sexuality studies have observed shifts in the continuum of normality, particularly with regard to sexuality among youth. Whereas Rubin (1992) had distinguished 'good sexuality' from 'bad fringe' sexual activities and forms for the mid-1980s, the contemporary heteronormativity regime has changed, and so have regimes of kinship and sexuality. Our paper deals with the shifts in the sexual normality regime on the basis of two research areas: First, we take a look at the empirical status quo of sexual norms and practices on the basis of a quantitative online survey of teenagers and young adults in Germany (as part of the project "Safer Places", funded by the German Ministry of Education and Science). One interesting finding is that the norm of monogamy as frame for sexuality is just as much a part of sexual normality as are masturbation, and digital sexual practices (such as sexting, porn, etc.). Many previously marginalized, shamed, policed, even criminalized sexual forms such as solo- sex, kink, BDSM, and online sex have, we suggest, become de-dramatized, perhaps even normalized. In a second step, we connect these shifts to the specific contemporary moral panic in Germany which evolves around the sexualization of (anti-)migration politics. Using the concept of 'ethnosexism' (Dietze 2016 et al), we will analyze how the sexualization of ethnicity and the racialization/nationalization of sexuality play out as a larger moral framing of sexuality in Germany.

"But for us It's Our Life!" – Queer Utopian Imaginaries in Times of Pandemic

Miriam Friz Trzeciak1, Mart Busche2

1BTU Cottbus Senftenberg, Germany; 2ASH Berlin

Our paper addresses the question of how queer subcultural articulations in audiovisual media – produced during the first wave of the Covid19 pandemic – negotiate the question of a "liveable life" (Butler 2009). As queer authors have shown, the emergence of queer spaces can be related to alternative forms of temporality and spatiality, "about where to live, how to live and how to recraft relationality itself" (Halberstam 2005: 152). Due to heteronormative measures in order to tackle Covid-19, many of these queer forms of spatiotemporal organization have been shut down.

Using the Sociology of Knowledge Approach to Discourse (Keller et al. 2018), we analyze how processes of meaning-making during the pandemic invoke imaginaries of "queer world-making" (Muñoz 2009). Drawing on the theoretical work on queer utopias (Muñoz, Halberstam et al.), we understand articulations on queer subcultural spaces as negotiations to think and feel 'other' forms of temporality and spatiality, thus involving the potential for a queer futurity in the 'here and now' during Corona. Unfolding specific subject positions and interpretative schemes offered in mediatizations of three queer subcultural spaces in Berlin, we show that heteronormative logics of pandemic control do not only perpetuate processes of marginalization and isolation for queer people. Rather, in the context of (temporary) loss and queer utopian memory-making, knowledge formations on subcultural spaces are renegotiated and new visions of queerness are mobilized. Likewise, we show that queer configurations do not only offer ways for making everyday life more liveable, but also reproduce different forms of exclusion.

All Fun and No Protest: Covid19 Influence on the Israeli Gay Bear Community

Ami Pomerantz

Ben-Gurion University of the Negev, Israel

The gay 'Bear' sub-culture challenges the mainstream gay male ideal of beauty. It promotes an inclusive gay community that acknowledges the beauty in fat and hairy men. Yet, the Covid19 crisis has significantly diminished the Bear community's ability to provoke and challenge the hegemonic gay mainstream.

Since the 1980's fat (L)GBTQ men and their admirers have gathered to form local Bear communities all around the world. The Bear sub-culture, much as other minority social movements, adopted two modes of action: the separatist and the provocative. The separatist mode is intended to promote body pride and develop the bear identity within the community, while the provocative mode aims to penetrate hegemonic gay spaces and oppose the oppression fat gay men suffer there.

I examined the influence of the covid19 pandemic restrictions on the Israeli bear community, which I am a member of. Unsurprisingly, I discovered that most physical spaces the bears had founded for themselves had come to a halt due to social distancing measures. On the other hand, new virtual bear spaces had emerged. I argue that these changes shift the Israeli bear community towards the separatist mode, causing it to be less oppositional.

This shift happens because the separatist mode existed in virtual spaces long before the pandemic, and had developed its online repertoire, building on the general online tendency towards segregation. Meanwhile, the provocative mode that operated in physical spaces, fails to reinvent itself in the newly enforced virtual existence.

Queering Illness and Disability

Expanding Sexuality Knowledge Across Disabilities: An Intersectional Framework

Julia Bahner

School of Social Work, Lund University, Sweden

It is no longer possible to state that there is a lack of knowledge about sexuality and disability: for the past two decades this interdisciplinary and intersectional field of study has grown and deepened – made especially visible with the publication of the new Routledge Handbook of Disability and Sexuality. What is still missing though, are studies across disabilities. This is needed for two reasons: firstly, to expand the narrow scope of knowledge that results in specialized conceptualizations of disability and sexuality which risk leading to missed connections across experiences; and secondly, to expand what sexuality can entail, specifically from an intersectional perspective. Because while research about disability-specific experiences is needed to qualitatively understand certain standpoints, I will argue that it is time to broaden the perspective in order to see the many commonalities that exist independent of disability category – as well as among people living with same types of disabilities. These commonalities most notably include social, cultural and political limits to sexual bodies and minds that are perceived as non-normative and outsiders in Gayle Rubin's charmed circle. My paper will discuss these points by drawing on preliminary results from a current research project in Sweden which explored the lived experiences of 50 people with various disabilities and the barriers they face in achieving sexual health and wellbeing. I propose a development of how we as sexuality researchers can conceptualize and make use of intersectionality to better include people independent of (dis)ability.

Bodies, Relationships and Desires. The Social Construction of the Sexuality of Women with Disability in Italy

Chiara Paglialonga

University of Padua, Italy

In sociological literature, sexuality emerges as one of the most critical and meaningful aspects of an experience of disability, but also as one of the less explored. In ableist, heteronormative and patriarchal societies the stereotypes and the prejudices related to sexuality and disability are still rooted: the disabled bodies are generally infantilized, considered neutral gendered and described alternately as asexual, or characterized by a dangerous sexual charge. The processes of desexualization compromise the possibility of access to equal sexual health and reproductive rights, and act on disabled bodies in a plurality of ways involved with the normativity attending the construction of masculinity and femininity. Grounded on the theoretical contribution of feminist disability studies in dialogue with crip studies, this work is based on an empirical research I'm conducting in Italy with women with physical and/or sensorial disability, focused on the study of the mechanisms of socialization and embodiment of the sexual, gendered and ableist norms. Through in-deep interviews I'm collecting self-narratives about the life experiences, the meanings and the believes that women with disability refer to their sexuality. The research aims at investigating the dimensions of the body, sexual health, affectivity, intimacy, relationship and pleasure in their connections to disability and to gender identity. At the same time, the study aims to recognize, eventually, strategies of negotiations and reconceptualization of the notions of sexuality and disability. The topic, still underexplored in Italy, is examined with the purpose to contribute to the existing investigations on disability and sexuality, focusing on the specific aspects of the experience narrated by women with disabilities.

812

Italy, Portugal, 2028. Chronically Ill Lgbtq+ Adults Discuss Visions Of The Future

Mara Pieri

University of Coimbra, Portugal

The paper discusses how LGBTQ+ young adults with chronic illness project themselves in the future. The discussion draws from a qualitative study with LGBTQ+ young adults with chronic illness in Southern Europe and it examines 24 biographical interviews conducted in Italy and Portugal. Having a chronic illness often means relying on the support of families, not being able to work and encountering difficulties in everyday activities. This uncertainty is negotiated also through experiences of (in)visibility as LGBTQ+, in a context in which homo-transphobia is still socially predominant. When asked about how they see themselves in the next ten years, interviewees reflect all of these layers of precariousness, offering different perspectives on how the political challenges they encounter as LGBTQ+ and chronically ill inform their capacity of making projects and having hopes for the future. The prevalent narrative shows a general scepticism towards a political change that may improve their condition and the socio-cultural context in general. Moreover, the horizons of imaginations do not include the hope for legislative changes. The narratives that emerge demonstrate how the lack of adequate legislative protection and the multiple challenges imposed by illness and sexuality undermine the possibility to imagine, and hence, to enact emancipatory changes in the future.

Adjusting to an/Other sexuality: Negotiating Ableism and Heterosexism After an SCI

Laura Sanmiquel-Molinero1, Andrea García-Santesmases Fernández2

1Universitat Autònoma de Barcelona, Spain; 2Universidad Nacional de Educación a Distancia, Spain

Several authors in Critical Disability Studies have pointed out that ableism and heterosexism construct disabled people as both asexual/undesirable and as fetish objects (García-Santesmases, 2017; Liddiard, 2011; Slater, 2013). While most of the reviewed studies work with people who have been "disabled" for a relatively long time, this ethnographic research explores what a "good psychological adjustment to a recently acquired spinal cord injury" entails in a neurorehabilitation hospital and in the community. Particularly, this communication analyzes how disabled people, their families and the health professionals who work with them relate to the discourses that link disability with asexuality/undesirability and fetish. Sustaining an SCI challenges the very belonging to the categories "man" and "woman", as well as the opportunity to perform gender roles regarding sexuality. This brings into play the decision to keep or interrupt affective relationships around the advent of the SCI, which is mediated by the discourse of the undesirability of disability. Finally, health professionals provide their users with tools to problematize ableist and heterosexist mandates. However, these systems of social differentiation are never mentioned, thus running the risk of reindividualizing the complexities of navigating sexuality while embodying disability.

"Straight-men Model" Homosociality between Chinese Male College Students across Sexual Orientation

Jianji Chen

Autonomous University of Barcelona, Spain

How does the friendship between heterosexual and non-heterosexual men comes into being while most heterosexual men are homophobic? Conducting qualitative research with 19 in-depth interviews, the author systematically studies the practice of intimacy and masculinities in homosociality between Chinese male college students across sexual orientation, and then analyses the constructing logic of friendship between straight men and tongzhis (non-heterosexual men).
The study finds that this kind of friendship follows a social logic of the "straight-men model", pervading the three elements of inclusivity, ambiguity and anxiety. On the one hand, there is intimate emotional communication and physical contact between the straight man and the tongzhi. The frankness brought by the tongzhi's coming out could promote his effective communication and

intimacy with the straight man. On the other hand, although both the straight man and the tongzhi take the initiative to maintain a certain intimate distance with each other, the friendship may also be prone to ambiguous and struggling homoeroticism. The straight man also often feels anxious as potential objects of desire from his tongzhi friend, employing series of "de-objectification and re-subjectification" strategies to alleviate his anxieties. To fit in the homosociality with straight men, Tongzhi needs to work hard to weaken his expressions of sexuality and feminine masculinities; to some extent, he regards the "inclusivity" and special care from the straight man as just expressions of "political correctness".

This study contributes to our understanding of friendships and social bonds between heterosexual and non-heterosexual men and masculinities of youth practicing in contemporary China.

Stay Harder Longer: Italian General Practitioners' and Older People's Discourses on Male Sexual Ageing.

Raffaella Ferrero Camoletto

University of Turin, Italy

The arrival on the scene of Viagra and equivalent sexuopharmaceuticals (Cacchioni 2015), together with the spreading rhetoric of "positive" and "active" ageing, are key components of the reshaping of contemporary sexual cultural scenario. This clinical and cultural revolution calls into question both medical and commonsensical views of sexual ageing: from old age seen as characterized by a process of de-sexualization and "sexual retirement" to seeing ageing people as "sexy oldies" (Gott 2005) or "sexy seniors" (Marshall 2010).

In Italy, from the beginning of the 21st Century, several social campaigns have addressed aspects of ageing men's sexual lifestyles and life courses, not only propagating the idea of male sexual health as a new public health and medical issue, but also conveying a view of masculinity that needs to be "repaired.

Focusing on recent Italian mixed-method qualitative research project, first I shall examine the position of Italian GPs by analyzing their representations of sexual difficulties of male patients and their approach to sexual ageing. I shall then examine older people's narratives of male sexual ageing, accounting how they define and cope with the age-related changes in their sexual lifestyle. While few critical voices raise from medical experts - tending to reframe "sexual health" in terms of gendered

age-appropriate "respectable sexuality" - on the contrary older men provide a more nuanced and pluralized understanding of male sexual ageing, and of active ageing as a whole: if some older men take up the ideology of medical sexual repair, others reject a pharma-mediated notion of a forever functional sexuality, swinging from the traditional representation of sexual retirement to a more progressive notion of a redefined intimacy (Sanders 2013).

"A Whole Other World": Heterosexuality and Women in Gay Pornography

Doron Mosenzon

Ben-Gurion University of the Negev, Israel

In the last few decades, representations of heterosexuality in film, television, literature, advertisement, etc. frequently feature recurring discursive constructions of the relationship between men and women in terms of a natural and oppositional gendered difference, that includes women's investment in emotional relationships in contrast to men's emotional ineptitude, and men's insatiable sex drive in contrast to women's role as sexual gatekeepers.

One genre that is seldom mined for representations of heterosexuality is gay pornography. Gay porn commonly features straight characters who find themselves having sex with men, a trope that has been singled out by some critics as perpetuating internalized homophobia and repressive standards of masculinity. In my research, I analyze contemporary commercial gay pornographic films from 6 popular websites that feature heterosexual characters and examine the way heterosexual relationships, and women in particular, are represented. The talk will explore the ways in which the motif of the straight man in gay porn deploys the commonly depicted troubles of heterosexuality. Women's emotionality poses a barrier for men's sexual gratification; sexual and gender differences render heterosexual relationships fraught with tension; and women are presented as objects of disdain for men. By contrast, male brotherhood is depicted as reliable and easygoing, leading to the pornographic narrative of sex between men as uncomplicated and attractive.

Thus, by stretching the logic of heteronormativity these porn films deploy it against itself, making it undermine the very superiority of heterosexuality, though they do so while regurgitating misogynistic portrayals of women.

814

Journalism and Polyamory – An Analysis of CNM Representations Over a Decade in Portuguese Media

Daniel Cardoso[1,2], Christian Klesse[1]

[1]Dept. of Sociology, Manchester Metropolitan University; [2]ECATI, LUSOFONA University

Social representations are important when it comes to fighting for social rights for Othered groups; having publicly available narratives is a fundamental part of that process (Plummer, 1995; Ritchie & Barker, 2006). In this context, journalism occupies a special context in the production of social narratives, given its normative power, visibility, and epistemological status, even though there are many competing narratives about what exactly is 'media power' (Mesquita, 2004). That is why looking at media representations, and engaging with journalists and other media outlets, is often a concern of activists. In the project CNM-MOVES, we have systematically traced the main framings used by journalists to talk about consensual non-monogamies (CNMs), the main social actors involved in those representations, and the (de)politization of CNMs as compared to other sexual citizenship issues, considering that CNMs are a political issue (Rambukkana, 2015; Rosa, 1994; Vasallo, 2018). Drawing from a comprehensive analysis of newspaper and magazine articles mentioning CNMs over the last decade in Portugal (in total, over 260 news pieces), we have concluded that CNMs are mostly framed as an issue that pertains exclusively to relationship dynamics, that celebrities' lives tend to dominate a lot of the exposure around this topic, and that explicit references to activism around CNMs are mostly (but not completely) absent from the coverage. By doing so, a normalization of CNM lives might be possible but at the expense of deradicalizing CNMs, and their connection to systemic power structures (Schippers, 2016).

RN23_T06_01 | Sexual Identities, Choice and Resistance

Regulation and Resistance: Intersubjective and Intergenerational Surveillance of Single Feminine Subjectivities

Kate Gilchrist

London School of Economics, United Kingdom

This paper fits with the Sexualities research network in relation to the theme of alternative intimacies and kinship. The number of single women has steadily grown over the past two decades in the UK, however within a society which continues to privilege the coupled norm, the lived experience of single women remains significantly under-researched. Amidst such societal shifts, it is increasingly important to explore how women are experiencing and understanding their intimate lives. This paper takes Foucault's theory of technologies of the self (Foucault, 1988) and Butler's psychosocial understanding of gender subjectivity (Butler 1997) as it's theoretical framing to investigate how single femininities are being discursively constructed through gendered discourses of power. Methodologically I draw on self-narratives taken from semi-structured interviews with 25 single women living in London, conducted as part of my PhD thesis. I employ a thematic and a Foucauldian discourse analysis which incorporates an intersectional approach (Crenshaw, 1989) to argue that single women are being incited to perform intensive self-surveillence through processes of intersubjective and intergenerational regulation, at significant psychic cost. However, troubling a binary understanding of regulation and resistance, I demonstrate that there are simultaneously moments of resistance to such regulation, particularly in relation to non-heterosexual, non-monogamous feminine subjectivities. I conclude that while single women are subject to intensive gendered forms of regulation, normative femininity is being troubled and at times transformed through alternative kinship structures.

Keywords: single women; Foucauldian discourse analysis; psychosocial theory; subjectivity; non-monogamy

Black Girlhood and Emerging Sexual Identities: Sexual Citizenship and Teenage Girls of African Descent in Athens

Liza Tsaliki, Despina Chronaki, Derzioti Olga

National and Kapodistrian University of Athens

Despite their long presence, African immigrants in Greece have been under-researched, with Black women in particular being largely ignored to this date. Following the paucity of research regarding the media perceptions, popular culture, media consumption and uses of young Black girls in Greece, we have embarked upon the study of how young teenage girls of African descent construct their sexual identity and citizenship. Our work draws upon a larger project - «**Black Lives Matter**: **everyday politics**, **cultural practices and popular culture amongst Black women and teenage girls in Athens**», which involves, among other things, face to face interviews with teenage Afrogreek girls.

Given the intersectionality of race, class, sexuality and religion, of particular importance to us is the extent to which religion (for example, in the form of the (Black) Church) and popular culture (African/Greek/Western) inform each other, reproducing and maintaining racialized gendered meanings and re/presentations of sexuality along the way. We explore how young teenage Afrogreek girls perceive and construct their sexual selves through their sartorial choices, their hair, their choice of music and popular culture, their use of technology and their media practices. In addition, taking into account how hip-hop is one of the most pervasive and popular spaces for the portrayal of Black youth identities (within the United States) (Leigh-Kelly 2015), as well as a "site of identity negotiation" (Richardson, 2006: 9), and the increasing popularity of hip-hop amidst Greek youth, we are also interested in the girls' 'critical hip-hop literacies' (Leigh-Kelly 2016) and their constructions of 'sexiness'.

"Nothing to worry about": Emotion Work, Contraceptive Responsibility, and Pregnancy Prevention among University Students

Laurie Elizabeth James-Hawkins[1,] Christie Sennott[2]

1University of Essex, United Kingdom; 2Purdue University, United States

Gendered feeling rules prescribe that women do the majority of emotion work in intimate relationships. Although the emotion work that occurs in marriages has been well documented, few studies have examined how partners manage emotion work in unmarried sexual relationships and how the division of emotional labor might contribute to gender inequality. Drawing on the theoretical concepts of feeling rules and gendered emotion work, we analyze 57 in-depth interviews with university-attending women to show how worry about pregnancy in unmarried heterosexual relationships constitutes a form of emotion work that is disproportionately done by women. Our findings suggest that gendered feeling rules prompt women to assume the bulk of the responsibility for pregnancy prevention, contraceptive management, and the accompanying emotion work, including actively shielding their sexual and romantic partners from worry. Specifically, we document the chronic nature of women's worry about pregnancy risk and prevention, which represents a significant amount of time and energy managing their emotions. Women worry about their own risks and their partners' emotional states, reflecting gendered feeling rules anchored in idealized femininity. This emotion work serves to perpetuate gendered feeling rules and expectations, resulting in inequality for women in sexual relationships.

Naming the Phenomenon without Naming Names: Language(s) of Commercial Sex

Anastasia Diatlova

University of Helsinki, Finland

In the field of commercial sex research, terminology is a thorny subject that divides researchers, activists, and practitioners along ideological lines. In this paper, I explore how those who engage in various forms of physical and/or emotional intimacy in exchange for compensation talk about and name what they do. The paper is based on interviews conducted with Russian-speaking women and with Finnish and non-Finnish (cis and trans) men and non-binary people engaged in different forms of erotic and sexual labour in Finland. In addition, the study also draws on data derived from ethnographic research in private shows, erotic dance clubs and sex restaurants in two large cities in Finland. I explore the practicalities of language use, the issues of translation, interpretations and misinterpretations. In this paper, I demonstrate how people employ language to make sense of their own position and their experience of compensated sex, as well as how they strategically use language to maximize profit or avoid different forms of harm.

Sugardating as Empowerment or Exploitation? Feminist Interpretations of the Commodification of Intimacy

Sofia Strid, Lena Gunnarsson

Örebro University, Sweden

The paper explores the mechanisms of heterosexual so called "sugardating" and the proliferation of specific sugardating online dating platforms from a feminist perspective. Sugardating, according to these platforms, is an arrangement based on the exchange of intimacy and material support, often including sex and money. The aim of the paper is to describe, analyse and provide a critique of sugardating seen as a specific manifestation of the changing nature of the contemporary social organisation of human sexual experience, where women are increasingly commodified. In so doing, the paper informs about and engages with lived life and real-world events, with the aim to stimulate discussion over controversies surrounding contemporary sexualities. The analysis is based on semi-structured interviews with men and women with experience of sugardating (n=23), a structured questionnaire with members of a sugardating online community (n=100), and registered membership profile data of a sugardating online community (n=34 578).

The paper argues that sugardating needs to be situated and analysed in its socio-sexual and economic contexts, rather than from an individual perspective. In remaining based on structural inequalities and unequally positioned men and women, sugardating perpetuates gender and binary norms and practices of women's sexuality as subordinate to men's sexuality. Further, this inbuilt structural inequality does little, contrary to postfeminist arguments, to transform or subvert fe/male (hetero)sexuality. Ultimately, sugardating serves to uphold prostitution and underpin the prevailing gender order. The enabling mechanisms are the continued commodification of women and the conflation of intimacy and patriarchal capitalist practices of the sex industry.

The Cuddle Industry: Rethinking Intimate Touch in a 'Sex-normative' Society

Paulo André Santos

University of Padua, Italy

With the decline of community life, the commodification of family-like practices and it's cultural acceptance (Zelizer, 2005; Hochschild, 2003), many have begun resorting to the market in search for surrogate forms of intimacy. The cuddle industry — which so far has passed unnoticed to sociological enquiry — is one of the many relatively recent phenomena that have emerged from an attempt to supply such demands. Although it promises to provide physical affection to others in a platonic, non-sexual way, press depictions range from a 'new form of therapy and self-care' to suspicions of 'prostitution in disguise'. As a result, professional cuddlers come to experience a representational limbo regarding their line of work, a delicate balance between sex work and care work which bears a stigma for both practitioners and recipients. Moreover, as expected from an emerging service offered by a new professional category, there's currently no license requirements nor industry regulation, leaving all actors in a vulnerable position.

Drawing from a three-year virtual ethnographic (Hine, 2000) study of the professional cuddling community, the present research highlights the importance of institutional recognition of new forms of body work (Wolkowitz et al., 2013) towards preventing sexual harassment and providing legitimacy; the advantage of "unbracketing" the body and recombine it with the mind when traditional forms of therapy fail to address the embodied nature of human experience, a condition that has been exacerbated by lockdown restrictions that require physical distancing; and, finally, the challenges faced by non-normative intimacies.

Sexuality as Hypertext: Cross-Disciplinary Insights from Marketing and Consumer Research

Christian A. Eichert[1], Jack Coffin[2]

[1]Goldsmiths, University of London, United Kingdom; [2]University of Manchester, United Kingdom

In the popular imagination sex sells, yet in the academic discourse on marketing and consumer research, sexuality is remarkably absent. Even from the vantage point of socio-cultural scholarship on markets and consumption, sexual phenomena are regularly conflated with discourses on gender, or sanitised notions of 'consumer desire'. A third line of research has studied sexuality and consumption through the theoretic lens of 'consumption subcultures'; a compartmentalisation that relegates sexuality to the sub-terranean, the sub-ordinated, or the sub-versive. This theoretic treatment has rendered sexuality as relevant only to certain consumer groups considered as deviant or 'other' -- mostly for non-heterosexual individuals. As a result, sexuality and sexual phenomena in everyday consumption practices and marketing systems are not treated as worthy of theorising in their own right, and are as such understudied.

818

The present paper seeks to overcome such abridged accounts of sexuality and consumption, by advocating a novel understanding of sexuality as hypertext. This conceptualisation treats sexuality as a metatextual web of ideas, emotions, affects, practices, and meanings, which differentiate, yet interlink consumers, communities, and societies in nontrivial, complex, and multifaceted ways.

In line with the conference theme, and grounded in our exchanges with a heterogeneous group of early-career and established consumption scholars interested in sexuality, we seek to spark new cross-disciplinary conversations about future sociological knowledges on the manifold ways in which sexuality influences markets, marketing, consumption, and consumers. Implications are discussed for sociologists of sexuality and consumption, as well as for consumer researchers, policy makers, and the wider public.

RN23_T07_01 | Health, Sexuality and Medical Practices

Foul Blood: Slovakia, homosexuality and blood donations

Patricia Szoradova

Slovak Academy of Science, Slovak Republic

Blood donation is considered as an altruistic act that is accessible and the safest form of donating human material capable of saving many lives. During the ongoing pandemic of Covid-19 in Slovakia and in the world the number of blood donors is quickly decreasing. Despite the crisis in blood donation, Slovakia is currently still enforcing a rule banning homosexual and bisexual men who have sex with other men from donating. This ban can last between 12 months to indefinitely. Slovakia is among other European countries enforcing this ban; however, it is crucial to note that several of them have removed it due to the decline in blood donation during Covid-19.

Despite the increase in academical and political interest in this regulation, the research in Slovakia is non-existent. Understanding the historical enforcement and introduction of these limitations in blood donation, in the view of current state of constant medical advancements the reasoning no longer stands up.

The aim of this project is to critically analyse the institutional, historical and social factors influencing the enforcement and continuous existence of this ban in Slovakia. This project also involves qualitative research within the LGBT community in Slovakia as well as the institutions who deal with the blood donation process. The aim is to not only discuss the current state but also showcase the realities of excluding a marginalised group of individuals from not only health beneficial, but also social activity and hopefully contribute to the reassessment of the limitations.

"Sida O No Da:" Politics of Sexual Health of Men Who Have Sex With Men In Spain

Ibrahim Sonmez

Pompeu Fabra University, Spain

The main objective of this study is to take a comprehensive look at the HIV prevention efforts and examine State action in the efforts of HIV prevention in Spain. This paper uses a qualitative content analysis applied to the most-read Spanish newspapers (El País, La Vanguardia, El Mundo, El Periódico, and ABC) with HIV/AIDS related information between 1983-2010. Through an analysis of these newspaper articles and public health discourses on HIV prevention, this study aims to demonstrate the governmentality of the HIV epidemic conducted by the Spanish government. To understand the complexity of the relationship among the individual, society, and the State, I draw on the theoretical and practical implications of the Foucauldian concept of biopolitics and apply it to the analysis of this complex relationship. This study will produce theoretical predictions under the Foucauldian study based on the following three objectives. First, this study aims to reveal the patterns of biopolitics governing HIV prevention policies in Spain, by documenting whether the Spanish government forced an understanding of sexual liberation through recognizing the transmission and protection channels of HIV, or, sexual conservatism with promoting sexual abstemiousness. Second, it aims to investigate HIV responsibilization efforts by the Spanish State and analyse the varying roles of disciplinary institutions (i.e. hospitals, organizations, schools) in such efforts. Lastly, it aims to analyse how the health discourses of these newspaper articles construct sexual orientation in relation to the epidemic, and whether these discourses present an assumption of a negative relationship between homosexuality and prevention efforts.

Intersex Persons In Medical Practice

Martin Fafejta, Zdeněk Sloboda

Faculty of Arts, Palacký University, Olomouc, Czech Republic

The bodily integrity, sexual and reproductive rights of intersex people are not always respected and normalizing genital surgeries are sometimes carried out without proper informed consent. Intersex people often live in concealment, since they fear stigmatization, when their bodies do not conform to gender stereotypes. Consequently, they do not form associations advocating their rights and if these associations are formed most of the intersex people do not participate in their activities. The paper is based on research among Czech physicians and intersex people. The research questions are: Are the sexual and reproductive rights of intersex people respected? Is the medical term for the intersex condition "disorder of sex development" (DSD) harmful? How useful is the concept of "third sex/gender"? The research shows that physicians mostly do not question the current practice, when sometimes admitting that previous approaches were "mutilating". Nor do they question the term "disorder of sex development" arguing that in medical practice the term "disorder" is value free – the term intersex is more stigmatizing according to them, since the identity of patients with a DSD condition is not between genders (etymologically inter-sexes) and patients see themselves as male or female. For the same reason, the term third gender/sex is not useful according to physicians. At the same time, physicians stressed that sexual and reproductive rights are a top priority in current medical practice, although they are paradoxically convinced that in some cases practices like clitoral reduction are necessary. The intersex participants do not identify with the term intersex, even when they use it to describe their condition. They call themselves man/woman or homosexual/heterosexual and add their medical otherness.

Mapping Intersex Discourses in Contemporary Spain

Sveta Solntseva[1], Lucas Platero[2]

[1]Universitat Autònoma de Barcelona, Spain; [2]Universidad Rey Juan Carlos, Spain

'Intersex' as a cultural and discursive category has been historically shaped and policed by multiple social actors, including medical professionals, policymakers, activists and scholars (Amato, 2016). There are various context- and actor-dependant meanings assigned to intersex, making it an umbrella term not just for many biological, but also for multiple political "possibilities" (Dreger & Herndon, 2009, p. 201). In the past years several Spanish autonomous communities introduced a legislative ban on intersex genital mutilation for minors, however, there is no state law in place to protect intersex people against discrimination and guarantee their right to bodily integrity (Fernández-Garrido & Medina-Domenech, 2020). Using framing analysis and Carol Bacchi's approach to policy analysis (2009), this study looks into how intersex discourses are shaped by different stakeholders in contemporary Spain. It does so by identifying the main sites where the discussions happen, how those become politicised and grow into political claims, and by looking into silences and absences of intersex representations in political agenda(s). We analyse different representations that are being constructed by policymakers, an emerging intersex activist group, condition-specific patient support associations, medical staff and LGBT(I) organisations. Departing from strongly medicalised and pathologising notions of intersex as a "rare disease", coupled with the heteronormative understanding of sex as essentially binary, the evolution in intersex discursive representations towards depathologisation, positive identity and human rights-based framework is an important milestone indicating a gradual biopolitical shift in Spanish society.

Sexual Consent in Young People's Everyday Negotiations

Marja Peltola, Timo Aho

Tampere University, Finland

The globally spread #MeToo-movement brought the question of sexual consent under heated public debates in many European societies, including Finland. Although the themes related to personal integrity and borders between acceptable and unacceptable (sexual) behaviour is relevant for people of all ages, young people's intimate relationships in specific have been a source of recurrent concerns in the discussions. In the project "Contested Consent: Social and Digital Borders and Orders of Intimacy in Young People's Romantic Engagements" (Academy of Finland 2019–2023), we examine what kind of role sexual consent has in the everyday lives of young people. We seek to go beyond the typical (heteronormative) definitions of sexual consent that center around sexual intercourse, and look at the everyday experiences and negotiations related to borders of acceptability in young people's physical and digital environments. The presentation draws from focus group discussions with 15–19-year-old young people living in metropolitan Helsinki. We discuss what kind of narratives on sexual consent and its everyday negotiations are collectively produced by the young people, what kind of femininities and masculinities they are attached to, and what kind of methodological challenges are related to researching such sensitive topic.

Children's Sexual Rights: An Appeal for Recognition

Stefan Lucke

California Institute of Integral Studies, United States of America

The field of sexuality studies has lamented the absence of theory and empirical data about children's sexuality for a long time. Whereas childhood studies have started to employ sociological views on childhood and to conceptualize children's agency, pre-pubertal sexuality remains an ignored issue besides concerns about sexual abuse and risk. Concurrently, human rights frameworks for children (i.e. the UNCRC) and LGBTQ people (i.e. the Yogyakarta principles) exist next to progressive WHO definitions of sexual health and sexual rights. Yet, all these frames and concepts remain disconnected from the lived experience of young children developing their sexual identities and selves without noteworthy support. This paper critically discusses a consideration of Children's Sexual Rights (CSR) in three parts: (1) the rationale for proclaiming CSR; (2) proposing and investigating key rights; (3) the potential issues and consequences of implementing CSR. Children's access to early, comprehensive sex education and information will be highlighted as one key right juxtaposed with the increasing political attacks on gender theory and sexual science in many European countries. CSR will be critically distinguished from naïve, historical ideas about the sexual liberation of children while emphasizing CSR as one crucial approach to empower children's developing sexual competence. The current public discourse on childhood sexuality, sex ed, and constitutional children's rights in Germany shall provide an analytic example for discussing to what extent CSR can be understood as an embattled mode of sexual citizenship.

LGBT+ life in 'lockdown': Young people's experiences in England

Eleanor Formby[1], Jo Woodiwiss[2]

[1]Sheffield Hallam University, United Kingdom; [2]University of Huddersfield, United Kingdom

In this paper we draw on longitudinal research with LGBT+ young people in one English region to explore how the onset of coronavirus has impacted on the lives of LGBT+ young people, particularly during periods of 'lockdown' in England. These periods have involved school and college closures, and wider restrictions on

821

how people have (not) been able to socialise. Significantly, the LGBT+ youth service that all participants were in touch with became an online service, rather than a face-to-face service. Although there is growing awareness of negative impacts of the pandemic on LGBT+ young people (Barnardo's 2020, Batty 2020), research on this has so far been limited.

In our research, young people discussed what they found hard, such as missing seeing friends, missing the routine of school, and fears about the 'threat' of the virus, but they also talked about what they liked about the enforced change in lifestyle. These included the benefits of 'escaping' unwelcome school-based experiences, a strengthening of peer support, and the responsive and adaptable youth service provision they were in receipt of. We explore these experiences using data from a short online self-completion survey (23 respondents) and 22 participants involved in a series of discussion groups and/or 1-1 interviews. In conclusion, we highlight the importance of access to support, but also show how LGBT+ young people's experiences - including of 'lockdown' - are not wholly negative.

RN23_T08 | Sexuality, Embodiment and Empowerment

Framing Sexuality During Pregnancy and Post-partum in Individual Intimate Trajectories

Maria Madalena d'Avelar[1], Violeta Alarcão[2], Sónia Cardoso Pintassilgo[1]

[1]Iscte - University Institute of Lisbon, Portugal; [2]Instituto de Saúde Ambiental, Faculdade de Medicina, Universidade de Lisboa, Portugal

Experiences of sexuality during pregnancy, delivery and post-partum period can be better understood when they are framed by an individual's intimate trajectory. In this communication, putting the sociological focus at an individual scale, we aim to show how taking into account the singularities in women's romantic, sexual and reproductive trajectories, and the ways in which these are interwoven, can shed a light on their experiences of sexuality during pregnancy and post-partum, and help better understand and give meaning to them.

To do so, we use data from the FEMINA project (Fertility, Immigration and Acculturation), with a cross-sectional telephone survey following a biographic structure to take into account the complex relationships linking sexual and reproductive individuals' life events, and which was applied to a probabilistic sample of 400 Portuguese and Cape Verdean women and men of reproductive age residing in the Greater Lisbon area. In this particular analysis, we focus on studying ten case-studies of Portuguese women who have had children less than 5 years ago. We draw their detailed intimate partnerships trajectories, looking at the number and duration of their romantic relationships, and analyse indicators reporting to sexuality during pregnancy and post-partum in light of those trajectories. This type of approach aims to look beyond the identification of trends and similarities, trying to understand how considering the diversity of intimate trajectories within a somewhat homogeneous group of women can help reach a more comprehensive knowledge of experiences of sexuality during pregnancy and post-partum.

Women's 'Empowerment' Through Pleasure? Exploring The Embodied Experiences Of Orgasmic Meditation Practitioners

822

Katy Pilcher

Aston University, United Kingdom

Drawing on interviews with 33 practitioners of 'orgasmic meditation' (OM) in the UK and US, this paper explores the embodied experiences of OM practitioners and how they characterised the practice as facilitating gender and sexual empowerment. Orgasmic Meditation is a 15 minute practice, centred around the 'power' of the female orgasm, in which a woman's clitoris is 'stroked' by a fully-clothed partner with 'no goal' but 'to feel' (definition from participant interviews). This paper questions the extent to which the practice of orgasmic meditation might facilitate ways to uncouple orgasm from negative gendered constructions, opening up ways to redefine what 'sex', 'pleasure' or a sexual 'act' might mean. In doing so, I explore 4 inter-related themes: 1) how the practice enables people to establish clear bodily boundaries; 2) the characterising of the practice by some women as an important means for them to 'reclaim' their bodies (Pitts, 1998), following previous sexual trauma; 3) the ways that the practice encourages people to centre their own pleasure; and 4) how participant conceptions

of the practice not being 'sexual' or about 'sex', but rather as a 'consciousness' practice, might enable us to rethink normative conceptions of what constitutes a 'sexual' practice. Theorised through a queer feminist perspective, I argue that while OM opens up space for women to explore sexuality on their own terms, tensions remain with the onus upon women to police bodily boundaries, and with moments where boundaries are broken.

Harnessing the Power of the Menstrual Cycle – Self-help as a Means for Reimagining Menstruation

Aino Katariina Koskenniemi

University of Helsinki, Finland

Contemporary western cultures conceive of menstruation in mostly negative ways. Menstruation is a taboo, an uncomfortable nuisance best dealt with in private with commercial products. In recent years, the negativity related to menstruation has been countered with calls for period positivity. Alongside overt activism, a growing number of books, podcasts, and courses address menstruation as a vital and wrongfully stigmatized part of the lives of approximately half the world's population. These commercial media products often present menstrual cycle awareness as a source of empowerment and advocate lifestyle changes and self-care practices as means to better periods and better life. Analysing ten contemporary menstrual self-help books with feminist critical discourse analysis, this study examines the reimagining of menstruation in menstrual self-help literature, and explores how self-help discourses on menstruation draw from earlier forms of feminist self-help and contribute to contemporary forms of feminism. The study shows the presence of two intertwined discourses that challenge the idea of the menstruating body as dirty, flawed, or shameful. The first discourse treats menstruation as a vital bodily process and a signal of health and advocates menstrual cycle awareness as a tool for self-diagnosis and self-care. The second discourse reimagines menstruation as a spiritual practice and source of feminine power and sees menstrual cycle awareness as key to unlocking that power. The analysis discusses the potentials and problems of these discourses for contemporary forms of menstrual activism.

Towards the Restoration of Sexual Citizenship: The Experience of Women with Functional Diversity in Portugal

Inês Silva, Alexandra Oliveira

Faculty of Psychology and Education Sciences of the University of Porto, Portugal

The right of people with functional diversity to independent living has received global growing attention, both socially and politically, since the 1960s. However, their sexual and reproductive rights are still neglected and denied, as sex is a cultural taboo antagonist to the paternalistic view associated to people with functional diversity. Concerning women with functional diversity, their social marginalization is aggravated by gender roles, resulting in a double sexual oppression. Furthermore, it was noticed a shortage of female voices in the literature about sexuality in functional diversity. Thus, following a feminist social constructionist and intersectional approach, this paper examines how women with functional diversity live, think and feel their sexuality. To achieve these goals, we conducted a thematic content analysis of 13 individual semi-structured interviews with Portuguese women with functional diversity. The study found that sexuality is a significant area in their lives and although they are physically and psychologically limited by the social prejudices regarding both functional diversity and gender, they develop strategies that allow them to access sexual self-determination. These results stress the need for a reconstruction of social conceptions of sexuality, gender, functional diversity and, particularly, normality, that have been obstructing the sexual citizenship of women with functional diversity. Ensuring their full emancipation requires a broad intervention that embraces the adaptation of the educational curriculum in order to demystify functional diversity and normalize non-normative sexual alternatives, as well as the representation of people with functional diversity in the mass media.7

Male Sex Working and Masculinity: Finding 'Check and Balance' Between Stigmatisation and Homosexualisation

Marco Bacio[1], Cirus Rinaldi[2]

[1]University of Milan, Italy; [2]University of Palermo, Italy

Despite the large and growing number of research on the topic, sex work and sex workers can be still labelled as an unresearched area of study; even more under-explored is the male side of this phenomenon. But sex work and sex workers cover many issues that go beyond the questions related to legislation, criminalisation, and feminists' debates. Indeed, studying sex work can be an essential analytical tool to understand sexuality at large. In this paper, we present two studies carried out in Italy and Sweden about male sex workers who sell sex to other men online and in public venues (such as porn cinemas and cruising areas). Our focus is on the concept of masculinity and the declinations of such term that male sex workers employ in their relationship with clients. Since selling sex and sexual services is perceived as a stigmatised activity, especially for those men who self-identified as heterosexuals, men who engage in these behaviours need to find a way to justify their presence in the market. At the same time, as recent research highlighted, it is possible to observe the growing presence of self-identified homosexuals in sex work. Then, in our analysis, we compare the behaviour of these two categories of sex workers to understand differences and commonalities about the type of masculinity employed.

'You Can't Live without Money': Economic Uncertainties of Male Sex Workers and Economic Opportunities Provided by Sex Worker-Led Organizations in Nairobi, Kenya.

Lise Woensdregt

Vrije Universiteit Amsterdam, Netherlands, The

Research on African sex worker organizations tends to focus on their community-led approaches to reach hidden populations and promote sexual health. Drawing from ethnographic fieldwork in a male sex worker-led organization in Nairobi, Kenya, this paper attempts to broaden the dialogue by focusing on the members of these organization, an underexplored but highly significant part of such community-led approaches. Male sex workers in this research, most of which identify as gay, experience multiple economic uncertainties, and increasingly limited opportunities to engage in sex work. The organisation's position in the official development aid system enables it to employ members as peer educators and offer other means of financial support, particularly through their participation in development activities. For members, this economic support sex worker organisations provides is significant. Nonetheless, the paper illustrates how development programs continue to conceptualise male sex workers primarily as volunteers when funding community-led programs, while for members their involvement in these programs has become a main source of income. The economic incentive of sex workers in relation to membership of, and involvement in, sex worker organisations is hardly addressed in academic literature. Findings suggest a need to broaden the disproportionately narrow focus on members of sex worker organizations and to include their lived realities of economic uncertainty, thus going beyond an illusion of voluntariness, in order to advance sex workers' social and economic justice.

Anti-LGBTQIAP Resolutions in Poland: When and Where Are They Proposed?

Wojciech Rafałowski

University of Warsaw, Poland

During the eight months preceding the 2019 parliamentary election in Poland, resolutions aimed against the LGBTQIAP minority were adopted by over sixty out of 2,477 municipalities. They were proposed by a local rightist organization called Ordo Iuris. Based on the prerequisites from the political opportunity structure approach, I test two sets of explanations as to why certain municipalities were targeted by the organization, while others were not. One set of hypotheses is associated with social demand; municipalities chosen by Ordo Iuris are expected to be more religious and supportive of the political right. The other approach assumes that the activity of the organization was determined by the resources available in the community, such as high percentage of members of the local council representing the rightist Law and Justice party, electoral turnout, membership in religious organizations, and population density. The empirical analysis confirms the significance of resources and disproves the argument associated with social demand. The study has implications for understanding how the social movements of the radical right gain political influence in Eastern European countries. It shows that they do not serve a particular demand from the society for the worldview they represent, but they rather rely on the aid from political elites and the resources provided by them and the community to promote their agenda where they can.

Getting Married Overseas When It is Locally Denied: Sexual Citizenship of Same-sex Couples in the Era of Global Unequal Sexual Rights Development

Eliz Miu Yin Wong

London School of Economics and Political Science, United Kingdom

Against the backdrop of unequal development of sexual rights around the globe, getting married overseas becomes an option for same-sex couples living in a society where same-sex marriage is locally denied. However, the social and legal recognition of their marriages in their home societies are ambiguous. This study examined same-sex couples' decisions on getting married overseas in the interpersonal, institutional, and global contexts in which they are 'tolerated minorities' rather than equal citizens. Twenty in-depth interviews were conducted with same-sex couples in Hong Kong, a global city which legal protection for same-sex couples has been developing in some aspects (e.g. tax allowance) but far from complete. Three dimensions of precarity experienced by same-sex couples were identified: the uncertainties of legal recognition, the precarity of political unrest and diaspora, and the unpredictability in lives during the pandemic. Having only partial recognition of same-sex couples' rights, some adopted the pragmatic approach of 'better than nothing' and chose to marry overseas, while others refused to accept the partial citizenship status. The political turmoil started a wave of migration in Hong Kong. Migration is a pulling factor for same-sex couples to get married overseas as their marriages may be recognized by their intended host countries. The unpredictability in life and death during the pandemic gave them a sense of urgency to formalise their relationships. This study contributes to the sexual citizenship literature, especially with the global and diasporic perspective of sexual rights, in the era of global uneven sexual landscape and the post-COVID world.

825

The Influence of Police Officers' Gender in Their Attitude Towards Domestic Violence and Intimate Partner Violence in Portugal

Cristina Pereira Vieira[1], Paulo Manuel Costa[2], Rui Coelho[3], Catarina S. Nunes[4]

[1]CIEG (Interdisciplinary Center for Gender Studies, Institute of Social and Political Sciences, University of Lisbon (CIEG/ISCSP-ULisboa); Universidade Aberta (Open University, Portugal); [2]Centre for Functional Ecology; Universidade Aberta (Open University, Portugal); [3]Universidade Aberta (Open University, Portugal); [4]Universidade Aberta (Open University, Portugal) Department of Sciences and Technology; and LAETA/INEGI; Porto, Portugal

In recent years, Intimate Partner Violence (IPV) gained increased visibility in the public space in Portugal, mainly due to the number of women killed by their partners. In the complexity of social structures and interaction mechanisms of the public and private spaces, we perceive an unequal distribution of power between men and women that legitimizes the prevalence of authority as an expression of male identity (Vieira 2017, 2020; Begonya 2020; Santos, 2020; Vanesa Pérez-Martínez et al.,2020). If we put the lens on patriarchal social structures, we perceive the reproduction of hierarchies and privileges,that naturalize and legitimize the domination of women by men (Bourdieu, 1999). Given the relevance of police intervention, and the level of decision allowed to police officers to judge IPV situations (Myhill & Jonhson 2016), it was our goal to understand the influence of gender in the police officer's attitude towards IPV situations. To this end, GNR military personnel were surveyed through an online questionnaire about their beliefs, values, and professional attitudes regarding domestic violence. A total of 1871 valid responses were received. The results were analyzed using the IBM SPSS version 25 software. The distribution of responses across the levels of the scale, shows the existence of differences in how respondents of different genders evaluate the problem of IPV. The dimension and impact that IPV continues to have in contemporary societies, make it necessary for police forces to adapt and deepen their training and action models, to the knowledge that has been acquired about victims and aggressors.

Modern Inquisitions: Technologies Of Evaluation And Testimonial Practices In Assessing The Inner Truth Of Individuals

Valtteri Vähä-Savo

Tampere University, Finland

My paper introduces a new research project that deals with questions of sexuality, gender and migration in relation to expert authority and power. The project examines how the "inner truth" of individuals is rendered an object of scrutiny by public officials and experts. It focuses on three cases: 1) the diagnostic process that individuals seeking gender reassignment surgery have to undergo, 2) the evaluation of whether an asylum seeker claiming to have converted from one religion to another has truly changed their beliefs, 3) the assessment of an asylum seeker's sexual orientation in claims based on persecution due to their sexuality. By focusing on these three cases, which have not been previously analysed together, the study provides a much-needed critical perspective on the evaluative practices that experts use to assess the inner truth of individuals. The study analyzes expert authority, technologies of evaluation and testimonial practices involved in public officials' and experts' decision-making processes. Theoretically the study brings together three emerging strands of sociological scholarship that have not previously been in dialogue with each other: epistemic governance, sociology of valuation and evaluation, and epistemic injustice and vulnerability. It is crucial to examine the evaluation processes, as the experts involved are entrusted with power to make far-reaching decisions regarding people's lives in cases that defy objective criteria. The results of this project are vital for combating discrimination based on gender, religion and sexual orientation.

826

RN23_T11 | Queering Kinship

Same Sex Families In Italy Between Conformity And Challenges To The Norm

Marina Franchi[1], Giulia Selmi[2]

[1]London School of Economics and Political Sciences, United Kingdom; [2]University of Verona

The Covid crisis in Italy, as elsewhere, has once again shown how representations of care and domesticity revolve around heteronormativity as the 'fundamental organising principle throughout the social order' (Green 2002: 521) that disciplines the boundaries between the natural heterosexual family and others (Warner 1993). Such boundaries, scholars argue, have been also policed by the partial recognition of sexual citizenship rights for LGBT+ population in contemporary neo-liberal western society, with the notion of homonormativity highlighting the potential of assimilation to fundamentally exclusionary norms (Duggan 2003). In contemporary Italy, despite the growing visibility of non-heterosexual identities, non-heterosexual parenting, legally not recognised, struggle to find space within the available set of representations and practices. Against the ongoing backlash against sexual citizenship rights, and the threat of anti-gender movements, it is crucial to explore further the tension between assimilation and disruption in legislative contexts that do not legally recognise same-sex families. Research shows how challenges to heteronormativity can be context-specific (Ryan-Flood 2005) and heteronormativity can be a resource strategically deployed in claim-making processes (Franchi and Selmi 2018, Rosenfeld 2009). In this paper, we analyse campaign narratives produced between 2016 and 2020 by Italian LGBT parents' associations such as Famiglie Arcobaleno (Rainbow Families) and Rete Genitori Rainbow (Rainbow Parents Network). In a context characterised by enduring heterosexism and institutional homophobia we ask how do narratives, designed to oppose homophobic discourses, navigate exclusionary notions of normality and normalcy? How, and to what extent, normative notions of family and love are queered to make space for kinship formations routinely labelled as 'unthinkable'?

Becoming a Gay Father Family: Israeli and German Couples and their Surrogacy Journey to Parenthood

Julia Teschlade

Universität Hamburg, Germany

This qualitative study examines the struggles for legal recognition and social visibility among gay father families from Israel and Germany who pursue parenthood via surrogacy. Surrogacy presents a viable route towards parenthood for same-sex couples, yet it is banned in many countries. While Germany prohibits all surrogacy, Israel allows it – but not for gay men. Through cross-country comparison, the study illuminates how different contexts shape the reproductive practices of gay couples and their navigation of the legal, political, and sociocultural contexts of both their country of residence and destination country. In-depth interviews were conducted with 11 gay couples from Israel and Germany, all of whom contracted a surrogate in the US. Findings show that participants shaped their reproductive trajectories according to legal norms and heteronormative family narratives. Israeli couples have reached a stage where they are part of the reproductive mainstream, while German couples still operate under the radar and remain either invisible or become known as an exception to the norm. Following Strauss' (1993) trajectory concept, the reconstructed trajectory of "becoming a legally recognized and socially visible gay father family" integrates the different sociolegal contexts, suggesting that a legally enabling environment and affirmative social discourses grant greater visibility to gay couples with children conceived through surrogacy.

827

Queering the Origin Story: Narratives from Adults Raised by LGBTQ Parents

Eliza Garwood

University of Southampton, United Kingdom

Recent research into LGBTQ kinship has explored how reproductive technology might both stabilise and disrupt dominant ideals about the importance of biogenetic relatedness in family formation. While understanding the role of genetic and biological discourses is essential for understanding LGBTQ-headed families, this paper argues that it is equally important to investigate the relevance of LGBTQ culture and history for people LGBTQ parents. This paper considers the ways in which many people raised in LGBTQ households were interested in tracing their queer family histories, rather than solely their biological relations.

Data comes from biographical narrative interviews, conducted in Britain, with 21 adult-children raised by LGBTQ parents. This paper examines how participants' origin stories relate to parents' identities and journeys to, and through, LGBTQ parenthood. Knowledge of queer origins was pivotal in the process of self-making and enabled participants to produce and express connections between themselves and their LGBTQ parents. Furthermore, queer social histories allowed them to articulate their affinity to LGBTQ communities and culture more widely, particularly noting the how their knowledge and experience of past socio-legal discrimination against LGBTQ people had influenced their outlooks and relationships with LGBTQ people/communities. Thus, origin narratives of people raised by LGBTQ parents highlight that the desire to 'know ones' origins' is not rooted exclusively in biogenetics. In this case, origin stories disrupted the established biogenetic narrative, stressing the importance LGBTQ culture and history for constructing a connection between collective and individual identity.

"I'll At Least Need a Shelter if They Kick Me Out!": Class Accomplishment and Gay Men's Coming Out Process in the Family

See-Pok Loa

University of Oxford, United Kingdom

Coming out to parents remains a significant life decision for gay adult sons in Chinese families to struggle with. Using data from interviews with 19 middle-class homosexual men in Hong Kong, this paper discusses how class resources shape middle-class gay men's decision to come out and the strategies they deploy to buffer potential hostile reactions from parents. I argue class accomplishment plays a paradoxical role in gay men's coming out process. Economic and symbolic resources of class both delay and facilitate gay men's disclosure of their gay identity. Coming out is a risk of status loss for middle-class gay men. They fear that homosexuality would threaten the class respectability they have garnered in the family from their educational and occupational achievement. However, class accomplishment could also be constructed as a precondition of coming out. Gay men strive to accumulate a reservoir of economic resources as an exit route to any potential retaliation from parents. Yet, economic advantages, especially home ownership, end up postponing gay men's disclosure and reinforce compartmentalisation. Following their disclosure, middle-class gay men enact the strategies of economic domination and mobilising class displays to minimise family conflicts. Income disparity within household members offers gay men power to silent their parents' homophobic responses. Gay men also neutralise their parents' rejection by leveraging on class displays and borrowing class privileges from their intimate partners. The findings complicate the linear model of coming out in existing studies. More importantly, it highlights the salience of class resources in managing risks of family instability.

Women's Visibility In Scientific And Political Events: Is There a Gender Gap?

Corona-Sobrino Carmen, García-Melón Mónica, González-Urango Hannia, Poveda-Bautista Rocio

Ingenio (CSIC-Universitat Politècnica de València), Spain

The importance of participation on academic conferences is well known for the members of the scientific community. It is not only for the feedback and the improvement of the work is also about career development, building networks and increasing visibility. Nevertheless, women continue to be under-represented in these conferences and even more in the most visible positions.

Different research studies (Jones et al. 2014; Nittrouer et al. 2017) turn a spotlight on diverse aspects in women's participation in academic events such as the differences on exposition time between women and men, different roles of participation, importance of women participation as a member of the Organize Committee to provide greater opportunities for women to speak or the idea of "token-women" to fill the female quota in events, among others.

In this communication, we expose our project MAGGIE (Monitoring and Assessing Gender Gaps in Events). The aim is the development of a tool based on performance indicators, which will allow monitoring and evaluating gender roles and inequalities in scientific and political events in order to tackle the underrepresentation of women. This tool is based on a combination of two multicriteria techniques: AHP and AHPSort. The purpose of our new panel of performance indicators will be to support and provide evidence and arguments to inform political debates and academia policymaking in the field of gender equality.

Our objective is identifying all these relevant perspectives or dimensions, and to design specific lists of performance indicators for each of them. These indicators will allow the organizers of the scientific and political events to monitor their performance according to each specific dimension. Seven different academic and political conferences have been monitored.

The Leaky Pipeline Reconsidered - An Inter-Sectional Analysis of Dropout Intentions Among Doctoral Students in Germany

Almuth Lietz[1], Sabrina Jasmin Mayer[1,2], Justus Maximilian Karl Rathmann[3]

[1]Cluster Data, Methods and Monitoring, Deutsches Zentrum für Integrations- und Migrationsforschung, Germany; [2]Department of Political Science, University of Duisburg-Essen, Germany; [3]Department of Sociology, University of Zurich, Switzerland

829

Social inequalities still prevail in academia: Even today, female, ethnic minority as well as first-generation students are found to be less likely to pursue and complete a PhD than their counterparts (e.g. Litalien & Guay, 2015). Besides the societal issue of unequal representation, the shortcomings in diversity in academia can also have negative effects on outcomes such as creativity and productivity. To be able to address this inequality in academia, we focus on doctoral students as the doctorate is often considered the entry into the academic professional life.

Previous studies analysed several groups of factors that affect dropout in the course of the academic lifecycle, such as individual factors, social capital or material resources as well as organizational determinants. However, they either had to rely on single-case studies (one university or one discipline) or used non-survey data. Furthermore, no study to our knowledge was able to provide an analysis that allows to disentangle intersectional differences between gender, ethnic minority status, and social origin for the determinants of dropout intentions.

By drawing on a novel data set, the first wave of the German National Academics Panel Study (Nacaps) 2018 (N = 23,612), we study to what extent dropout intentions among doctoral students differ by gender, immigrant-origin and first-generation status and how these differences prevail when we take individual, interpersonal and organizational factors into account.

We find substantial gender differences even when other explanatory factors mentioned above are taken into account; on its own but also in interaction with migration background.

Certifying Gender Equality in Science: Lessons learnt from existing schemes

Charikleia Tzanakou[1], Lidia Arroyo[2], Kate Clayton-Hathway[1], Anne Laure Humbert[1], Jorg Muller[2]

[1]Oxford Brookes University, United Kingdom; [2]Universitat Oberta de Catalunya, Spain

In the past two decades, many Certification and Award schemes (CAs) have emerged in the higher education, research and industry sectors. According to a recent report (Nason and Sangiuliano, 2020), 114 CAs have been identified across Europe and beyond. The growth of CAs reflects the shift of policies and efforts from 'fixing individuals' into 'fixing the system', highlighting that gender equality is a structural, systemic challenge. Certifying individual or organisational excellence is particularly challenging, and even more so when certifying content related to gender equality (O'Donnell & N. Johnson, 2003; Yrjö Collin, 2007; Tsouroufli, 2019; Kalpazidou, et al., 2020).

Studies focused on analysing and evaluating gender equality initiatives in higher education have been scarce, and often limited to specific schemes, drawing predominantly on Athena SWAN in the UK (Caffrey et al., 2016; Ovseiko et al., 2017; Tzanakou and Pearce, 2019). This study aims to contribute towards filling this gap by providing a better understanding of the CAs landscape through comparing (gender) equality schemes that target research-performing organisations in different countries such as Athena SWAN (UK), Label Diversité (France), and Total E-quality Award (Germany). Based on qualitative interviews with stakeholders across Europe and document analysis, it focuses on capturing enablers and challenges, strengths and weaknesses of existing CAs.

This research stems from a Horizon 2020 project entitled CASPER (Certification-Award Systems to Promote gender Equality in Research), which examines the feasibility of a European CAs for gender equality in research organisations.

How Do Research Organisations in Central and Eastern Europe Commit to Gender Equality? Findings from the ACT Project

Marta Warat, Paulina Sekuła, Ewa Krzaklewska

Jagiellonian University, Poland

Gender equality in research and academia is recognised as an important European goal. To counteract gender inequalities various measures had been promoted and introduced both on the levels of the European Union, member states and research organisations. While there is a growing body of studies on implementing gender equality measures as well as factors facilitating and hindering these processes, research on Central and Eastern Europe (CEE) is still scarce.

In the presentation, we examine the current status of gender equality interventions in higher education institutions (HEIs) and research performing organisations (RPOs) in CEE. More specifically we reflect on the legal and institutional frameworks for gender equality as well as the internal and external drivers of institutional change in CEE research organisations and academia. The empirical basis of the presentation are the results of the analysis of policy documents and organisational strategies related to gender equality in HEIs and RPOs in CEE as well as selected results of the Community Mapping Survey conducted under the framework of the H2020 project ACT.

The analysis of the impact of both exogenous and endogenous factors on the implementation of gender equality measures in research and academia in CEE shows that it most often takes place under the influence of external, international incentives combined with the efforts of internal, local change agents. While there is still a substantial need for more institutional initiatives with measures based on comprehensive status quo assessment and tailored-made solutions, there is a gradually growing stock of good practices from CEE region, which we also discuss.

I never wash meat! - Exploring how teenagers learn about food safety using Personal Meaning Maps

Luis Junqueira[1], Mónica Truninger[1], Alexandre Silva[1], Ana Delicado[1], Paula Teixeira[2]

[1]ICS-ULisboa, Portugal; [2]Centro de Biotecnologia e Química Fina, Universidade Católica Portuguesa - Porto

According to estimates, foodborne illness is a significant but poorly known health burden in Europe that is linked to 23 million cases of illness and 5000 death per year. While changes in food production and distribution play an important role in managing contamination risk, foodborne illness can origin in food handling practices at home.

Public health interventions aimed at changing consumer behaviour often rely on a rational choice framing and knowledge deficit model approach that assumes that providing consumers with information from experts is enough to steer them towards safer food handling practices. Alternatively, our research is informed by a practice theory approach that addresses food safety at home embedded in the mundane and distracted context of cooking and food preparation. Here, the mobilization of knowledge is often in the form of how to do food handling safely, instead of propositional or referential knowledge.

Drawing on a study of 65 Portuguese students between 15 and 18 years old we employ a mixed method approach combining Personal Meaning Maps and group interviews. Our results show that students more promptly mobilized and engaged with practical concepts directly linked to their experience of food handling at home than abstract concepts of food safety and contamination. These results contribute to showing the centrality of practice and learning by doing when designing interventions aimed at activities that are intertwined with everyday life routines, such as shopping, food preparation and cooking.

Digital Skills as Citizenship Competence

Touko Vaahtera, Sirpa Lappalainen

University of Eastern Finland, Finland

"Digital skills" have emerged as contemporary civic skills. This paper takes a closer look at this articulation by exploring how ableist standards frame the ideals of digital skills. From the perspectives of cultural studies and the Foucauldian genealogy we focus on cultural assumptions emerging from Finnish policy documents on digitalization. We will read these texts as cultural texts and discourses which articulate cultural values. This perspective will help to better understand the implicit norms and values and the societal functions intertwined with digitalization. The disability studies perspective enables us to pay attention to ableist assumptions in this context. In particular, the concept of ableism (Campbell 2009) enables us to explore how the societal aims around digitalization produce an ideal of a specific kind of mind on which the civilizational hopes of digitalized society are projected.

We wonder whether the emphasis on individual digital skills may cover more structural situations that Shoshana Zuboff (2019) has interrogated through the term "inevitabilism". "The ideology of inevitabilism" (Zuboff 2019) can be recognized from the understandings that connect digital skills with the present moment for example through the phrase of "21st-century skills". We will explore how such temporal framing and the emphasis on citizenship competence in the discourses around digitalization engender such visions in which digital skills are connected unquestionably with progress. In addition, our account that interrogates the societal aims around the so-called digitalization considers technology as a social practice which both draws on specific assumptions about human bodies and their abilities as well as reconfigures bodies and abilities.

831

Towards plural 'mappings' of science for Sustainable Development Goals (SDGs)

Ismael Rafols[1], Ed Noyons[1], Hugo Confraria[2], Tommaso Ciarli[2]

[1]CWTS, Leiden University, The Netherlands; [2]SPRU, University of Sussex, England

The shift in S&T policy from a focus on research quality towards societal impact has led to a demand for indicators that capture the contributions of research to society, in particular those aligned with SDGs. Responding to these demands data providers, consultancies and university analysts are rapidly developing methods to map projects or publications related to specific SDGs. These 'mappings' do not analyse the actual impact of research, but hope to capture instead if research is directed towards problems or technologies that can potentially contribute to improving sustainability and wellbeing. Yet this quick surge of news methods raises new questions about the robustness of the mappings and indicators produced. In a new study that aims to map publications to SDGs, we have found a high degree of inconsistency obtained through different approaches, in agreement with Armitage et al., (2020). In this contribution, we propose that these inconsistencies are not due to minor technical issues, but instead they represent different interpretations of SDGs. In other words, there is no single objective 'truth' about which research is relevant for reaching SDGs. Since different stakeholders have contrasting and often conflicting views about the relationships between science and SDGs, we propose that analysts should support stakeholders to explore which areas are 'really' related to SDGs according to their perspectives, values and contexts (Rafols and Stirling, 2020). We describe here an interactive platform that allows stakeholders to explore in a global map of science the relationship between publications and SDGs.

RN24_T02_01 | Scientific Careers and Practices I

Let's Talk about Networking: On the Influence of Informal Relationships and Networks on the Career Trajectories of Scientists in Technical Disciplines

Andrea Wolffram, Jennifer Dahmen-Adkins, Astrid Schulz

RWTH Aachen University, Germany

Gender research on networking and promotion practices in higher education and in other professional fields has shown that these practices are subject to gender bias. The lack of awareness of the impact for these gendered practices is seen as a major explanation for the persistence of structural gender inequalities in higher education. (Van den Brink & Benshop 2014) Based on problem-centred qualitative interviews with postdocs and people in leadership positions in technical disciplines at universities and in industry (in total 63 interviews), we reflect on networking practices, and the influence of individuals and relationships on the career trajectories of postdocs. The influences of informal network relationships can thereby contradict institutional employment and career development policies aimed at transparent and fair scientific careers. This raises questions about how these effects are discussed and perceived, and how they are legitimized among different groups of scientists. Moreover, this aspect is fundamentally linked to the question of framework conditions under which network relationships emerge in the academic field. Against this background, the talk will provide insights into networking activities and attitudes towards networking of postdocs and gatekeepers at the micro level of scientific fields where women are structurally and culturally in a marginalized position. And finally, these practices are framed and discussed from a perspective of structural change policies towards gender equality in the European Research Area.

832

Topical Gender Segregation Among Grant Recipients

Nina Fárová, Radim Hladík

Institute of Philosophy of the Czech Academy of Sciences, Czech Republic

Academia can be considered a horizontally gender-segregated labor market where women and men can concentrate in certain research areas. We can observe a gender gap in the broad STEM fields (She Figures 2018), but gender differentiation can trickle down to the level of topics (Thelwall, Bailey, Tobin, Bradshaw 2019). Topical preferences may also affect success rates in securing funding for marginalized groups (Hoppe et al. 2019) and a gender gap in funding has been documented for some disciplines (Lee, Ellemers 2015). Our work explores topical gender segregation among grant recipients in the Czech Republic. We built a topic model (Gerlach et al. 2016) from the titles, abstracts, and keywords of ~81k publications of Czech scientists in the Information Register of R&D Results from the years 2017-2018. Next, we selected only publications related to project-based funding and averaged publication-level topic weights to obtain topic mixtures for individual projects. We then converted the compositional topic weights into zero-corrected log odds ratios to avoid multicollinearity issues. From the Central Register of R&D Projects, we extracted the names of principal investigators and estimated their binary gender labels using the genderize.io service. The resulting dataset consists of 5696 projects, each described by the gender of the principal investigator and 327 topical features. A logistic regression of the gender variable on the topics suggests that only 32 topics (or about 10%) are significant predictors of gender, some of which correspond to stereotypically coded areas of interest (health for women, computers for men).

Publish More or Publish Differently? New Aspects of Relationship Between Scientific Mobility and Performance.

Alena Nefedova[1], Maxim Kotsemir[1], Ekaterina Dyachenko[2]

[1]HSE, Russian Federation; [2]RANEPA, Russian Federation

The paper presents the preliminary results of a research project on the international mobility of early career Russian researchers. This study is focused on the impact of education or work experience abroad on their future scientific careers, particularly their publication activity. The case study of one large Russian university was examined: a database combining both biographical data (information from CV published openly) and publication activity indicators (data from Scopus) of employees of this university was collected. A positive relationship between the international mobility and scientific productivity of scientists was revealed. Those involved in international mobility not only publish more scientific article on average, but their papers are in fact published in more higher-level journals and are cited more often. We also found some difference in choice of topics and collaboration behavior between mobile and non-mobile scientists.

From Precariousness in Science to Professional Burnout: The Mediating Role of "Passion for Science"

Ana Ferreira

CICS.NOVA; NOVA FCSH; Portugal

In recent decades, science and higher education witnessed profound modifications that reshaped their organizations, practices and epistemic culture. In Portugal, this was concomitant to a significant growth in human resources that despite some legislative initiatives, were not integrated into stable scientific careers. In spite of this scenario, no recent research has characterized this population, their work and labour relations, nor their subjective relations with scientific activities.

Integrating quantitative and qualitative techniques, this work characterizes Portugal's scientific precariat (n= 2726), mostly composed of women (64%), with an

833

average age of 38 years, with children (46%) and developing research, teaching and science management and communication activities. In common, labour trajectories composed of a long series of fellowships,fixed-term contracts and periods of unemployment in which workers continue to develop their activities. These precarious trajectories are perceived to impact on their work, social lives and physical and mental health, with at least a third presenting high levels of professional burnout. Interestingly, most report high satisfaction with work and dissatisfaction with labour relations. Discursively, a "passion for science" justifies the maintenance in situations of precariousness recognized to be harmful at multiple levels.

Reproducing a meritocratic ethos understood as the only possible path, these workers are trapped into a vicious circle that pushes them towards immediacy, sets them apart from the quality work they wish to perform and the lives they dreamed of. The reported detrimental impacts on their health, reflect the embodiment of precarity and remarkably exemplify the ambivalences of scientific working cultures.

RN24_T02_02 | Science, Technology, Innovation & Society I

Extending the Resources and Appropriation Theory: the Role of Trust in the Social Process of Internet Appropriation.

Giuseppe Lamberti[1], Jordi Lopez-Sintas[2]

[1]Universitat Autonoma de Barcelona, Spain; [2]Universitat Autonoma de Barcelona, Spain

The use of the Internet has increased exponentially in recent years, affecting every aspect of people's lives. Traditional activities are being brought to the Internet (e-entertainment, e-shopping, e-health, etc.). The theory of resources and appropriation has argued and provided evidence that digital skills are becoming increasingly important not only for individuals' social and economic advancement but also to enhance the quality of human resources and ensure a fair distribution of wealth. Yet, they are unequally distributed to the detriment of individuals and countries. The unequal distribution of uses and outcomes of the Internet is known as the digital divide. Even though digital skills are essential in explaining the digital divide, trust in using the Internet may mediate the effect of digital skills on the Internet's use and outcomes. Trust, however, ut can be increased by organizational and institutional innovations, reducing the weight of digital skill in the digital divide production. We extend the sequential model developed by the resources and appropriation theory by introducing trust as a mediator on the Internet's use and outcomes. We tested our comprehensive partial least squares structural equation model with data from a European Union ICT survey. Findings indicate that while trust is another significant driver of the digital divide that mediates the effect of digital skills on internet use, skills continue to be the most crucial driver in generating the digital gap. We conclude that innovation that ensures more trustworthy technologies, systems, and infrastructures is essential to reduce the digital divide's social distribution.

Fancy A Bumble And We Can Tinder Or Grindr For Plenty Of Fish

Hannah R. Marston[1], Sarah Earle[2], Deborah J. Morgan[3], Robin A. Hadley[4]

[1]The Open University, UK; [2]The Open University, UK; [3]Swansea University, UK; [4]Independent Researcher, UK

834

Covid-19 has challenged people's social, emotional, sexual relationships and their mental and physical health and wellbeing. One consequence has been people's embracing of technology to build new and maintain existing, connections with family, friends, groups, peers, and places of work. Understanding of Dating apps usage prior to the pandemic was mostly limited to sexual liaisons. Moreover, there is a paucity of data on the use of Dating apps during the pandemic, and what impact they have on people's relationships and wellbeing. Given the extensive use and role that technology plays in everyday life, Dating Apps are a means for people to develop their social, emotional, and sexual connections.

Taking a life course perspective, 10 adults will be interviewed: 5 adults (<49 years) and 5 older adults (>50+ years). The aims of the research are to understand the use and impact of Dating apps during the pandemic. Research questions include: 1. how Dating Apps effect isolation and social connectedness. 2. what impact Dating apps have on social, emotional, and sexual connections and any effect they have on feelings of loneliness and/or social isolation. An Interpretative phenomenological

analysis will identify the impact of Dating apps on people's relationships and wellbeing.

Currently there is a paucity of knowledge surrounding Dating app use outside of sexual encounters. Drawing on sociology, gerontechnology and social sciences, this interdisciplinary study explores the existing narratives and discourse surrounding people's use of technology and its impact on their social and physical relationships, health, and wellbeing.

RN24_T03_01 | Science, Technology, Innovation & Society II

Tinkering with Technology: New Practices and Redistributed Roles within the Smart Home

Line Kryger Aagaard

Aalborg University, Denmark

This paper explores the role of smart home technology (SHT) in everyday practices and household members' experiences. SHT is developing rapidly and will most likely form the fabric of our future homes. The technology causes alterations in everyday life, social practices and domestic roles. The SHT field is often described as male dominated, but how this exactly plays out in practice is less researched. Taking a practice theoretical approach, the paper demonstrates how the implementation of SHT results in new practices and a redistribution of (gender) roles. Based on home tours and interviews with SHT users, the study documents how different types of SHT require work and technological skill to be set up for optimal performance and interoperability, which involves programming and a mapping of the household's routines. Such activities make up a new domestic practice – proposed in the paper as SHT tinkering. This involves monitoring and control and requires tech-savvy competences. In the study, SHT tinkering would most often (or solely) be performed by the man of the household whom simultaneously took the biggest interest in SHT and held the basic competences for its implementation. SHT tinkering also affected other practices in the household, e.g. by automating lighting and heating. This reconfigured not only materials, but also competences at play in practices, unequally

distributed among household members in terms of gender and age. Thus, the practice of SHT tinkering indicates a redistribution of roles within everyday practices, with the risk of creating power imbalances and reinforcing gender roles.

Assessing Social Acceptability: Seven Challenges, and a few Strategies to Tackle Them

Christian Dayé, Armin Spök

Graz University of Technology, Austria

Assessing the social acceptance of technological innovations has become more and more important in innovation policies at many levels. These range from companies to local communities and to national as well as supra-national governments.

For social scientists, however, acceptance is a complicated concept. In this paper, we wish to reflect on these complications by drawing on our own research on social acceptability in the frame of an ongoing Horizon 2020 project. This project is concerned with applying gene editing techniques to increase the quality and quantity of certain compounds in chicory roots (http://chicproject.eu/).

The first part of the paper sets out to identify and characterize seven challenges for a scientific assessment of social acceptability. These challenges are: (1) the tensions between acceptance and acceptability; (2) the multiple subjects of acceptance; (3) the multiple objects of acceptability; (4) the various factors of acceptability, some of which are by and large unrelated to the technology under scrutiny (psychological attitudes, beliefs and values, economic situation, social networks and groups, political convictions etc.); (5) the balance between realism and tedious detail in the description of the technology used in the assessment; (6) the subjective moral consequences, partly unintended or unwished, of asking people about hypothetical technological benefits (e.g., raising unjustified hopes); and (7) the socio-political effects of assessing the social acceptability of a technological product (e.g., self-fulfilling prophecy).

In a second part we describe strategies to deal with these challenges. These strategies are derived from both the available literature and our own research experience.

835

Discourse of Progress and Narratives of Comfort and Novelties: Technology Domestication Practices in People's Republic of Poland

Joanna Zalewska

The Maria Grzegorzewska University, Poland

The domestication of technology in People's Republic of Poland was the key factor in the shift towards consumer society. Drawing upon ethnographic data, this artcle discusses: (1) how the discourse of progress - legitimized and propagated by the socialist state - stimulated technology domestication practices; (2) how technology domestication practices were orchestrated and experienced in households. Progress, it was the shared meaning of the domestication of technology practices. In the state policy, home technologies were advertised as progressive and modern. At the same time the state distributed and controlled the access to the home technologies, thus the material element of technology domestication practices. The practices of technology domestication were introduced as part of the discourse of progress and the category of progress was the first meaning assigned to home technologies. However, the practices of domesticating technology helped to reorganize everyday life into easier, less difficult, demanding less physical labour and effort. Thus the experience of domestication technology was organized by comfort narratives, in which emerged the new meanings of home technologies: of facilitation, improvement, comfort, relief. Comfort narratives concern home technologies perceived as necessities, such as electric grid, a fully equipped bathroom, a kitchen with appliances; and they are clearly visible among generations born before the year 1960. In a different way so called novelties are perceived, such as cars, television sets, automatic washing machines. These are objects of desire and they serve to create pleasant environment in accordance with the mechanism of modern hedonism. However, the novelties are also labeled as progressive and modern, possessing them meant being progressive and modern, while being progressive was a status indicatior in the socialist times.

Societal Implications of System Innovation: Exploring Alternative Socio-Technical Configurations in the Case of Household PV and Stationary Battery Systems

Titus Udrea, Michael Ornetzeder

Institute of Technology Assessment of the Austrian Academy of Sciences, Austria

The energy transition will involve new technologies and infrastructures, as well as new institutions and practices. However, the strong emphasis on decarbonization runs the risk of 'technocratic reduction' leading to new technological fixes and undesirable side effects. Social science research can help, however, to ensure that the various implications of innovations are examined in detail and that the options for decision-making are broadened. This paper empirically applies a new approach for systematically assessing societal implications of emerging innovations in the context of transition processes. Using a comparative case design based on distinct configurations of photovoltaic (PV) and stationary battery systems, we explore the following questions: How do consequences emerge from different socio-technical configurations and how can we better understand the implications of such configurations? Our comparison demonstrates how even similar configurations may lead to rather different consequences. Specifically, we show how effects of distinct configurations relate to generated electricity and the share of energy autonomy of households, implying different local, regional, and systemic effects. While in all cases electricity is produced by means of PV panels, it becomes obvious that different configurations involve rather different sets of societal implications.

With socio-technical configurations in the center of the analysis, we deepen and simultaneously broaden our understanding of ongoing variation in the energy system. We argue that such a configurational perspective is essential if we are to ensure that future developments do not lead to new technological fixes and negative path dependencies, but remain open to change and adaptation.

What Can Say Us Human Genome Editing Technology About The Extend Healthy Lifespan?

Franc Mali

University of Ljubljana - Faculty of Social Sciences, Slovenia

Ray Kurzweil, the famous transhumanist and engineering director at Google, wrote in 2005 (in book The Singularity is Near) that the pace of technological change in next two decades will be so rapid that our life will be irreversibly transformed. One of the new technologies which radically transformed our life is human genome editing technology (HGE). In spite of the fact that its basic discovery (CRISPR-Cas 9) did not arise before 2012. HGE gives especially new momentum by searching for mechanisms that could prevent aging and extend human health lifespan. In my contribution, I'll try to highlight, if (and how) key stakeholders at EU and national levels who put ethic guidelines and practical institutional requirements concerning the progress of new emerging technologies are encountering with the challenges of HGE. Are they already developing any strategy to find balance in strong (expert and public) polarisations, with strong advocates for and against use of HGE in efforts to come to radical life extension? I will devote particular interest to the question, how (if at all) the expert advisory boards and policy decision makers "regulate" HGE, if is developing as by-product of usual medical therapy of illness of old people (which are based on HGE) the human enhancement as well. The contribution will be based on author's theoretical and empirical analysis in the last two years.

Between Market, Informality, and Activism: Access to Medicines in Russia

Olga Temina

Maastricht University, Netherlands, The

A significant body of literature in the field of STS has been dedicated to the co-production of knowledge by the patient movements, their participation in shaping research and identity and citizenship formation in the Western societies. However, non-Western contexts that are characterized by less developed healthcare systems, lower incomes, and often non-democratic political regimes remain understudied. In my research and presentation I will focus on how patient organizations involved in advocating for oncological and rare diseases patients in Russia enable access to medicines. Although guaranteed by the law, access is often not achieved in practice due to inefficient procurement, shortages, lack of registration, specific pharmaceutical policies, etc. However, unlike in many other spheres of activism in Russia, actions of patient organizations bear results not only on individual level of people accessing medicines but also on a scale of legislative and societal changes.

In my study I will be asking how activist groups bridge the healthcare system, medical professionals, financial resources, and patients, how they accumulate and produce knowledge, empower patients, and contest the existing political epistemologies. Through ethnographic research of several patient organizations concerned with problems of oncological and rare diseases patients in St. Petersburg, I will explore how they organize their practices, co-produce knowledge, and introduce societal change and what role informality plays in their work. Drawing on the STS literature and informality studies I will provide insights on the patient participation and democratization of healthcare in a non-Western context.

Building Private Health Care Spaces in Russia: Organizational-Epistemic Assemblages of Care

Mariia Denisova

Maastricht University, Netherlands, The

The marketization of health care was largely criticized by scholars for increasing inequalities, excessive profit-orientation, and the selected use of evidence-based medicine (EBM). While these critical studies were mainly performed in the "West", we lack insight into how new private health care practices relate to new standards of care and knowledge practices in Eastern-European settings. Russian health care that was suddenly penetrated by market forces provides a unique opportunity to observe "marketization in action". So far, most studies of Russian health care focused only on the institutional, economic, or political dimension in public health care, while the epistemic dimension of health care transformations has not been studied yet. Recently, new epistemic ideals such as EBM have become rather prominent in Russian health care, but we lack insight into how these ideals relate to private health care practices. More private clinics claim to bring better care in treating such severe illnesses as cancer or cardiovascular diseases by following EBM. In my research, I explore two questions: how are private health care spaces enabled in the uncertain environment of Russian health care? How do organizational-epistemic characteristics of those private spaces relate to the provision of care? To explore these questions, I combine two theoretical approaches – STS and informality studies – to trace the assemblages of formal and informal practices and new epistemic dimensions involved in building private spaces. Drawing on the ethnography of the private oncology clinic in St. Petersburg, I seek to contribute to the debate about the marketization of health care.

Digital Platforms and the Transformation of Public Communication

Jan-Felix Schrape

University of Stuttgart, Germany

Intermediary media platforms are not an exclusive phenomenon of the digital age: In the 19th century, news agencies were established to collect, process, and pass on content to subscribing media outlets; in some respects, newspapers can also be described as intermediaries between journalists, advertisers, and readers. However, only with the establishment of easy-to-use digital devices, recipients are able to access the catalog of the platforms themselves and to personalize the content with algorithmic tools—just as all usage dynamics can be evaluated.

Thus, on the one hand, ›platforms‹ as socio-technical coordination structures become the focus of attention; on the other hand, this change results in serious shifts in the structures of public communication. In this respect, José van Dijck et al. (2018) aptly speak of an ›unbundling‹ and ›rebundling‹ of content, distribution, advertising, and audience. Contrary to many expectations, journalism has so far not experienced elementary competition from amateurs or algorithms. However, media companies are losing control over the dissemination of their news since the central online platforms are becoming the all-decisive intermediaries. Thus, the visibility of content is no longer determined by large media outlets, but in a socio-technical interplay between online platforms, advertising networks, media providers, and reception dynamics.

Against this background, my talk aims to explore the potentials and limits of given conceptions of the public sphere and public communication: To what extent do established theories continue to offer an informative classification foil? Which novel dynamics of interaction remain invisible in traditional models? Which alternative conceptions have so far proven to be instructive?

Digital Public Services: Intersecting Social Conditions and Situated Practices of Access and Use

Nuriiar Safarov, Ulla Buchert

University of Helsinki, Finland

The application of digital tools for the delivery of public services has been the focus of the attention of many European welfare states. The reduction of the in-person service provision and the digitisation of the health and social services has brought many possibilities as well as challenges for their access and use by the disadvantaged groups. This article examines in detail the intersecting ways that social conditions and situated practices may affect access and use of digital public services and the internet in the case of people with a migrant background. A qualitative study of Russian-speaking migrants in Finland utilises participant observation, interviews, and diaries to gain insights into the adoption of digital public services from the user perspective. The narrative approach enables the accomplishment of research results that go beyond a simplistic understanding of the digital divide determinants and provides a rich description of social conditions and situated practices that affect differently migrants' ability to navigate the welfare service system digitally. We claim that the problems that migrants encounter adopting digital public services are complex, intersecting, and originate situationally from different sources. In conclusion, the study discusses how the problems with accessing and using the digital public services may threaten the social rights of people with a migrant background.

Disinfection Robots and Cleaning Women. Ethico-Political Debates around Robotics in Caring

Núria Vallès-Peris, Miquel Domènech

Universitat Autònoma de Barcelona, Spain

With the syndemic caused by COVID-19, the expectations and development of robotic technologies for care has received a new impulse, because of their ability to be used to reduce physical contacts and thus prevent the contagion and spread of the virus. Although not considered care robots, disinfection robots are the most widely developed and introduced in hospitals during Covid-19 in Spain. Although these devices are not designed to interact directly with humans, from a science and technology studies and care ethics approach to robotics, these technologies could be considered care robots. From this perspective, in this presentation we develop a reflection on the ethical and social implications of introducing disinfection robots in hospitals or other healthcare settings. We base this reflection on empirical research, based on a series of interviews with women cleaners working in hospitals. Using the ethical framework of discussion developed in healthcare robotics, as well as some debates linked to industrial contexts, we identify a set of controversies. The comprehension or not of these artefacts as care robots has relevant ethical and political implications and allows us to open up a series of debates around the socio-technical solutions developed against Covid-19, as well as to critically reflect on the role of care in technological innovation.

The Situation Of DBS In Clinical Practice

Tamara Schwertel

Goethe-University, Germany

The contribution deals with the situation of the therapy with deep brain stimulation in Germany and its meaning as a technical implant. I apply a sts perspective to study how practices and networks are built through implant and during everyday life after the implantation. In the therapy with Deep Brain Stimulation (DBS) a small device, similar to a pacemaker, is surgically implanted to deliver electrical stimulation to targeted areas of the brain. It is used to treat a variety of neurological symptoms including the therapy of: essential tremor, Parkinson's disease, epilepsy, psychiatric disorder. DBS has also been investigated as a therapy in depression, Tourette syndrome, Alzheimer's disease, anorexia, addiction disorder, chronic pain, and bipolar disorder. But there are possible side effects and life changing risks, which have to be taken into account like brain hemorrhage, brain infection, depression and personality changes. Therefore, DBS is the ultima ratio and will be implanted, when every other treatment isn't successful (anymore). In my research I focus on the fact, that DBS is non-curative and will analysis different situations in the clinical routine which evolves of the technology and its agency. I analyse technical objects from a new materialistic view as objects with agency and a degree ate rigidity and I use the concept boundary object by Susan L. Star, to show different functions and meanings of the DBS. The results are based on an ethnography (5 months) in a clinic in Germany. The evaluation is based on situational analysis (by Adele Clarke et al) and constructive grounded theory (by Kathy Charmaz).

Deep Reading: Socio-Material Practices and Epistemic Ecologies of "Natural" Contraception

Julia Caroline Wummel, Alev Pinar Kuruoglu, Dorthe Brogård Kristensen

University of Southern Denmark, Denmark

Recently we have seen an increase in fertility and menstruation tracking apps marketed with the promise of enabling users to enhance their bodily knowledge, monitor their health as well as pursue family-planning related goals. While many tracking apps come with similar promises, some critiques have been that they isolate the users, and moreover, serve to "black-box" their bodily processes - allowing them to perform only a "surface" - rather than "deep" reading of their bodies.

This paper draws on interviews and observations with members of a German forum who practice technologically-aided "Natural Family Planning" (NFP) methods. Our focus is on women who practice NFP in order to ensure contraception.

We find that the affordances of NFP practices include a heightened tactility, hormone or barrier-free enhanced pleasure and intimacy with both one's self and the partner. Tracking, as well as understanding and acting upon its outputs is co-enabled by a collectivity of participants who share the social space of the forum. The safe usage of NFP both requires and facilitates the acquisition of bodily knowledge, and we see that this acquired knowledge allows many of these women to have better sexual experiences while also feeling safer. We argue that this knowledge acquisition is made possible by performing tracking activities while embedded in the sociality of the forum. We attend to the affordances and ecologies of online spaces as epistemic communities geared towards collective building, sharing, as well contesting intimate bodily knowledge - thereby facilitating a socially performed 'deep reading' of the body.

Emotional and Affective Labor in the Development of Data-Driven Technologies in Public-Private Partnerships

Marta Choroszewicz

University of Eastern Finland, Finland

The article extends the previous analysis of power dynamics as materialized into the data-driven technologies. Much of emotional and affective labor around data and new data-driven technologies, including coordination of public-private partnerships, remains invisible and uncredited. The article builds on the notion of the invisible labor and feminist scholarship on care and emotions to capture various types of emotional and affective labor embedded in collaborative development of data-driven technologies. It presents the results of two-year ethnographic study of the collaboration between the Knowledge Team of a public organization and a private IT company in developing and maintaining a data analytics product in a Finnish regional healthcare and social service organization.

The results point at three types of emotional and affective labor that are identified: 1) emotional labor of experts of private IT company, who cope with the feelings of disappointments of customer organizations or when they try to understand their needs; 2) affective labor of public sector professionals who engage in caring practices for data that is utilized, and 3) public sector professionals' emotional and affective practices as ways to cope with laborious collaboration. The results of this study contribute to the understanding of mechanisms through which the processes of technology design, development and implementation can be improved.

Gender Transitions as a Sociotechnical Issue: A New Materialist Approach

Louka Maju Goetzke

Goethe University Frankfurt, Germany

In this paper, I argue for a methodological framework that accounts for the intra-action (Barad 2007) of science, technology and society in a research object. I exemplify this argument with my own empirical research on gender transitions, a qualitative study on people who change their gender.

Many activities and human as well as nonhuman actors contribute to forming, maintaining, and redefining the boundaries of what makes a gender transition: e.g., transitioning subjects, bodies, implants, hormones, medical science, laws, community knowledge, technological and medical innovation. To follow the processes and practices co-constituting a gender transition, I make use of an anti-dualistic new materialist approach. Thus, the idea of inter-relations and an autonomous subject with individual agency is replaced by entangled, intra-acting, sociotechnical processes with multi-situated agency. With multiple methods of data collections (interviews, observations, re-enactments) I engage with the transversal intra-activities of these processes.

New materialism also emphasizes the involvement of the research process itself with its materiality (e.g., computer and programmes) in the co-constitution of the research object. Consequently, the argument of my paper is twofold: First, it calls for a methodological arrangement that accounts for the complex intra-relations of science, technology and society and therefore does not reduce research data to simple processes of causation. Secondly, it emphasises the co-constitutive character of the research process itself and provides an example on how to include the sociotechnical involvement of the research in the analysis.

Sociotechnical Asymmetries for the Production of Knowledge in the Emergence of Open Science: a Case Study of Genomic Medicine Researchers in Mexico

Nestor Martínez-Domínguez

UNIVERSIDAD AUTÓNOMA METROPOLITANA, Mexico

The objective of this work is to analyze the perceptions and practices of Open Science of a group of Mexican researchers for the production of scientific knowledge. With a content analysis and in-depth interviews, a biographical reconstruction of the article "Heterogenous Distribution of MTHFR Gene Variants among Mestizos and Diverse Amerindian Groups from Mexico", published in PLOS ONE in 2016, was carried out.

Even though the researchers recognized the relevance of open science within genomic medicine, and that in their daily activities they work with open science resources (such as the use of open-source software), they also expressed a critical position on the idea of openness and open data. In a context where originality is the most important point to be recognized at the disciplinary level and, through a national evaluation focused on the publication of journals with a high impact factor, the interviewees pointed out the ease with which other research groups (regularly from the North) with better socio-technical infrastructures, they can absorb the data and generate contributions without considering the "data shadows" (Leonelli et al 2017) that consists of the different sociotechnical relationships that are built for the elaboration of scientific evidence (financing, networks of collaboration, instrumentation, among others).

These results allow a preliminary reflection on how Open Science redefines the center-periphery power relations between scientific communities and creates new asymmetries in scholarly communication and production of scientific knowledge.

Thinking About Biobank Donation in the Context of the Good Habit of Blood Donation: a Pragmatist Approach

Vera Raivola[1,2]

[1]University of Eastern Finland, Finland; [2]The Finnish Red Cross Blood Service

Between 2015-2017 me and Dr. Karoliina Snell organised interviews and group discussions with current voluntary blood donors at the Finnish Red Cross Blood Service. We conversed with donors about their views on blood donation and its purpose, and asked if they would be interested, why and how to donate their blood sample and personal information also for then soon-to-be opened Blood Service Biobank for future research and development use. While biobank was an unfamiliar concept for most, the study participants said they would agree if there was a request to add biobank donation to the normal blood donation which they commonly described as "a good habit". I take this framing as my viewpoint to find out how blood donors concluded to donate despite their acknowledged uncertainty and doubt on biobanks' use of donated data. To answer this question, I have used pragmatist John Dewey's conceptualization of social habits presented in Human Nature and Conduct (1920) and also compared my data on habitual practices and values or "goods" of blood donation with previous STS and sociology studies on these issues. Based on my analysis, I argue that to understand the kind of choices donors' make in new science and technology contexts like biobanks, we have to ask what kinds of assembled habits of donation they already have and look at their institutional structuring because it is these customary habits that organize the process of reflecting and imagining what this situated choice means and how – or whether - to plan forward.

842

From Participatory Procedure To Gestalt: Lessons Learned From The Implementation Of The German Corona-Warn-App

Karoline Krenn

Fraunhofer FOKUS Berlin, Germany

The use of invasive technologies is often justified by imminent peril, recently exemplified by the introduction of Corona apps. The pandemic doesn't differ in this respect from other crises. Technology is handled as obvious solution to an urgent threat. The variety of apps used in different countries demonstrates that technological responses to the pandemic vary. This draws us to the technological design process and how it impacts the Gestalt of technology. I put forward the thesis that a closer look on the design process itself is the best lever for more societal impact on technological outcomes.

The contribution addresses the question of alternative futures by looking at variants of Corona apps. (1) By comparing functionalities found in different apps such as health monitoring, quarantine control and contact tracing it reflects on the contingency of problems solved by technological design. (2) By looking at the German Corona-Warn-App (CWA) it examines how requirements are recognized in sociotechnical design processes. The focus will be laid on the simultaneous participation of experts and expert knowledge on the one hand and public engagement on the other hand. Through the involvement of civil society and the open-source procedure the CWA is an insightful case for a participatory process. We will discuss what we might learn from it and how broad participation may lever technological solutionism. (3) Finally, the contribution reflects on public and media discourse on the CWA and the interplay of expectations in technology, understanding of technology and a learning rather than a failure culture.

Scientific Uncertainty and COVID-19 Pandemic: Face Mask Controversy in Turkey

Zubeyde Demircioglu

Istanbul Medeniyet University, Turkey

People want to access reliable information quickly in times of uncertainty, such as natural disasters, terrorist attacks, and pandemics. In many cases, this information is produced and disseminated by experts. However, due to its rapidly spreading nature, the pandemic left behind the production of scientific knowledge, and many questions about the disease remained unanswered. When empirical results are not sufficiently replicated or conflicting and experts have not reached a consensus over evidence, scientific uncertainty and controversy can arise. In this sense, we faced many scientific uncertainties and scientific controversies during the pandemic.

At the beginning of the pandemic, due to lack of scientific evidence, the issue of how the virus spreads in the air has become one of the biggest controversies. The discussions on the use of face masks have intensified.

Although evidence has accumulated that wearing a mask reduces the transmission of infected respiratory particles, there is still no global consensus on masks. In the absence of sufficient reliable evidence, countries made different public decisions and the face mask controversy was closed through political procedures rather than scientific consensus.

In this context, I will focus on how the discourse about face masks changed over time and how the authorities terminated the controversy in Turkey. I will discuss discourses of members of the Science Board that is the authority figure of the pandemic in Turkey and non-board experts, in the light of evidence from scientific research.

843

Necropolitics of Vaccine Capitalism

Salla Sariola

University of Helsinki, Finland

Current arrangements for achieving immunity to COVID-19 by vaccines is both epidemiologically short-sighed, and unjust. Taking cue from Achille Mbembe's theory of necropolitics, the presentation will describe the political economic structures hindering global vaccine access, and the reasons underlying why 10% of the world's countries have reserved 70% of the world's vaccines and why most African countries do not have vaccines at all. Inequitable

vaccine access is organized by vaccine capitalism: pharmaceutical companies, exclusive patent regulations that protect industry profits, and proprietary contracts between countries and companies. As the virus does not abide by national boundaries, having billions of people without vaccines risks the continuation of the pandemic. The presentation also describes the international social movement that is seeking to subvert the intellectual property rights system of the World Trade Organisation, and the proprietary pharmaceutical sector. Questioning the present logic, they are using the pandemic to re-organize state-science relations and geopolitical relations between the Global South and the Global North. The social movement politicizes open science in a way that aims to not only create vaccine access, but subvert and decolonize knowledge production at large.

RN24_T06_01 | Science, Technology, Innovation & Society V

What Scientists Think And Know About the Future After Covid-19

Emilia Araujo, Paula Urze

Communication and Society Studies Center, Institute of Social Sciences, University of Minho, Portugal

Pandemic disaster has reinforced in many ways the interest in foreseeing about future catastrophes, and anticipating technologies and modes of dealing with them. This communication seeks to show what scientists actually think about the ability of science to prevent societies from crisis similar to covid-19 pandemic, and what are their views about the role they will have on that process. Actually recent years have witnessed a growing interest in future, and future studies in general. Several studies have been made about the trends and possible societal developments in many areas. However, few studies have been published concerning the perceptions, the visions and the images scientists have on that, what role do they ascribe to science, and politics for designing that future, and what are the main actions that in their view politics should take in the present, to avoid the worsts consequences. This communication will analyse the dimensions giving particular attention to the perceptions of scientists about the best adapted technologies for screening, marking and dealing with

people most affected by health catastrophes, including people infected or more vulnerable to infections. The communication is based on a literature review on the concept of future, as well as on the results of a survey developed during 2021 involving portuguese and foreing scientists.

The Body Through The Prism of Risk Anticipation: Contemporary Airport Apparatus In Question

Manon Beaucourt

Université de Strasbourg, France, France

For a decade, in France but also in other European countries, body scanners and new behavioral analysis methods have been gradually introduced to the array of techniques and technologies used inside the airports. These new practices intend to anticipate the risks of terrorist attacks, trafficking and illegal migration. Like palpations or biometrics, they have in common to read the identity or locate a potential threat from the bodies while meeting the requirements of efficiency, speed and economic cost of airport security. Because they push back the limits of the private and the public, the visible and the intimate, and because they may require putting bodies to the test, these surveillance techniques are nevertheless subject to criticism and resistance. This communication aims to take stock of the progressive introduction of body scanners and behavioral analysis in French airports :first, by questioning the diversity of their scientific roots in order to identify the normative conceptions on which they rely on, particularly in the fields of medicine and psychology and then, by highlighting the registers of protest to which they give rise in civil society as well as any margins for negotiation.

844

Resistance Strategies of Individuals Against Digital Surveillance

Julia Heller

University of Warsaw, Poland

Are we free in the digital world, or should we be more worried about digital surveillance? Nowadays, the public attitude towards online communication has drastically changed. It is caused by publishing more and more information about misuse of the users' data. Corporations collect Big Data to modify user's behaviour. It thus becomes a form of control. The subject of Big Data and the impact of using predictive models is widely discussed in the social sciences. However, researchers mainly focus on the analysis of institutions collecting and using Big Data. Much less attention has been paid to users themselves. For this reason, my empirical material comes from interviews, among others with employees of online marketing departments, media agencies and people dealing with the subject of online supervision. Besides I have significant knowledge of consumer data usage due to my business experience. I am focusing on Poland because it is an example of a country where the General Data Protection Regulation is in force. I plan to demonstrate various resistance strategies against digital surveillance in Michael Foucault's and his followers' theoretical framework. My project is based on two of his surveillance theories: panopticon, and governmentality. He used the panopticon metaphor to describe a situation in which control-conscious subjects discipline themselves. However, every step online is being registered, but the users are not necessarily aware of it. E-panopticon is when users limit their freedom by creating and ignoring the consequences of unconditional data sharing. On the other hand, as in governmentality, Big Data is used to manage by influencing peoples' behaviour. My main focus lies on the nature of power and how individuals intentionally act against it.

RN24_T06_02 | Science and the Public

Numbers and their Frailties: Statistical (Non-)Knowledge as a Matter of Concern

Lukas Griessl

University of Essex, Germany

845

Statistics offers a mechanism to understand the world based on limited pieces of it. Especially in survey research, the question of how to select those pieces undergoes permanent controversy. This topic found particular prominence in recent years in the dispute around probability vs. non-probability sampling strategies, concerning the changing means of data generation and the role of randomization. This controversy displays a tension between constructivism and realism concerning statistical numbers: as highlighted by Desrosières, statistical figures depend on conventions but nevertheless reflect a reality. Under the auspices of post-truth, this tension calls for a critical investigation into the genesis of numbers and their fragilities.

Following Latour's suggestion to focus on matters of concern instead of matters of fact, this paper aims to bring to the fore the various investments in the pursuit of statistical knowledge within the aforementioned controversy. It thereby aims to offer a discourse theoretical perspective on how statistical knowledge can be characterized beyond constructivism and realism. To this end, this research draws on interviews with statisticians to map this controversy that touches the heart of statistical reasoning. For now, 10 interviews have been conducted and 20 additional interviews are planned.

From the lenses of the sociology of science, preliminary findings point to two interesting phenomena: the highly contested nature of statistical knowledge and inner disciplinary attempts to withhold current developments in the field, pointing to a Kuhnian understanding of scientific progress. The research is particularly timely, as it concerns major developments in statistics and relates to the dissolving trust towards numbers in the light of post-truth politics, whereby disagreement and controversy raises the question about what constitutes authoritative evidence for decision making.

A choice of ignorance? Ethnic categorization, National statistics, and Inequality indicators in Israel

Sigal Nagar-Ron

Sapir academic college, Israel

National statistics play an important role in the construction of ethnic categorization. Although Israel is a migration country and divided by ethnicity, Israeli sociology did not pay attention to the National statistics' contribution to the construction, maintenance and (the last decades) gradually erasure of intra-Jewish ethnic categorization; the binary distinction between "Ashkenazim" and "Mizrahim".

By analyzes the "Statistical Abstract of Israel", published by the Israeli Central Bureau of Statistics (CBS) from 1950 till 2020, I expose the national statistics' contribution to the construction of intra-Jewish ethnic categorization during the first formative decades, parallel to the construction of Israeli ethnic inequality, and the gradual erasure of ethnicity from the CBS inequality indicators at the last decades. Since CBS set an expiration date for ethnicity- two generations after immigration- in the last two decades third and fourth generations have become untraceable in official statistics. At the same time, the CBS developed new indicators to examine and measure inequality: the "Socio-Economic Cluster Index" in 1987 and the "Peripherality Index" in 2008. These new inequality indicators, "bypass ethnicity", are based on space. I discuss the implications of this "statistical ethnic-blind approach", arguing that the new inequality indicators erase the history of immigration and settlement in Israel which created the ethnic inequality structure prevalent till this day. Furthermore, the absence of ethnic-based statistical data hinders proper analysis of current inequality in Israel.

Curating Urban Knowledge - A Comparative Study of Citizens Surveys in Stuttgart, Nottingham and Shanghai

Jenni Cauvain[1], Hannah Keding[2], Reiner Grundmann[3], Lei Xie[4]

[1]Nottingham Trent University, United Kingdom; [2]Institute for Applied Economic Research (IAW) at the University of Tübingen; [3]University of Nottingham; [4]Institute of Governance, Shandong University

Civic epistemology (Jasanoff 2004, 2005) has gained popularity in explaining the ways in which "states and their citizens arrive at collective settlement regarding epistemic foundations of public life" (Miller, 2008: p 1896). In Jasanoff's original application of the concept, states and their politically relevant knowledge machinations were brought under comparative scrutiny. Less is known about how civic epistemology applies to legitimating claims of urban knowledge through relations between the local state and citizens. In this paper our aim is to elaborate on the utility of civic epistemology in the local context through a comparison of three very different cities located in Europe and China. The question addressed in this research is how does knowledge about the local population gain civic authority in these three contrasting case studies, and what role in particular does the "citizens survey" – a technology of government with global spread, play in this process of local legitimation of knowledge?

846

Personal Citizen Science Through the Lens of Commons-based Peer Production

Enric Senabre Hidalgo, Bastian Greshake Tzovaras

Université de Paris, INSERM U1284, Center for Research and Interdisciplinarity (CRI), France

New citizen science communities of practice have formed around the ideas of personal science and self-research. Personal science describes the growing field of individuals as non-professional scientists that use empirical methods to answer questions related to their own lives and well-being, covering topics as diverse as chronic health conditions, personal mood, behaviour. For this, the tools used by personal science practitioners range from high-tech wearables to simple spreadheets. These sociotechnical advances represent an opportunity to expand the state of the art of community-based research and the democratization of science. Personal science practitioners perform all steps of their own research – often with the smallest possible sample size: the n-of-1. Despite this often self-centered focus – where individuals work on their own research questions and objectives – these extreme examples of participant-led research are building new collaborative forms of expert and scientific knowledge, thanks especially to the adoption of commons-based peer production (CBPP) principles and practices. This has resulted in scientific discovery platforms like Open Humans that connect with existing communities like the Quantified Self, or even the community-led development of open source prototypes in the current context of COVID-19. Based on 22 in-depth interviews and an action research approach we investigate the interplay of motivations, learning processes and peer-support dynamics among personal science practitioners. In particular, we establish a comprehensive framework to characterise this phenomenon from a CBPP and open science perspective, describing its knowledge co-creation interactions for developing scientific literacy, self-empowerment and personal research strategies as part of a dialogic, evidence-based, inclusive and distributed process. We also identify relevant applications of CBPP principles allowing practices of personal citizen science to evolve beyond n-of-1 approaches.

RN24_T07_01 | Energy, Climate Change & Sustainability I

Energy Transition: How Risk Perception of Energy Technologies Mediates Public Acceptance?

Agnė Budžytė

Kaunas University of Technology, Lithuania

The world's increasing energy consumption requires a stable and secure energy supply. However, environmental challenges, increasing pollution of air, water and soil, and the lack of resources creates the need to find alternative ways of development. Thus, more and more countries are deciding to act and convert their energy sector into a more environmentally friendly form. Therefore, the transition from fossil-based energy to near-zero-emission sources is finding its place in national energy strategies. Although government agencies mostly discuss energy security or financial aspects, scholars note the importance of the social dimension.

Studies, that have already been conducted, have found, that public support for the energy transition is critical if the country expects to successfully shift to renewable energy sources. It has also been highlighted that behavioural and attitudinal changes are one of the most important components of the whole process. Nonetheless, the risk perceptions of energy technologies also need to be considered. Public concerns about energy technologies and perceived risks could lead to significantly lower support for such an energy transition, despite major concerns about climate change or other environmental issues. Therefore, using data from a nationally representative survey in Lithuania, this presentation examines how environmental and energy concerns are mediated by risk perceptions of energy technologies and how these mediations influence the public acceptance of these technologies. The analysis found that risk perceptions can change public acceptance in one of two ways: the first way is by increasing support for energy technologies and the second way is by decreasing it. These results thus offer new implications for the social dimension of the energy transition

Infrastructural Work at Home: Households in a Decentralizing Energy System

Harald Rohracher, Julia Velkova

Linköping University, Sweden

Energy infrastructures in households are increasingly becoming fluid. They are refigured by energy utilities and policy makers who design strategies to 'activate' users to contribute to the management of electricity loads; by software companies who develop various digital platforms that offer households to connect and steer devices or trade electricity; and by the affordability of technologies for micro-production and energy storage or transportation like electric vehicles. Particularly for more resourceful households such as single-family houses with solar panels and/or EV ownership, this new infrastructural environment creates opportunities to actively arrange infrastructures at household level in ways which were not possible before, e.g maximizing their own use of self-generated electricity or offer flexibility services to utilities. In this presentation we draw on a project where these new practices of assembling and inhabiting energy infrastructures are investigated through interviews and video-walks in households and analysed as 'infrastructural work'. We analyse two modalities of this work, when households create new socio-technical constellations in their home through the enabling and mediating role of new IT platforms, services and digital devices; and when they are drawn into the infrastructuring projects of larger actors. We discuss how these new constellations lead to ambivalent negotiations of (self-) control and autonomy, creating new relations to energy, but also new dependencies, driving households to link ever more devices to the platforms, allowing data-driven companies to harness user data for their purposes, and integrate energy and data ecologies.

Stop Burning Garbage. Analyzing Activists' Assemblages In A Environmental Controversy

Oriol Barat Auleda, Miquel Domenech Argemí

Universitat Autònoma de Barcelona, Spain

In 2019, the opening of a waste incinerator in a Pyrenean village of just over 1000 inhabitants meant the birth of a socio-technical and environmental controversy that would end up involving institutions and organizations from all over the country. With the aim of protesting and paralyzing the project, a group of neighbors formed a citizen platform called the Cercs Anti-Incinerator Platform (PAIC). In a relatively short time, the PAIC became a key actor in the evolution of public policies in the municipality. Through a focal ethnography around this group of activists, we have been able to study from a STS perspective the three strategies through which the group of activists built a heterogeneous and interconnected assemblage of a wide variety of associations, institutions and individuals, with a capacity of influence that reached the highest legislative organs of the country. The weaving of alliances, citizen mobilization and the legal struggle allowed the platform to achieve the paralyzation of the incinerator. Our research shows how the simultaneous combination of these three strategies was the key factor for the activists' success. At the same time, we analyze the highly technical nature of the bureaucratic processes surrounding environmental issues. These technical issues are a barrier to public participation in local policies but, also, a problem for public authorities in order to make decisions on the political and social suitability of this kind of projects.

RN24_T07_02 | Scientific Careers and Practices II

Which Problems Do Research Collaborations Face and how can They be Solved? An Analysis from a Self-Governance Perspective

Carina Weinmann[1], Florian Meißner[2], Gerhard Vowe[1]

[1]Heinrich Heine University Düsseldorf, Germany; [2]Macromedia University of Applied Sciences Cologne, Germany

Because research collaborations (RCs) are one of the most efficient forms of tackling complex research issues such as the development of alternative futures in order to deal with the current global changes and challenges. To reduce substantial risks for the productivity and success of scientific work, understanding and solving collaboration problems is of paramount importance. However, theory-driven research on this issue is scarce. Our study is based on the assumption that problems arise from inside an RC and have to be addressed by those who are involved. We therefore relied on self-governance as the basic principle of addressing collaboration problems and adopted a micro-theoretical view by combining two theoretical approaches: club theory enabled us to diagnose problems and commons theory to conceptualize solutions. Our aim was to develop theoretically informed, concise and generalizable catalogues of problems and solutions based on experiences and expectations of participants of research collaborations. For this purpose, we conducted a series of in-depth interviews (N = 18) with leading researchers and research managers in Germany. Seven typical problems (e.g. lack of commitment or fairness) were identified, as well as twelve possible solutions (e.g. continuous evaluation or creating cognitive common ground) that can be applied within the self-regulatory framework. Based on our integrative theoretical foundation, the findings add coherence to the fragmented research on problems and problem solutions in RC. Furthermore, they provide a useful framework to further investigate problems and solutions and interlinkages between both and practical implications to improve research collaboration.

The Disciplinary Frameworks of Interdisciplinary Collaborations During Scientific Careers

Pierre Benz1, Thierry Rossier2

1University of Lausanne, Switzerland; 2London School of Economics, United Kingdom

During the last decades, interdisciplinarity through research projects has been increasingly valued by political authorities and institutions promoting and funding research. As a consequence, this practice has increasingly spread as a scientific standard throughout the careers of researchers. However, these changes do not seem to have affected the general structure of disciplinary hierarchies, and interdisciplinarity appears more as a situated practice, varying from one discipline to another. In this context, not many studies examine the modalities of interdisciplinarity during scientific careers. This contribution questions these dynamics through research project co-applications. We are interested in biographical paths, as well as the frequency and form of this interdisciplinarity during scientific careers: between more or less similar disciplines, and between subfields within the same discipline. To do so, we use the data from the Swiss National Science Foundation (SNSF) on all the projects funded since 1976: N = 35,762 researchers who have (co-)directed 64,823 projects. This material offers the possibility of analyzing the frequency and temporality of collaborations. First, we compare the proportion of interdisciplinary collaborations, between disciplines, and groups of disciplines. Then, through sequence analysis, we describe typical interdisciplinary pathways, and show how the symbolic hierarchy of disciplines structure them.

RN24_T08_01 | Science and Social Context

Science, Evolution and Belief in Global Context

Stephen Howard Jones[1], Rachael Shillitoe[1], Rebecca Catto[2]

1University of Birmingham, United Kingdom; [2]Kent State University, Ohio

Based on data gathered as part of a large international research project examining public perceptions of the relationship between 'science' and 'religion', this paper explores perceptions of science and evolution across religious and nonreligious groups in Germany, Spain, Argentina, Canada and the UK. The 'Science and Religion: Exploring the Spectrum of Global Perspectives' project, based at the University of Birmingham, seeks to explore public perceptions of the relationship between science and belief utilising methods from psychology, sociology, media studies and history. In this paper, we will focus on the data gathered from the qualitative strand of the research and examine attitudes both among scientists and members of the public.

Sociological research into science and belief since the mid-2000s has sought to move beyond the problematic assumptions that dominate public and, to some extent, scholarly discourse, particularly in relation to the construction of the relationship between science and religion as being necessarily mutually exclusive. One way in which more recent research (Ecklund et al, 2019) has developed this argument is by seeking to show 'conflict narrative' to be a distinctively Western myth. This paper builds on this research, using initial interview and focus group data to highlight how 'religion', 'nonreligion' and 'science' are constructed in different contexts, with a focus on how distinctive moral and social conflicts can cause science and religion to emerge in public discourse in varied ways.

Fiction as a Sociotechnical Phenomena

Andreu Belsunces Gonçalves

Universitat Oberta de Catalunya, Spain

From an STS perspective, fiction can be considered both as an agent and an epistemic object -a thing that makes things- that participates in processes of sociotechnical stabilisation and change.

Acknowledging the material agency of fiction is primarily based on Actor-Network Theory (Callon 1998; Latour 1996). Sociology of knowledge (Knorr-Cetina 1993), has shown how fiction has an operative and instrumental function not only in science communication but also in the very production of scientific knowledge in High Energy Physics. In a similar sense, Savage et al (2018) have argued that organisations are non-existent entities that mobilise fiction to create behaviours and material contexts that are acted upon "as if" they were real.

Similarly, but focusing on the act of futuring, sociology of expectations explains how fiction is a crucial element in the decision making process, for example in the act of investing and therefore embracing risk (Beckert, 2014). It is also mobilised in innovation, especially in projecting future users in technology design (Wilkie & Michael, 2009).

To future is a social practice that activates different levels of fiction. In this respect, anthropology of science (Adams et al 2009) draws upon anticipation as a common practice in biomedicine, and political STS describes sociotechnical imaginaries (Jasanoff & Kim 2015) as visions of future collectively held that reproduces and interrupts hegemonies setting the railways for progress.

Based on the analysis and systematization of how sociological research on technosciences considers fiction, this work aims to define fiction as a sociotechnical phenomena. By doing so, it expects to add a conceptual tool in the research about science and technology semiotic-material production and its role in social change.

A Biased Mind: Significance As A Publication Booster?

Julia Jerke, Antonia Velicu, Heiko Rauhut

University of Zurich, Switzerland

Publishing research results is probably the most fundamental prerequisite of scientific progress. Any finding remaining in the file drawer, independent of its quality, importance or relevance, is in fact meaningless. However, we know from studies on publication bias that what is published is not representative for what is being researched. While the existence of publication bias has been documented across various disciplines, it is widely unexplored how different actors of the scientific system contribute to the problem. We combine quantitative and qualitative elements to provide an in-depth analysis of researchers' perception of significance and how it affects their understanding of research quality. In a quasi-experimental design we confront 15'778 scientists from Austria, Germany and Switzerland with a hypothetical study for which we vary the strength of the statistical results. Across all disciplines, we find that researchers that are shown a study with statistically significant results rate the methodological approach, the scientific contribution and the publication likelihood substantially higher than those that are shown the identical study but with insignificant results. In a second step, we further analyze the content of 11'250 detailed comments on the study: preliminary results clearly suggest that the (in)significance serves as a strong signal that affects researchers' perception of the study quality. More precisely, the comments reveal that significance seems to matter especially when it is not present. In conclusion, our results demonstrate that publication bias is a widespread and structural problem that has become manifest in the researchers' minds.

RN24_T08_02 | Energy, Climate Change & Sustainability II

National Specificities in Safetization: Decision-making on nuclear waste management in Finland and France

Tapio Litmanen[1], Matti Kojo[2], Markku Lehtonen3, Mika Kari[2]

[1]University of Jyväskylä, Finland; [2]University of Tampere, Finland; 3Universitat Pompeu Fabra, Barcelona, Spain

While both Finland and France are seen as forerunners in final disposal of nuclear waste, there are striking differences between the countries in public and policy discussion on the safety of the project. This paper studies safety-related arguments in national level decision-making on final disposal of nuclear waste in Finland and France, using selected parliamentary documents as the empirical material.

The paper adopts safetization in decision-making on nuclear waste management as its central concept. By safetization we refer to a process whereby, first, images of risks and uncertainties are either created or explained away to give assurance of safety. Second, current practices are normalized or various – sometimes even exceptional – measures are demanded in order to change current practices and thereby solve the issue and assure safety. Thus, prevailing views of safety can be supported to build further trust and confidence or alternatively challenged in order to achieve more robust understanding regarding the issue. As a result of safetization, political power will be re-distributed between key actor groups such as implementers, regulators, and politicians. Our empirical analysis explores such processes whereby Members of Parliament frame, politicize and depoliticize safety.

We argue that safety is not only an outcome of scientific research and technical competence, but that efforts at ensuring safety include also frames of safetization and de-safetization in public debate. Research on energy policy should integrate safetization as a key topic, alongside issues such as energy security and climate change mitigation, given that safetization involves similar politicization/de-politicization processes and exercise of power.

851

Contextualizing the History of Energy Transitions in Early Postwar Taiwan (1945-1979) from the Perspective of Large Technical System

Tsai-Ying Lu

Maastricht University, the Netherlands

This presentation revisits the history of Taiwan's power system from the rebuilt to its first energy policy's establishment in 1979. Taiwan has been treated as the Japanese Empires' colony for its Southern expansion and then became the military base for the Nationalist Party (Kuomintang, KMT) 's ultimate unification in the first half 20th century. The KMT manifested this country as the United States' anti-communist ally during the Cold War to maintain its legitimacy and ensure the international monetary and technical help for its planning economy. The state-owned Taipower Company (TPC) electricity system was the main infrastructure and support for the KMT's economic rehabilitation plans. That is, the growing TPC power system reflects the development towards the state's gradual independence in terms of politics, economic, and technology.

To scrutinize this interwoven history of Taiwan's power system, this presentation applies the "system-builder-following" approach of the Large Technical System (LTS) to understand what elements had shaped the energy-mix of the TPC system over time. Materials such as the government report from the national archive and two TPC internal-circulated journals will be studied to offer a better understanding through the lens of engineers. By elaborating how TPC engineers forecasted possible fuel options to create "firm power" in different periods and decided the so-called "optimal energy mix" amid Taiwan's difficult political situation, this presentation will bring to light the contested energy futures visible in different engineers' assessments. In turn, it will enrich the literature of complex socio-technical transformation embedded in energy and electric power development.

The Paradox of Publically Engaged Research - Scientific Authority, Self-Reflection and Problematization in the German Coal Phase Out

Jeremias Herberg[1,2], Johannes Staemmler[2]

[1]Radboud University, The Netherlands; [2]Institute for Advanced Sustainability Studies, Germany

In this contribution we present reflections and empirical findings from our sociological, political scientific and transdisciplinary engagement with the social consequences of the coal phase out in the East German Region of Lusatia. In working with civic initiatives, large industries and policy makers we have encountered three paradoxes which are characteristic for engaged research: 1) The paradox of scientific authority (Bijker et al. 2009; Eyal 2019) takes on a particularly dynamic development in transdisciplinary collaborations. Committed scholars are called upon to participate in the design process, but at the same time they are often criticised for doing so. 2) A paradox of reflection becomes apparent: The public role of science often includes the expectation that it should create transformative impacts on the one hand, and that it needs to re-think and control its transformative impact on the other. 3) The paradox of problematization is the most complex challenge to engaged researchers. In transformation processes and public conflicts they are expected to offer policy solutions, but even the problematization of socioecological and sociotechnical changes can intricately involve scholars in the public conflicts that often shape socioecological transformations. The German coal phase out, which we have studied for three years by means of ethnographic approaches and interpretative policy analysis, is a fitting case study: Environmental pressures, inherited inequities, populist tendencies and innovation policies shape the affected regions. It follows that the authority, reflexive capacity and problematization, which social scientists come up with, is likely to bear unexpected consequences and heated controversies. We present ethnographic snippets and policy processes that exemplify those paradoxes, while proposing sociological concepts and transdisciplinary practices that help to tackle them.

What do Scientists Think About Grant Lottery in Lower Saxony (Germany)? In Relation to Their Views on the Current State of Funding and Peer Review

Axel Philipps

Leibniz University Hannover, Germany

In the last years scholars discussed grant lottery as an alternative to peer review in a growing number of papers and comments. Some of them argued that contrary to peer review random allocation seem to be even-handed, less biased and more supportive of innovative research. However, we know little of what researchers actually think about grant lottery and even less about the thoughts of those scientists who rely on funding. In my presentation I will show results from a survey among scientists on their perspectives on selecting grants by 'lots' in Lower Saxony, Germany. Based on qualitative interviews with scientists (Philipps 2020) we prepared an online survey in spring 2021 and examined scientists' view on the current state of funding and peer review as well as on different mechanisms of grant lottery and their potential impacts on science and allocation of grants. In contrast to previous studies results of our survey offer a more differentiated picture - especially for distinct models of funding-by-lottery. Earlier studies had concentrated either on successful applicants of a single funding program (Liu et al. 2020; Röbbecke & Simon 2020) or on random grant allocation of formally correct applications (Ambrasat & Heger 2020).

Rolling The Dice For Science – Peer Review And Lotteries In Scientific Funding Decisions

Christophe Heger

Deutsches Zentrum für Hochschul- und Wissenschaftsforschung (DZHW), Germany

The CoVid-19 Pandemic has demonstrated how consequential public trust in science and scientific results can be. A crucial mechanism by which scientists themselves gain trust in funding decisions and their colleagues' scientific results is the institution of peer review.

But while it remains central to the scientific endeavour, there are several issues with peer review such as nepotism and gender bias (Ceci & Peters, 1982; Cole, 1970), as well as high costs (Roy 1985), and insufficient predictive validity of funding decisions (Bornmann & Daniel, 2004; van den Besselaar & Sandström, 2015). As a reaction, lotteries have emerged in the discussion as an innovation possibly capable of driving down costs as well as excluding nepotism and bias in scientific funding decisions (Adam, 2019; Avin, 2015; Egger, 2018; Roumbanis, 2019).

However, introducing elements of chance to peer review necessarily calls into question by which means this foundational institution has, up to this day, embedded trust, legitimacy and openness in science. If lotteries are to take on a more prominent role in the scientific method, we must examine how they can reliably and comprehensively insure the enduring functioning of science in the 21th century.

Consequently, my main aim in this presentation is to discuss, from a theoretical standpoint, the role peer review plays today in scientific funding decisions as well as future potentials for lotteries. Additionally, I give a first empirical outlook, drawing on unique data from the DZHW scientist survey, on evolving attitudes towards peer review and lotteries.

853

Peer Review As A Laboratory For Deliberation — Reconciling Research Quality And Democratic Legitimacy At The Science-Policy Nexus

Martin Reinhart, Cornelia Schendzielorz

Humboldt-Universität zu Berlin, Germany

Scientific knowledge is crucial in many societal fields and the current pandemic has highlighted how societies rely on scientific evidence and expertise for political decision making. While the robustness of research results and the reliability of experts can be paramount in situations of crisis, their legitimacy is, in the long-term, anchored in peer review as an institution. The common view is that peer review ensures research quality by emphasizing scientific quality criteria, e.g. originality or methodical rigor, thus legitimizing the relative autonomy of science in society. Based on empirical research, our paper will challenge this view by focussing on the variability of peer review procedures in science funding by comparing different national contexts (Germany, Switzerland, Canada) and different funding programmes (for individual careers, individual research projects, and collaborative consortia). Peer review shows remarkable diversity, complexity, and adaptability to various contexts. We argue that peer review procedures act as laboratories for deliberation at the science-policy interface by balancing scientific quality (robustness, validity) and political legitimacy (participation, representation, accountability). Considering the increasingly collaborative and transdisciplinary orientation of publicly funded research further questions regarding the design of peer review procedures with respect to their democratic legitimacy emerge: How can demands for responsiveness and participation be balanced with ongoing changes, both, in research practices and conceptions of what criteria for good and relevant research are? How can accessibility to funding programmes be increased for diverse applicants and diverse research approaches?

Drawing the Line: Evaluation in Emerging Academic Disciplines

Alison Gerber

Lund University

Issues of quality and value are perpetually lively and contentious in academic work, and research on the architecture of evaluation has consistently shown that organizational constraints, whether well-motivated or adopted ad hoc, have enormous influence on outcomes. The negotiations behind the development of standards are especially decisive in new and emerging disciplines; historical work on disciplinarity and the development of the academy offers important conceptual and theoretical frameworks, but it is unclear how such processes might have changed in a modern academic context marked by increasing quantification and competitive national and supranational funding.

This paper takes as its case the recent development of the state-funded field of artistic research and the PhD in artistic practice in Sweden, where the interplay of artistic, scientific, and public standards and values is pushed front and center with each funding cycle and public viva. Drawing on an analysis of documentary evidence (dissertations, evaluation committees' assessments, hiring decisions, and funders' reports), this manuscript shows how diverse evidentiary regimes are mobilized by insiders (artists, artistic researchers, art school faculty) and outsiders (faculty and researchers from other disciplines and research funders) in the development of standards in the the artistic research field. With special attention to those judged not good enough, and the justifications offered by those who reject them – for research funding, for entrance to doctoral programs, and for the PhD degree – this analysis will leverage unique sources to understand the interplay between architectures of evaluation, internal and external standards, and outcomes in emerging academic disciplines.

RN24_T09_02 | Artificial Intelligence I

Social And Ethical Dimensions In Finnish AI Policy And Practice

Aaro Tupasela

University of Helsinki, Finland

During the past three years Finland has been developing and implementing its national AI project called AuroraAI. AuroraAI has branded itself as being a people-centered and pro-active project which utilizes AI to empower Finnish citizens. Through-out the development process, AuroraAI has been touted as being ethical and transparent, respecting the rights of individuals to privacy and seeking to help them in everyday life. At the same time AuroraAI shows problematic features which have been identified within the AI ethics literature relating to bias, discrimination, as well as nudging. Some of the plans within the AuroraAI network have even suggested the development of a social credit rating system, such as in China. The difference between rhetoric and implementation and the inability of many of the people working with AuroraAI suggests that there is a significant misunderstanding among government officials as to what ethics means within the context of AI. Furthermore, this belief is based on a rather naive belief of government as only a force of good. This presentation will describe the development of the AuroraAI program, as well as the main challenges associated with its development in relation to ethical and socially responsible AI.

Public Perceptions of Artificial Intelligence

Ana Delicado, João Estevens, Jussara Rowland

Institute of Social Sciences, University of Lisbon, Portugal

Artificial intelligence is a constellation of emerging technologies that have been gaining exponential academic interest, market development and policy intervention. From medicine to law, from industry to science, from entertainment to personal care, there are countless domains in which machines that are able to think like humans and learn by themselves can be invaluable aides.

However, the swift development of these technologies have substantial social impacts. Between the promises of countless benefits and the risk of human extinction, public discussions of AT are fairly polarized. However, due to the complexity of the topic, debates seldom include ordinary citizens. And it is the public perceptions of AI that concern us here.

This presentation is based on the results concerning AI of a world-wide citizen consultation on Internet governance that took place in October 2020. 'We the Internet' was promoted by Mission Publiques and was held in over 70 countries, with the aim of understanding public preferences on how to handle the future of the Internet, in order to inform decision-making at the UN level. ICS was in charge of organising the consultation in Portugal, which brought together 86 citizens.

During the consultation, qualitative (recorded discussions, group exercises) and quantitative (questionnaires) data were collected. In this presentation we will discuss the main concerns, but also hopes, of citizens regarding IA, the applications in which IA will have more benefits but also more risks, the values citizens hope will steer IA development and the ethical restraints they would like to see implemented. We will also explore AI imaginaries: how citizens envision AI, what references from popular culture or daily life they conjure, and the emotions they express.

Preserving Accurate Historical Sources for Future Generations: The Role of Artificial Intelligence in Collective Remembering and Forgetting

Stefania Matei

University of Bucharest, Romania

The very architecture of the internet establishes cultural records by providing an interconnected socio-technical channel for storing and retrieving information in diverse formats and on various platforms. Complex data-processing devices are employed to store traces of collective actions, and records of important events are created on the basis of data-driven algorithmic rationalities. Moreover, in the context of novel market opportunities that are developing in response to the imperatives of surveillance capitalism, the accumulated stocks of information may serve as historical sources to document cultural practices for posterity. How will future generations come to know their past in light of the fake news phenomenon that characterises society today? What kind of evidence will be available for future historians to research and interpret? How do algorithms

855

intervene in defining the legitimacy of historical facts? How will accuracy and authenticity be ensured and preserved when algorithms co-participate in the production of knowledge? Digital technologies are changing how collective memories are produced and distributed in society. Algorithms are given the role of curators, and artificial intelligence is positioned as a guarantor of authenticity. In this context, the paper discusses the ethical challenges arising from the use of digital media to validate knowledge of historical events. New technologies reinforce a mnemonic hegemony in which the past is defined as a taken-for-granted reality rather than a knowable asset that may be explored, understood and resisted. Algorithms mediate a type of historical awareness in which certainty appears as a technological artefact in the politics of social memory. This has implications for how collective identity is built and for how citizenship is manifested in relation to people's understanding of themselves and the world.

Striving For Epistemic Access. Methodological Lessons From An Ethnographic Fieldwork On Building AI-driven Public Care

Marja Alastalo

University of Eastern Finland, Finland

Ethnographers often tell stories of getting access to the field. In this paper I suggest that it is analytically fruitful to make a conceptual distinction between access to the field and epistemic access and argue that access to the field does not guarantee epistemic access. By epistemic access I tentatively mean access to information and situations expected to be crucial for research. I discuss "epistemic access" in the context of the organisational ethnographic fieldwork on data and data analytics work to build AI-driven public healthcare and social services. The fieldwork was conducted in a Finnish hospital district in 2019-2020. According to my observations, epistemic access was 1) linked to field access which was not gained everywhere at once as agreed upon during the research permit process, but rather it was constantly challenged and renegotiated. In the fieldwork in a multi-actor setting, the field access had to be negotiated over again with different institutional and expert actors. Furthermore, epistemic access was shaped by 2) how the research subjects positioned the researchers' loyalties and 3) the power relations, tensions, and pressures both within the expert community and the wider network including business actors. Finally, also 4) conflicting

timescapes of the field site and the research project affected the epistemic access.

RN24_T10_01 | Science Policy & National Research Systems II

"You Are Being Influenced by Osmosis" – Examining the Interplay Between Science Policy and Knowledge Production in Scientific Collaboration

Martin Reinhart[1], Melike Janßen[2]

[1]Humboldt-Universität zu Berlin, Germany; [2]German Center for Higher Education Research and Science Studies, Germany

Scientific collaboration is considered vital to address complex challenges both in research itself and in wider society. It has become an essential part of knowledge production, being associated with various advantages (e.g. synergies, pooling of resources) but also challenges (e.g. transaction costs, trust and reciprocity). Types of collaboration oscillate between different poles: e.g. between inter-, trans- and monodisciplinarity, basic and applied research, or bottom-up and top-down research. We take this spectrum as a starting point to examine the determinants and effects of scientific collaboration in diverging and changing (policy) contexts and focus on two constellations: collaboration within organisations and collaboration within networks. In two comparative case studies in the fields of biomedical and biodiversity research, we capture characteristics of collaboration such as spatial proximity and heterogeneity of the partners and examine the influence of diverging institutional conditions on research practice. Two research questions will be discussed:
How is scientific collaboration realised in different institutional contexts?
How do (changes in) research policies shape collaborative practices and patterns?
To provide answers to these question, we apply a mixed-methods design and combine bibliometric data with qualitative in-depth analysis. This allows us to link

856

changes in patterns of collaborative behaviour on both the meso and micro level (e.g. in terms of interdisciplinarity or internationality) with the internal dynamics of collaboration that aren´t identifiable from the published record, such as the reasons, practices and the policies enabling, pushing or impeding collaboration. By comparatively examining the reciprocal influence of institutional conditions and research action, we deepen our understanding of the interplay between science policy and science production.

Social Machine and Digital Capture of Social Ontology. The Case of Blockchain Systems.

Łukasz Jonak

University of Warsaw, Poland

Social machines are laboratories of social sciences. They are workshops where through tinkering and experimenting social phenomena can be (re-)produced, stabilized, observed, and manipulated. They are alternative methods of producing social knowledge (Afeltowicz and Pietrowicz 2011). Sometimes the techno-social contraption created in this laboratory can become a universal mechanism – not merely a model but a fabric of social reality. Digital technologies allow for extremely efficient building and enhancement of social machines (Haugeland 2000). They have the ability to capture the elements of the ontologies of social sciences, make abstract notions such as "relation", "structure", "understanding", or "identity" very concrete entities, embedded in technology, enacted by individuals interacting with software and hardware (Smith 1996).
In this talk, I will detail the patterns of digital capture of social ontology using the example of blockchain technologies, a very fine social machine. Blockchain systems reify notions of "consensus", "common knowledge", and "trust" first by formalizing them, then coding into algorithms and data structures. These are then utilized to build products, services, and institutions engaging individuals. The end results are alternative digital currencies, decentralized autonomous organizations, markets, governance systems. I will discuss the potential consequences of these processes for sociology: first, the rapid, parallel construction of social reality/theory by non-sociologists, but also the "incompleteness" of blockchain social machine (Bowles 2008), creating the space for social inquiries to be meaningful and useful.

RN24_T10_02 | Artificial Intelligence II

Transformation of Human-Object Relationship in Digital Society: Chatbot Experience as a Case of Artificial Intelligence in Daily Life

Esra Aslan

ANKARA YILDIRIM BEYAZIT ÜNİVERSİTESİ, Turkey

Today, we are witnessing the rapid spread of digital technology all over the world and the beginning of a new era. In this new era, artificial intelligence (AI) has crucial role in terms of reconstructing human-nature or human-object relationship. This study focuses on this changing relationship between human and object through the chatbots as a kind of AI application. AI chatbots used for both corporate and personal purposes. While corporate chatbots, used as customer representatives in the service sector, answer customers' questions; personal chatbots as if they are friends, family members or lovers, can chat with users. In this respect, this study aims to understand the interaction between human and machine by dealing with the experiences of chatbot users. More specifically, the study explores how users perceive, conceptualize and describe their relationship with chatbots both personal and corporate contexts (e.g. employment issue, risk taking, short-term and unfaithful work life, job alienation, sexual issues). In addition, the study explores evaluate how users construct their identity, moral attitudes and behaviors in the personal chatbot world in which there is no social pressure and norms. By adopting qualitative research method, in-depth interviews (face to face and/or online) with users who actively utilise the software. Preliminary findings of this study as part of my PhD thesis will be presented.

857

A.I. Imaginaries: New Evidence from Qualitative Interviews and Social Media Monitoring

Aliyeva Viktoriia[2], Tymofii Brik[1]

[1]Kyiv School of Economics, Ukraine; [2]ISAR Ednannia

Scholars and social commentators are interested in how media sources provoke the human imagination about the future of humanity and A.I. Specifically, researchers study sociotechnical imaginaries (term coined by Jasanoff and Kim, 2015) represented in media--e.g., books, movies computer games--consumed by technological visionaries or policymakers. Most of the existing studies address narratives about A.I.. However, surprisingly, very little is known about how these narratives affect individuals: i.e., how people interpret them and act on them. Our project addresses this gap. Using mixed methods of in-depth interviews with elements of the intellectual biography, and social media monitoring, it traces the reactions and interpretations of the different scenarios of A.I.-human future. As of now, the project has collected 37 in-depth interviews with A.I. narratives consumers from various socio-economic backgrounds.The second stage of the research is to be launched in March 2021. We aim to collect textual data from Facebook (the most popular social media in Ukraine - a country under investigation) on people's comments and posts regarding A.I. and robotics. They will be disaggregated by region, language (Russian, Ukrainian, or English), and gender of authors. Although the data analysis is still in progress, a certain connection to the cultural origins of consumed media is emerging. For instance, consumers of Japanese A.I./robot-themed anime/manga tend to be less hostile to the parity of A.I. and humans than consumers of Western mainstream A.I./robot cinema, specifically when it comes to private sphere (romance and sex) or A.I. rights. These findings offer new insights for facilitating social consensus around future adoption of AI-based technologies in a respectful and humane manner.

Conceptualization of the Human Subject: Between 'Homo-Microbis' and 'Homo-Algorithmicus'

Dan M. Kotliar[1,2], Rafi Grosglik[3,4]

[1]Stanford University; [2]The Hebrew University of Jerusalem; [3]Ben-Gurion University of the Negev; 4Beit Berl College

In the last two decades, the study of human microbiota – the vast microbial communities in and around the human body – has highlighted human and microbial interdependency and co-evolution, thus offering a radical epistemic and ontological shift from the individualistic, modernistic view of the human subject (Gilbert, Sapp, and Tauber 2012, 326). Research has accordingly offered to see humans as "homo-microbis" (Helmreich 2014), or "holobionts" – complex biomolecular networks composed of a human host and its associated microbes (Bordenstein and Theis 2015). But what happens to this shift when it gets commodified? Based on an ethnographic account of a prominent scientific research project that offers a microbiome-based personalized nutrition, and of the successful start-up that emerged from it, this article examines the popularization and commodification of the microbiome, and the ensuing constitution of the human subject. We show that in its commodification, the microbiome is acknowledged, but it is also paradoxically seen as a data-driven, individuating marker that does not question humans' individuality, but rather, highlights it. We further argue that this view necessarily depends on opaque machine learning algorithms that produce a quantified self – a supra-human, neoliberal agent who relies on meticulous self-tracking. We accordingly show that the homo-microbis is also a homo-algorithmicus – a being that can only access its own nonhuman sub-parts by blindly following opaque algorithmic recommendations on an app. Thus, we show that the ontological turn offered by microbiome research which is highly dependent on cultural, economic, and technological determinants, and is accordingly shaped by them.

How can American Unicorns swallow up Canadian Narwhals? On the Rise and Fall of Montreal Element AI

Jonathan Roberge, Guillaume Dandurand, Kevin Morin

INRS, Canada

Montréal prides itself in being an emerging hub for artificial intelligence (AI), a site of technical innovation as well as a hotspot for "ethical" experimentation. In recent years, Canadian state institutions have heavily subsidized AI research, including Montréal-based computer scientist Yoshua Bengio's private consulting firm Element AI. Considered among the godfathers of AI along with Geoffrey Hinton and Yan LeCun, Bengio has benefited from advantageous coverage in the Canadian mainstream media, which enabled him to present AI under a positive light and claim that upcoming machine learning techniques could significantly contribute to both Canadian society and the betterment of human kind. Beyond these technological expectations, Element AI was also set to become the next Narwhal, the Canadian equivalent to the American Unicorn, i.e. any start-up valued at more than a billion USD. However, in late 2020, Element AI was sold for 200+ million USD to such a Unicorn, the American firm ServiceNow. Locally, the sale raised concerns, most notably around the broken promise it represents as well as the waste of public funding. While true, this series of events also reveal, we argue, the discursive power that 21st century AI has on collective imaginaries, and the conditions under which the making of an AI innovation hub, as a political project, is culturally and socially constructed. Building on Boltanski's sociology of justification and on critical analysis of governance, our presentation considers the controversy around the sale of Element AI as a liminal moment through which it becomes possible to better capture the meaningful life of AI in Montréal, Canada and glean lessons learned in other contexts.

Women's Movements and Government Responsiveness. Comparing the Policies to Combat Violence against Women in Spain and Italy

Consuelo Corradi, Stellamarina Donato

Lumsa University, Italy

In comparison with other EU countries, Spain and Italy have approved policies to fight and prevent violence against women (VAW) at a later stage. The reasons for this situation may be found in the movements' characteristics, action by women's policy agencies, and type of interaction established between movements and governments.

The aim of this research is to compare the different level of government responsiveness to VAW in Spain and Italy from 1996 to 2011. By focusing on the interplay between movements and governments, we present the results of two national case-studies conducted with the tools of process-tracing, comparative analysis between similar cases, and collection of semi-structured qualitative interviews.

Our case studies show that in Spain, institutional dialogue between movements, policy agencies and governments, as well as continuous activism by the movements, greatly influenced government responsiveness on VAW. In Italy, women's movements clashed with the government and did not seek mediation with policy makers; creation of women's policy agencies was key in starting policy making in this sector.

We conclude that, while women's movements may be considered key variables in terms of shaping or leveraging government responsiveness on VAW, the domestic socio-political context exercises a primary influence on the dynamics and characteristics of their role as well as on those of other players.

Rethinking the Structuration of Social Movements: Virtuous and Vicious Cycles of Social Mobilisation in Mature Welfare States

Rune Halvorsen

Oslo Metropolitan University, Norway

This paper theorises how a structuration perspective on social movements can contribute to a better understanding of the relationship between welfare policy reforms and social movement mobilisation at the margins of the welfare state. Since the 1980-1990s, social movement theory has been divided between a focus on the structural conditions for social movement mobilisation and the construction of collective identity as drivers in social movements. The paper argues that by placing 'habitus' centre stage in social movement analysis researchers may overcome the dualism between resource mobilisation and collective identity that has characterised much of the social movement literature. A structuration perspective may sensitise researchers to focus on the interdependencies and interactions between external and internal structures, social practices and outcomes of social movements. Drawing on findings from two cross-national projects on disability policy in mature European welfare states, the paper demonstrates how the conceptual framework can be operationalised and applied in empirical research. The paper identifies an ideal-typical cycle of social recognition and social mobilisation and an idea-typical cycle of social misrecognition and individual coping and resistance strategies. A structuration perspective provides analytic tools to examine mechanisms that may explain the relationship between welfare policy reforms and social movement mobilisation among citizens who have experienced dependency on welfare institutions, policies and professionals, differences in social movement mobilisation between mature welfare states, and differences in scope for social mobilisation and collective voice among citizens who have been objects of help, assistance and control in the welfare state.

The Animal Rights Movement in the political arena

Rocío Thovar

University of Barcelona, Spain

Social interest in the Animal Rights Movement (ARM) has increased in recent decades giving rise to its participation in the public space, what has involved significant legislative, educational and social changes. ARM activists have overcome the traditional ways to make their claims heard, diversifying their strategies, empowering and connecting activists, developing and promoting regulations and laws and, ultimately, putting their petitions in the political agenda. This paper explores (1) the currently political dimension of Animal Ethics through the documentary analysis of ARM political initiatives to study how the problematization of the treatment we give to animals (that activists make visible) is resulting in the incursion of Animal Ethics in public policies and (2) the political turn in Animal Ethics through the exploratory-reflexive method. It will be argued that there is a growing tendency in the ARM activists work toward the animal's protection institutionalization. It is further argued that this phenomenon impacts on the public and transforms the social practices regarding the way in which we treat animals. Consequently, the criteria of political participation should be contemplated to create new realities concerning to animal advocacy, and not only those related to moral. This would mean that the important thing to reach binding agreements is to promote realities that make them possible to do Ethics by other means. Perhaps this is how we finally reach many of the moral milestones, starting from a possibilism that could encourage an update of the animal welfare discussions in the political arena.

Stones vs Routines: Students and Politicians in Higher Education Tuition Policy

Didem Turkoglu

New York University Abu Dhabi, United Arab Emirates

Welfare state retrenchment in advanced industrialized countries seeks to expand market-like logics in public services, based on the assumption that public services benefit from non-state initiative and competition. This logic gained a stronghold in policymaking but its implementation nevertheless struggled to find acceptance. Public university tuition is one such case where policymakers aimed to increase investment in human capital through cost-sharing. While students in some countries accept them as a necessary evil, opposition arises in others. Students in Germany and Turkey took to the streets in support of tuition-free higher education. Despite differences in their political contexts and the differential mediating roles political culture plays, student mobilization in both countries reversed right-wing parties' policies. This article focuses on how opposition to tuition policies are covered by the news in both countries. Using a mixed-methods approach combining topic modeling with qualitative analysis, I show that student protests and tuition policy discussions are reported separately. In both countries, student protests involving confrontation were highlighted. However, when movements pressure political parties to "own" an issue in their platform, party endorsement subsequently amplifies issue salience even if movement organizations and parties are not covered together by the media. This indicates an indirect effect of movements' collective action on news coverage. Political party endorsements mediate the amount of coverage movement issues receive. This finding provides insights into how opposition to welfare state retrenchment might navigate difficulties in closed media cultures that heavily favor institutional actors.

The Impact of Anti-Corruption Activism: the Role of Digital media over the Whistleblowing Process

Alessandra Lo Piccolo[1], Alice Fubini[2]

[1]Scuola Normale Superiore - Faculty of Political and Social Sciences, Italy; [2]University of Bologna – Department of Political and Social Science

Social movement studies have focused on the influence of collective action over processes of policy-making and political change. Similarly, anti-corruption studies have investigated the role of civil society initiatives in obtaining anti-corruption policy results. These perspectives have been recently combined to investigate grassroots anti-corruption initiatives, through the concept of societal accountability. Despite the attention devoted to the political consequences of this form of activism, contributions in these fields have overlooked the impact that digital media have on activists' repertoires of action. To fill these gaps, this work draws on an interdisciplinary theoretical framework that bridges corruption and movement studies with media studies. The study investigates the mediating role that grassroots actors play over the implementation phase, fostered by the strategic use of digital media. The paper focuses on the whistleblowing process, framed as an anti-corruption practice that exposes institutional wrongdoing from below.

Building on the Italian case, this work draws on a qualitative research design which combines interview material and documents analysis. Nowadays, major whistleblowing initiatives are coordinated by civil society organizations, among which we have selected two case studies that use different media in their anti-corruption practices: 1) Whistleblowing PA, a digital whistleblowing platform for public administrations based on Global Leaks software and provided by Transparency International, 2) Linea Libera, a telephone service and a mailbox dedicated to whistleblowers, conceived by anti-mafia association LIBERA. The article suggests that the strategic use of digital whistleblowing platforms have indeed granted grassroots organizations a role of intermediaries in the accountability field.

The Political Economy of the Spanish Indignados: Political Opportunities, Social Conflicts, and Democratizing Impacts

Jorge Sola, Eduardo Romanos, Rendueles César

Complutense University of Madrid, Spain

The 15-M mobilizations shook Spanish society and placed the demand for 'real democracy' at the center of political debate. In order to better understand the scope and impact of the Indignados' democratizing endeavors, this paper aims to address an issue that has not received much attention: the connection of this protest cycle with the political economy. To this end, both the opportunity structure generated by the economic crisis and the class and generational conflicts shaping the mobilizations are analyzed. The paper proposes that the symbolic and short-term success of 15-M in re-politicizing distributive conflicts contrasts with its medium-term inability to materially democratize the political economy. This relative failure can be explained by the confluence of several factors: on the one hand, 15-M's organizational weakness and its disconnection from a somewhat declining labor movement; on the other, the lack of responsiveness of Spain's political institutions to street politics and the powerful structural inertia of economic dynamics after decades of neoliberalism. The findings of this case study aim to contribute to scholarly debates on the impacts of social movements and their connection to political economy and social classes.

How to Paint the Bigger Picture? Analyzing Interrelated Effects of the NoG20 Protests in Hamburg

Dorte Sophie Fischer

University of Trento, Italy

Lately, there has been growing interest in the effects of collective action. Even though it is undisputed that collective action can produce various effects, most research focuses on singular outcomes, thereby largely failing to account for other effects and their various interactions. This paper analyzes consequences of the NoG20 protests 2017 in Hamburg in three different arenas - parliament, court, and police - and asks how they interplay. The analysis is based on interviews carried out with activists, police, lawyers, journalists, and policy makers between 2020 and 2021. The findings suggest that one central parliamentary decision after the NoG20 protests was the introduction of police identification, a change in legislation that made police more accountable. Given that the protests were marked by heavy escalations of violence that were mainly attributed to the activists, the finding seems paradoxical. However, a closer examination of post-G20 developments in the other arenas reveals that this legislative change concurred with the institutionalization of new, more restrictive practices within police and courts. Newly established techniques of criminal investigation and stricter interpretations of criminal law show that the NoG20 protests affected the activists´ environment by no means in a single direction only. Adopting a relational perspective, the paper demonstrates how the observable processes within parliament, court, and police interacted with each other, producing a set of outcomes that can only be understood in their interplay. The paper aims to give a more holistic account of movement effects. Thereby, it aims to contribute not only to literature on the outcomes of social movements, but also tries to connect to literature on repression that can just as well be read as analyzing social movement outcomes.

"Fighting Against the Neoconservative TV-agenda? The Discursive Outcomes of the Feminist and Women's Grassroots Movements in the Popular Russian Talk-Shows

Natalia Kovyliaeva

University of Tartu, Estonia

Considering the large number of people who consume information from the Russian TV with its mostly neoconservative discourse around the issues of domestic violence and sexual abuse, it is important to analyze whether and, if so, how the discourse on domestic violence and, in addition, sexual harassment have been sustained and transformed over the past four years - since the start of the #Iamnotafraidtosayit movement in 2016 and further feminist and women's grassroots mobilizations in Russia. Thus, the main purpose of this paper is to focus on the discursive outcomes of the women's and feminist hashtag movements against domestic violence and sexual harassment in Russia. By examining the most popular Russian talk-shows and their discourse, it will allow scholars to see the level of "success" of these grassroots feminist and women's movements. The study relies on the discursive opportunity structure theory and the concept of "discursive eruption" that will help to explain the outcomes of the feminist and women's hashtag movements in Russia. The paper contributes to the literature on how to measure the specific outcomes of the online social movements in a non-democratic political setting. More specifically, it will extend our understanding of the discursive and/or outcomes of the social movements in a non-democratic political regime. While the majority of literature is focused on the political outcomes of the social movements, particularly in non-democratic regimes, this paper explores the importance of the discursive outcomes and their potential to influence the political outcomes of the movements in the long-term perspective.

Connected Crowds: Repertoires of Contention and Cognitive Frames for Action in the Digital Era

Guiomar Rovira Sancho, Salvador Martí Puig

Universitat de Girona

Contentious collective action has been transformed by the extended use of internet and digital networks. Connected crowds are emerging collective actors that spread through the world since the Arab Spring in 2011 characterized by its digital communicative essence, their ability to cooperate without co-presence and their unexpected malleability for action. Through self organization within networks, connected crowds have a widespread and unexpected political impact. "Connective action" occurs when personal action frameworks or "easily personalized ideas" are linked together via digital networks.

Since 2015, a growing transnational wave of feminist crowds arose as consequence of the systematic dynamics of violence and expulsion but also thereby from doing, saying and organizing online, close to the amateur and not to the expert/professional/militant style. The network paradigm, characterized by the autonomy of its nodes, opens the code of the struggles, hacks and destabilizes the organizational culture of social movements and their programmatic tendencies. Thus, the network paradigm pluralizes, distributes, and overflows voices, and hereby feministizes collective action.

In this paper, an theoretical approach to connected crowds, the changes in repertoires and freming for social movements will be proposed.

Digital Activism Masked. The Fridays For Future Movement and the Global Day of Climate Action: Claims, Media Ecology and Polarisation Behaviour on Twitter

Ana Fernández-Zubieta, Juan Antonio Guevara, Rafael Caballero, José Manuel Robles

Complutense University of Madrid, Spain

This paper aims to analyse the polarisation behaviour in online social media on climate change. Polarisation in online communication is receiving increasing attention for the specific negative dynamics that it could raise (e.g. Garimella et al., 2018). Contentious issues such as climate change appear to be prone to polarisation, with partisan divides affecting polarised believes on climate change (e.g. Hamilton, 2011; Dunlap et al., 2016). Twitter has been proven a useful source to analyse the discourse on climate change (e.g. Veltri and Astanasova, 2017) and the dynamics of online polarisation on climate change (Tyagi et al., 2020).

864

We collected real-time tweets using the Twitter's API with keywords "Climate Change", "#climateStrike", "#FridaysForFuture" before and after the Global Day of Climate Action that took place on September 25th, 2020. Due to the Covid-19 pandemic this event is a unique opportunity to study digital activism as marchers were considered not appropriate. The dataset was collected between September 24th and 28th 2020. We collected 111,844 unique tweets and retweets from 47,892 unique users.

The dataset allows as to: (1) portray global discourses on climate change and the Covid-19 pandemic (i.e. How Covid-19 relates to climate change activism?); (2) describe the media ecology related to climate change (i.e. How climate change activists refer and use different media?); (3) explore the polarisation behaviour of climate change activists (believers) and deniers of climate change (disbelievers) in the context of a digital mobilisation action day. We expect to find a multidimensional discourse accounting for the complex relationship between climate change and the Covid-19 pandemic; a limited number of media sources types, and high levels of interactional and affective polarisation among disbelievers.

Communication and Organisation in Climate Action: The Cases of Italy and Belgium

Lorenzo Zamponi, Marco Deseriis, Diego Ceccobelli

Scuola Normale Superiore, Italy

The explosion of youth climate protest in 2018 has sparked a renewed interest on the issue of climate-centred collective action. Research has shown the emergence of a new generation of climate activists and the possible development of a broader, grassroots movement. On the one hand, offline, the new climate movement represents an innovation in the field of environmental politics, with the massive participation of young people, not involved in traditional environmental organisations or in social movements milieus.On the other hand, online, it is undeniable that the mediatisation of Greta Thunberg's figure and the widespread use of social media have favoured a form of participation that escapes the traditional channels of activists' recruitment, establishing a direct identification between individual students, or peer groups, and the issue of the climate crisis, with Greta as its most recognisable icon. How do different components of the movement engage with social media, and how does this relate to their repertoire of action? What is the role of social media influencers in the movement? How do media practices shape the boundaries of the movement itself?

This paper aims at addressing these two different components and its interactions, through the lenses of social movement studies and social media analysis, in Italy and Belgium. Rather than considering organisation and communication as separate dimensions of climate action, we aim at understanding how the two interpenetrate and influence each other. This is done via a mixed method approach, relying on data collected via semi-structured interviews with organizers and a qualitative reading of social media posts.

Unpacking the Echo Chamber: How PEGIDA and Generation Identity Use Links for Ideological and Mobilizational Purposes

Anita Nissen[1], Anton Törnberg[2]

[1]Aalborg University, Denmark; [2]University of Gothenburg, Sweden

The rise of social media has led to polarized publics and the formation of online counter publics: spaces in which participants' views are enforced and radicalized, often referred to as echo chambers. Research has shown that the process of radicalization and polarization occurs through various both affirmative and contesting processes. Particularly far-right online forums have gained notoriety for providing such spaces.

By using social network analysis on Facebook data obtained from PEGIDA and Generation Identity Facebook groups, this paper investigates how these organizations are connected with each other, as well as to other sites and sources. Both PEGIDA Germany and the French Génération Identitaire's organizational and ideological blueprint spread to numerous European countries in the mid-2010s, making it highly relevant to employ these groups and their offshoots as case studies, in order to unravel national differences and similarities in the dissemination of content expressing hostility towards Islam, immigration, and the establishment. Combining natural language processing and qualitative content analysis, we then investigate how content in these groups is framed and how different types of links are used, discussed and negotiated in affirmative and contesting ways. In this way, the paper attempts to provide further insights into how echo chamber dynamics may lead to radicalization, and how such processes are furthered through transnational networking and the sharing of links and information.

RN25_T02_02 | Social movements and authoritarian regimes

Social Movement Agency In Subnational Authoritarian Enclave Democratization: The APPO In Oaxaca

Trix van Mierlo

University of Innsbruck, Austria

A growing body of literature in comparative politics focuses on pockets of authoritarianism that persist within democratic nations. Most scholars seek the locus for democratizing such enclaves with political elites. Despite fascinating insights, we still lack knowledge on the role of social movements in subnational authoritarian enclave democratization processes. I combine subnational democratization literature with social movement theory to fill this 'bottom-up gap'. I do so by employing causal process tracing, relying on archival research and original interviews. I take an interactionist stance and gathered data on political opportunity structure and strategic choice. The case study is on the 2006 civil society uprising in the state of Oaxaca, Mexico. The APPO movement made contentious claims for the ouster of their authoritarian governor, causing him to flee the province. After six months, federal police violently repressed the movement and the authoritarian governor returned to his seat. Yet, in 2010, Oaxaceños elected the first governor not belonging to the authoritarian party in more than 60 years. I trace the causal mechanism from the social movement actors to this democratizing event. Preliminary results indicate that an overt claim-making mechanism provided the antecedent cause for party-led subnational democratization. This study implies that civil society in subnational authoritarian enclaves have agency and should therefore be taken into account. I furthermore argue that organized claim making in subnational authoritarian regimes is inherently different from other regime types and therefore call for further research.

Generational Divides in Tactical Tastes: The Case of Hong Kong's Pro-Democracy Movement

Hang Li

Hong Kong Shue Yan University, Hong Kong S.A.R. (China)

Structuralist approaches in social movement studies understand changes in movement repertories as an outcome of shifting configurations of political opportunities and threats. Cultural models, however, claim that structural factors are often filtered by activists' cognitive and moral visions. Although the cultural models promised to offer a more dynamic understanding to contentious politics, more work is still needed to discern how culture shapes tactical choice. This paper aims to address this gap by investigating the generational divides in tactical tastes in Hong Kong's pro-democracy. Over the past three decades, pro-democracy politicians and activists in Hong Kong have been employing primarily non-violent tactics such as mass demonstration and electoral politics to advance their claims. However, this dominant tactical repertoire has come under strong criticism from the newer and more radical cohorts of the movement in recent years. Based on the qualitative data collected from over 40 in-depth interviews, this paper argues that the emergence of radical tactics in the case of Hong Kong is not just a structurally determined response to opportunities and threats, but also the results of the generational shift in tastes for tactical repertories after a series of movement successes and failures over time. Overall, the analysis of shifting movement tactics in the case of Hong Kong underscores the inevitable cultural underpinnings of social movement and contentious politics.

866

Universities vs Rectorate: Student Protests in the Age of Pandemic in Turkey

Ezgi Nilgün Güney[1], Akın Bakioğlu[2]

[1]Lund University, Sweden; [2]Erzincan Binali Yıldırım University, Turkey

As populism escalates and numbers of authoritarian right-wing regimes and antidemocratic practices rise, politics is becoming more restricted and oppression within daily life is increasing. In addition to this, the COVID-19 pandemic and the strengthening domination over the individual's body have had a transformative effect over tools of social pressure and legitimization of policies. Meanwhile, social fights taken to the streets have allowed for awareness of racist policies, but the global health crisis has been used to reorganize oppressive and racist discourse, and legitimize antidemocratic decision-making. Parallel to the world, the state of the pandemic in Turkey has set the stage for the increase and variation in tools of oppression over the individual's daily life. Anti-authoritarian movements intrinsic to university culture throughout Turkish history have been one of the main actors of Turkish politics, and important determiners of the structure, content, means and development of social movements.

The present study is a comparative historical analysis of how the effect of increasing authoritarian practices on individuality and collectivism have influenced social movements. This analysis is conducted on the student protests against the rector appointments at METU and Boğaziçi University, the two largest student protests of the last ten years in Turkey, occurring before and during the pandemic respectively. They are addressed in the light of information gathered from the students' personal and organized social media posts, mass media and participant observation.

This study claims that what underlies different political, discursive and legal contexts is the dynamics of the allegedly temporal use of authoritarian power during the pandemic. Drawing students' different actions, the future of social movements and alternative ways of popularisation are brought up for discussion.

The Dominance of Islamist Movements in Revolutionary Situations: A Comparative Analysis of Iran and Egypt

Kamran Geshnizjani

Tarbiat Modares University, Iran, Islamic Republic of

Drawing on insights from the recent scholarly efforts to bring Islamic activism into the realm of contentious politics and social movement studies, this paper examines the conditions that affect the dominance of Islamist movements in revolutionary situations. The present research does so through a comparative analysis of the Iranian 1978-79 and Egyptian 2011-2013 revolutions, which includes a positive (dominance) and a negative (failure) case for the Islamist movements. In the Egyptian case, after decades of socio-political activities, the Islamist Muslim Brotherhood had succeeded in establishing "the largest Islamic movement of the twentieth century"; however, in spite of political achievements such as winning the 2012 Presidential Election, they lost political power and were outlawed at the end of the 2011-2013 Revolution. In contrast, in the case of Iran, the Islamist movement of the Combatant Clerics succeeded in achieving dominance in the 1978-79 Revolution and seizing power in the post-revolutionary political system. According to the findings of this study, the dominance of the Islamist movements in revolutionary situations is mostly a function of five factors: Structural position of the armed forces in politics (highly dependent to vs. semi-independent from the head of the state) and in the economy (non-active vs. highly active); the extent of historical conflict between the clergy and non-clergy politico-Islamic activists; the extent of political influence of the conservative Islam; the extent of the Islamist vs. secular polarization during the revolutionary situation; and the non-Islamists' perception of the Islamists (as opportunity vs. as threat) during the revolutionary situation.

RN25_T03_01 | Survey research of protest

Counter-hegemony, mobilization potential and protest participation: the comparative study of Central Eastern and Western Europe

Viktoriia Muliavka

Graduate School for Social Research, Poland

In this paper, I analyze how differences in mobilization potential contribute to the explanation of the regional gap in protest participation between Central Eastern and Western Europe. Applying the apparatus of cultural hegemony theory (Gramsci 1971), I expect such factors as the level of unionization and the availability of left discourses in the public reality to enhance the counter-hegemony and, therefore, increase the mobilization potential of protest participation on the country level. Based on that, the lack of mobilization structures in post-socialist states contributes to the lower levels of protest participation comparing to Western Europe. In addition, the mobilization impact of available alternative discourses is stronger in Western Europe compared to CEE region due to the cultural dependency of Eastern European civil society on the ideas developed in the Western context. Transferring of those ideas could result in the situation when social movements formulate claims that do not directly correspond to the local contexts and, therefore, cannot induce mass mobilization (Gagyi 2015). I test these predictions based on ESS (2010-2018) data and macro-level indicators of the level of unionization and the share of left attitudes. The results of the analysis show that contextual factors such as the share of left attitudes contribute substantially to the explanation of the regional gap in protest participation. Considering the broader implications for protest participation theory, such results also suggest that bringing the peripheral perspective into protest participation analysis has a substantial contribution to the understanding of individual protest participation.

Determinants of culturally conservative activism in Eastern Europe

Katerina Vrablikova[1], Paulina Pospieszna[2], Dorota Pietrzyk-Reeves[3]

[1]University of Bath, United Kingdom; [2]Adam Mickiewicz University, Poland; [3]Jagiellonian University, Krakow

Activism of populist and radical right in some of the Eastern European countries has been attributed to political mobilization by political elites and activists. Those actors compete on issues like protection of national values, anti-Europeanism, or anti-LGBT positions. In some countries, they built or politicized existing grassroots social groups that are used to recruit people to get politically involved around culturally conservative issues. This study uses original nationally representative survey data from Poland and the Czech Republic to examine mobilization around culturally right-wing issues at the individual level. Specifically, we expect that 1) Poland – a country with high grassroots mobilizing activity of political actors around culturally conservative issues – will have a relatively higher mobilization of cultural right-wingers than Czechia – a country where grassroots mobilization around culturally conservative has been lower and that 2) right-wing mobilization in Poland will be related to a higher recruitment activity of grass-roots social groups. We contrast the grass-roots mobilization explanation with an alternative demand-side argument that attributes mobilization around culturally right-wing issues to a larger mobilizing potential (i.e., support of these issues in the local population). The results show that despite having a slightly larger mobilizing potential, Czech cultural conservatives are less likely to be politically active relative to the rest of the population than Polish cultural conservatives and that the gap in their participation originates in membership in cultural, social and sports organizations. While membership in these groups increases political activism of conservatives in Poland, it does not mobilize conservatives in Czechia.

868

Ten Years After. The Impact of the 15M movement on the Indignados political engagement.

Araceli Mateos[1], Eva Anduiza[2], Carol Galais[2]

[1]Universidad de Salamanca, Spain; [2]Universitat Autònoma de Barcelona, Spain

Academic works distinguish between the electoral, institutional and personal effects of social movements (della Porta and Diani, 2011), most of them rather in the short term. As a result, the biographical and personal effects of activism on the attitudes and behavior of the activists themselves have received less attention. The reason for this inattention lies fundamentally in methodological limitations (Helader 2016; Giugni and Grasso 2016), and, more particularly, in the difficulty to identify a control group of non-participants to draw generalizable conclusions about protest events' impact.

Previous studies suggest that having participated in demonstrations has a reinforcing effect on activists as compared to non-activists (Giugni & Grasso 2016; Vestergren et al. 2016). We test this theoretical expectation for a particularly relevant case: the Spanish Indignados movement (AKA 15M). Indeed, the tenth anniversary of the 15M represents a very opportune time frame to assess its long-term effects. Using a unique panel survey covering eleven years (from 2010 on), we assess the effects that taking part in the May 2011 massive demonstrations had in the political engagement attitudes of the Indignados, both in the short and in the long term. For this purpose, we rely on a series of quasi-experimental techniques, namely difference-in-difference analyses and propensity score matching. Our results suggest that participating in the 15M had indeed positive effects in most attitudes related to political engagement in the short term, although most of these effects fade in the long run.

Returning to Demonstrations: A Multilevel Analysis of Abeyant Protestors Across 84 Demonstrations In Eight European Countries

Hanning Wang

University of Pittsburgh, United States of America

While acknowledging that protest participants are not a homogeneous group, scholars in social movement studies tend to focus on new protestors who have never engaged in demonstrations before, or established protestors who engage in protest activities consistently. This study focuses on a third underexplored category – abeyant protestors – who are active in protests in the past and return to demonstrations after a temporary leave. Through a three-level multilevel analysis of 12,356 protestors in 84 demonstrations in eight European countries, this study compares abeyant protestors to new and established protestors. The results reveal that: 1) Abeyant protestors are a distinct group from established protestors, which suggests the problems grouping them together as "experienced" protestors; 2) Abeyant protestors are not mid-way on a continuum between new and established protestors for being unique in their sociodemographic characteristics, social networks affiliation, grievances, perceived efficacy and contentious politics participation; and 3) Abeyant protestors' unique pattern of participation is the result of individual motivations, protest features and macro social contexts. Seeing abeyant protestors as an independent category of protestors not only highlights the importance of examining the different motivational dynamics of social movement participation, but also brings insights into strategies to recruit different mobilization potentials, as well as cross-national differences in social movement composition.

Organizing structures of contentious politics

Diffusion Processes Within and Across Movements: the Spread of Protest in Networks Prior to Indignados', s Movement in Madrid and Its Influence on This Movement

Gomer Betancor Nuez

UNED (Spain), Spain

The 15M Movement crystallizes a change of social movement's model in Spain. This change is not sufficiently studied. With this paper, I research this gap and present part of my doctoral thesis that I am developing as a PhD. student. I focus on the main alternative networks that capitalize the protest in Madrid during this period (2001-2011) up to 15M.

I argue that the studies on social movements in Spain have not analysed in depth the importance of the networks of social movements prior to the 15M Movement to explain its broad overflow as a political phenomenon (with exceptions such as the researches of Romanos, Flesher or Díez).

A central idea that I propose is that, among these networks, the previous movements have a certain continuity of activists, resources and identity that imply processes of diffusion of an activist culture among these social movements. In these processes of diffusion of activist culture, some characteristics such as deliberation, assemblyism, autonomy and civil disobedience are key. These elements influence the form that the 15M Movement takes as a disobedient movement that occupies the public space debating central political issues.

Organizing Protest Outside Organizations: The Defense Of The Voting Stations During The 2017 Independence Referendum In Catalonia

Hans Jonas Gunzelmann

Scuola Normale Superiore, Italy

On October 1, 2017, more than two million Catalans cast their vote in a referendum on independence from Spain. Activists occupied voting stations throughout the region, using nonviolent resistance to prevent Spanish police from entering the voting stations and confiscate the ballot boxes. These actions have come to be known as the 'defense of the voting stations'. The defense of the voting stations represents a curious case of collective action, because it was organized almost exclusively outside of the boundaries of the established social movement organizations. Within a week, activists made the necessary preparations to occupy the voting stations and resist the police intervention. How was it possible to organize these actions within such a short time and without the involvement of the major social movement organizations?

In this paper, I analyze the preparatory process of the defense of the voting stations by drawing on 30 semi-structured interviews with key organizers. The analysis shows that organizational structures were hindering rather than enabling collective action as it became more disruptive. Instead, organizers employed communication and decision-making practices to prepare contention at the local level. They combined open neighborhood assemblies with diffusion through messenger applications, thereby establishing communication channels outside of those of the existing organizations. The leadership and experience of local organizers in these settings were instrumental in the organizing process. These findings underpin the role of practices in protest organizing, as well as the need to acknowledge the organizational dimension of secessionist movements to understand their action repertoire and strategy.

How Organization of Social Movements Matters. A Study of Citizen Mobilizations during the Lockdown in the City of Wuhan in China

Jun Chu[1], Jingyue Xing-Bongioanni[2]

[1]Institute of Cultural Anthropology/European Ethnology, Georg-August-Universität Göttingen, Germany; [2]Centre d'études de l'emploi et du travail (CEET), Conservatoire National des Arts et Métiers, France

In this paper, we study the role of the organizing process in the development and disappearance of a social movement. We wish to reintroduce organizational theories in the study of social movements and to combine resource mobilization models and collective identity models. To do so, we conducted a qualitative field survey, through interviews and the study of archives, on citizen mobilizations reacting to the shortages of medical materials and protective equipment during the lockdown in the city of Wuhan in China.

Our study shows that these Chinese citizen mobilizations comprise three phases:

-a birth phase that is motivated by a common target and collective identity. This phase relies on semi-institutional networks of inter-knowledge (networks of alumni from prestigious universities / high schools, family groups etc.).

-a second phase of restructuring and formalization, corresponding to a period of merging and recomposition of the groups. The new citizen groups after the merger adopt the "professional bureaucratic" organizational method of modern companies by developing a division of work and a high degree of horizontal specialization. This organizational rationality ensures the efficiency of resource mobilization and guarantees the success of the movements.

-a third phase of disappearance of the groups, marked by the intervention of professional companies supported by the Chinese State, such as Alibaba, to meet the need for medical materials and protective equipment. The common goal is gradually lost with the arrival of these specialized organizations.

This study shows that the organizational aspect of social movements plays a decisive role both in the level of trust in the movement by the participants (motivation), and in the effectiveness of resource mobilization.

Shifting Alliances Among Minority Nationalists: How Elites Choose to Participate in Secessionist Insurgency

Başak Taraktaş[1], Ubeydullah Ademi[2]

[1]Boğaziçi University, Turkey; [2]Boğaziçi University, Turkey

The factionalism within early nationalist movements is often hard to identify. Due to the lack of data and attention, the significance of the emergence and organization of the early secessionist movements in the early 20th century is left largely unclear to date. Our original data which compiles the interaction of 816 individuals consisting of local and nationalist elites as well as high-level administratives allows us to analyze the groupings and networks among early nationalists. To this aim, we compare the elites from three distinct minority groups around 1908, the Macedo/Bulgarian, the Albanian, and the Kurdish nationalists, and examine the variables that lead to the prevalence of the secessionist faction among these movements. Deploying network analysis to understand the elite decisions, we find that the organizational experiences, the ideology of the central government and the anticipation of foreign support shape the shifting to the secessionist faction among nationalist movements. Despite being in the camp of the federalist or autonomist factions, individual elites join the secessionist insurgencies over the course of events. With this study, we aim to contribute to the discussions on the within-group mechanisms of social movements and organizations as well as shedding light upon dynamics of interaction among different groups.

Picking the Fight: How Social Movements Select their Targets

Felipe G. Santos, Gareth Jonas, Eryn Parker, Dan Mercea

City, University of London

Contentious collective actions can have a variety of targets. Some may be directed at public incumbents, others may seek to influence private actors and yet others may aim at other challenging actors in a movement-countermovement dyadic relation. While extensive research has focused on these different targets separately, some scholars have highlighted that less attention has been paid to the strategic decision of selecting the targets of a contentious collective action (Armstrong & Bernstein, 2008; Earl & Kimport, 2008; Snow, 2004; Van Dyke et al., 2004). Yet, we know that most fields where social movements operate have incumbents of different sorts (Fligstein & McAdam, 2012). This paper aims at exploring which characteristics of contentious collective events increase the likelihood that these actions target private or public actors. Through the analysis of thousands of contentious collective events that took place in 7 EU countries between 2015 and 2020, extracted from the Global Database of Events, Language and Tone (GDELT), we explore how event characteristics such as who the organizers are, its location, the number of participants, and the level of violence of the action are correlated with the type of actor targeted by the activity. This study contributes to strategic-actor approaches to social movements by advancing our knowledge about the targeting tactics of contentious collective actors and their relation to the characteristics of their actions.

Protests and collective bargaining in Sweden

Katrin Uba, Jenny Jansson

Uppsala University, Sweden

As in the rest of Western Europe, the number of strikes has declined in Sweden since the 1980s, making industrial relations appear as peaceful. However, trade unions' contentious actions often take other forms than strikes or participation in the 1st of May manifestations. Although seldom examined, unions' protests are important to map and analyze since these actions constitute an important part in engaging members in unions' work, strengthening the construction of a common identity, and potentially increasing the public support for the labor movement and its power in collective bargaining processes. Protests mobilized by trade unions are often covered by news media and this contributes to increasing relevance of the unions even among the non-members.

In this manuscript, we use the contentious politics framework known from social movement research and examine the cycles of protests mobilized by the Swedish trade unions during the last thirty years. The analysis is based on data from the Swedish Protest Database, combined with data about collective bargaining and notices of industrial action. We particularly intend to answer questions about the typical targets of the unions (state or business), the typical protest repertoires and the most frequent claims and cooperating actors of protesting unions. By focusing on the timing of the protests, we will show the relationship between unions' protest cycles, the timing of collective bargaining, as well as ordinary political processes such as elections. The results of the paper make a contribution to current research on industrial conflict by moving beyond traditional work stoppages and demonstrating that also in the Nordic context trade unions have been rather active on the streets.

The Evolution of Contention in Spain (2000-2020): An Analysis of Protest Cycles

Igor Sadaba, Eduardo Romanos, Ines Campillo, Jorge Sola

Universidad Complutense Madrid, Spain

The aim of this paper is to analyse the evolution of contentious politics at the beginning of the 21st century in Spain through the protest event analysis (PEA) methodology. In order to achieve this objective, a new and large database (n>4000) coding two Spanish newspapers between 2000 and 2020 will be used. Therefore, empirical analysis is provided through this methodological approach, which allows us to identify the main changes and continuities in the protest cycles and thus to observe more precisely the variations and the influence of political and economic crises in social movements. By doing so, this paper will contribute to a better understanding of the spatial and temporal dynamics of collective action in the country. We also provide recent data on the most recent mobilizations, which include, for example, feminist movements, extreme right-wing movements and pro-independence movements. This allows us to compose a long-term sociological picture of protest at the historical level at the beginning of the 21st century in one of the countries that has suffered most from the Great Recession. The interest lies not only in describing this evolution but also in addressing the role of classic social movement organizations and other political actors, identifying the main protest issues, understanding the response of the authorities, etc. The case of Spain is paradigmatic of the recent waves of mobilization in southern Europe and provides an interesting model with which to compare other countries, both similar and different.

Against Dictatorship, Against Backsliding? Examining the effect of protests and boycotts on Serbian parliamentary elections

Indraneel Sircar[1], Karlo Kralj[2], Danijela Dolenec[3]

[1]London School of Economics, United Kingdom; [2]Scuola Normale Superiore, Italy; [3]University of Zagreb, Croatia

The power of the Serbian Progressive Party (SNS) has been steadily growing ever since 2012. The party has successfully taken control over all levels of government in Serbia, and the country has suffered from gradual democratic backsliding as a result. In this article, we focus on two protest movements in Serbia triggered by the political situation. Crucially, a number of opposition parties involved in the more recent movement boycotted the 2020 parliamentary election. This article focuses on characteristics of the citizen-led response in local communities across Serbia and estimates its electoral impact. The case of Serbia not only elucidates modes of citizen response and their impact in post-socialist Europe, but also provides comparative insights for the potential for citizen-led resistance to arrest an 'illiberal turn' in other countries. The objectives of the article are two-fold. First, the article will use an original data set of Serbian protest events between 2017 and 2020 to ascertain how the two protest waves were conducted, particularly the framings and repertoires, and thus, how citizens respond to democratic backsliding. Using data on municipal-level turnout and SNS vote share in the 2020 parliamentary election, we examine the average electoral impact of protest and, related to that, evaluate the success of opposition parties in mobilizing the voters for the electoral boycott. Put together, the article investigates whether SNS-led democratic backsliding is resilient to sustained citizen-led mobilisation, or whether this bottom-up resistance challenges the notion that 'stabilocracies' such as Serbia are immune to fundamental political change.

RN25_T04_02 | Emotions in protest

Emotions of protest: Emotional dynamics during the Black Lives Matter protest wave

Rune Ellefsen, Sveinung Sandberg

University of Oslo, Norway

The death of George Floyd in May 2020 triggered the global diffusion of Black Lives Matter (BLM) protests, manifesting as a highly visible protest wave. In this wave, like in other social movement mobilizations, emotions played an important role. Our study explores emotional dynamics during the global BLM protest wave by looking at the motivations and experiences of young black people who took part in the protests in Norway during the summer of 2020.

The BLM protest wave erupted during the ongoing Covid-19 pandemic, and the Norwegian authorities strongly discouraged any protest. Widespread BLM protests still took place. This paper seeks to answer this research question: What role did emotions play in relation to individual mobilization, protest participation and the negotiation of racism among the young people who engaged with BLM in Norway?

To answer the question, we conducted 40 in-depth interviews with young (between 16 and 30 years), mainly black, people who took part in the large demonstrations in Norway and who identified with the wider BLM movement that had its peak during the summer of 2020. We analyze three interrelated aspects of emotions and their dynamics in the BLM protest wave. First, the role of emotions in mobilizing people to identify with BLM and take part in its protests. Second, the emotional influence of taking part in, and being part of, these collective protest events. Third, the emotional influence of participation on the individual's mood towards (and negotiation of) racism and anti-racism.

'Love Is Over, This Is Going To Be Turkey!': Cathartic Resonance Between The June 2013 Protests In Turkey And Brazil

Batuhan Eren

Scuola Normale Superiore, Italy

Studies on the diffusion of protests and social movements stress the importance of geographical, historical, organizational or cultural proximity as facilitating factors for the spread of ideas, frames, identities and repertoires of collective action. Yet in the last two decades, the explosion of various protests across the globe and their mobilizing impact on each other challenged this established view. The interactions between the June 2013 protests in Turkey and Brazil were no exceptions: despite the absence of proximity factors, protests in Turkey were referred to as an inspirational benchmark by a considerable number of Brazilian protesters. Designed as a case study investigating the least-likely case of these protest interactions, this study explores why and how protests inspire other protests in distant and diverse places. To address these questions, I employed Grounded Theory by analyzing twenty-four in-depth interviews with protesters who participated in the June 2013 Protests in Brazil. Drawing on the constant comparison method, I introduced the mechanism of 'cathartic resonance' as an explanatory framework for the cross-national spread of protests even in the absence of proximity factors. Cathartic resonance refers to the stimulation of collective agency due to moral shocks that are triggered by the tragedy of a sympathetically identified foreign protester group. In its findings, this study reveals the role of cognitive and emotional processes in the spread of protests by applying an innovative methodology. It also aims to further refine the linear and causal theorization of protest diffusion from a more agentic, processual and cultural perspective.

The Power of Stories: A Psychosocial Understanding of Protest Participation and Demobilisation

Dionysios Mitropoulos

Birkbeck, University of London, Greece

Since 2008, waves of protest and/or social movements emerged all around the globe, such as the Indignados, the Occupy, and the Greek Aganaktismenoi. The mainstream media and some scholars characterised them as having strong emotional character, being apolitical and dispersed while lacking a specific political agenda. Besides an impressive amount of literature analysing the emergence and escalation of these protests, I argue that there is a lack of relevant empirical research in which the voices of the protesters have not adequately heard. A number of scholars, mostly following rationalist approaches, argue that these protests are unable to influence parliamentary politics and achieve solid social change. Following their analysis, emotions are perceived as means to mobilise people and emotions are dangerous for deliberative democracy. However, these mobilisations lasted in time; were passionate and popular; and attracted numerous and heterogenous multitude(s). These protests challenged the perception of emotions as merely instrumental and the role of emotions/affect(s), while they challenged theory on the question of demobilization.

This paper presents a critical reflection on the theoretical implications of the above two issues by providing empirical evidence derived from my empirical research with 35 participants of the Syntagma Square occupation (2011). The questions which drive the paper are: what are the impediments to continued political engagement and how can we trace them through participants' stories? The paper will argue that research of collective and individual action needs to go beyond the division between emotion and reason, and also re-consider the perception of emotions as negative or instrumental; will provide empirical evidence on the transformative and mobilising power of emotions/affect; and answer the question of political demobilisation.

The "S" Factor. Feminist Movements and the Production of Safer Spaces in Urban Context

Giada Bonu

Scuola Normale Superiore, Italy

Despite the phases of more or less visibility and mobilization, feminist movements tend to produce structures of maintenance even in time of abeyance, according to Taylor's definition (1989). Feminist spaces are typical example of such structures (Spain 2016). Beyond protests and other type of repertoire of action, the opening and management of political space allows for testing prefigurative politics and everyday practice of social change. According to gender studies assumption about gender based violence as a structural organizing factor of contemporary society, feminist spaces develop counter-community of emotions, politics and relationships. How and why are these spaces safer? Why activists produce and preserve these spaces? Why the notion of safety politically matter?

In order to disentangle this puzzle, I will make reference to my PhD research project on the comparative analysis of feminist spaces between Rome and Madrid. Using participatory action research as a comprehensive approach I pursued three years of participant observation, interviews and focus group in three different type of spaces: quite institutionalized women's spaces; self-managed feminist services; radical transfeminist and queer squats. Retrieving from a constructivist grounded theory method of analysis, I focus on safer spaces as a working concept guiding different levels of understanding: actors; spaces; repertoire of action; in/out relations. Although these factors simultaneously occur, I am here disentangling them in order to shade light on all the facets of the emotional, political and relational density of safety. Safety, in contrast to neoliberal understanding of the concept, is not a stable configuration but an ongoing and relational process. While engaging with safer dimension of activism, feminist spaces are oriented to directly challenge and to re-shape democracy from below.

Party in the Movement: The Role of Political Parties In the Portuguese Anti-Austerity Arena

Tiago Carvalho

Iscte-Lisbon University Institute, Portugal

Even if political parties have been overlooked in social movements studies, in the last decade a new research has been repositioning it as an important player in protest arenas. In this paper, I analyze the role of left-wing political parties in the anti-austerity cycle of protest in Portugal between 2008 and 2015. As in other cases, a plurality of players contested austerity such as not only movements, but also trade unions and political parties. Relying on a protest event analysis, interviews, and observation of multiple protest events and party congresses, I find that political parties were an essential part of the anti-austerity protest arena. Parties did not only react and support social movement actions, as they molded the nature of mobilizations throughout the different phases of the cycle. The protest arena can be divided within different spheres of influence of political parties, shaping claims, frames and repertoires even if strategically alliances emerged in the most contentious phase of the cycle. In many ways being the movement in the backstage, parties' participation in anti-austerity mobilizations helped maintaining their own hegemony, resulting, rather than in the creation of new successful political parties, in a shift in alliances that kept their position within the party system undisputed. This case-study shows political parties are a constitutive part of protest arenas and a wider integration of this player in social movement studies is needed.

From Refusing Office to Seeking It: When Former Community Organizers Politicize Their Individual And Collective Identities

Clément Petitjean

Université Paris 1 Panthéon Sorbonne, France

The election of Barack Obama to the White House in 2008 was not just the election of the "first Black president": it was also the first time a former community organizer held the office. Until then, most people did not know what that the category "community organizer" and the job it referred to even existed; with Obama's election, the widely publicized category was woven into the very fabric of a mythified individual political career. But this phenomenon is bigger than Obama. Indeed, community organizing now constitutes one of the recruitment channels for US elected officials. This connection between a very rationalized—though understudied—form of contention and electoral politics, however, has fallen under the academic radar. What's more, this phenomenon is highly paradoxical. Not only has community organizing as a specific area of practice been built against the political field as a form of nonpartisan "citizen power," but, as experts in fashioning people's mobilization and representation, community organizers actually refuse to accomplish public political tasks, which are executed by the lay "leaders" they identify, train, and "develop." Contrary to what classical works by R. Michels, M. Weber or P. Bourdieu suggest, here the professionals are not the spokespeople. In order to address this paradox, the paper draws from research in the sociology of professions, political sociology and social movement studies. It builds on fieldwork conducted in Chicago between 2015 and 2018 during a PhD program in sociology. The data was constructed through ethnographic interviews, participant observation, and archival work.

Mapping Pathways of New Left Movement Party Formation in Postsocialist Europe: Comparison of Slovenia and Serbia

Karlo Kralj

Scuola Normale Superiore, Italy

Over the last few years, the literature on left-wing movement parties has made many new insights about movement parties' organizational structure, action repertoire, and framing. However, research on processes of activists' shifting between non-electoral strategy, based on social movements and NGOs, and electoral strategy, based on political parties, remains relatively scarce. To further our understanding of these processes, this paper compares recent cases of new left movement party formation in Slovenia (The Left) and Serbia (Don't Let Belgrade D(r)own). Based on detailed case studies, including the analysis of thirty interviews with activists, as well as media material and organizational documents, the paper outlines two distinct pathways of new left movement party formation in post-socialist Southeast Europe. In the Slovenian case, characterized by a high level of institutional openness and adequate discursive opportunities, the electoral new left was predominantly articulated as democratic socialist, with a focus on national-level electoral competition. In the Serbian case, characterized by the institutional framework closed for new challengers, as well as widespread discreditation of left-wing politics, the electoral new left predominantly took the pathway of green-left municipalism, with a primary focus on local-level electoral competition. The observed variation in these two pathways is used to discuss how differences across post-socialist contexts influence left-wing movements' decision for electoral turn and the specific pathways of movement party formation.

RN25_T06_01 | Mobilization of far right

The Italian Extreme-right Network: Fragmentation, Issues and Frames.

Federica Frazzetta

University od Catania, Italy

Previous studies have already highlight that in Italy extreme right wing is a political area particularly fragmented, in which does not exist a common identity among the political actors belonging to it. However, it is not very clear why such fragmentation occurs. The absence of social movement networks should not lead to think to the lack of any kind of consistent network. In fact, social movement studies have identified several modes of coordination of collective action, in addiction of social movement one.

In this contribution I consider Italian extreme-right network as an organizational mode of coordination, where nodes identities are well defined and distinct, and the density of the relation is very low. To explain such fragmentation, I analyse the issues faced by some Italian extreme-right actors in their political activity, focusing on how such issues are framed. I focus on three relevant extreme-right organizations (CasaPound Italia, Forza Nuova and LealtàAzione) for a ten-year time span (from 2010 to 2019), comparing how each organization framed some relevant issues. This is a mixed methods analysis, combining quantitative and qualitative data and methods, namely PEA, SNA and the analysis of documents produced by political actors.

877

How Transnational or Transnational How? Far-Right Politics in Europe (2017 - 2021)

Damla Keşkekci

Scuola Normale Superiore, Italy

Far-right politics today is often liberally branded as a transnational, or even a global, phenomenon. Defined broadly, the term covers all nativist mobilizations, such as social movements and political parties, including the extreme and radical right variants. However, most of the time, far-right actors' transnational branding could be unfounded or inflated. This paper investigates the transnationalization of the far right in Europe by questioning how much they have actually become transnational. Following an inductive approach, my analysis builds on the far-right Identitarian Movement. Although it is rare for the far-right to engage in street politics, since 2012, the Identitarians have established a dozen national chapters in Europe and beyond while frequently taking part in protest actions. Nevertheless, I argue that the degree of their transnationalization is not only a direct result of their organizational structure or claims. Their media resonance and interactions with other actors are also imperative. Therefore, I initially map the field by using articles from (inter)national newspapers (Süddeutsche Zeitung, Die Presse, The Guardian, The New York Times) that mention the Identitarians. I code challenger and supporter actors, first vis-a-vis the Identitarian Movement, then I expand to accommodate more (far-right) actors, including governments, political parties, and civil society. Following, I assess the media resonance around the Identitarian Movement and their claims, as well as other far-right actors in the field. Consequently, the paper aims at providing a new operationalization for assessing the rate of and the mechanisms involved in the transnationalization of the far right (movements).

Interactions Between Right-Wing Extremist Social Movements And Political Parties. The German Case Study Of Afd And PEGIDA

Andrea Grippo

University of Rome Guglielmo Marconi, Italy

Over the past few years, Germany has experienced a significant growth of support for right-wing extremist movements and parties. The anti-Islamic PEGIDA (Patriotische Europär gegen die Islamisierung des Abendlandes) and the Alternative für Deutschland (AfD) have hegemonized the recent spring of right-wing extremism. However, the renewed academic interest in this phenomenon has primarily focused on the electoral arena, while little attention has been paid to the social movement and, above all, to the movement-party interaction. Interactions between political organizations are a complex phenomenon, the outcome of which is oriented by multiple factors. In this paper I intend to privilege the relational variable, namely the behavior of Afd and PEGIDA as allies and opponents. In light of the hypothesis that interactions dialectically influence political and organizational choices of political actors, this paper aims to examine the centripetal process that steered the initial hostile relationship between the AfD and PEGIDA toward the current collaboration

878

From Street to Parliament: Right-wing Party-Movement Relationship in Germany

Bhakti Deodhar

Indian Institute of Technology Bombay, United Kingdom

Research on right-wing party-movement relationship has long focused on mapping the influence of rightist movements on parties in terms of supply of activists, ideological resources, social base and networks. However, the impact of right-wing parties on movements has been largely neglected. My paper seeks to fill in this gap using insights from party organisation of 'Alternative für Deutschland' (AfD)- a right-wing party in Germany. Based on original extensive ethnographic fieldwork among party members in the eastern German state of Saxony, I present a textured and process-oriented narrative on the structural and normative influence of institutionalised politics on the interconnections between rightist party and protest movements. The paper argues that although unmistakable ideological affinities and personal overlap between right-wing electoral politics and protest politics (street movements) exist, the norms of conventional politics make their relationship less straight forward and often problematic. Right wing political activists cannot and do not remain immune to parliamentary forms of collective claim-making and see themselves compelled to soften their radical, protest-oriented stance to become more effective and successful in electoral arena. This process, however, is far from smooth and marks a slow, tedious and piecemeal cross-over from movement strategies to parliamentary mode of operation.

RN25_T06_02 | Discourse, framing and memory

The Political Economy of Activists

Jessy Bailly

Free University of Brussels / CEVIPOL, Belgium

Through the notion of "political economy", I want to question the relations of different groups of activists towards the legitimate principles that should guide the economic order. More than considering the economic thoughts of activists, I refer to "political economy" as considered by Foucault in his lecture on neoliberalism (2004), that is to say, the ways such activists deem the necessary and desirable political order and forms of public intervention.

Exploring the vision of political economy defended by social actors allows us to focus on the frames of collective action. First, I will come back to a typology built from the observation of different activist groups from different countries. The entry by "political economy" of the protesters makes it possible in particular to invalidate the false distinction of sociologists between traditional materialist social movements and new post-materialist social movements.

Furthermore, the second part of the proposal aims to analyze the "political economy" of particular activists : the "citizen debt audit" groups (in France, Spain and Belgium). Constituting the empirical material of my thesis in political science, these groups refer to activist actions that have emerged in several European countries since 2010's. They condemn the way in which the debt is used, not exclusively to improve the social conditions of the population (social investments, in public infrastructure, social redistribution of the wealth produced), but to justify what they call "transfers of resources from public to private actors' (bailouts, public borrowing conditions too favorable to private banks, etc.)

This second part thus extends the theoretical proposition of the first part, by giving a concrete view of the analysis of the political economy of a group of activists.

879

The Mobilizing Memory of the 15-M: Remembrances and Sediments in the Spanish Protest Culture

Manuel Jiménez-Sánchez, Patricia García-Espín

Universidad Pablo de Olavide, Spain

The 15-M movement, that emerged in 2011 amidst the Great Recession in Spain, seems well on the way of becoming as a transformative protest event. Research using this concept have put the focus on the meso-level legacies of these events: movement memories shape later organizational dynamics and collective identification of activists. Memory and its mobilizing effects can, however, transcend the activists' milieu. In the case of 15-M, the high levels of remembrance, even among those who did not experience it first-hand (Jiménez-Sánchez, et al., 2019), suggest the occurrence of transformative effects on the political culture of wider publics.

We inquire into the memory of the 15-M and its mobilizing effects among run-of-the-mills participants in two of the most significant mobilisations after the crisis protest cycle: the 8M (international women day) and the pensioners' protests. The analysis of 44 interviews conducted in 2018-19 confirms the presence of a memory of 15-M among "ordinary" protesters. Acting as a sediment in their political culture, this memory had several mobilizing effects: the perception of protest as a genuine citizen's right, the extension of the scope of protest forms considered legitimate to a more confrontational (but not violent) repertoire, and the advancement of a new political subjectivity that envisages a more active conception of the role of people. These effects are also discernible among those who experienced the 15-M as attentive public, and even among those who were too young to experience it then at all.

Separating the Future: Socialism, Valuation, and Conflict

Colm Flaherty

Lund University, Sweden

While social movement scholars have long recognized the importance of collective memory and shared pasts in the construction of collective identities, less attention has focused on the role of imagined futures. Based on a long-term ethnographic study of radical left-libertarian groups in Sweden, this paper explores the role of utopia in structuring, influencing, and evaluating actions and practices in the present. I argue here that the social world of these groups can be understood not only as rejection of the mainstream, but also as the creation of another reality. This reality, shared, maintained, and reproduced largely through face-to-face interactions between individuals in both the same and different movement groups, contains a different scheme of valuation, rewarding the ability to create protected and separated places, groups, and interactions. Within these separated spaces, individuals and groups attempt to live their utopias. However, as the social reality exists only in limited number of interactions, it remains inherently unstable. This paper argues that not only does this perspective enable us to develop a more thorough understanding of conflicts between and within social movements, but it also helps to explain individual life-courses of activists. The paper concludes in arguing that the projected future should not be thought of as ideology, but as practice, suggesting that future-oriented spaces play a role in both maintaining and limiting a radical movement.

Acclaiming vs. Marginalizing Protest—Media Framing of Hong Kong Anti-Extradition Movement and French Yellow Vest Movement

Yao Li, Marion Cassard

University of Florida, United States of America

Regarding media framing of social movements, current studies have primarily focused on the negative side of framing tools, that is, how news media employ marginalization devices to belittle and demonize a protest. Yet little scholarship has scrutinized the positive side of framing tactics, i.e., how mass media adopt acclamation devices to show sympathy, approval, and applause toward a protest. Through comparing how an elite U.S. newspaper covers two different movements in contrasting ways, this paper illustrates a series of acclamation devices in comparison to marginalization devices. It then provides explanations for the employment of acclamation devices, through the lens of indexing theory and ideology affinity. A careful examination of acclamation devices, we argue, contributes to a more comprehensive understanding of media framing and the relations between media and social movements. The paper also challenges the popular conception that violence by protesters typically leads to negative media coverage.

Multiple Scenarios of Local Urban Conflicts in Two Big Russian Cities: The Perceived Opportunities of Grassroots Activists

Anisya Khokhlova[1], Elena Tykanova[2]

[1]St. Petersburg State University, Russian Federation; [2]The Sociological Institute of the RAS – Branch of the Federal Center of Theoretical and Applied Sociology of the Russian Academy of Sciences

This paper explores the scenarios of local conflicts caused by the elaboration, discussion and realization of controversial initiatives and projects of urban (re)development in two big Russian cities. Local urban conflicts are often analyzed in social science through the lenses of social movement studies that focus on the opposition of strong actors, majorly political and economic elites beaming down (re)development decisions, and weaker actors – protesting urban activists and local residents. However, we stray from this approach in favor of strategic interaction perspective (Jasper & Duyvendak 2015) that is more sensitive to the diversity of involved actors, and to the variability of interim and eventual outcomes of activists' efforts. To analyze the participants' subjective evaluations of conflict scenarios, we also apply the notion of 'perceived opportunities' (Giugni 2009).

Following the logic of comparative case study, we examine two (re)development conflicts in Nizhny Novgorod: prospective construction of a waterworld in Avtozavodsky park and road expansion in Molodezhny Avenue as part of preparations for FIFA World Cup-2018; and two conflicts in Moscow: expected commercial development on the premises of the public park 'Beryozovaya Roshcha' and the construction of the Northern service drive of Kutuzovsky Prospekt, a major radial avenue of the city. We reconstruct the dynamics of these conflicts and show what dilemmas involved city activists faced when choosing their interaction arenas; explore how their earlier experiences, informal bonds, interim wins and losses as well as the efforts of other players shaped these choices; and focus on the outcomes of their efforts.

Contending Movements in Shared Urban Spaces: Practices of Territorialization in Verona

Ipek Demirsu Di Biase

University of Padova, Italy

Internationally known as the romantic setting of Romeo and Juliet, the city of Verona is recognized in the Italian peninsula as the 'laboratory of intolerance' where an alliance between nativist populism, far right movements, and ultra-Catholic groups rule city life and urban politics, marking clear boundaries of belonging based on a white northern identity and traditional Christian values. Against this backdrop, an informal network of grassroots actors undertakes the struggle to create inclusive and democratic spaces that promote an alternative representation of the city, fostering an outward-looking local identity and thereby challenging particularistic exclusionary belongings. It is at this setting that the study undertakes an investigation of contending movement dynamics operating in the proximity of shared spaces in a mid-sized Italian city and focuses on the practices of territorialization employed by these actors. The study is premised on a 14-months of ethnographic fieldwork and seeks to shed light on the intersection of urban everyday life on the one hand, mobilization around local identities on the other hand, tracing how movement-countermovement dynamics unfold in cityspace.

Beyond Protests. Antigentrification And Antituristification Social Movements, Prefigurative Politics and Direct Action In Lisbon And Seville

Lucca Viersa Barros Silva

Instituto Universitario de Lisboa - ISCTE, Universidade Nova de Lisboa, Portugal

882

In the last decade, several cities have witnessed the consolidation of social movements that contest the effects of gentrification and touristification. The most recognized and broadcasted of these movements are the actions of protests and demonstrations, however these are just a few possibilities within a much broader repertoire of action. Among these movements, a large number of initiatives belonging to what is called prefigurative politics and direct action stand out. Although not widely addressed in academic research, these initiatives are essential for collective action and for the constitution of networks that integrate them. Thus, this article proposes to carry out an analysis of the different actions carried out by the anti-gentrification and anti-touristification movements in the cities of Lisbon and Sevilla. Both cities have a similar context of increasing gentrification and an exponential increase in the number of tourists in the last decade, generating a series of social responses. To do this, first the debate on gentrification and touristification is contextualized; then is discussed the concepts of prefigurative politics and direct action; and finally the case study will be done. For this, is made a mapping of the collectives that work on this theme in two specific locations, the Anjos/Graça and Penha de França area in Lisbon and San Gil en Sevilla. Then, through information available on social networks, the different actions and event held by each of these collectives will be counted and analyzed.

Reclaiming The City Through Street Art: An Exploration of Activism in Opposition to Gentrification in Birmingham and Barcelona

Marianne Geraldine Walker

University of Loughborough London, United Kingdom

Graffiti has been utilised globally as a mechanism of resistance and self-expression. Despite this, much existing work fails to analyse the specific implications of both the act and the result of graffiti in regards to political process and mobilisation theory.

In a time where activism and urban struggle against different forms of gentrification is abundant, graffiti becomes an interesting area of study. The very nature of it allows for an aesthetic change, leading to direct 're-claiming' through altered visuals, and as the act of resistance is very much public, analysis of how far graffiti acts as an agent of social change is needed.

Focusing on different forms of gentrification in Birmingham, UK and Barcelona, Spain, this research aims to discover how activists work, and how impactful their work is. Through qualitative interviews with artists and social movement groups in the two cities utilising a communicative methodology this project thus aims to comparatively explore street art. Focus will be given to analysing how street art is used as an act of resistance on two levels. Firstly, how artists and movements use it to reclaim identity on a personal and collective level, and secondly, how it is used to mobilise greater support for perceived injustices and broader acts of resistance. Attention will be given to its ability to achieve social change in both these respects and additionally on a broader long-lasting societal level.

RN25_T07_02 | Novel approaches to the study of social movements
Student Activism and Engagement Across Difference: Ethical Dilemmas of Inclusion and Exclusion

Gritt B. Nielsen

Aarhus University, Denmark

In recent years, there has been a marked upsurge in student mobilization against the systematic marginalisation or discrimination of certain bodies and voices at university and in wider society. Quests for safe spaces work to enact new ideals of good and desirable conduct. This paper focuses on student activism as a site of experimentation with profound moral and ethical dilemmas around how to conceive of and engage with others across difference. By drawing on ethnographic fieldwork material generated with left-wing student activists in New Zealand in 2012 and 2015, it investigates how student activists, in their various struggles for justice, constantly navigate ethical dilemmas, comprising questions of inclusion and exclusion and the balancing of universal moral claims with a sensitivity to situated ethical complexities and locally embedded experiences and values. The paper draws upon two interconnected strands of theories, namely, debates about Habermasian deliberative democracy, including questions of universal accessibility and inclusion/exclusion, and theories around ethics as a question of living up to universal moral imperatives (deontology) or as embedded in everyday negotiations and cultivations of virtues (virtue ethics). Inspired by Mansbridge (1996), the paper proposes that central to radical student activism as an ethical practice is the ability to act as a (subaltern) counter public that not only 'nag' or haunt dominant moralities from the margins, but also allow for the cultivation of spaces and identities within the activist networks to 'nag' their own moral frames and virtues, and goad them into action and new democratic experiments.

883

If Twins Were a Minority: Minorities as Social Movements

Mikko Lagerspetz

Åbo Akademi University, Finland

Every human society is inevitably characterised by unending diversity. With respect to at least some quality, every single one of us belongs to a numerical minority. However, not all numerical minorities can be called 'minorities' in any political or legal sense. A seminal book by Armand L. Mauss (1975) was titled, 'Social Problems as Social Movements'. It became a starting shot for what later became known as the Constructionist School in the research on social problems. Within this approach, social problems are analysed as discursive constructs that emerge as the result of claims-making activities by individuals and groups. Similarly, the creation of group solidarity and gaining acknowledgement of a group by others as a minority results from mobilization and claims-making, within an existing or emerging political possibility structure. When successful, the processes behind this can be called minority building. For purposes of policy development, the constructionist analysis might however not always be the best methodological choice. Those writing on minorities, even from a basically constructionist angle, tend in practice to end up in an insecure balance between essentialist and constructionist definitions. In my presentation, I will develop these ideas with references to numerical minorities that presently do not act as 'minorities', or do not have a corresponding legal or political status.

Constructing Movements through Communication: On the Applicability of Communicative Constructivism to the Study of Social Movements

Necdet Coskun Aldemir

TU Berlin, Germany

The literature on online dimensions of social movements has grown exponentially over the past decade. Despite this exponential growth in the number of studies, there is an apparent lack of theoretical and methodological advancement in the field. Given the widespread use and continuing popularity of classical paradigms, it can be said that this underdevelopment is especially observable in the area of social movement theories.

By introducing a recently developed sociological theory, namely communicative constructivism, and discussing its applicability to the study of social movements, this paper aims to make a contribution towards theoretical and methodological discussions in social movement studies in general and on the online dimensions of social movements in particular. Building on the inheritance of social constructivism, communicative constructivism places a strong emphasis on communication and views it as the main determinant of the dialectical process of the construction of social reality. Thus, communicative constructivism has the potential to illuminate the ways in which contemporary social movements occur through the use of diverse media (digital and non-digital) within different communicative processes of social interaction. Moreover, since it was developed from the findings of various empirical studies, communicative constructivism is an empirically-oriented theory and equipped with well-established methodological approaches such as genre analysis, focused ethnography, videography, to name but a few. Therefore, communicative constructivism offers not only an overarching theoretical framework for the study of social movements, but it also provides a sophisticated methodological apparatus that might help pave the way for further advancements in the field.

A Structural Field of Contention Approach to Social Struggles

Kerstin Jacobsson, Ioana Florea, Agnes Gagyi

University of Gothenburg, Sweden

This paper introduces a novel analytical approach to social contention and struggles, conceptualized as a "structural field of contention" approach. Earlier field approaches to social movements have noted the need to address the multiplicity of actors involved in a certain type of contention, and the fact that not all field relations can be described as intentional forms of alliances and conflict. The structural field of contention approach adds a further dimension, by including structural and political factors as part of the field of contentious relations. Additionally, in contrast to most field approaches, it incorporates silences – meaning the lack of mobilization in face of structural tensions, on behalf of social groups whose structural positions do not get to be represented through a collective voice. We illustrate the gains of this approach by bringing examples from a comparative study of housing contention in Bucharest and Budapest.

RN25_T08_01 | Contentious politics during COVID-19 pandemic

The Pandemic Is A Battlefield. Social Movements In The Covid -19 Confinement

Geoffrey Pleyers

FNRS-UCLouvain, Belgium

This contribution will propose an overview of ways social movements have responded to the COVID-19 pandemic, emphasizing the evolutions of the movements after the summer of 2020. Social movements have adapted to unexpected circumstances and been particularly active during this challenging period. The first section complements an article written in the previous period, insisting on the importance of unions and on the production of knowledge by social movements. The second section points to the increasing role played by women in social movements and to some recent evolutions in contemporaneous movements that have been deepened by the pandemic. Finally, I will discuss projects that aim at gathering initiatives and experience at regional or global scales as contribution to a limited but global wave of movements, embodied in countless decentralized reactions to a global event that has shaken billions of human lives.

This paper draws on online interviews, on local, national and international media consulted during the lockdown period and on social movements websites and social media.

Environmental Justice, Tactical Innovations, and the Digital Divide in Mexico During the COVID-19 Pandemic

James Everett Hein[1], Alessandro Morosin[2]

[1]California State University, Los Angeles, United States of America; [2]DePauw University, United States of America

The COVID-19 pandemic has erected numerous challenges for environmental justice activists in the Global South. Mexico has declared the metal mining industry as an "essential activity" and has been emblematic of how neoliberal deregulation policies facilitate the exploitation of natural resources by transnational mining corporations. At the same time, various movement organizations in Mexico have networked with local communities and international supporters to oppose the State's collaboration with the mining industry. How has the COVID-19 pandemic influenced anti-mining organizing in Mexico? We examine this problem by interviewing anti-mine activists working in the states of Oaxaca and Guerrero and compare their digital communications. A multi-method analysis of movement tactics and framing during the year 2020 reveals how COVID-19 has acted as a constraining "focusing event" for anti-mine activists. We consider the responses of two indigenous environmental organizations (REMA and EDUCA) to two Canadian mining companies (Goldcorp and Minaurum Gold). Both groups utilized the Mexican government's response to the pandemic in order to shift their frames. Both expanded their presence onto digital platforms, though to different degrees. Activists seized upon COVID-19 outbreaks in mines to accuse the mining industry of further endangering public health, while companies utilized social media to portray themselves as socially responsible. Additionally, some tactics have risen in importance during the pandemic, such as radio

885

broadcasts to rural municipalities resisting the mines. Our findings expand the understanding of how focusing events can constrain social movement tactics; the limitations of social media for mobilizing indigenous people in rural isolation; and the staying power of more traditional face-to-face organizing in anti-mine activism.

Strategic and Tactical Impact of the Corona Crisis on Climate Activists in Finland and Sweden

Mattias Wahlström[1], Magnus Wennerhag[2], Joost de Moor[3], Eeva Luhtakallio[4], Tuomas Ylä-Anttila[4]

[1]University of Gothenburg, Sweden; [2]Södertörn University, Sweden; [3]Stockholm University, Sweden; [4]University of Helsinki, Finland

While the climate movement has clearly been affected by the Covid-19 pandemic, the actual character of this impact appears somewhat ambiguous. Among climate movement intellectuals and organizers, the sometimes drastic actions by governments across the world have been used as a proof that joint political action against planetary crises is possible. Simultaneously, the global wave of climate protests during 2019 appears to have been impeded by public measures against the spread of the coronavirus introduced during 2020, including lockdowns and restrictions on protest activities in public spaces. Moreover, Covid-19 has pushed climate down the political agenda. Hence, the Corona crisis may be seen as much as an opportunity as a threat.

In order to disentangle these effects on the climate movement, this paper investigates climate activists' perspectives on strategic and tactical impacts of the Corona crisis: (1) how the corona crisis has affected the prospects for a carbon-free society and the climate movement's opportunities for mobilization; and (2) the effect on individual choices of protest tactics. Using a panel survey conducted in the fall of 2020 among Finnish and Swedish participants in a previous survey round of climate strike demonstrators in September 2019, we analyze activists' attitudes to the pandemic's effects on the movement's strategies and tactics. The two rather similar Nordic countries used quite different measures for suppressing and/or mitigating the spread of the virus, which allows us to investigate whether this aspect of the political context led to different experiences, attitudes and future outlooks among climate activists.

Disrupting business-as-usual? The Swedish climate movement and COVID-19

Lotte Schack

University of Gothenburg, Sweden

COVID-19 disrupted business-as-usual through the complete re-organisation of society it necessitated. For the Swedish climate movement, it did so in two ways: it disrupted the movement's momentum, making most of their usual activities impossible. On the other hand, movement actors saw the pandemic as an opportunity to insist that 'we cannot go back to normal'. Especially the response to the crisis from states was seen as proof that the kind of drastic measures necessary to slow down global warming were indeed possible, contrary to what governments had previously argued. However, the transformative potentials of the crisis are still yet to be realized. Business-as-usual in regards to the climate have been allowed to continue: in Sweden, two-thirds of the economic support packages have been invested in the fossil fuel industry and goals of reduced emissions continue to not be met.

In this paper, I engage with this tension in exploring the role of the pandemic in how the Swedish climate movement (re)negotiate visions and strategies for a fossil-free future. I examine the pandemic's consequences for movement activities, focusing on their use of digital media. I draw on semi-structured interviews with activists, online movement activities and statements from different organizations to explore differences between how institutionalized and non-institutionalized movement actors have engaged and engage with COVID-19. I inquire into the strategic dilemmas the groups face based on their different resources and established repertoires of action to assess how they view the transformative potentials of the situation one year on.

Right To The City Movements And The New Authoritarianism. Analysis Of The Democratic Potential Of Urban Activism In The Context Of Right-wing Populism: The Polish Experience

Przemysław Pluciński

Adam Mickiewicz University, Poland

The rise of the right-wing populism and the danger of the new and/or electoral authoritarianism, partly as a result of several decades of progressing nonlinearization, have also very clearly exposed the deficiencies of representative democracies. At the same time, they have once again reinforced the historical need to re-examine and seek for the democratic foundations in grass-roots structures and processes, inter alia among social movements. This leads to further tensions: between the demands of populist, centralized and vertically oriented power actors and all the counterpower actors operating horizontally.

The main objective of the paper is to address/assess the political potential of the Polish right to the city activists in defending democracy and human rights, and resisting state authoritarianism in the wake of right-wing populists taking power. In the paper I will provide the analysis of the local politics of urban movements activists as well as the main conflicting areas with the right-wing populist authorities and narratives. In this regard I will address the following problems: 1. The challenge of 'democratization of democracy' in terms of urban democracy; 2. egalitarian and sustainable city versus exclusion; 3. minority rights; 4. defense of the pluralist public sphere against the nationalist regressive narratives.

The paper will be based on the author's long-term empirical research conducted between 2015 and 2020: in-depth interviews conducted in 6 Polish cities, participant observation and elements of content analysis.

Syncretism In Ecological Movements And Hubs: The Problems Of Unreflect Dual Political Subjects

Mónica Catarina Soares

Centre for Social Studies, Portugal

Spectres of fascism (Gandesha, 2020), or in more general terms of the populist far-right reason, are back to upper concerns on political sciences and social movements theory in particular. Bottom mobilizations, protests and political activity on seems to be suffering a turn towards more right-winged positions and, in certain cases, to far-right ones. More important than ever it is important to understand how lay people begin to accept and to endorse far-right wing positions. But also, right-wing imaginaries begin to be normalized amongst previous or new social movements, both through leftist co-option or through syncretism in movements perceived as a third-way (not from the left neither from the right) (Reid Ross, 2017). This presentation delves into the problematic of syncretism within ecological-based social movements and corresponding hubs (e.g., eco-communities, eco-villages, among others). Ecological-based movements are of paramount importance on this matter because they seem to present an apparent political benignity and neutrality wherein far right-wing political imaginaries may nestle without a profound debate about the historicity of their political matrix. Based on a long-term research design on social movements and hubs in the Iberian Peninsula – the project 'Imagining and crafting for world ahead' (financed by the Portuguese Foundation of Science) - I intend to problematize the main shared critics, claims and diagnoses (e.g., critic of modernity, primacy of plural ecological practice) that may benefit syncretic discourses and practices between dissimilar political subjects who thoughtlessly converge to ecological-based movements and projects.

887

"Mobilizations Against Enforced Disappearances In Mexico: Collective Identity Construction Of Victims' Relatives' Organizations. The Case Of Fuerzas Unidas Por Nuestros Desaparecidos En Coahuila y En México"

Thomas Aureliani

State University of Milan, Italy

The Mexican "War on Drugs" has caused a serious humanitarian crisis, that has seen over 80.000 disappearances from 2006 to 2020. In response to this tragedy, a human rights movement against enforced disappearances has arisen, composed mainly by victims' relatives that have grouped into Social Movements Organizations (SMOs), claiming truth and justice for their beloved ones. The aim of this contribution is to understand the process of collective identity formation of these organizations through the analysis of a case study: Fuerzas Unidas por Nuestros Desaparecidos en Coahuila y en México (FUUNDEC-M).

Drawing on in-depth interviews with victims' relatives and participant observation carried out in 2018 in Mexico City and Coahuila, this contribution investigates the boundary work developed by the group, which involves creating a reciprocal identification between members. Despite having no previous experience in activism, shared networks, or political affinities, the group's members have managed to build a strong collective identity based on similar experiences and life circumstances; a shared action project; a similar collective action frame and diagnosis of the problem; as well as shared emotional experiences. As their collective identity has contributed to boosting different forms of mobilization in the high-risk context of Mexico, this contribution also highlights some differences in the process of boundary construction between FUUNDEC-M's members and other SMOs' victims' relatives. This helps shed light on the way in which activists mark boundaries within movements in an attempt to distinguish their particular SMO from other SMOs within the same movement.

Law, Medicine And Shame. Activist Strategies Towards Three Technologies of Power

Agata Chełstowska, Agata Dziuban

Jagiellonian University, Poland

Social movements mobilizing around criminalized issues encounter particular set of challenges and have in recent years generated interesting new strategies. Our research projects on movements fighting for abortion access and sex workers' rights in Poland can be an example of a new approach to theorizing social movements' strategies. Author one proposes to focus an analysis around three key "technologies of power": law, medicine and shame. In operational terms that requires analyzing activist strategies towards (de)criminalization, (de)medicalization and (de)stigmatization of a given issue. We argue that this framework can be a useful theoretical tool for mapping out strategies of many different social movements, dealing with various marginalized groups and experiences, such as race, sexual orientation, drug use, or migration status.

We demonstrate the use of the new method with two case studies of feminist movements in Poland: a network of activists helping women in accessing pharmaceutical abortion under a de facto abortion ban in Poland; and an organization advocating for sex workers' rights Sex Work Polska. Both groups set themselves apart from older branches of the feminist movement by insisting on destigmatization of abortion and sex work, and both encounter backlash and resistance to their innovative strategies. An analysis of the organizations' materials (publications and interviews, grey literature) allows us to map out their strategies towards criminalization, medicalization and stigmatization in their respective fields.

RN25_T09_01 | Activists' trajectories

Past Storylines and Present Moves: Migrant Agency in Collective Action

Angela Adami

Scuola Normale Superiore, Italy

This contribution investigates the trajectories towards collective forms of emancipatory migrant agency, focusing in particular on their temporal dimension. Moving from Social Movements and Critical Migration studies, the analysis engages with political biographies of migrants and people with a migration background involved in collective action, drawing on life histories conducted during my fieldwork in Rome and Naples.

Scholarship on migrant forms of collective action has lingered on highly visible instances, displayed in times of intense mobilizations. The lack of a deeper understanding of migrants' trajectories towards collective action is coupled with the risk of objectifying both the experience of migration and that of activism. Conversely, the analysis of political biographies engages with an internal perspective on migration and fosters the idea that migration experience encompasses the before and after of migration and interlaces with a number of other spheres of people's lives – family, friendships, community of origin – which play a crucial role in understanding the trajectories towards collective action. The work of narration and signification of past experiences from the point of view of the present entails that subjects temporalize their storylines in horizontal ways, by establishing watersheds and pathbreaking moments, and in vertical ways, by finding correspondences between the plies of their singular experiences and those of collective and political levels and occurrences. In turn, the focus on temporalities enhances our understanding of the constitutive processes of migrants' collective action by clarifying some peculiarities of migrant agency, such as the forms of political invisibility and political translation, and informing concepts such as transnational activism and diffusion in less mechanistic ways.

Professional Identity And Organizational Strategy Among Policy Professionals in Civil Society

Joanna Mellquist

Södertörn University, Sweden

This article investigates identities, strategies and commitment among policy professionals in civil society organizations (CSOs). Policy professionals are a growing group of actors who populate many CSOs. They comprise various types of policy professionals with different backgrounds, feelings and identities, working with the organizations' policies. By asking policy professionals about their identity and motivation to work in civil society and then following their work through ethnographical observations, this article contributes to the understanding of policy professionals' strategies connected to their identities and commitment to the organizations they work for. To understand the dynamics of civil society, this article proposes a categorization of policy professionals in civil society as policy scholars, policy lobbyists, policy communicators and policy activists. The conceptualization of these actors is important, because the balance between these groups affects the organization. If one or the other group dominates, it will have consequences for the organization's policy strategies.

Keywords: role orientation, civil society, policy professionals, strategy

Streets, Ballots, and Bullets: Engagement and Activism in the Kurdish Space

Massoud Sharifi Dryaz

The Autonomous University of Barcelona, Spain

What are the factors that explain the choice of activists to join the Kurdish Movement? What are the different modalities of engagement in the Kurdish space? Why did the activists engage in one mode of action and not in the others? The main purpose of this paper is to analyze the profile, the trajectories, the motivations, and the subjectivity of those individuals who, at a given moment in their lives, decided to join pro-Kurdish organizations, associations, or political parties. An analytical approach that juxtaposes the theories of social movements and nationalism, is proposed to grasp the dynamics of Kurdish protest activities and pro-Kurdish activism.

The methodology used to conduct this study consisted of seventy-seven semi-directive interviews, supplemented by numerous informal discussions with members of associations and the pro-Kurdish political party in Turkey as well as guerrillas and former PKK (The Kurdistan Workers' Party) militants, all carried out during the fieldwork at multiple observation sites in Turkey, Iraq, and France.

The main results will be communicated in three parts. First, the paper focuses on the profiles of those involved in the Kurdish cause in organizational forms of collective action. Then, the different modalities of engagement in the Kurdish space and the characteristics of each militant category will be discussed. Finally, through an examination of the biographical accounts of Kurdish activists, the article examines the process of engagement in its objective and subjective dimensions. The aim is to explain how individual actors understand and interact with the distinct experiences they have had both before and during the engagement process, leading up to their decision to join an association, political party, or armed group.

New Conceptualization of Civic Participation

Kamil Charvát

Slovak Academy of Science, Slovak Republic

We live in a time when the trust of citizens in traditional democratic institutions has decreased, the participation in elections has been falling and general skepticism has increased. On the other hand, mainly thanks to digital media and technologies, new forms of civic participation have emerged that help introduce new topics, and democracy is reviving. Social movements that have mobilized around the fight for climate justice, gender equality or minority rights have rightly attracted the attention of social science.

Existing concepts of civic participation build on typologies that can be continually updated and that can include new forms of participation but that do not provide the analytical framework for its more complex research. What is missing is universal conceptualization that allows us to examine the participation in all its forms and to compare various topics and social movements. The purpose of the work is to map the existing approaches by J. Ekman, E. Amna and J. Van Deth and to reformulate on their basis the conceptualization of participation. The primary starting point is viewing the political and civic participation as a process in which an individual goes through various participation phases – such as getting familiar with a topic, identification with it and action. Primarily, it should be used for the digital environment where most new forms of participation belong and which is an important arena for new mobilization topics. Author aim is to to examine possibilities of adoption of Customer Journey approach from marketing studies.

New conceptualization of participation is meant to be used as an analytical tool for following research of climate change mobilisation of young people in Slovakia.

Countering Neoliberalisation In, Against, And Beyond The Local State? The Role Of Social Movements In Re/municipalisation In Argentina, Germany And The United States.

Laura Stegemann, Emilia Arpini, Grace Brown

University of Glasgow

A 'new municipalist' movement is emerging across different towns, cities, and communities worldwide, contesting the effects of neoliberalisation (Peck and Theodore 2019). Through local activism and citizens' initiatives, the movements critically engage with the local commons, economic democracy, state transformation and democratic ownership (Cumbers and Traill 2021; Russel 2019; Cumbers 2015). Simultaneously, (re)municipalisation has been on the rise, a process of localities and communities bringing formerly privatised assets and services back into public ownership, with more than 1,450 cases since 2000 (Transnational Institute 2021). In the wake of the Covid-19 pandemic and a looming climate catastrophe, the causes of these movements crystallise. Universal access to services such as energy, water or health care, has become both a pressing socioeconomic and environmental issue.

Building on the argument that the form and potential of (new) municipalism is locally situated, (Cumbers & Paul, 2020), this article conducts a comparative case study to analyse and compare the spatial dynamics that shape (re)municipalisation in Argentina, Germany and the United States. Drawing on local press reports, websites, official documents, social media posts and radio interviews, the analysis focuses on how social movements, civil society and state actors promote municipalist local politics, specifically analysing how municipalism unfolds in, against and beyond neoliberal local state structures, institutions, and agencies.

The findings suggest that municipalist campaigns predominantly unfold 'in' the state, both through local state actors, as well as activists and initiatives who engage with and work to transform existing state structures. They furthermore underline the importance of understanding municipalism as a variegated global phenomenon in different institutional and geographical settings.

Contentious Action And The Politics of Implmentation In Chile's Sistema De Evaluación De Impacto Ambiental

Eduardo Silva

Tulane Univerity, United States of America

This paper analyzes the impact of contentious action by social movement organizations on the politics of policy implementation in the environmental issue area in Chile. Building on new approaches, the paper proposes that the politics of policy implementation is what follows after a policy has been formulated and put into action. At that point, contending actors use new institutions, rules, and procedures to pursue their objectives. This effects how well policy accomplishes its objectives and then feeds into the politics of policy adaptation and reform. I examine this proposition in conflicts over the implementation of the System of Environmental Impact Evaluation (SEIA) and how they affected reform efforts from 2014 to present. In the 1990s and 2000s, the new SEIA became the fulcrum for socio-environmental conflict over mega-project development. The paper shows how the SEIA "in action" shaped demands for its reform from large-scale business, social movement organizations, and citizen groups. It analyzes how shifting power balances between movements, business, and the state affected subsequent reform processes. Thus, a second contribution of the paper is a more precise specification of how context at a systemic, intermediate, and immediate level shape the relative power of contending actors. Third, the paper shows differences in the politics of implementation vs. formulation or reform. In the former courts and regulatory agencies feature prominently, in the latter the action is in legislatures, the presidency and cabinet. Thus, actor, strategies and tactics vary too.

891

Social Movements and a Policy Shift Towards a Diversified Energy Matrix

Ludovico Feoli

Tulane University, United States of America

Costa Rica shifted its official electricity policy stance away from mega-hydro sources towards a diversified matrix, and from centralized to distributed generation. This paper examines the role that social movements played in this transformation. It argues that the new policy vision resulted from the interaction of exogenous factors like technological change and slower energy demand, with endogenous factors such as the high costs and impact of the dominant mega-hydro model. These forces altered the relative power of ICE and other actors creating opportunities for social movements. The paper argues that social movement actions contributed to a frame shift in the public debate about electricity generation. This shift was centered around policy goals the movements had articulated a decade earlier. Because the emergent Citizen Action Party (PAC) benefitted from the new frame, as did important pressure groups like industrialists and private generators, the new policy vision gained substantial backing, forcing ICE to move towards its implementation.

Transformative Strategies Of Mutual Aid In The Covid- 19 Pandemic

Maria del Carmen Mayer

Bielefeld University, Germany

892

Almost one year after the outbreak of the pandemic, a yet limited, but nevertheless growing, body of research and literature is paying increasing attention to impact of the pandemic context on action repertoires of social movements. This paper aims to contribute in this respect to a still open task, by analysing how activists perceived the emergency caused by the pandemic and how it correlates with the activist's choices on mutualistic repertoires. The paper combines the literature on solidarity structures, direct social action and mutualism in the social movement studies with the literature on strategy and tactics and connects it to an ongoing empirical case study.

This paper explores the particular case of the Voluntary Brigades of Milan/Italy. The Voluntary Brigades are a heterogeneous solidarity network, created in the epicentre of the pandemic outbreak in Europe. It is still active to date, working in different neighbourhoods, in charge of a range of topics including food distribution, mental health and free testing / vaccination.

The analysis is based on semi-structured Interviews with different groups of activists within the network and the analysis of social media content (sources: Telegram, Facebook). The paper compares two different time frames, partly following a reconstructive design for grasping contrasting pandemic contexts: The outbreak of the pandemic and first lockdown in spring 2020; and one year later, facing expected initial effects of a broader vaccination coverage in spring and early summer 2021. The analysis scrutinises that the critical and dynamic context matters significantly for the Voluntary Brigades and their action repertoires but is far from being an automatic reaction to it but, importantly, influenced by strategic interpretations.

Examining necro-resistance in India-controlled Kashmir

Umer Jan

University of Westminster, United Kingdom

During the past decade or so, while the armed insurgency in India-controlled Kashmir rages on with renewed vigour and an overwhelming popular support, the extent of its military success remains debatable.In the absence of regular military gains, the notion and objective of Shahadat or martyrdom has become central to the recruitment and functioning of the insurgency in Kashmir. In this paper, I will first set out to explore the modalities of Shahadat or martyrdom within the discourse of Islam and other Abrahamic religions, in addition to explaining how Kashmiri rebels within the mostly indigenous armed rebellion and the Kashmiri population in general have adopted this as a primary paradigm of anti-India resistance. I do this in order to elucidate the continuity of insurgent praxis and position Kashmiri reliance on martyrdom within a historical continuum, rather than upholding it as an instance of exceptional, 'terroristic' expression, as it is often presented within the, dominant, discourse of the states. Expanding on Achille Mbembe's necropolitics (2019), I will set out to explain how his thesis does not take into account the agency of subjects upon whom this 'biopolitical sovereignty of death' is enacted. Through this exposition based on ethnographic fieldwork in India-controlled Kashmir, I will demonstrate how Kashmiris have appropriated necropolitics, and imbued it with religious characteristics, to resist the necropolitics of Indian state- a strategic protest tactic. In the paper, the aim is to establish how, by wresting away the sovereign right of the allocation of death from the structures of India's military occupation, 'necro-resistance'- the term that I borrow from Banu Bargu (2014)- has become a dominant mode of popular political resistance/expression in India-controlled Kashmir.

"Feminist Direct Social Action. Insights From The Case Of Italy"

Anastasia Barone, Giada Bonu

Scuola Normale Superiore, Italy

Social movements scholars have recently drawn attention to the re-emergence of practices of what has been called "direct social action". These studies underline how direct social action tends to spread during moments of crisis both because of the urgency to respond to immediate needs and because traditional forms of political participation are contracted. Hence, direct social action as "welfare from below" presents itself as a way to re-politicize society, starting from basic needs, in moments of low mobilization.

Drawing on data collected during our fieldworks on feminist groups in Italy, and focusing on health and anti-violence practices, we contribute to this literature with the aim to shed light on some peculiar features of what we define as feminist direct social action.

While the first forms of FDSA emerged during the 1970s in the field of health, they have been typical both of phases of strong, massive and visible mobilization and of phases of "latency". Furthermore, we show how FDSA, far from being a simple response to immediate needs represents a) the enactment of a political response to gender-based violence as a structural dimension of contemporary society b) a way to let new, previously not recognized, needs to be articulated and addressed c) a feminist approach to subvert the relation between user and experts, based on the idea of self-determination.

Hence, this contribution also helps us to blur the boundaries between moments of massive mobilization and phases of latency, and between the social and the political dimension of welfare from below.

893

Making-With-And-For-Others in Times of Pandemic. Espacio Open and The Spanish Maker Movement amidst the Ongoing Coronavirus Crisis

Ignacia Perugorria

University of the Basque Country, Spain

The objective of this paper is threefold. First, it sets out to offer an in-depth account of Espacio Open (Bilbao, Spain) as a case study of the broader Maker Movement. I analyze Open and the Maker Movement as examples of what I define as "sharing society" in the realms of grassroots social innovation, creativity, craftsmanship, leisure and entrepreneurship. I examine them, as well, as privileged settings for the study of "sharing practices" of three main kinds: learning-, creating- and playing-with-others.

Relatedly, my second objective is theoretical. This paper develops the notion of "sharing society" as a field composed of grassroots, small and mesoscale initiatives addressing large-scale social issues through "sharing practices" in which material resources and immaterial "riches" of the sort of visions, knowledge, and fun are crafted, activated, shared and exchanged collaboratively. These practices are rooted in a commitment to action that puts people and the planet at the center and pursues the common good.

Finally, I test these theoretical ideas in a context of social emergency in which sharing practices have contributed to saving lives: the current coronavirus crisis. Born under the slogans "protect those who protect us" and "open source to live," the Spanish platform CoronavirusMakers is now the largest global network of free and open-source technology specialists manufacturing personal protective equipment to protect essential workers. Espacio Open, our case study, was one of its founding members.

Data comes from a multi-methods approach based on netnography, in-depth interviews, participant observation, and the analysis of secondary data.

European Citizens´Initiative to Start Unconditional Basic Incomes (UBI) throughout the EU: Cybercampaing Analysis on Twitter.

José Manuel Robles-Morales[1], Inmaculada Gutiérrez García-Pardo[1], Juan S. Fernández-Prados[2]

[1]Universidad Complutense de Madrid; [2]Universidad de Almería

This contribution aims to analyze the new campaign to collect signatures for a Universal Basic Income through a European Citizens' Initiative from the perspective of social media (URL: https://eci-ubi.eu/). Its objective is to establish the introduction of unconditional basic incomes throughout the EU which ensure every person's material existence and opportunity to participate in society as part of its economic policy. Since the start of the campaign on September 25, 2020, tweets with the hashtags #universalbasicincome, #ECIUBI and its Twitter account (@eciubi) associated with this cybercampaign have been collected. The results show a disparate success by country depending on the debate promoted on social networks. The evolution of the results in the collection of signatures shows certain peaks related to specific moments of the cybercampaign. The debates on Twitter have generated clusters and structures among the users themselves according to mentions of other users, other hashtags, etc. These clusters and structures make it possible to detect threads of argument and fringe or polarized discourse. In short, the aim is to evaluate the success of the initiative from the cybercampaign strategies and to study the impact on the debates and positions of the users of the social media.

894

Gendering Protests. Transfeminist Movements Re-Inventing Repertoires of Contention and Public Protests

Giulia Bonanno

Sapienza Università di Roma, Italy

This contibution aims to explore, with a transdisciplinary approach, how the performative protest practices (Ramírez Blanco, 2018; Serafini, 2018) adopted by transfeminist movements (Borghi, 2019; Butler, 2004) are changing the public protest scenario (Della Porta 2013 and 2017). It is based on the mapping of transfeminist performative collective actions carried out over the last three years by transfeminist movements in Italy (Rocheleau, 1995). In addition, ethnographic research was carried out through interviews with privileged witnesses (feminist activists).

While it is widely acknowledged that instances of bodies in protests can give voice to powerful emotions and feelings of collective empowerment (Serafini, 2018), the central role played by the production of performative protests on the road to radical social and political change and the involvement of the body in contesting actions to subvert the normative nature of public space (Kraidy, 2018) is an unresearched but pivotal issue and is therefore at the heart of this contribution.

Within this framework, urban space, permeable to structural violence and social hierarchies, can be seen both as a product and a generator of power relations. The new feminist wave traces a genealogy with previous cycles of feminist protests and at the same time imposes a break against them. Investigating repertoires of action and the created practices can provide an in-depth understanding of the new processes of democratization of these new social actors and offers an important debate opportunity both at national and international level.

Vigilantism as a Political Phenomenon in Finland

Johan-Eerik Kukko

University of Lapland, Finland

In an article dissertation written for the Faculty of Social Sciences of the University of Lapland, I study vigilantism in Finland in the 2010s. People who take the law into their own hands are called vigilantes. The etymology comes from ancient Rome and the Latin word "vigil" which means "watchful" or "alert". The aim of my study is to create a comprehensive picture of what kind of vigilantism happens in Finland and to whom it is directed. Dissertation takes part in the latest theoretical discussion on vigilantism and uncivil disobedience. A term that has been discussed for example by Jennet Kirkpatrick and Candice Delmas. I also examine what opportunities social media creates for vigilantes, and how politicians, authorities, and the press have responded to the phenomenon.

The dissertation focuses on street patrols but also cyber vigilantism. I will focus on groups who wanted to operate on the streets as the "eyes and ears" of the police, people who consider themselves as "pedophile hunters" and the desire of some Finnish municipalities to establish their own serif system. I'm especially interested in the activities of anti-immigrant street patrol Soldiers of Odin, clown dressed counter patrol Loldiers of Odin, a group of frustrated entrepreneurs called Yöpyövelit and an internet group called Finnish Pedohunters. Some of the groups use masks and in my dissertation, I will focus on two kinds of masks; one to wear and one to hide their actions' real purposes.

Keywords: Vigilantism, Uncivil disobedience, Masks, Security

"Together We Stand? An Analysis Of The Digital Relations Developed By LGBTQIA* Organisations"

Aurora Perego

Università di Trento, Italy

Cooperation between civil society organisations has been extensively analysed in social movement literature. Both organisational characteristics and external socio-political conditions are shown to shape the emergence and duration of inter-organisational cooperation. However, these findings mainly concern within-movement cooperation. It is not yet clear whether such factors similarly contribute to the emergence of within- and cross-movement cooperation and, if not, why they may be more influential in one case or another. Within this framework, the LGBTQIA* (lesbian, gay, bisexual, transgender, queer, intersexual, asexual, and others) collective action field has often been described as both internally fragmented and isolated from other fields. However, recent studies have observed the emergence of local cooperative events between LGBTQIA* organisations and other collective actors. This paper aims to address these concerns by considering how LGBTQIA* organisations interact and communicate on digital platforms. In particular, it proposes a preliminary analysis of how contextual features and collective action frames may enhance the creation of within- and cross-movement relations across contexts and their evolution over time. To do so, this paper compares different networks resulting from public interactions on Facebook between LGBTQIA* organisations located in two European metropolises (Milan and Madrid) at three different points in time (2011, 2015, 2019). After mapping within- and cross-movement relations, the analysis examines whether specific collective action frames are associated to the observed ties. By doing so, this paper aims to contribute to literature on collective actions in two ways: it explores the emergence of the digital relations developed by LGBTQIA* organisations, which have not been systematically studied yet; and it provides initial evidence on how the similar factors may differently shape within- and cross-movement cooperative dynamics.

Protesting civil society in Poland. Towards a pillarized structure?

Daniel Platek

Lund University, Sweden

Grzegorz Ekiert (2020) argues that the organizational trajectory of civil society in Poland has fundamental features directing it towards cultural and political polarization, which in effect facilitates the current turn of the country towards authoritarianism. According to the author since the country's transition to democracy in 1989, Polish civil society has evolved into an organizational form that can be described as the "pillarized civil society". This phenomenon concerns the vertical segmentation of civil society into sectors that have their own organizational resources, normative orientations and, consequently, their own patterns of building protest coalitions. The support of the Law and Justice for the extreme right-wing organizations further consolidated the cultural polarization of Polish civil society. Despite the formulation of a strong thesis about "pillarized civil society," it has not yet been empirically verified. Assuming that the variable number of actors behind the organization of protest events reflect the nature of collective identities in the civil society I ask the question whether and to what extent coalitions of protest in Polish civil society are being formed under the impact of specific political opportunities that have arisen in Poland in the year 2020. Using a collection of protest events drawn from Polish newspapers, clustering methods and betweenness centrality measures algorithm of network analysis are employed to map the civil society protest actors coalitions and specify what it implies that Polish civil society may be perceived as a pillarized vertical structure.

Negotiating Contention During The Great Recession: A study Of Inter-Union Interactions Prior To Contentious Collective Actions In Madrid Underground (2008-2016)

Nicholas Pohl

University of Lausanne, Switzerland

Much attention has been paid to interactions between unions, company managements and governments in the course of labor disputes. Less attention has been given to the precise processes through which different unions come to rally behind joint calls for action. With the present paper, I provide a closer look at inter-union processes prior to open industrial conflicts. The analysis is based on an extensive examination of union circular letters produced by eight Madrid Underground unions between 2008 and 2016. Starting the analysis at the outset of the Great Recession, I examine when and how periods of inter-union conflict merged into inter-union unity and joint contentious collective actions against the deterioration of working conditions. The findings show that the dynamics of inter-union competition are key to understanding how contentious collective actions come about – or not.

Vigilantism and security production in rural Burkina Faso

Nestor Zanté

University of Leipzig, Germany

The analysis of vigilantism, especially the contemporary one, mainly focuses on the extra-legal character of vigilante groups, their use of violence and their impact on state authority and social cohesion. However, in Burkina Faso, vigilante groups commonly known as Koglwéogo, participate in the production of security and the fight against terrorism especially in areas where state security structures are absent or seem ineffective. To legitimise their existence as local actors in the production of security, they collaborate with traditional chiefs and religious leaders. The relationship between vigilante groups and traditional and religious power is one of the neglected aspects in the analysis of contemporary vigilantism. In this article I analyse vigilantism as a collective action of strategic actors in the provision of security in rural Burkina Faso. I show the relationship of tacit collaborations and strategic negotiations between Koglwéogo actors and traditional and religious authorities to analyse the way the Koglwéogo negotiate their role as security actors in rural Burkina Faso. In this context I elaborate on the forms of collaborations they established with other groups of actors in the field of security production.

My article is based on an ethnographic survey conducted in 2019 and 2020 among Koglwéogo groups in the south-central region of Burkina Faso and on an ongoing process of digital ethnography.

The Silent Reform. Transforming the Norwegian welfare state from within

Johans Tveit Sandvin

Nord University, Bodoe, Norway, Norway

Norway is considered to be among the most resilient to the ongoing changes in European social policy, changes which according to Jenson (2017) are about to form an "emerging policy paradigm" combining social investment and social entrepreneurship. Despite high scores on parameters for 'social investment' in European comparison, the concept is hardly discussed in Norway, and no reforms have seriously challenged the role of public sector either in the funding or in the provision and delivery of welfare services. However, it is argued that such macro-level parameters are insufficient to capture possible changes affecting people's welfare and citizenship. It should also include an assessment of how reforms and policies affect the logic and configuration of welfare (Evers and Guillemard, 2013). Drawing on a large study of the state and resent developments in the Norwegian welfare state as perceived by local service providers in a number of service areas, this paper discuss the more silent and subtle changes taking place in the Norwegian welfare state. We show how political trends similar to those in the EU have led to more implosive changes, creating tensions that risk undermining traditional features of the Norwegian welfare state from within.

The Trajectory of Brazilian Social Protection System

Ana Cleusa Mesquita

University of Coimbra, Portugal

What is known about the Brazilian social protection system? How it has changed in the last 50 years? To answer these questions is inevitably comes back to the accounts of the Brazilian social protection system and examine them from the perspective of welfare regimes. Titmuss (1974), Esping-Andersen and others had identified different models of welfare and hence provided important approaches to analyze the conception, implementation and management of social protection. The Esping-Andersen's typology define a set of principles and values and political, economic and social objectives, and can be associated with a prevailing institutional configuration determining the rights and benefits, the financing and the management of the social protection arrangements. It also helps to identify the role and position given to social protection institutions in relation to other factors of social protection (the market, the family and the voluntary sector), as well as the objectives pursued in terms of individual welfare, quality of social rights, social stratification and the structure of the labor market. Such analytical categories can help to situate the core features of any welfare system, despite the complexities that inevitably characterize any empirical reality.

The Brazilian system is one of the most complex in the world and its recent trajectory seems quite different from other systems in Latin America. So the proposal is a comprehensive literature review on Brazilian social protection system, framed by welfare regimes approach. The aim is understanding the features of Brazilian welfare, its trajectory and then suggest some hypotheses for a further research project.

898

The Welfare State As A Lifecycle Redistribution Machine

Robert Ivan Gal[1,2], Marton Medgyesi[3,4], Pieter Vanhuysse[5,6]

[1]Hungarian Demographic Research Institute, Budapest; [2]Corvinus Institute for Advance Study, Corvinus University, Budapest; [3]Child Opportunities Research Group, Centre for Social Sciences, Budapest; 4TARKI Social Research Institute, Budapest; 5Department of Political Science, Danish Centre for Welfare Studies, Odense; 6Danish Institute for Advanced Study, University of Southern Denmark, Odense

Social scientists identify two core functions of modern welfare states as redistribution (a) from higher to lower socio-economic status groups (Robin Hood) and (b) 'across the lifecycle' (piggy bank). But what is the relative importance of these functions? There has been no conclusive answer to this question, as the piggy bank is metaphorical: the intra-personal time-travel of resources its 'lifecycle redistribution' implies is based on non-quid-pro-quo transfers. In practice, piggy banks operate instead through inter-age-group resource reallocation in cross-section. At any time, different birth cohorts live together as different age groups, so 'resource-productive' working-aged people can finance 'resource-dependent' people in earlier and later life stages. We reconceptualize the piggy bank accordingly in cross-section and separate it from the Robin Hood function on a sample of over 400,000 Europeans from 22 countries in 2010. Analyzing their joint distribution, we decompose the effects of socio-economic status and age on (a) all cash and in-kind transfers ('benefits'), (b) financing contributions ('taxes'), and (c) the resulting 'net benefits.' What may appear to be badly targeted Robin Hood states riddled with Matthew effects turn out, in joint bivariate models, to be better characterized as inter-age reallocation states performing a more important second task rather well: lifecycle consumption smoothing. European welfare states, first and foremost, are neither redeemers of markets or families nor inequality-reduction or poverty-relief vehicles. They are primarily lifecycle redistribution machines: an institutionalized way of letting the working-aged finance the young and the elderly.

Unveiling the EU Policy Framing of the Social Economy: an Analysis of Recent Policies and Strategies

Ana Luisa Martinho[1,2,3], Márcia C. Santos[4,5,6], Joana Marques[1,7]

[1]A3S; [2]Phd student University of Valencia; [3]P.Porto/CEOS.PP/ISCAP; [4]IPS; 5ISCTE-IUL; [6]ISTAR-IUL; [7]CIES-Iscte

Over the last decades, the social economy has been called upon as a provider of social and employment policies, both at the European and national levels. Social economy organizations have proven to respond to the main social challenges in an innovative way (Borzaga et al., 2017). In the Green Paper on Equality and non-discrimination in an enlarged European Union (2004), the Commission recognizes the instrumental role of civil society organizations, in advancing EU priorities in combating discrimination. At the turn of a new decade of European strategic and funding framework, our research aims to unveil the main themes that emerge from EU strategic orientation documents and to analyse the place of the social economy in such documents. The paper analyses the main EU official strategies and policy documents using automated text analyses to allow the extraction of relevant terms and the possible relationships among them within a large textual corpus. Text mining and topic modelling techniques have been applied based on a comprehensive lexicon of nonprofit terms related to social economy organizations, which have been reviewed and validated by experts. The automated techniques allow to identify the main guidelines, recurring themes, and emerging concepts, and the critical analysis of the results allows to explain the ways in which the social economy is framed (as provider of social services, as social innovator and entrepreneur, as an advocacy actor). The challenges and opportunities of applying text mining technologies in qualitative research and social policy analysis are also discussed.

Subjective Wellbeing in Central Europe – A Longitudinal Comparison Between Rural and Urban Regions of Seven Central European Countries

Vladimir Ivanović, Bruno Šimac, Tijana Trako Poljak

Department of Sociology, Faculty of Humanities and Social Sciences, University of Zagreb

This paper relies on European Social Survey (ESS) data to measure, analyze and compare subjective wellbeing in urban and rural areas of seven Central European countries. The chosen countries are Austria, Croatia, Czech Republic, Germany, Hungary, Poland and Slovenia. Based on available items we have chosen to construct a more concise version of the VanderWeele et al.'s theoretically and conceptually more complete Flourishing Index (FI). 'Subjective Wellbeing Index' (SWI) is based on three selected domains (out of 6) that constitute the VanderWeele et al.'s Flourishing Index. The chosen domains of flourishing that we will focus on are (1) happiness and life satisfaction, (2) mental and physical health and (3) financial and material stability. The 'Subjective Wellbeing Index' is constructed using 4 items featured in all rounds of ESS research: (1) current happiness, (2) current satisfaction with life, (3) general physical and mental health assessment and (4) feeling about current household's income. The paper concludes that 'Subjective Wellbeing Index' is a measuring instrument of satisfactory reliability which measures a single phenomenon. In order to make this longitudinal cross-national comparison we will be using 2008 (Round 4) and 2018 (Round 9) data for the chosen countries' rural and urban areas. Furthermore, using multivariate regression analysis we will analyze whether the chosen conceptual predictors, such as sociodemographic characteristics, human values scale, interpersonal and institutional trust, satisfaction with welfare of the state and other potential predictors are related to the 'Subjective Wellbeing Index'. This research was conducted as part of the project SECRURAL funded by Croatian National Science Foundation (UIP-2019-04-5257)".

Do Strong and Weak Regions Agree on Which Regions Deserve Support? A Survey Experiment on Public Attitudes Towards Reducing Regional Inequalities

Jan Gniza

University Erlangen-Nuremberg, Germany

Although regional inequality is increasingly seen as an economically, socially, and politically extraordinarily relevant problem, only few studies examine public attitudes towards policy measures aiming to reduce these inequalities. This study investigates experimentally those characteristics of a recipient region that explain public acceptance of financial transfers to eligible regions. Here, I focus on how residents from economically strong and weak West German regions use different criteria for their judgements. I conducted a factorial survey experiment in August 2018 via Norstat online access panel with two subsamples of n=780 respondents from strong regions and n=777 from weak region (total n =1557). I designed a hypothetical regional policy program and varied the characteristics of eligible recipient regions by tax revenue per resident, conditions of the public infrastructure, economic growth potential, impacts of past global trends and political dissatisfaction of the inhabitants. The results indicate that respondents from weak and strong regions agree on the fundamental deservingness aspects need and responsibility for this need. However, only respondents from strong regions use political dissatisfaction for their judgements and only those from weak regions prefer greater economic growth potential. Furthermore, the results show that only in strong regions, risk-aversion moderates the greater acceptance of recipients who suffered from global economic trends. I indicate from the results that residents from strong regions accept regional transfers out of a motive to insure against economic decline and political dissatisfaction, while residents from weak regions want to unleash their perceived potential.

The Polish Middle Class in Relation to Social Services: Disappointed, Humiliated, and Abandoned

Krzysztof Lepczyński

Nicolaus Copernicus University in Toruń, Poland

The middle class, one of the pillars of the social order of Western democracies, is particularly vulnerable to crises, cyclical economic slumps, and unexpected emergencies, such as the COVID-19 pandemic. How does the state respond to problems affecting the middle class? What are the experiences of the middle-class in contact with welfare institutions?

My contribution is based on an analysis of 800 diaries from two nationwide competitions announced by the Warsaw School of Economics and the Nicolaus Copernicus University in Toruń. In the first (2016), the authors described their experiences of unemployment; in the second (2020), they presented everyday life in the first wave of the COVID-19 pandemic.

The autobiographical method gives a unique picture of everyday experience for reflecting structural problems. It also takes into account that cultural components play an increasingly important role in the differentiation of social structures. Therefore, I define the middle class as a category based on socio-cultural similarity, as expressed by higher education and occupation.

The research findings show (1) the fragility of the status of the middle class, (2) disappointment and humiliation accompanying contact with social welfare institutions, (3) a lack of social policy that addresses the needs of the middle class, and (4) an imbalance of rights and obligations assigned to the middle class. These findings indicate the necessity of creating a social policy that responds to the needs of the middle class.

Deservingness And Direct Solidarity: Choosing Who Should Get Alms Among People Who Beg

Teodora-Maria Soare, Stef Adriaenssens

Katholieke Universiteit Leuven, Belgium

A strand of the social policy literature investigates who the general public deems deserving of benefits or other types of assistance. This is argued to be based on a deservingness heuristic – the 'judgmental shortcuts' people use to make choices. We apply this to direct solidarity towards people who beg through a discrete choice experiment (DCE). This method allows revealing preferences and the relative relationship between them which are otherwise difficult to estimate reliably in non-experimental designs of questionnaire research. We apply the methodology to assess the criteria passersby apply when deciding whether or not to give alms to beggars. We show subjects digital illustrations of individual passive beggars, depicting a combination of four attributes (gender, ethnicity, disability, and the presence of an infant). These illustrations are combined into pairs and respondents selected in the streets of Brussels choose to give alms to one of the depicted beggars or opt-out and not give at all. The originality of this research lies in the design and the type of solidarity. To the best of the authors' knowledge, this is the first study to apply the DCE-approach to assess choices in direct solidarity towards people begging. We expect the results to inform policymakers and stakeholders about the general public's (lack of) empathy toward people begging.

RN26_T03_01 | Session 3: Work and Unemployment (I)

Does The Unemployment Rate Moderate The Well-being Disadvantage Of The Unemployed? Within-region Estimates From The European Social Survey

Gábor Hajdu[1,] Tamás Hajdu[2]

[1]Institute for Sociology, Centre for Social Sciences, Hungary; [2]Institute of Economics, Centre for Economic and Regional Studies, Hungary

Using eight waves of the European Social Survey, we analysed how the local unemployment rate influences the well-being disadvantages of the unemployed. We estimate region fixed effects and slopes models that, unlike the standard region fixed effects approach, provide an unbiased estimate of the cross-level interaction term (the term between being unemployed and the unemployment rate). We find that the satisfaction of unemployed people (relative to employed people) is lower when the unemployment rate is higher. The results are similar for the depression scores, but the differences are smaller and insignificant regarding the happiness scores. Our results do not support the "social norm of unemployment" hypothesis that states that the negative impacts of unemployment are smaller if the unemployment rate is higher. In contrast, these results are in line with the argument that worse re-employment perspectives in high-unemployment regions may be particularly harmful to unemployed people. We note that these results do not contradict the claim that, in regions with a weaker social norm to work, unemployed people may be more satisfied. Instead, the results suggest that the unemployment rate is not a good proxy for the social norm to work. Our analysis also provides evidence that the empirical method is an important determinant of the findings. The results show that models without a systematic specification of macro-level effect heterogeneity (e.g., as a standard region FE model) do not fully eliminate the effects of correlated unobserved macro-level moderators from the cross-level interaction estimates.

The Articulation Between Employment and Social Protection Policies. A Portuguese Overview from the 1974 Revolution to the Ongoing Pandemic Crisis

Jorge Caleiras[1], Renato Miguel do Carmo[2]

[1]ISCTE - Institute University of Lisbon, CIES-Iscte, Portugal; [2]ISCTE - Institute University of Lisbon, CIES-Iscte, Portugal

This communication is a result from the ongoing Employall research project, funded by the Portuguese Foundation for Science and Technology (PTDC/SOC-SOC/30543/2017). From a critical perspective, it discusses the main guidelines of employment and protection policies in Portugal, as well as their articulation over the last five decades (from the democratic Revolution in April 1974 to the ongoing pandemic crisis caused by COVID-19). The aim is to understand the ways and misplacements of employment and protection policies, and to detect in them signs underlying Karl Polanyi's double movement process. From a methodological point of view, the various macroeconomic and political frameworks are considered, being developed a diachronic qualitative analysis of changes in employment and protection policies considering how do they approach, intersect or differ from eachother. Regarding sources, legal diplomas which regulate policies, government programmes defining policy proposals and statistical data are used to mirror the main trends. Three major phases are distinguished, composed of different political and economic cycles and the results point in a double direction. There are three main stages, consisting of different political and economic cycles, and the results point in a double direction. The long-analyzed period is crossed by moments of tension and alternation between policies, and is punctuated by two movements that, being able to coexist in time, have different meanings: a movement of social progress, which incorporates progressive values into policies; and another social backsliding movement, which carries a dominant neoliberal political matrix and has been deepening.

The Right To Family Life In Post-National Citizenships. How Are Child Protection Policies Dealing With It?

Asgeir Falch-Eriksen[1], Viorela Telegdi-Csetri[2], Jørn Holm-Hansen[3], Aron Telegdi-Csetri[4]

[1]Oslo Metropolitan University, Norway; [2]Babes-Bolyai University, Romania; [3]Oslo Metropolitan University, Norway; [4]Babes-Bolyai University, Romania

The Norwegian Child Protection Services has been on the dockets of the European Court of Human Rights 39 times from 2015 till present. It is unprecedented that one specific public service has been trialled in this magnitude before. Almost all cases are concerned with the democratic implementation of the right to family life of the European Convention on Human Rights (Art.8).
The main objective of the article is to unravel the variation of conceptions of the right to family life within policies on Child Protection Services, and answer what conceptions are aligned with a democratically imposed human rights standard and post-national citizenships. In order to achieve this objective, this article first asks what different conceptions of family-life can be identified across policies in the Norwegian and Romanian systems respectively. Through these two countries we will be able to identify a broad variety of conceptions. Second, we go on to discuss to what degree some conceptions of the right to family-life are contrary to a human rights standard most countries formally ascribe to through democratic law-making. Third, and final, we discuss different democratic obstacles to enforcing a right to family life corresponding to a human rights standard and post-national citizenship, and which can secure coherent future policy development.
We will draw on multiple interviews with stakeholders and policy-developers in both Romania and Norway. We will also draw on comprehensive document-data on policies and legal developments that provide a broad and detailed picture of the two countries child protection systems.

Deinstitutionalization of Foster Care in Poland – Financial Problems and Challenges

Katarzyna Matuszczak

Warsaw School of Economics, Poland

Children brought up in institutions develop significantly worse in terms of emotional and intellectual growth than children brought up in a family environment - biological or foster. In Poland 16.7 thousand of children in foster care out of 72.1 thousand. were in institutional care, of which approximately 44% of children were under 10 years of age (PL Statistical Office, 2019). At the same time, work has been underway on deinstitutionalization of foster care in Poland, which has not brought satisfactory results so far. The aim of this paper is to discuss the problems and challenges related to the financing of foster care. For this purpose e.g. public statistics, reports of public institutions on the implementation of foster care, reports of public institutions on the control of foster care and qualitative data from internet blogs about foster care were analysed. Particular attention was paid to the policy of local governments.

Perspectives Of The Deinstitutionalization Process Of Alternative Care In Poland In The Context Of Street-Level-Bureaucracy Theory And The Concept Of Apparent Actions

Agnieszka Golczyńska-Grondas[1], Magdalena Błaszczyk[1,2], Patrycja Chrzanowska-Przybylska[1]

[1]University of Lodz, Poland; [2]Regional Centre of Social Policy, Lodz

The aim of the paper is to present the perspectives of the deinstitutionalization of alternative care for children and youth in Poland. Deinstitutionalisation is both one of the key objectives and mechanisms of European Union social policies. In the case of alternative care, deinstitutionalization means the prevention of social problems through the development of local high-quality social services and the development of professional

903

forms of foster care. The Polish authorities undertook to develop deinstitutionalization process in social welfare system, but despite legislative changes, its progress is not satisfactory. A national deinstitutionalisation strategy has not been published till February 2021, although there are some deinstitutionalizing efforts performed at the local level. In 2019-2020, we conducted an analysis, (based on the desk research of strategic international, national, local social policy documents as well as existing statistical data on accessible social services), depicting the progress of the deinstitutionalization process in the Łódzkie Voivodeship in central Poland. In the presentation, we interpret the results of this analysis in relation to Michael Lipsky's street-level-bureaucracy theory and Jan Lutyński's concept of apparent actions. The analysis, based on a comprehensive approach, goes beyond the classical "silo approach" to the issue of alternative care. It showed among others that the actual number of children in institutions is almost twice as high as indicated in ministerial statistics. It also enabled to identify the main barriers to the deinstitutionalisation process in terms of barriers related to social awareness, as well as organisational and economic barriers.

RN26_T04_01 | Session 5: Work and Unemployment (II)

Persistent or Temporary? Effects of Welfare Benefit Sanctions on Employment Quality in the Short and Long Run

Markus A. Wolf

Institute for Employment Research, Germany

The shift towards activating labour market policy within OECD countries during the last decades has been subject to critical discussion: should activation focus on taking up work as fast as possible ("work first") or support a more long run, sustainable labour market integration? This paper aims to contribute to this discussion by studying effects of benefit sanctions on the re-employment quality of welfare recipients.

Previous research has demonstrated that sanctions increase transitions to employment, but also negatively impact employment quality. Most of these studies have focused on short-run consequences on employment quality. Particularly for welfare recipients, who tend to take up instable employment, it is important to take into account repercussions in the longer run. Therefore, I analyse sanction effects over a period of five years after the sanction. Furthermore, I analyse a broader range of employment quality dimensions than previous contributions, e.g. earnings, type of employment and qualification (mis)match.

For the analysis, I make use of administrative data on welfare recipients in Germany. I use propensity score matching to study the effect of sanction implementation for the treated with respect to a control group who does not receive a sanction.

Results show that sanctions increase employment probabilities of sanctioned welfare recipients in the short run. In the longer run, sanctioned welfare recipients have lower earnings and a higher probability to be in qualification mismatched employment compared to the control group. In summary, results indicate that benefit sanctions have a long-run detrimental effect on employment quality of the sanctioned.

Worse-Off but not Chanceless? Young Adults' Employment Situation after Participating in Active Labor Market Programs

904

Veronika J. Knize, Markus Wolf, Cordula Zabel

Institute for Employment Research (IAB), Germany

Disadvantaged young adults in Germany face serious barriers to finding a job of quality or an apprenticeship. In particular, young adults who are dependent on welfare benefits are among those worst off, as unemployment together with welfare collection might leave scars in their life-course. From the perspective of social investment, active labor market programs (ALMPs) potentially alleviate unsuccessful school-to-work transitions providing classroom or on-the-job training. Following a cost-effectiveness principle, however, policymakers have established that public employment services should preferably target some programs, in particular those located in firms, at people with better employment chances. The main reason for this lies on the routine-based belief that only those with better employment chances will succeed in in-firm training. Against this backdrop, this paper addresses the question on whether only young adults with such characteristics benefit from participating in these ALMPs. Does social investment not represent a chance for those most disadvantaged among

the disadvantaged? We evaluate whether the effects of program participation systematically vary due to possible dissimilarities embedded in individuals' biographies, e.g. education and employment history, as well as in their parents' biographies, e.g. welfare collection history and education. Moreover, although some studies have shown that workfare programs have detrimental effects on participants, young adults are still being assigned to this kind of programs. To contribute to clarifying this issue, this paper also analyzes the effects of these programs on young adults' employment opportunities. To this end, we use propensity score matching on a sample of young adults in their early twenties from register data.

Digitalized Activation : A Transformational New Approach For The Organization Of Public Employment Services?

Gianluca Scarano, Barry Colfer, Stefano Sacchi

Polytechnic University of Turin

In recent years, technology has become crucial to support systems for matching vacancies and jobseekers and for providing public employment services (PES) with access to reliable labour market intelligence. During this time, many countries have expanded their reliance on digital tools for the administration of PES and to provide effective activation policies

The composition of digital interventions in PES differ markedly across Europe in terms of the tools mobilised, their scope and intended purpose, and rates of investment. However, it is possible to distinguish two levels at which different policy aims may develop. At the macro-level, the introduction of digital tools can be primarily motivated by an intention to reduce expenditure or by a desire to improve services. Meanwhile, at the micro-level, a key issue relates to whether caseworkers are bound by the decisions reached by digital tools, or whether there is room for discretion on the part of the caseworker and recourse on the part of the service user.

This contribution undertakes a comparative analysis of five European countries at the forefront of the digitalization of PES in the European context, namely: Austria, Belgium (with a focus on Flanders), Denmark, Germany and the Netherlands. Original data was gathered through semi-structured interviews with PES officials at both the central and local levels in each of these cases. Previous studies have framed the adoption

of new technologies in PES by focusing on performance management, and particularly on the context of wider new public management (NPM) reforms that have been widely adopted over recent decades. Thus, this contribution considers whether there is convergence in the use of digital tools in PES or whether different approaches persist.

A Relational Approach To The Social Composition Of The Injured At Work In Portugal

Virgílio Borges Pereira, Vanessa Rodrigues

University of Porto, Portugal

Most recent official data published by Portuguese and European sources demonstrate that work accidents maintain its permanent and substantial character, despite increasing improvements on prevention and reduction of fatal accidents. Moreover, risk exposure is unevenly distributed among professional groups, and the most affected tend to be those who belong to socio-professional categories and social groups, most often economically, culturally and socially less equipped and more unprotected. A reality that seems to present itself as a double penalty, later deals with facing the Portuguese legal repair system: the expected compensation does not go beyond the conception of the individual merely as a worker, which is based on an evaluation of the incapacity resulting from the injuries (subject to a considerable degree of subjectivity) and on the "official" salary earned. In light of the assessment of the social contradictions underlying these processes, this paper seeks to enhance the available sociological knowledge on the social composition of those who experience work-related injuries in Portugal. To this end, it explores the results of the most recent Portuguese official survey on the subject - the "ad hoc" module of the 2013 labour force survey. Examining the micro-data from the survey, the research seeks to enhance the available sociological knowledge and uses a relational statistical methodology to define the detailed social profiles of the agents who experience such striking processes.

905

RN26_T04_02 | Session 6: Youth

Debtfare State for the Youth: Framework Analysis for the Student Loans in Turkey

Havva Ezgi Dogru

Anadolu University, Turkey

Working with the case of the student assistance program in Turkey, this proposed paper demonstrates how the state-led student debt policy actively contributes to the development of the neoliberal debtfare state. The uniqueness of the Turkish case comes from the fact that the student loan, unlike its counterparts in the Global North, is not fully commodified and it is not connected to secondary international markets. With a major legal change in 2004, the Higher Education Student Loans and Dormitory Institution became the only institution allowed to provide student loans for undergraduates. As a result of the centralization of state power, between 2003 and 2019, the number of indebted students increased by 24 times and exceeded 11 million. In addition to the remarkable expansion of student debt, the unemployment rate among university graduates exceeds 20% and almost half of them are not covered with basic income security. Taking this into account, this paper answers the following question: why does the Turkish state actively include university students in perpetual debt without employment opportunities? Methodologically, this paper analyzes official youth statistics, university statistics provided by the presidential office, and changing policy frameworks for the youth. This paper intends to offer political economy insights about how student assistance programs without basic income security contribute to the perpetual financial inclusion of undergraduates as a new feature of the neoliberal debtfare state.

Managing the Active Society in an Industrial Community: Observations From a Youth Activation Centre

Jon Sunnerfjell

The Department of Sociology and Work Science, University of Gothenburg, Sweden

In the 'active' welfare states, the notion of social in/equality is increasingly reconceptualised in terms of individual ex/inclusion (cf. Boltanski & Chiapello, 2005), hence dislocating conflicts previously belonging on a structural level to the level of the individual (Crespo Suárez & Serrano Pascual, 2007). Here, the supranational 'active inclusion' strategy (European Commission, 2008) aims at turning the passive and socially excluded into self-reliant and employable selves who are able and willing to seize opportunity and navigate life responsibly. In line with neoliberal rationales of abandoning welfare systems encouraging, as it were, passive dependence on solidarity, the discourse on activation thus marks a shift from 'secular' to 'moral' perspectives on social welfare (Møller & Stone, 2013). Notably, the emphasis on activation policies have coincided with vast structural transformations of the western labour markets. That is, in Sweden as elsewhere, technological innovations and relocation of production into low-wage countries have spurred vast rationalisations whereby the industrial sector is increasingly outmanoeuvred by an ever-expanding text-and-talk ditto, requiring in turn an ever so educated work force able to move swiftly between employments on labour markets demanding not only formal qualifications and skills, but increasingly, skills in communication, socialising and self-presentation. In a time when a substantial part of the labour force is however still adapted to economies dependent on raw materials and production, this study explores ethnographically how the active society is managed and resisted locally in a pronounced industrial community that for generations have nurtured working-class, and thus presumably active bodies and subjectivities.

RN26_T05 | Session 7: Welfare recipients and workers

Between Stigmatiser and Stigmatised: Mutual Stigmatisation Among Welfare Recipients and Ideas of Social Justice

Melissa Sebrechts, Thomas Kampen

University of Humanistic Studies, Netherlands, The

In sociology there is a long-standing tradition of research into stigmatization of vulnerable groups, known for its focus on micro-level experiences of the stigmatized. Recently, scholars have pointed out the importance of moving beyond the micro-level by focusing on stigma production on the macro-level. While this literature has made a very important contribution to the sociology of stigma, it tends to create a stark division between stigmatisers and stigmatised. This article attempts to complicate and nuance this division by showing how, on the micro-level, the stigmatised take up the role of stigmatisers. This 'mutual stigmatisation', for instance amongst people on welfare, is often interpreted as a result (or a way) of maintaining self-esteem. To protect their fragile self-image, the stigmatised talk down people who are more dependent or less deserving than they are. However, our findings show that mutual stigmatisation among welfare recipients is not only a result of maintaining a positive sense of self, but can also be explained by their strong ideas about social justice. We base these findings on interviews with 53 welfare recipients. The theoretical implication of our research is the urgently needed connection between micro-level instances of mutual stigmatization and philosophically inspired theories of social justice.

Only in Case of Emergency? The Non-Take-Up of Means-Tested Social Benefits in Germany

Felix Wilke

German Federal Pension Insurance, Germany

Empirical research of the last two decades has shown a surprisingly stable pattern of non-take-up in different institutional contexts and across a wide range of welfare systems. Recent studies on social assistance in Germany reveal that approximately four out of ten eligible households do not take up social assistance for the long-term unemployed. Non-take-up rates for the old-age basic income support are even higher, with six out of ten eligible pensioners not taking up benefits. To assess non-take-up, most studies rely on complex microsimulation models that need a comprehensive set of indicators to approximate eligibility. Data sources that allow for a microsimulation, however, lack indicators explicitly dealing with reasons for non-take-up. Therefore theoretical explanations for non-take-up often lack a proper empirical foundation.

My presentation will contribute to this problem of non-take-up research by using a novel data set – the innovations sample of the GSOEP. The sample of the panel consist of approximately 5.000 respondents with extensive longitudinal information about the living situation (income, social security benefits, household structure, household expenses…). Together with other researchers a special questionnaire was implemented in wave 2020. All low-income respondents had to answer questions on three topics: a)Questions regarding the perception of and attitudes towards means-tested benefits and beneficiaries. b) Questions regarding the overall motivation to take up benefits in case of eligibility. c) Potential reasons that could prevent people from taking up means-tested benefits.

By using descriptive and multivariate statistics, I will deal with different reasons that prevent people from claiming benefits. Special focus is given to the general motivation to take up benefits in case of need.

907

Broadening The Access And Use Of Electronic Administration To Elderly People: A Wicked Solution

Salvador Manzanera-Román[1], Francisco Eduardo Haz Gómez[2]

[1]University of Murcia, Spain; [2]University of Murcia, Spain

Currently, one of the fastest processes being carried out in the different countries of the European Union is the implementation of Electronic Administration. This implies a series of limitations for those people who are not digital natives. Especially the group of older people, who are increasingly vulnerable and dependent on help to carry out different telematic procedures with the advance of digitization. What at first could be a solution, by making administrative procedures more flexible, becomes a wicked solution that can lead to a loss of citizen rights for this group of people.

The goal of this research is twofold. On the one hand, to know the causes that prevent the access and use of public services by people over 65 years of age due to the process of implementation of Electronic Administration. And, on the other hand, to determine the possible improvements of public administrations so that said group is not seen in a situation of vulnerability and digital (and social) exclusion that limits their citizen rights.

This research has used a mixed technique that combines interviews with experts with the Delphi technique.

Among the recommendations to alleviate the problem is to advance in universal accessibility, improve the usability of devices and applications, increase the proactivity of public administrations, promote the training of civil servants and the elderly in digital skills, and enable the acquisition of digital devices and Internet access.

Anti-violence Interventions: Welfare Or Gender Social Policy? Some Reflections.

Angela Maria Toffanin, Marta Pietrobelli, Maura Misiti

CNR, Italy

The paper analyses the transformations of welfare institutions, organizations and policies in Italy, focusing namely on the field of gender-based violence services.

Well before the covid-19 pandemic, the social work system is characterized by several transformations, due to social, demographic, political and governance transformations, closely linked to the consequences of economic and financial crises (Payne and Askeland 2008; Bruni 2013, Beck, 2011; Bertin et al., 2015). These changes have consequences on the conditions of work and life of workers well before the services' quality provided, since this kind of job is highly characterized by interpersonal everyday relations (Giullari et al. 2019).

In this context, the Italian system of gender-based violence services is an interesting case study: initially stemmed from feminists' and women movements' activities and practices, in the last decade it has been crossed by bureaucratization and standardization processes.

Therefore, the paper intends to investigate the impact of these transformations focusing on professionals' subjective practices, the professional relations within specialized and general services, the gender approach adopted by the staff in different services, and the co-construction of personalised interventions between workers and the women supported.

The analysis is based on interviews conducted with 41 selected women's anti-violence centres and shelters in Italy, as well as on a critical review of the more recent literature on the topic.

Results show that anti-violence interventions can be considered as an example of a gender social policy.

RN26_T06 | Session 8: Healthcare

Rare Disease Patients' Experiences in Access to Healthcare Services during the COVID-19 Pandemic: The Example of Turkey

Puren Aktas[1], Volkan Yilmaz[2]

[1]The University of Manchester, United Kingdom; [2]Bogazici University, Turkey

The COVID-19 pandemic has introduced challenges for all dimensions of healthcare systems, forcing countries to restructure the provision of healthcare services to meet urgent demand. The shifts in resources among healthcare systems have affected the delivery of clinical services to patients without COVID-19, especially to patients with chronic diseases. Among the chronically ill, patients with rare diseases experience these challenges most profoundly. In need of regular, multidisciplinary consultations and complex treatment services, the shift towards the pandemic-oriented provision of healthcare services aggravated the limited access that patients with rare diseases already experienced. In Turkey, the transformation of all hospitals with ICUs into pandemic hospitals hindered the access of those with rare diseases to multidisciplinary services. This research explores the experiences of patients with rare diseases during the COVID-19 pandemic by drawing upon interviews with representatives from groups of people with rare diseases in Istanbul, Turkey. In doing so, this study discusses Turkey's healthcare system capacity to meet citizens' needs as a country that provides universal health coverage.

Approaches Of Civic Activism In The Restructuring Of Healthcare Services: On The Example Of The Closure Of Obstetric Units In Estonia

Silja Mets-Oja[1], Anu Toots[2], Kadi Lubi[1]

[1]Tallinn Health Care College, Estonia; [2]Univerity of Tallinn, Estonia

In the context of urbanisation and population ageing, some restructuring processes are needed in provision of healthcare services to manage different challenges. However, it is necessary to ensure the population access to healthcare services geographically, to promote regional development and to reduce regional disparities. This is a major challenge for policy-makers and citizens, as neo-liberal and economic reform in medicine refers to the "alleged conflict of socio-demographic ethos". One of the main changes is regionalisation: specialised care is centralised in higher-level hospitals, uniting high-level expertise with best technical capacity, being economically more cost- and resource-efficient. According of this aspects, six birth units in four county hospitals have been closed in Estonia since 2002 and further three units will close down in the future. Mentioned changes are not targeted at complex solutions, the actual situation is not analysed, it is incomprehensive for the citizens, local community activated in 2018 to oppose the decisions taken. Continuously, the role of local civic activists has increased worldwide for various reasons, increasing social capital gives citizens the opportunity to oppose or contribute to political decisions. Hence, it is important to understand the nature, development and influence of active citizenship in health policy making. This will be done by analysing documents and theoretical approaches in healthcare, how theory supports citizens' inclusion in different policy decisions, and which influences the development of active citizenship. The analysis concludes that, while there is a theoretical value in involving citizens at the local level to make changes to healthcare restructuring, policy makers are still not ready for real-life events. In this context, more active state intervention is needed to empower local activists.

909

Policy Formation In Palliative Care – Backstage Processes And Ambiguous Governance

Simon Daniel Erik Boethius, Ann-Charlotte Nedlund, Barbro Krevers

Linköping University, Sweden

Healthcare professionals are situated in a position as mediators between structural, institutional logics, and everyday practice. At this intermediate position, professionals interpret, negotiate, and make sense of equivocal situations, ultimately constructing how welfare services are carried out and distributed. Hence, institutions are "inhabited" (Hallett & Ventresca 2006) and subject to ongoing renegotiation from within. This paper discusses how a palliative care team balances social and institutional logics to construe policy practice and how knowledge is understood in relation to dominant trends, such as evidence-based medicine. We focus on collegial interaction in situ, where practitioners with different professional backgrounds reason and weigh up various types of knowledge, values, and experiences. Drawing upon direct observation and a critical policy ethnography approach, we aim to show how the tension between maintaining good and equal care with limited resources is managed "backstage", and how different rationales that constitute palliative care practice are constructed through collegial interaction. Critical policy ethnography is thus a feasible way to discern how the often instrumental, linear model of health care governance is ambiguous when applied in day-to-day practice and how palliative care professionals rather inch forward to create standards of care. The paper aims to broaden the debate on the use of evidence in knowledge-intensive institutions, by critically analysing how evidence and power are conflated in practice. Moreover, we show how critical policy ethnography can help us imagine alternative ways of governing healthcare institutions, which considers the complex world of everyday work and contribute to fair and equal care, even in swift changing environments.

Disability In Older People And Socioeconomic Deprivation: Relationship And Indicators. Lessons From An Italian Case

Roberto Lillini[1], Carolina Moreno Castro[2], Georgia Casanova[2,3]

[1]Analytical Epidemiology and Health Impact Unit, Fondazione IRCCS Istituto Nazionale dei Tumori, Milan, Italy; [2]Polibienstar - Research Institute on Social Welfare Policy - University of Valencia, 46022 Valencia, Spain; [3]Centre for Socio-Economic Research on Ageing, National Institute of Health & Science on Ageing (INRCA), Ancona, Italy

Activities of Daily Living (ADL) disability, ageing and poverty are central themes in the European social policy debate. Nowadays, an increasing of the family burden for LTC can be easily forecast. The high fragmentation of the Italian care system underlines many differences at regional level, increasing the relevance of Italy as case study.

The study aims to define the correlation between ADL disability and increasing poverty of the families in Italy, evaluating the effects on families, describing the main factors, to provide some useful information for an improvement of the policies.

Indicators, available in Italian Health for All database, were used. A combination of linear regression and factor analysis allowed to compose two indicators to classify the Italian regions in terms of role of the public offer and of the familial resources used to reduce the increasing effect of disabilities on poverty. The first index shows how the reduction of familial poverty was helped by the rate of residential structures and the presence of ADL public services. The second index shows how the familial poverty increased at the growth of ADL disability, unemployment and presence of large families. The presence of two kinds of Italy was evident. The public strategies seemed particularly relevant in protecting individuals and families, with the help of the informal network of support for the family care. This study could be replicated at European level to improve the common strategies for reduction of poverty due to ADL disability.ùR

RN26_T07 | Session 9: Local welfare policies (I)

Public Policies with the Roma Community: Towards a Better Evidence-based Service

Ariadna Munté[1], Diana Valero[2], Gisela Redondo-Sama[3]

[1]University of Barcelona, Spain; [2]University of Zaragoza, Spain; [3]University of Deusto, Spain

The Roma community, the largest ethnic minority in the European Union, has suffered various forms of discrimination throughout history and current policies have failed to remedy the inequalities they face in areas such as employment or education. In fact, the 2016 FRA survey (EU-MIDIS II) indicates that 80% of respondents live below the risk of poverty threshold in their country; one in four Roma has suffered discrimination in the last 12 months for their ethnic origin; one in three Roma is unemployed (with shares above 50 % in Croatia, Spain and Bulgaria); and half of the Roma between 6 and 24 years of age do not attend school and, of those who do 18 % attend at an educational level lower than the one corresponding to their age. In sum, Roma continues to suffer discrimination and unequal access to vital services. Consequently, serving the Roman community adequately and reducing these differences is a challenge that European society faces and for which it requires new tools and to base interventions on scientific evidence. One of those evidences is to count on the Roma community and make policies with them and not just for them. This communication analyzes some policies that have been successful in the Spanish context when the Roma community itself is involved. Based on the discussion of this evidence, elements are proposed that can serve as a basis for developing effective policies for Roma inclusion.

"Local Social Policies For The Roma People In Terms Of Social Inclusion"

Maria Dogia

Panteion University of Social and Political Sciences, Greece

The concept of the social and economic inclusion of the Roma is of particular concern, since the discrimination and the marginalization which they face in their majority, contradicts the aims and values underlying the EU. According to the European Union Agency for Fundamental Rights (FRA), many Roma in the EU face similar living conditions compared to those of the populations of the world's poorest countries. The existence of multiple inequalities function as a vicious circle, making it extremely difficult to include them into the social frame. The aim of this paper is to investigate how such policies regarding the social inclusion of Roma people are implemented locally, as well as the basic guidelines governing these policies in the wider social context, and whether the Roma community itself is involved in the decision-making process. The inclusion of Roma people is a subject of considerable interest for both social scientists and policy makers, since Roma are on the receiving end of a "formalized" social protection system addressed to a country's general population. What is of particular interest in the case of Roma people is the discrimination frequently experienced by the latter as a result of the antigypsyism. and of its tendency to transfer responsibility for inclusion failure to the Roma themselves. The main point of research of this paper argues that local social policy implementation involves factors that affect both the attitudes and perceptions of the local authorities involved in its implementation such as particular conditions, dynamics, hierarchies based on power and dependence that generally shape the conditions of the coexistence of the Roma community within the wider local community.

911

Trust reforms in Norwegian municipalities

Janne Paulsen Breimo[1], Christian Lo[2], Camilla Risvoll[3]

[1]Nord University, Norway; [2]Nord University, Norway; [3]Nordland Research Institute

Recently, the role of trust in the public institutions of the Nordic welfare states has been politicised and entered the public debate in a previously unprecedented form. At both national and local levels, and across different governmental sectors, political reforms explicitly emphasizing trust as an alternative approach to public management have emerged as a trend. While the implementation of so called "trust reforms" has been most visible in Sweden and Denmark, the demand for such reforms has gained increased leverage also in the Norwegian context where unions and political parties have made similar reforms part of their political agendas. While attempts to launch national trust reforms have so-far failed in Norway, several small-scale trust reforms are currently being implemented at the local level. The content of such reform initiatives varies, but they are typically framed as means towards replacing excessive control regimes with trust-based leadership promoting professional autonomy, co-determination and accountability. The present paper presentation reports from an ongoing study of trust reforms in Norwegian municipalities and, specifically, a mapping aimed at identifying the variety of such reforms currently being implemented and the motives informing them. In the paper, the wide sociological literature on trust is applied to unpack the meaning of trust in the different types of reforms identified. The main question asked is: What are the perceived problems and understandings of trust that inform the new emphasis on trust as a principle of public management in Norwegian municipalities?

The Application of Participatory Appraisals and Collaborative Causal Attribution Maps to Local Development Planing and the Improvement of Social Welfare: the Case of Rolândia (Paraná, Brazil).

Iker Jimeno, Jose Javier Mañas-Navarro, Antonio Aledo, Guadalupe Ortiz-Noguera

University of Alicante, Spain

The case of the city of Rolândia (Paraná, Brazil) is a good example of how the public management model and the policies developed by administrations shape the socio-economic structure of a city. In this case, political instability and short-term management have led to institutional vulnerability that has resulted in the stagnation of economic development, an increase in inequality and a loss of social welfare. Faced with this problem, a constructivist diagnosis of the local development model has been carried out in Rolândia with the aim of identifying the city's deficits and opportunities . Based on the identification of the main local problems and their causes, this diagnosis has allowed the design of strategic lines of local development appropriate to its socio-economic context.

The diagnosis was built upon a participatory methodology grounded in endogenous knowledge and of an iterative nature. The contributions of 92 participants representing the main economic, social and institutional areas were analysed. Semi-structured interviews and participatory workshops were the two main sources for data collection. The participants indicated the most relevant problems of the city and established cause-effect relationships that linked the different problems. These causal relationships have been articulated into Collaborative Causal Attribution Maps and exploited by means of a Multicausal Network Analysis, supported by Atlas.ti and Gephi software. The reflective process of participants and their multi-faceted vision made it possible to identify the main problems of Rolândia, to point out windows of action and to design strategic lines for local development.

RN26_T08 | Session 10: Local welfare policies (II)

Covid19 Outbreak and its Governance at the Neighborhood Level: The Sociological Dynamics Behind the Effective Role of Local Administrators (mukhtars)

Kezban Çelik[1], Sibel Kalaycıoğlu[2]

[1]TED University; [2]Middle East Technical University

This presentation examines how the Covid-19 outbreak is experienced at the neighborhood level in the case of İstanbul and the significant role of crisis governance by the mukhtars as local administrators. The data of the study is based on semi-structured interviews with 20 mukhtars working in different districts of 4 different districts of Istanbul via Zoom and Whatsapp applications. Governance of the social, economic and health impacts of the crisis during Covid -19 pandemy has been a major problem for central as well as local authorities all over the world. However handling the crisis needed a transparent and trust based collaboration especially between the local authorities and the communities. On the other hand, the socio-economic differences of different districts and neighbourhoods were a major challenge for an effective governance. To handle the crisis in such different contexts and conditions of different neighbourhoods, the local authorities were forced to develop creative and different strategies of governance rather than continuing with their usual know how. Hence the study first focused on understanding the community's social, economic and health based experiences due to pandemy in relation to the socio-economic characteristics of different neighborhoods. Then the second stage of the study has concentrated on understanding the efforts and strategies of the mukhtars as local administrators in order to fulfill effective governance of the pandemy crisis. At the end of the study, it was concluded that mukhtars' effective governance have depended on their capacities of associating with the sociology of the neighborhood.

Contradictions Of Ordered Trust. Trust-based Work And Conflicting Logics Within Municipal Care.

Helena Hakansson

University of Gothenburg, Sweden

In the aftermath of NPM, a more trust-based governance is being enhanced in many countries. The path from controlled employees to trusted employees is however often not stated. Despite the increased interest in trust as a governing technique, there is a lack of research on trust and control in public sector organizations. Furthermore, it is inexplicit how trust is defined, or should be practiced, in hierarchical organizations governed by control. The public sector is an arena for several institutional demands, and hence multiple conflicting institutional logics. Institutional logics is here used as an analytic tool to analyze how interrelationships and interactions between different levels in the organization affects the possibilities for intra-organizational trust.

The empirical data presented is a case-study on a developmental project within social care in a municipal district in Sweden. The data consists of interviews and observations with care workers, first-line managers and persons with strategic functions. The results demonstrate how institutional logics can create different worlds within the organization, and that the governing logic of bureaucracy is not only in conflict with, but also seems to overrule attempts to establish a more trust-based logic. Contributing to the literature on institutional logics, this paper shows how primary and secondary logics manifest in various ways depending on level within the organization. It further adds insights about how notions of trust may differ depending on position within the organization, creating difficulties for trust-based developmental work.

Between Taking Local Control And Exacerbating Inequalities. A Case Of Local Welfare Systems Responses To Migrant Poverty.

Karolina Łukasiewicz, Ewa Cichocka, Kamil Matuszczyk

Centre For Migration Research, University of Warsaw, Poland

While central governments have been curbing social citizenship of immigrants, local actors have been at the forefront of welcoming new residents. Much academic attention has been paid to the benefits of the city-level responses to immigrants' needs, appreciating local social innovations and efficiency in service provision. However, less attention has been paid to the difficulties and risks of shifting policies to the local levels. Using a case of four local welfare systems in London, Berlin, Stockholm and New York this presentation aims to analyse the response of governmental and non-governmental organizations to immigration. We will focus on the response to the needs of the most vulnerable low-income foreign-born residents. Drawing from interviews with Polish migrants who experienced poverty, with direct service providers, and with local experts, we captured recent changes and differences between local welfare systems. We argue that the tendency to shift the responsibility for social welfare and immigrant integration policies from national to the city level and non-governmental organizations brings local authorities more autonomy, local control and stimulates social innovations. However, it also generates risks overlooked in migration scholarship. While anti-migrant sentiments and cuts on welfare spending are emerging at the national level, local governmental and non-governmental organizations are struggling with underfunding, unequal quality of provided services or coordination challenge. As a result, immigrant clients are granted unequal opportunities to settle in their hosting societies. The negative outcomes of policy decentralization can be mitigated by larger social expenditure or absorbent labour market and inclusive migrant policies.

"B-MINCOME: an Innovative Minimum Income Scheme in Barcelona"

Sebastià Riutort Isern[1,2], Bru Laín Escandell[2], Albert Julià Cano[1,2]

[1]IERMB; [2]University of Barcelona

The need to combat inequalities and poverty in Barcelona gave rise the B-MINCOME pilot, an innovative minim income scheme led by the Barcelona City Council between 2016 and 2019. This project aimed to test the efficacy and the efficiency of combining a monetary transfer (that was called Municipal Inclusion Support, which would be a kind of GMI) with various active policies (on training and employment, social entrepreneurship, housing and community participation). The project focused on improving the living conditions of vulnerable households of the Eix Besòs, which is one of the most deprived areas of the city. A random and stratified draw selected 950 households participating as treatment group divided in 10 modalities combining: conditioned/non-conditioned, limited/non-limited income, GMI combined or not with active policies. The draw also selected a control group composed by 383 households. Altogether, it represented an integrated strategy to fight poverty and exclusion by reducing participants' dependence on public and private subsidies and promoting their wellbeing, empowerment and autonomy. Also, it attempted to go beyond the silos existing in public administration, establish integrated links between sectorial departments and with social-community organisations. The project was at the same time a public policy intervention and a social experiment. Considering the latter, B-MINCOME evaluation was based on a mixed-methods approach to data collection and analysis and involved various stakeholders. Evaluation revealed positive impacts on certain change dimensions (at individual, community and institutional level) and important lessons to improve local welfare policies and services.

RN26_T09 | Session 11: Volunteering and citizen involvement

Main Aspects of Professional Cooperation And Volunteering in the Process of Poverty Eradication

Éva Perpék, Márta Kiss

Centre for Social Sciences, Hungary

A complex, interdisciplinary and interprofessional approach to the handling problems of vulnerable groups is a more and more accepted approach in the social and educational sectors. Moreover, services of NGOs and volunteering of non-expert ordinary citizens may also have a significant contribution in delivering social and educational services to children and families in need. Those principles were incorporated in planning and implementation of complex local development programs delivered in the most disadvantaged subregions of Hungary to combat poverty. An active and target group-oriented professional cooperation and a strong volunteer basis may contribute not only to effective implementation but sustainability of development programs as well. The aim of this paper is to present how local professional project managers perceive different aspects of professional cooperation and volunteering within their program. Based on the data of a 2020 survey, we examine their perception on the acceptance of the programs among the main relevant actors, such as professionals of the social welfare, educational and health care systems, NGOs, political and economic players, and local residents. We analyze how professional managers think about the operation of the child protection signaling system and the cooperation that takes place within this framework. We also explore their cooperation with similar human development programs, as well as the extent to which local actors have been involved in the implementation of project activities as volunteers. Finally, we cover how volunteering can contribute to the long-term sustainability of the programs.

Citizen Involvement In Social Welfare Services

Karen Christensen

Roskilde University, Denmark

The idea of involving people in public discussions and decisions has a long history. Within the welfare sector, one of the first recognitions of user/patient participation started in the UK during the 1970s, aiming at facilitating patient interests in the NHS (National Health Services). In the 1990s, the concept of user participation entered the social welfare sectors of many European countries. It has since developed into one of the most central concepts of social welfare today. An increasing body of literature is currently discussing new roles of social welfare recipients in terms of for example 'users', 'consumers', and 'co-producers', and relating these new roles to a range of very different social changes and processes regarding public services, particularly within the last decades. While social scientists within the area of welfare policy and sociology have pointed at welfare recipient roles as part of democratization processes, these processes are today increasingly about individualization, consumerism, and other implications of NPM (New Public Management) reforms, as well as NPG (New Public Governance) reforms in many European countries. Theoretically, social scientists have discussed these changes in relation to ideas about empowerment of individuals, marketization, governance, governmentality, new citizenship types, and new types of welfare partnerships. This paper will provide an overall discussion of the different social and sociological theories inspiring the different approaches to user participation, and critically discuss implications for users of welfare services within the different user participation approaches.

RN27_T01 | The values of culture in Iberian cultural policies

Portugal And Its Ministry Of Culture: A Case Study On values And Controversies In The National Cultural Sphere

Sónia Apolinário[1], João Teixeira Lopes[2], Natália Azevedo[2], Lígia Ferro[2]

[1]CIES-Iscte, Portugal; [2]FLUP-ISUP, Portugal

This case study was developed in 2020-2021 in the frame of an European research consortium. Within a broader vision of the value of culture, the Project intends to capture the emergence and configuration of cultural values, in its plurality and complex contexts in Europe. The object of analysis here is cultural administrations. A comparative exercise is conducted with case studies either in Portugal and in Spain – although a broader comparative perspective crosses the Project's case studies, regarding other southern countries (Italy, France) and northern and eastern geographies (UK, Norway, Hungary), in territorial, institutional and sectorial levels. Also, the Covid-19 pandemic is addressed as a research dimension, in order to identify the administrations' responses to cultural sectors affected by this current sanitary and economic crisis.

The diversity of cultural administrations in European countries derives mainly from historic configurations and public policy models, and concerning Portugal, the fundamental distinctive characteristic is the cultural policy model of an Architect State in a country with some territorial asymmetries. The case study of the Ministry of Culture allows the analysis of the foundational cultural policy to the country.

The values are to be analysed regarding tensions, conflicts and public controversies, in two research levels: institutional documentation review and field research with interviews and focus groups. The actors consulted (reflecting multiple ideological perspectives and operative positions) are politicians, and technical and expert personnel both internal and external to the administration, which play a part in policies design and grant-making processes.

Bragança, City In The Portuguese Inland: A Case Study On Values And Controversies In The Municipal Cultural Sphere

Natália Azevedo[1], João Teixeira Lopes[2], Lígia Ferro3, Sónia Apolinário[4]

[1]FLUP-ISUP, Portugal; [2]FLUP-ISUP, Portugal; [3]FLUP-ISUP, Portugal; [4]CIES-Iscte, Portugal

This case study was developed in 2020-2021 in the frame of an European research consortium. Within a broader vision of the value of culture, the Project intends to capture the emergence and configuration of cultural values, in its plurality and complex contexts in Europe. The object of analysis here is cultural administrations. A comparative exercise is conducted with case studies either in Portugal and in Spain – although a broader comparative perspective crosses the Project's case studies, regarding other southern countries (Italy, France) and northern and eastern geographies (UK, Norway, Hungary), in territorial, institutional and sectorial levels. Also, the Covid-19 pandemic is addressed as a research dimension, in order to identify the administrations' responses to cultural sectors affected by this current sanitary and economic crisis.

The diversity of cultural administrations in European countries derives mainly from historic configurations and public policy models, and concerning Portugal, the fundamental distinctive characteristic is the cultural policy model of an Architect State in a country with some territorial asymmetries. The case study of Bragança municipality allows the analysis of an inland city playing a particularly rich cultural life, regardless its low-density territory.

The values are to be analysed regarding tensions, conflicts and public controversies, in two research levels: institutional documentation review and field research with interviews and focus groups. The actors consulted (reflecting multiple ideological perspectives and

916

operative positions) are local politicians, and technical and expert personnel both internal and external to the administration, which play a part in policies design and grant-making processes.

The Values of Culture in Contemporary Barcelona Cultural Policies

Mariano Martín Zamorano, Victoria Sánchez Belando, Arturo Rodríguez Morató

University of Barcelona, Spain

Under the Socialist Party of Catalonia (PSC, 1982-1997), Barcelona's cultural policies were characterized by its objectives of social inclusion and by using culture as a resource for urban development. This development, inscribed in the so-called "Barcelona Model", included an urban regeneration project with its landmark in the 1992 Olympics. However, since the beginning of the 20th century, cultural policies were gradually aligned with the creative city approach and oriented towards the internationalization of the already established urban brand. Since 2015, the government of Barcelona en Comú -a left-wing and electoral coalition born as a citizen platform- manifested a desire to resume more representative and communitarian cultural policies. The commons' narrative rejected cultural policies' entrepreneurial turn and aimed to deconstruct this conception of cultural property and circulation of cultural assets.

Against this historical background, what values are revealed in current policy and administrative practices within this administration? In what framework of tensions do these values appear? In the context of the European research project UNCHARTED, which aims to identify the plurality of values that emerge in cultural practices in all the different cultural sphere areas, we studied Barcelona City Council cultural policy. Through focused documentary research and extensive fieldwork involving interviews with politicians, technical staff, experts and advisors linked to this local administration, we have examined both values explicitly stated in electoral programmes and debates related to it and those implicitly inscribed in cultural planning, grant-making activities and budget allocations. In this way, going beyond the surface of political discourse, our analysis sheds light on the hidden value configurations behind both the creative city model and "commons' policies".

Identifying Values That Basing Cultural Public Policies: The Case Of Galicia's Regional Administration

María Andrade, Uxío Novo

Universidade da Coruña, Spain

Since the foundation of regional Xunta de Galicia government in the 80s, the region implemented two well-differentiated cultural policies associated with its two dominant political options: The conservative cultural policy and the one dominated by left-Galician nationalism. In this framework, this policy and its ecosystem have faced a lack of coordination between the multilevel cultural governance agents. Moreover, Galician cultural policies have reduced their institutional importance; initially managed by a Ministry has been later merged with Education and Tourism areas.

In this framework, this policy has also had an orientation towards promoting cultural products of massive consumption and focused on building big cultural infrastructures and celebrating international-focused events as exampled the 93'Jacobus Year. Linking Culture to Tourism, centralized on Santiago de Compostela Capital city as end of UNESCO World Heritage Santiago's Way and concentrating all their cultural diplomacy on Galicia as a touristic territorial brand abroad.

This case study aims to identify the plurality of Galician cultural policy's values and understand its ethnic dimension within an expanded and diversified cultural heritage. With this purpose, we have implemented a descriptive methodology on two complementary levels: On one hand, identifying and registering the actual configuration of this plurality of values inside through a descriptive analysis based on a systematic documental review. On the other hand, addressing these values from policy agents' viewpoint through qualitative interviews and focus groups. This methodology has allowed us to capture culture values within cultural administration activities and synergies, addressing its political conflicts and public debate.

RN27_T02_01 | Social Mobility and Social Policy

Pensions Reforms and New Trends

Antonio Martin-Artiles

Universidad Autónoma Barcelona, Spain

Globalisation and international competition have a spillover effect on
the reforms of pension systems that imposes a similar pattern of dismantling, hardening access to pensions, reducing expenditure and retrenchment in said reforms. The comparative analysis of four countries with different pension systems: two liberal (United Kingdom and Chile) and another two with contributory-proportional systems (Spain and Argentina) serves to determine the details of the reform processes, which discursively seem to have a shared pattern recommended by the international financial and economic institutions.
But the reality of the four case studies shows considerable differences in the implementation of the pension reform policies. The reforms depend on the societal context, institutions, history, the role of unions, the government in power, demographic factors and economic perspectives, among other matters. Many countries need to sustain pension systems because they are associated with many pensioners' political vote. Therefore, the spillover effect of globalisation and the convergence in certain uniform patterns of reforms is far from reality in the four countries, and as such, the measures adopted are specific for each country.
Keywords: Pensions, Occupational Pensions, Reform Policies, Globalisation, Social Dialogue, Neoliberalism, Corporatism.

Comparing Inequalities in the Labour Market from a Segmentation Perspective between Italy and Spain

Renata Semenza[1], Pedro Lopez-Ròldan[2]

[1]University of Milan, Italy; [2]Universitat Autònoma de Barcelona

Comparing Inequalities in the Labour Market from a Segmentation Perspective between Italy and Spain
The purpose of this paper is to carry out a comparative analysis of labour markets between Italy and Spain from the perspective of segmentation in order to explain the processes of social inequality that arise in the workplace. We ask ourselves to what extent labour market segmentation processes generate dynamics of structuring similar labour inequalities in both countries and what aspects are specific to a labour reality that is situated in different socioeconomic contexts but with diverse elements in common such as Mediterranean countries. We seek to corroborate the general hypothesis that there is no single labor market that adjusts supply and demand, on the contrary, we can differentiate various segments that structure hierarchical positions in the labor market in correspondence with certain specific profiles of the job supply. This process generates as result a high correspondence in the configuration of the employment segments between Spain and Italy. It is conceptualized from a multidimensional perspective of factors that affect the configuration of various segments of work and employment. We present results of a research of an international project (INCASI: International Network for Comparative Analysis of Social Inequalities between Europe and Latin America, http://incasi.uab.es) constructing a model of analysis combining both demand and supply variables. The results allow us to state that Italy and Spain share the same general logic of structuring the labour market in terms of segmentation expressed in terms of primary and secondary sectors, and also in terms of inside divisions.

Social Mobility From A Comparative Perspective Among Some Southern European Countries

Sandra Fachelli[1], Ildefonso Marqués-Perales[2]

[1]Pablo de Olavide University, Spain; [2]Sevilla University, Spain

The paper presents a review of the analysis of social mobility in the Southern European countries, in particular Spain, Italy and France.

As is usual in the specialized literature, the relationship between social origin and class destination is addressed. This is done by noting the comparisons made across the geographical areas. We review the analyses that have been made of the evolution of social fluidity as well as the distance between social classes within each country and the comparisons made between them.

We compare the main theories that have inspired the study of social mobility to date: modernization theory, which predicts an increase in relative mobility rates, and invariance theory, which postulates the constancy of social fluidity.

We study the difficulties for social change, i.e., upward mobility from one class to another, as well as the likelihood of reproduction in comparative terms. To do so, we use RCII model that serves as an empirical test of the ranking of classes, based on log-multiplicative models that measure the association between class of origin and class of destination, empirically estimating a ranking for the two (according to the association between them), thus generating a single parameter to measure the association of the classes intra countries. According to Torche and Wormald (2004) this procedure "reorders" the classes by estimating the distance between the classes and presenting a coefficient that measures the association between them.

As a result, we have a sociological measure of inequality among classes that we can compare inside each country as well as among them.

This presentation is part of the result of the INCASI european Project and of the the objective of internationalization of DINAMOS Project.

RN27_T02_02 | Education, Integration and Social Mobility

Is Overeducation Politically Relevant? Evidence from a High Overeducation Context

Miguel Caínzos, Carmen Voces

Universidade de Santiago de Compostela, Spain

In most developed societies the secular expansion of the education system has led to the rise of a high proportion of overeducated workers, i.e., workers whose education level exceeds what is required for their job. This has been for decades a source of concern for social scientists, who have warned about adverse effects at the individual and societal levels. Though attention has focussed mainly on the psychological and economic consequences of overeducation, it has been also suggested that this could have consequences in the political domain that could be detrimental for the civic and political integration of the overeducated workers. In this paper, using data from post-electoral surveys, we test a series of hypotheses on potential political effects of overeducation in Spain. More specifically, we study the possible influence of overeducation, understood as a form of status inconsistency, on four dimensions of political attitudes and behaviours: political support, political efficacy, ideological orientations, and social and political participation.

We use an objective measure of overeducation (job analysis method), attributing to each occupation the level of education considered normative for doing that job and comparing it with the educational level of each subject. We model the effects of overeducation using Diagonal Reference Models, a procedure that has become standard in research on status inconsistency and allows to determine whether the mismatch between achieved and required education has a net effect that is analytically distinguishable from the effects of either education variable.

919

Graduates' Insertion in the Labour Market in Italy. The Role of Overeducation and Internships

Sara Romanò, Tiziana Nazio

University of turin, Italy

Educational mismatch has long been shown to be associated with wage penalties or job dissatisfaction at the individual level, with higher turnout at organizational level as well as being considered a misuse of public investments in education. In Italy the estimated rates of graduates in situation of educational mismatch ranges from 23% to 36% (Romanò, Ghiselli e Girotti, 2019, Luciano e Romanò 2017; Cattani Guidetti e Pedrini 2017) depending on the measurement method adopted. During the last 15 years, the Minister of Education made recommendations and implemented reforms to address this phenomenon: each degree course must take into account the professional demands in designing the curricula (and clearly list the professional profiles it may lead to), curricular internships are recommended and there are incentives for firms to provide post-graduate internships. The rationale is that internship experiences would allow recent graduates to develop professional skills to be rewarded at the time of job-search.

We explore whether internships contribute to contrast overeducation (gauged through an objective measure), and provide an evaluation of recent reforms. We utilize AlmaLaurea unbalanced panel survey-data on Graduates' Employment Status involving overall M.A. graduates from 76 Universities interviewed at the time of graduation, and subsequently at one, three and five years from completion of their degree, respectively. Preliminary results suggest that curricular internships do not affect overeducation, but post-graduate internships are positively associated to overeducation. The number of jobs held interacted with job area (as a proxy of availability of job opportunities), is negatively associated to overeducation. We suggest that overeducation is mostly linked to macro and institutional factors: i.e., the quality of job-demand.

Comparing Intergenerational Social Mobility Over Birth Cohorts And Across Age Between Spain And France

Pedro López-Roldán

Autonomous University of Barcelona, Spain

This paper presents the results of a comparative analysis of intergenerational social mobility between Spain and France taking into account the role of education in social fluidity over cohorts and across age. We follow the work of Breen (2010) and Vallet (2017) addressed to determine the contribution of the different mechanisms to the increase in social fluidity over cohorts, adding age effect. Drawing data from pooled cross-sectional data from Spain and France (Vallet, 2020), both men and women are analyzed. In both countries we analyze change in the fundamental statistical associations: origin-destination, origin-education and education-destination, and the interaction OED, over cohorts and age (as an indicator of labour experience). As well as we apply a simulation or counterfactual analysis to test the relative role of education in shaping social fluidity. For both countries, as in all the countries studied with this methodology, we conclude that social fluidity is explained by educational expansion, with a slight additional effect of the age, but they differ in relation to the other mechanisms: in Spain it is also important a reduction of the direct effect, but in France, with different results for men and women, equalization plays a prominent role alongside the other effects considered.

This analysis is part of a research developed in the context of DINAMOS Project (Dynamics of Social Mobility in Spain, a coordinated project that is funded by the Spanish Ministry of Science and Innovation, "Generation of Knowledge and Scientific and Technological Strengthening of the R&D&I", 2019, https://pagines.uab.cat/dinamos/).

Who Loses? Nowcasting the Covid-19 Socioeconomic Impacts in Spain

Sergio Porcel[1], Sebastià Sarasa[2], Irene Cruz[1], Lara Navarro-Varas[1]

[1]Institut d'Estudis Regionals i Metropolitans de Barcelona, Spain; [2]Universitat Pompeu Fabra, Spain

Economic recessions affect the social and political equilibriums of societies, but the consequences of economic crisis on people's wellbeing are neither universal nor determined. The net effects of crisis depend on which economic sectors and occupational groups are most affected, and how welfare institutions act and favour different sociodemographic groups. The aim of this presentation is twofold. First, we compare the initial effects of the two crises in the 21st century (financial in 2008 and COVID19 now) on income inequality and the risk of poverty in Spain. Our hypothesis is that, as far as unemployment has harmed different sectors and occupational groups, and that the welfare institutions' response has been different in 2020 than in 2009, the consequences for the losers and the winners should also be different. The second aim of this presentation is to debate the efficacy of our method for estimating households' income. Drawing from households' earnings in 2019 (EU-SILC), we estimate households' 2020 total income by imputing un/employment status of individuals (2020 LFS). Then we recalculate individuals' labour income by subtracting lost wages and by adding the new public transfers implemented to combat the pandemic's economic effects. This method overcomes the inconvenience of the two-year delay in the publication of EU-SILC data, thus facilitating faster access to relevant information about the effects of the crisis on income distribution. First results suggest that while the 2008 crisis had a wide-reaching effect across social strata, the current one is impacting more narrowly those on the bottom tier.

RN27_T03_01 | Structural Social Dynamics

Intergenerational occupational class mobility in 1970 and 2005 in Spain, France, Poland and Hungary

Julio Carabaña Morales

UCM (University Complutense,Madrid), Spain

The question I address is how the mobility patterns of the different social classes changed during the last economic cycles. 'Mobility' means access to the various social classes. 'Pattern of mobility' means the distribution of people who come from a certain class (origin) between different classes (destination). 'Economic cycles' means periods limited by two recessions or by two boom or peak moments. The method consists on using two different sources of data to estimate the effect of the time period, keeping the age constant. I first did it for Spain between 1991, with data from the ESD, a survey carried out by the Spanish Office for Stastistics (INE), and 2005-2011, with EUSILC data (Carabaña, 2020). The results are that all classes of origin, except Professionals, improved their occupational destinations. I extend the study to the three countries for which CASMIN and EUSILC data are available, France, Poland and Hungary, comparing people 31-45 years old in 1970 and in 2005-11. France and Hungary result quite similar to Spain, but in Poland middle classes improved their mobility much more than workers and peasants. I will try to overcome problems to add more countries in order to compare southern and northern non-socialist countries.

921

Structural And Net Changes In Educational Inequalities In Spain

Ildefonso Marqués-Perales[1], Sandra Fachelli[2]

[1]Sevilla University; [2]Pablo de Olavide University

Throughout the 20th century, advanced societies have experienced a process of educational expansion. Such a process is driven by two mechanisms: on the one hand, the economic upswing experienced during the last century allowed families to deal with high opportunity costs; and on the other hand, educational reforms themselves can make access to higher education more equal. In spite of that, for many studies, educational inequality trends did not improve over time (Calero and Bonald, 1999; Martínez García, 2002). These conclusions have been gathered from methodologies based on compositional invariance. In this paper, we stress the need of taking into account measures reporting us information about the size of societal changes. To do that, we analyze the educational inequalities in Spain in cohorts between 1931 and 1981, using the mutual information index. Likewise, Thanks to the method proposed by Benn and Sieler (2019), we decompose the variations due either to structural or internal change. Our results paint a different picture: educational inequalities have experienced a decrease over time due to compositional changes that are not included in the more traditional methodologies.

How to measure the Second Demographic Transition evolution in Spain? Building-up an index at a regional scale. 1991 - 2016.

Jorge Blanco

Complutense University of Madrid, Spain

The dynamics of nuptiality, fertility and household's formation of Spanish population have changed over the last 30 years, following a typical pattern according to the Second Demographic Transition (SDT). The aim of the article is to explore the conjoint evolution of these dynamics, at the regional level, through the elaboration of an index that allows, in a 1-10 scale, to figure out the state of implementation of the SDT among 1991 and 2016, in a 5-year period. Employing births and marriages data from the vital statistics, as well as statistics from the 1991, 2001 and 2011 population censuses, it is found out that most of the Spanish regions are already close to complete the SDT.

RN27_T03_02 | Asylum Seekers in Southern Europe

The Struggle of the Asylum Seekers Autonomy in Spain: Between the Rigidity of the Asylum Regime and the Constraints of Covid-19

María-Jesús Cabezón-Fernández, Beatriz González-Martín, Pablo Pumares

Centre for the Study of Migrations and Intercultural Relations, University of Almeria, Spain

Spain has not been a majority destination regarding forced migrations until 2019, when it has become the third country in the number of registered asylum applications, behind Germany and France. According to Eurostat, Spain has registered asylum seekers from Venezuela (40,305), Colombia (28,880), Honduras (6,730), Nicaragua (5,840) and El Salvador (4,715), which explains this third position in the ranking in of "traditional" European destinations for asylum seekers. Spanish scholars had highlighted that the rigidity of this system has led to serious deficiencies in the integration of refugees in Spain, (Urrutia et al. 2018; Garcés-Mascareñas & Pasetti, 2019) manifested in the failure to achieve one fundamental objective: the autonomy of asylum seekers.

In this paper, we analyse from 18 in-depth interviews conducted with key informants from Fundación Cepaim and the Red Cross in the province of Almería, two housing models in order to identify to some extent they facilitate the integration of the asylum seekers and the acquisition of autonomy. Furthermore, due to the pandemic provoked by the COVID-19, we analyse how both housing programs coped with the intrinsic rigidity of the asylum regime constrained now by the difficulties derived from the pandemic. The results point out that the rigidity of the program, together with the high denial rates of

922

asylum applications, has an opposite effect that intended, increasing the insecurity and vulnerability of the asylum seekers. In this sense, autonomy has been pushed into the background by the urgency to solve the needs of the pandemic.

Colonial memories, mobilities and immobilities: ties between the Sahrawi Refugee Camps and Spain

María González Flores

Universidade da Coruña, Spain

The different dynamics of mobility to and from the South of Europe are undoubtedly grounded on its colonial past, with established migration routes connecting former Global South colonies and Southern European metropoles. In this scenario, the most flagrant case of uncompleted decolonization, occupied Western Sahara, has developed its own particular migration culture, with over 170,000 Sahrawis having the status of refugees and living under the legal supervision of the MINURSO, being forced to use Algerian passports in order to travel –even when some still have their Spanish IDs pre-1976.
In the Sahrawi Refugee camps, different logics of mobility and immobility have been developed to cope with the different constraints that hold them prisoners in the most inhospitable desert of the world (the hamada). Those logics reflect individual, familial and communal strategies deployed to resist the occupation but also to develop livable lives in the camps. With the current pandemic, Sahrawi Refugees are undergoing another confinement inside their own protracted confinement as refugees.
In this paper, we'll discuss the migrating flows and colonial ties that connect Spain and the Sahrawi Refugee Camps, focusing on and comparing the mobility and immobility tactics of Sahrawis in the camps and in the diaspora in Spain. We'll approach this investigation from a gender-conscious lens, and will also address how some new challenges that the COVID-19 pandemic has brought have affected and modified those strategies.

RN27_T04 | Migration and Welfare

The impact of the non EU-migrant arrival to the Welcoming Spaces in Southern European Societies. The case of Spain

Obdulia Taboadela

University of A Coruña, Spain

The Welcoming Spaces research program (project funded by the Horizon 2020 research and innovation programme, call H2020-SC6-Migration-2019, under grant agreement 870952), aims to answer the question about how to achieve inclusive and sustainable development in shrinking regions, contributing to revitalisation while providing opportunities for the successful integration of non-EU migrants.
We present in this paper the preliminary results derived from this project in Spain, one of the selected countries. In the first step, we did a selection of localities (all of them are located in shrinking regions while are developing welcoming strategies to attract foreign people). Once selected, we´ve applied a battery of quantitative and qualitative variables, as well as we´ve analysed the initiatives carried out by the municipalities to face depopulation and decline. We will analyse data on population, economic viability, social wellbeing and private and public policies: the population trends, the main labour market figures, the migratory tendencies, or investments flows. Such an analysis will allow us to establish typologies of localities in a double perspective: in terms of quantitative variables and in a typology of politics implemented in the localities.
Although it is still early days, where possible we will be able to tentatively analyse the impact of COVID-19 on the localities.

923

A typology of Italian migrants in Athens

Angela Delli Paoli, Domenico Maddaloni

University of Salerno, Italy

Migration flows from a southern European country to another one have received scarce attention so far. This is especially true for Italians migrating to Greece or, more specifically, the Athens area. Thus, there are limited insights as to the reasons why Italians are leaving and why they have been choosing Greece as their destination. This paper looks at their motives for migrating and their destination choice to understand the diversity of migratory trajectories through a typology. In order to do this, we carried out in-depth interviews to Italians living, both permanently and temporarily, in the Athens area, employing snowball sampling. As a result, we have identified 5 types of Italian immigrants in Athens. Mediterranean migrants are driven by the typically Mediterranean character of climate, landscape, food, and culture in their deliberate choice of Athens. Nomadic migrants have casually chosen Athens to satisfy their need of continuous physical mobility and multiple moorings as a defining aspect of their identity. Work migrants are motivated by the search of a job regardless of the place and work content. Entrepreneurial migrants are motivated by a vocation for a professional career in Athens. Finally, for marriage migrants the choice of Athens is a consequence of a couple choice and shared life projects.

Care Work, Migration and the Crossroads of Welfare in Pandemic Times in Spain

Paloma Moré-Corral[1], Raquel Martínez-Buján[2]

[1]Universidade da Coruña; [2]Universidade da Coruña

The purpose of this paper is twofold. First, to analyze the conditions of social inequality of migrant domestic care workers in Spain during the COVID-19 health crisis. Second, to explore the foundations of the welfare model that relegates these workers to a marginal position which is now exacerbated by the impact of the pandemic (layoffs, social isolation and illness have now been added to the precarious employment situation of the past). This landscape highlights the contradictions prevailing in the long-term care system in Spain and the dilemmas it is faced with. On the one hand, these workers have not been integrated into the public social protection system,

so their access to social benefits is limited - a situation which, in turn, prevents them from being recognized as citizens with rights and does not allow this activity to be considered essential to sustainability of life. Domestic work, by contrast, -especially live-in domestic service- has been revitalized to address the lack of an adequate network of social services and the growing mistrust of nursing homes. Drawing on 20 semi-structured in-depth interviews conducted from September 2020 to January 2021 with domestic workers, political representatives and other actors in the sector, this paper provides insights on crossroads which the Spanish care system is and the dimensions from which its transformation be carried out. The Spanish government has initiated proposals for changes in the funding, coverage and magnitude of social services aimed at dependency, but we argue that a more profound change in the model is necessary to overcome the deprofessionalization of care and job insecurity, as mentioned above.

Migration as Generative Local Welfare: Insights from Italian Shrinking Regions

Alice Lomonaco, Pierluigi Musarò, Maurizio Bergamaschi, Paola Parmiggiani, Melissa Moralli

University of Bologna, Italy

924

The aim of this contribution is to present some preliminary insights about the presence of non-EU migrants in Italian shrinking areas and their role in the sustainable development of these territories, sustaining that what is represented and socially constructed as "problem" can turn out to be an added value. On the one side, if the media distortions represents migration as a crisis to be solved, different studies have shown how it can sustain economic, social and cultural development for hosting territories. On the other side, although shrinking areas feature a set of critical issues (e.g., depopulation, lack of services and infrastructures), they can transform into privileged spaces for more equitable modes of territorial regeneration. Moreover, in Italy these areas cover more than a half of the national territory.

On this basis, the contribution argues that the revitalisation of shrinking areas should invest in processes capable of creating sustainable and inclusive development, able to enhance the well-being of the community. First, we will show how in the case of Italy the reception system is strictly linked with the presence of asylum seekers and refugees in shrinking regions.

Although related to dispersal policies, through the collaboration with local/bottom-up organisations gave birth to innovative welcoming initiatives. Secondly, a preliminary mapping of the initiatives has revealed a wide range of activities characterised by multidimensional sustainability, conceived in terms of social justice, environmental sustainability and fair access to local resources. Finally, the contribution analyses the possibility of such initiatives to represent an innovative form of local welfare for shrinking regions, capable to support sustainable development processes while recognizing aspirations and human rights.

RN27_T05 | Actors of Social Policies in Southern Europe

Innovating Regional Governance of Social Protection. A New Model of Local Welfare in Mediterranean Europe

Luca De Luca Picione, Lucia Fortini, Domenico Trezza

Università di Napoli Federico II, Italy

This communication aims to describe the regulatory framework of regional governance and the effects on policy-making and management performance of Social Districts (Ambiti Territoriali). Campania is located in the heart of the Mediterranean area and, like the other regional areas of Southern Europe, suffers from the socio-economic "double gap" (Bianchi et al. 2020) compared to its national and European context. The Covid-19 pandemic will most likely increase the range of such gaps, more so than the 2008 crisis. Southern Europe, as a welfare area with different context characteristics but several converging processes (Saraceno 2006; Consoli, Papadopoulos 2019) should plan a response to the social crisis as shared as possible. Starting from the experience in Campania, this response could involve the strengthening of decentralized welfare systems for integrated planning of territorial social services, creating strong and lasting legal bodies, and no longer associative conventions with roles and functions limited in time. As some studies suggested, local governance model may

have implications more significant on performance welfare system (Agodi et al. 2006). Furthermore, government effectiveness could be one of the problems of low performance in Social Southern European (Rontos et al. 2019). The contribution therefore highlights on the possible effects of experimenting with stronger unions, according to a mixed perspective, combining quantitative and qualitative approaches. The first, by constructing management performance indexes, analyzing the indicators of the last programming of social services; the second, by investigating the experiences of policy makers and local coordinators. This dual perspective has made it possible to construct an interpretative model to understand and compare other local systems in Mediterranean Europe.

The Effect Of Job Search Assistance In Spain

Álvaro F. Junquera

Centre d'Estudis Sociològics sobre la Vida Quotidiana i el Treball (QUIT), Institut d'Estudis del Treball (IET), Universitat Autònoma de Barcelona, Spain

925

Job-search policies are one of the five types of interventions related with the well-known active labour market policies. Inside this group, we can distinguish assistance from sanctioning or brokering. Specifically, job-search assistance programs are widely implemented in Spanish public employment services, but their effects on the probability to get an employment of the participants remain unclear. The literature is scarce and deeply disconnected, so it is difficult for policy-makers and practitioners to know which actions will cause higher or lower effects on participants' employability. Our paper tries to fill this gap by performing a narrative systematic review of Spanish public program evaluations on this topic. We analysed 20 studies and 249 impact estimates at four time horizons. Although the overall results indicate positive effects on employment, the findings are highly heterogeneous by group. We also discussed some methodological issues that could improve the evaluation of job search assistance programs. Our work is useful to guide the public policy design by attending the specific institutional context in Spain and tailoring certain measures for certain groups.

Political and Social Role of Veterans' Associations in Portugal: a Long-term Perspective

Ana Romão[1], Maria da Saudade Baltazar[2], Luís Baptista3, Inês Vieira[4], Sara Silva[2]

[1]Academia Militar, CINAMIL; CICS.NOVA; [2]Universidade de Évora, CICS.NOVA; [3]Faculdade de Ciências Sociais e Humanas da Universidade Nova de Lisboa, CICS.NOVA; [4]Lusófona University, CeiED

The end of wartime confronts governments and citizens with the urgent need of responses to take care of those who have been damaged in their physical and psychological capabilities during the conflicts and, more generally, the need of rewarding, from a moral and material point of view, the soldiers who fought serving the State. The First World War (1914-18) and the Portuguese Colonial War (1961-1974) are the wars of the 20th century in which Portugal participated with overwhelming consequences. In both contexts, common interest was established in order to organize associative movements of Veterans, claiming for welfare measures, social and political acknowledgment. In these nearly 100 years, political regime changed from the 1st democratic republic, to a dictatorship to, finally, a democratic regime as result of a revolution led by the armed forces (April 1974) that ended the Colonial War. Social policies devoted to Veterans have been developed along this period, especially in the second half of the 1970's and by the end of the 1990's. However, the Veteran Statute, which holds important political commitments for those who served in war contexts, was only approved in August 2020. This communication reviews the associative movement of Veterans in Portugal, adopting a diachronic perspective to elucidate the role these movements have undertaken to place the situation of Veterans on the public agenda and influence the evolution of social policies.

Digital Inclusion Of Vulnerable People In The Community Development Process. An Action Research In Southern Italy

Andrea Volterrani, Isabel Alfano

University of Rome Tor Vergata, Italy

This paper aims to present an action-research in the Pellaro district of Reggio Calabria (Southern Italy). Using a theoretical approach that refers to urban and media practices and the mediated construction of social reality (Blockland, 2017; Couldry,2004; Couldry and Hepp, 2017; Stephansen and Trerè, 2020) the objective of this research-action was to activate a process of community development within a city district characterised by the presence of a large vulnerable population and a high density of organised crime ('Ndrangheta) In particular, actions were developed that enabled the growth of social and digital/social skills among the most vulnerable people. In an edu-communication perspective (Barbas, 2020), these people were facilitated to become protagonists in the process of territorial and digital relational development also thanks to the use of participation and community platforms.

There are three aspects that will be examined: a) the ability to develop dual relationships (social and digital) within a peripheral, marginal and vulnerable community context such as that of Southern Italy; b) the deep interweaving between traditional and mediated communities even if these mostly consist of vulnerable people; c) the potential of the digital media to meet specific needs of vulnerable population.

926

RN27_T06 | Social Action in urban context

Volunteering in the Time of Covid-19 Pandemic as a Catalyst for Transformation and a Leading Social Development Solution: Models, Best Practices, Lessons and Prospects about Volunteer Sector in Cyprus

Athanasia - Spyridoula Kleanthous[1], Maria Ioannou[2]

[1]University of Cyprus, Cyprus; [2]University of Cyprus, Cyprus

The multiple challenges posed by the coronavirus pandemic highlight the fact that organised civil society and more specifically volunteer movement is a crucial social factor at the heart of the Covid-19 global response nowadays. In the face of these consequences and as the world finds itself at a crossroad, volunteer sector has responded to the crisis, using different and at some times creative methods, in order to meet specific needs of communities most affected by the crisis (curb corruption, campaign for policies, create remote services etc) at these hard times. In this context, the aim of this paper is to outline volunteer sector during the current crisis and present best examples of non-governmental organizations (NGOs) in response to COVID-19 pandemic examining the case of Cyprus. Furthermore, it also seeks to discuss, from a sociological perspective, current trends, actions and further policies concerning volunteerism and NGOs organizations and in general civil society regarding the Cypriot society during the pandemic era. It draws from a range of sources based mainly on secondary research concerning a variety of examples provided of volunteer sector initiatives and/or activities and at the same time including a series of interviews with volunteerism main actors at a local and national level. As the pandemic spreads, it is high importance to illustrate some of the few positive effects and best practices of the recent crisis, pointing to the volunteer movement as an integral part of the civil society and at the same time as a step to promote social change, enhance social cohesion and global democracy, demonstrate more solidarity and bring about more equal and cohesive societies in the post-Covid world.

Residents of the neighborhood ('island') of Bela Vista in Oporto-Portugal: Ways of Life and Living and Succes's Reasons for an Exceptional Case of Urban Rehabilitation

Manuel Carlos Silva[1,4], Fernando Matos Rodrigues[2,3], António Cerejeira Fontes[3]

[1]Interdisciplinar Centre of Social Sciences(CICS.Nova_UMinho/CEAM/UnB); [2]Centro Interdisciplinar de Ciências Sociais (CICS.Nova_UMinho/LHB); [3]Laboratório de Habitação Básica (LHB); [4]Centro de Estudos Avançados Multidisciplinares (CEAM), Univ Brasília

In this paper abstract the authors report on the results of a research located on the 'island' of Bela Vista in Porto. Based on quantitative and qualitative methods, data were obtained through the application of a survey, direct and participant observation, as well as the use of the collected life narratives. Historically the authors frame the origins of 'island' of Bela Vista in Porto in the 19th century, proceed to a typology of the dwellings, analyze the conditions of objective living, habits and ways of life, evaluate the their relationships, as well as their relations with the surrounding society and public institutions and powers, as well as its worldviews on certain issues of symbolic, political and ethical order. Having been one of the islands that, after 25 April, experienced the beginning of a process of rehabilitation, the non-implementation of this process of the 'island' in 1974-75 gave rise to enormous frustration. If in general the State and the municipal entities have not invested in public housing over 40 years, the rehabilitation of the 'island' of Bela Vista, despite its setbacks and difficulties, was due to the fulfillment of the necessary conditions to be successful: the determination of the Residents Association and the participation of the residents themselves, the commitment of architects and other technicians in LHB and researchers and the fulfillment of electoral promise by the municipal power. The data collected not only reflect the evaluations of residents over decades of abandonment by public entities, but also bring to knowledge and reflection their stories of resistance and

927

struggle before, being also pointed out the (semi)hidden records at the family and community level.

Living Conditions, Social Representations And Residents Resistance: The Case Of Dismantling Of The Neighborhood of S. João de Deus in Oporto

António Cardoso[1], Manuel Carlos Silva[2], Fernando Matos Rodrigues[3]

[1]Politecnico de Viana do Castelo/CICS.Nova.UMinho, Portugal; [2]Centro Interdisciplinar de Ciencias Sociais (CICS.Nova.UMinho)/CEAM/UnB; [3]Laboratorio de Habitação Básica (LHB), Portugal

In this article the authors report the results of a research located in the neighborhood of S. João de Deus in Oporto. Based on quantitative and qualitative methods, data were obtained through the application of a survey, direct and participant observation, as well as the use of the collected life narratives. The authors undertake a historical and socio-demographic characterization of the residents, proceed to a typology of the dwellings, analyze the objective living conditions, habits and ways of life, evaluate the relationships of the residents with each other, as well as their relations with the surrounding society and the institutions and public authorities, as well as their worldviews on certain symbolic, political and ethical issues.

If in general the State and municipal authorities have not invested in public housing for 40 years, the neighborhood S. João de Deus, known by the presence of roma residents, despite various forms of resistance, would be dismantled under the pretext of drug trafficking. The collected data not only reflect the assessments of residents over decades of abandonment by public entities, but also bring knowledge of their stories of resistance and struggle against the various attacks of the authorities, namely police, been these registered before the process of rehousing and the (semi)hidden records of resistance and criticism to national and municipal authorities.

RN27_T07 | Territorial cohesion and governance

Territorial Governance in Southern Europe: the Role of Social Entrepreneurship

Georgios Chatzichristos, Nikolaos Nagopoulos

University of the Aegean

Rural decline -unemployment, loss of income, outmigration- has become a deepening problem across southern European regions (EU). Enhancing territorial governance is a significant step towards breaking through these downward spirals. While more associational and participatory conceptions of rural governance gain momentum, the rural governance arenas still remain "invited spaces" that are conceptualised by the state. Still, examples across EU have showed that social enterprises -among other locally-embedded organizations- manage to penetrate the institutional, governance structure and by thus contribute to the development of new public schemes and legal frameworks. In this way, they alter the governance agenda, enhance territorial governance and revitalize their rural communities. This is something uncommon for the southern European regions, where social enterprises remain mostly institutionally unanchored. Empirical researches indicate that one of the basic reasons for that, is that the public sectors remain sclerotic, hierarchical and bureaucratic. Against this background, the current study explores: the dynamics that impede the institutionalization of social enterprises in the Southern Europe. A comparative case study was conducted in two social enterprises and their respective governance frameworks: ADC MOURA in Baixo Alentejo, Portugal, and STEVIA HELLAS in Pthiotis, Greece. The comparative results indicated the most important parameters for the non-institutionalization:a) an institutional fragmentation that generates a high intensity governance arena and limits the room to maneuver, b) a wide public paternalism that commonly suppresses bottom-up initiatives and c) the absence of strong interregional networks that would allow the social enterprises to disseminate their agendas.

928

Taking Care Of Social Issues Starting From New Business And New Governance

Carmela Guarascio, Maria Mirabelli

Università della Calabria, Italy

Business enterprises are increasingly interested in having social impact and, thus, they need to think beyond pure economics. This is particularly true in the framework of sustainable development goals (SGDs) in which this new conception of governance aims to build new networks among enterprises in dealing with social issues. The process of governance among enterprises and institutions indicates a greater degree of cooperation among public and private actors within mixed decision-making networks (Fortunato, Mirabelli, 2007).

For this reason, the article works on a case study of a network of about 200 enterprises involved in a process of corporate social responsibility, involving also institutions. The purpose of studying these organizations is to focus on the search for new institutional forms (Polany, 1957; ib. 1983; ib. 2000) of social and economic regulation (Magatti, 2006; La Rosa, Laville 2007, Singer, 2003). This specific study requires a prior acknowledgment that the economy is plural (Aznar at el, 1997), made up of different principles, that are embedded in social structure (Granovetter, 1985; Laville, 2000).

The case study presented is "Polo Lionello Bonfanti" in Italy that is a cluster of about 200 enterprises linked to corporate social responsibility. The methodology used is case study in depth, using interviews to privileged actors. Describing the regulatory logic means questioning the nature of the society to be regulated or at least some of its characters or significant processes, in order to draw a new regulatory framework. In this sense there is a growing interest in explicating the influences of non-economic factors on economic performance, on the labor market and on welfare regimes (Granovetter 1985, Trigilia, Burroni 2009, Ranci, Pavolini 2014).

Rurality, Environment and Support Policies: a brief approach of the Cohesion and Common Agriculture Policies in Portugal

Ana Maria Ventura[1], Cristina Cruz[2], Inês Pacheco[2]

[1]FC.ID, Portugal; [2]F.Ciências- University of Lisbon

Framework: This presentation is part of an in-depth reflection on Portuguese agricultural and rural development, based on the legislative and financial support available. The "PolRura- Policies, Rurality, Diversity and Development" Project, financed by PDR2020 and coordinated by the F. Sciences of the U. Lisbon, made it possible to critically assess the main policy to support Portuguese agricultural and rural development as well as its compatibility with the Territorial Planning Plans and Development (on behalf EU frame).

Objective: To identify the themes that, on the part of businessmen, consultants and public authorities appear as most important in agriculture and rurality, confronting this view with more in-depth and contextualized analysis, on normative and regulatory support. Is intended to open lines for future reflection.

Methodology: Basically documentary reading and other available information, treated by content analysis, carried out to respond to the objective set.

Intended results: Promote a broader reflection and debate on the paths of agricultural and rural development, at the crossroads of the growing demands of an environmental nature and in the context of Regional Planning and Territorial Cohesion policies. A brief introduction about rural and agricultural development is followed by topics highlighted in the scope of the information collected, which are seen as essential to the productive and complementary activities, namely: the use of water, soil management and the accessibility of technical and financial support for the agriculture / environment interface.

Added value: Contribution to the enrichment of the sociological approach to current agro-environmental issues and respective institutional support.

929

Moving (too) Fast? Addressing Temporality and Acceleration in Portuguese Business Ventures Scaling.

João Vasco Coelho

ISCTE-IUL, Portugal

Economic action is increasingly taking place in temporary settings and systems. Temporality regimes and acceleration, i.e., the performance of activities in ever-shorter periods of time, have distinctive importance as contemporary underlying sociocultural framework, primarily contributing to the socioeconomic base of a business venture.

Although prior research has highlighted that temporality and time regulation as key dimension to drive business ventures creation and scaling, little is known on speeding-up implications, namely on how actors experience speed as infrastructural base of employment relations.

Analytical work is based on a 12-month ethnographic study carried out in one of the most successful start-up ventures operating in Portugal, aimed to explore how actors experience their startupper employment relations. In Portugal, an evolving start-up hype has been promoted in recent years, presenting the country as a possible emergent European entrepreneurial hub, a rising start-up nation. In this context, less laudatory perspectives, focused on analyzing employment relations quality or job creation effects, are scarce or not particularly visible.

Analysis shows that speeding-up involve a plurality of partly conflicting implications, and such conflicts invoke tensions that actors live out in their daily activities. Three relational attributes are discussed as speeding-up implications, in an employment relations perspective: the prevalence of a short-termed task focus, emerging speed as a reassuring proxy for success and accomplishment; low levels of trust and institutionalized reciprocity; short-lived social relations and conflict deprioritisation.

The study has implications for understanding temporality and time uses in the expanding literature on contemporary economic action, namely in peripheral regions and economies such as Portugal.

RN27_T08 | Researching the effects of COVID 19 crisis

Double Invisibility: Effects of Hidden Unemployment on Vulnerable Collectives in European Southern Countries During COVID

Andrés Coco-Prieto[1], Montserrat Simó-Solsona[2], Laura Suárez-Grimalt[3]

[1]Universitat de Barcelona, Spain; [2]Universitat de Barcelona, Spain; [3]Universidade da Coruña, Spain

One of the most relevant effects of COVID-19 period in European Southern countries is the increase of fragility and insecurity in labour market. Nevertheless, official data from these countries don't show a relevant increase of unemployment (except Spain). These values might be misleading and interpreted as positive, since the measuring of unemployment rate —based on ILO criteria— don't reflect properly the real range of unemployment, because part of it is hidden in inactivity situations and other part in occupation.

Given this scenario, the main objective of this paper is to analyse the hidden unemployment rates and its impact on vulnerable collectives, defined according to analytical variables such as gender, nationality, age, economic status and occupational characteristics from a double comparative (time and geographical).

Our analysis takes into consideration three European Southern countries: Spain, Portugal and Italy. These countries share some similarities such as welfare state and economic situation, but also show relevant differences in the evolution of the pandemic and economic policies implemented by their national governments. Using secondary data from Labour Force Survey (Eurostat), we enlarge the operationalization of unemployment including discouraged workers who are assigned to inactivity situation because they don't look actively for a job and involuntary underemployment people.

Our findings demonstrate that the impact of unemployment is better-measured using alternative indicators to light up hidden unemployment caused by

930

COVID-19 pandemic in order to make visible vulnerable collectives who are traditionally in the dark side.

Life Expectations Of Young Rural Students In The "South Of The South". Elements To Move Or Stay In A Pandemic Context

Carmen Botía-Morillas, Luis Navarro Ardoy, Carlos Lubián, Manuel Tomas Gonzalez Fernandez

Universidad Pablo de Olavide, Spain

This work studies the life expectations of young rural students in Southern Europe. The main objective is to analyse the representations they have in relation to cities and their own environment as places to live and develop professionally. We focus on exploring the images of the territory, the type of studies they pursue and the possibility of working for the family business as key elements that can facilitate or hinder the decision to emigrate. Our empirical study is based on a survey amongst young rural students from post-secondary non-tertiary education of different educational pathways – high school general education, Vocational Training and Dual Vocational Training in their final year – carried out in a strategic sample of schools in Andalusia (Spain), selected according to indicators of local development.

Since youth migration is a phenomenon in rural Southern European societies, the work can lay the foundations for potential comparative studies in similar rural contexts. For this reason, the paper reflects on the potential of the method used for the comparative study in Southern European societies, which is even more necessary than before as they share images of the rural living expectations in the current context of pandemic crisis. These regions share the widespread representation that "nothing works", and the discouragement and frustration that impregnates various social sectors.

The research is part of the project "Educational pathways, development and rural sustainability: the relationship between academic trajectories and the expectations of rootedness of rural youth", financed by the European Regional Development Fund (Ref. FEDER-UPO -1260928).

Assessing Covid-19 information distribution through Big Data analytics.

Francesco Mazzeo Rinaldi[1,2], Giovanni Giuffrida[1,3], Emanuele Mambelli[3]

[1]University of Catania, Dept. of Political and Social Science, Italy; [2]KTH, Royal Institute of Technology, School of Architecture and the Built Environment , Stockholm; [3]Neodata Group, Italy

The spread of the coronavirus SARS-CoV-2 in the past year has dramatically changed people's everyday lives on a global scale. Its spread has left national economies counting the costs as governments struggle with new lockdown measures to tackle the virus's spread. Italy has been one of the first European countries to be brutally hit by the pandemic and implement a national lockdown starting on March 9th.

The best way to prevent and slow down the transmission of a pandemic such as COVID-19 is to be well informed about the virus, the disease it causes, and how it spreads. Unfortunately, we have witnessed what has been referred to as infodemic: an overabundance of information that makes it difficult for people to find trustworthy sources and reliable guidance when they need it. The COVID-19 case shows the critical role of information diffusion in a disintermediated news cycle (Quattrocchi, 2017).

In this work, we carry out an exploratory analysis focusing on online newspapers, which provide a valuable source of information diffusion on the recent COVID-19 pandemic. The aim is twofold. On one hand, we analyze the flow of contents published overtime on COVID-19 by a major Italian online newspaper. On the other hand, we analyze readers' consumption of that news through cookie-based logs activity. Our model is based on a combination of both semantic text analysis (Berna A., 2018) (i.e., concept-extraction methods and sentiment analysis) and more traditional quantitative Big Data methods. The proposed model can be easily adapted to other contexts and different newspapers.

931

Impact of the COVID-19 Pandemic on Third-Country National Students in Madrid and Barcelona

Silvia Carrasco, Marina Pibernat

Universitat Autònoma de Barcelona, Spain

The impact of the pandemic on the life of children and adolescents is raising concerns about the serious logn term effects it may have, particularly for students who are third country nationals. Paradoxically, since the beginning of the lockdown and when schools later reopened to intermittent in person instruction, the specific needs of this group of students and the effects of academic and social isolation as possible aggravating factors have been absent from the public debate on education in the pandemic beyond general mentions to family impoverishment and the digital divide. This paper draws on a prospective study funded by EU-AMIF and conducted through interviews with management teams and teaching staff specialised in the direct care of students who are third-country nationals in eight secondary schools in Madrid and Barcelona. We focus on the impact of the pandemic on these students from a comparative a gender approach, in the context of the transformations, readjustments and consequences experienced by all students from mainly disadvantaged socioeconomic backgrounds. Our findings reveal high disparity in schools' ICT and specific preparedness to meet he needs of their students, particularly of those lagging behind and still learning the tuition languages. Moreover, affecting students regardless of their migrant status, curricular setbacks and the loss of work habits have been aggravated by the recreational use of ICT, with clear differences by sex, which may lead to less predictable, but more persistent, processes of school disengagement. Finally, it is necessary to highlight that neither the digital tools nor the educational innovation that they may entail can solve structural social issues, such as socioeconomic inequalities intensified by the Covid19 crisis.

RN27_T09 | Gender inequalities

Recent Evolutions of Gender, State Feminism and Care Models in Southern Europe

Julie Jarty

Toulouse Jean Jaurès, France

This presentation partially retakes the title of a chapter I wrote with Pr. Karina Batthyány in the recent book edited by Pedro López-Roldán entitled Towards a Comparative Analysis of Social Inequalities between Europe and Latin America, by Springer. This chapter presents and characterizes the way in which, in the twenty-first century, after years of feminist struggles inside and outside of institutions, gender relations are organized in the different countries of the INCASI project (on the European side, Spain, Italy, Finland, France and the United Kingdom, on the side of the South American Southern Cone, Argentina, Brazil, Chile and Uruguay). Due to the objectives of the RN27, I will focus on Spain, Italy and France, but it will also be interesting to compare with a very positive standard in terms of gender equality such as Finland, as well as initiate a dialog between two continents. It pays special attention to the implementation of feminist issues on political agendas, and in particular the assignment of women to unpaid care work—an aspect of the power continuum that we look to relate to other aspects. Gradually and for almost a century all countries in both continents have granted women the status of subjects, citizens and employees. However, the conditions, challenges and timelines of this process differ considerably from one continent to another, so they need to be addressed separately. The neoliberal era did not have the same impact in Europe as it did in South America (nor was it exactly the same between particular European countries or among South American ones).

932

The Pandemic Crisis And The Deepening Of Gender Inequalities In Academia:The Case Of Greece

Eleni Nina-Pazarzi

University of Piraeus, Greece

The recent pandemic crisis has exagerated gender inequalities in many spheres of life. The rapid spread of the COVID-19 and subsequent countermeasures, such as school closures, the shift to working from home, and social distancing are disrupting economic and social activities. This contribution aims to present data for the impact of covid-19 on women's work in Academia. Legislation and other administrative acts in order to encounter the new reality have widened gender inequalities in the academia inequalities that will be critically discussed. new threats and inequalities have been emerging in times of the pandemic crisis and the policy and institutional responses are inadequate for the effective exercise of Human rights. the implications[impact]of legislation and other administrative acts which were imposed after the covid-19 crisis have created a new reality in the everyday life of women, especially these who have children.The presentation will focus mainly on women in Academia in Greece and we will present data from our research but also from analysis of data collected by European and Greek research organizations.

New academic governance in Southern Europe: an intersectional analysis

Ilenia Picardi

University of Naplese Federico II, Italy

Recent studies focusing on academic institutions have highlighted the deep impact of normative and organizational change on research practices. The new academic orientation is mainly defined by New Public Management principles (Ferlie, Musselin and Andresani, 2008) and the need for greater accountability (Power 1999; Amaral, Bleiklie, and Musselin 2008). How are the new academic candidates contextualized in the different Southern European countries, and what impact do they have in terms of gender? The paper addresses the gender dimension in science in its intersection with other analytical categories, particularly with that of precariousness in academic careers and geographical differences. The study indicates as misleading the model that looks at the glass ceiling as a "frontier" to be conquered and shifts the level of analysis of gender inequalities (and not only) to the glass door and on the glass labyrinths (Picardi, 2019; 2020), or on the mechanisms that regulate the entry, permanence, and exit of women from the scientific and academic path. The research reconstructs, through the comparison of academic data from different Southern European countries, an exposition of differences and similarities that the gender dimension assumes within the academic institutions of the different countries, in the light of different institutional, cultural and organizational practices. The thesis supported is that the liberal neoliberalism framework, which inspired the interventions and policies in support of gender equality promoted by the European Union in recent years, is not sufficiently adequate to counter the effect of some of the mechanisms underlying the current assessment, recruitment, and career progression systems and to face with difference between social, cultural, and institutional foundations of Southern Europe.

Binational Marriages in Portugal and Spain: Comparing Heterosexual and Same-sex Couples

933

José Manuel Jiménez Cabello[1], Sofia Gaspar[2], Diego Becerril Ruíz[1]

[1]Universidad de Granada, Spain; [2]ISCTE-Instituto Universitário de Lisboa, Centro de Investigação e Estudos em Sociologia, Lisbon, Portugal

Since the 2000s, Portugal and Spain have been established as immigration countries, receiving citizens from diverse national origins. These flows of migrants gave rise to binational marriages between native Portuguese or native Spanish with non-native partners, increasing the intercultural conviviality among the groups and reconfiguring the matrimonial market in these countries. With the further institutionalization of same-sex marriages in 2005 (Spain) and 2010 (Portugal), gay native Portuguese and gay native Spanish could also legalize their marriages with non-native partners. The aim of this paper is therefore twofold and innovative: first, it analyses the evolution and partners' national preferences of binational marriages in Portugal and Spain; and secondly, it compares these marriages both in

heterosexual and same-sex couples. Marriage statistical data has been retrieved from National Statistics (INE) from Portugal and Spain for the period 2010-2019, and it included some cross-national variables such as national origin, age, educational level and civil status. The results show that national origin preferences on binational couples are more pronounced between heterosexual and same-sex individuals. In contrast, gender differences between lesbian and heterosexual women and gay and heterosexual man did not reveal to be sharp, indicating that, contrary to previous studies, gender is not a determining variable to distinguish between heterosexual and same-sex marriages.

RN27_T10 | Values, welfare and economy

Valuation Of Fiscal Policy By Spaniards: Sociodemographic Profiles and Values

Ignacio Cazcarro[1], Ana Serrano[2], Cristina Sarasa[2]

[1]ARAID (Aragonese Agency for Research and Development), Zaragoza, Spain; [2]University of Zaragoza, Zaragoza, Spain

Within the frameworks of sociological theories, conceptual schemes (e.g Mouritzen, 1987, Inglehart, 1990, Wlezien, 1995,.Svalfors, 2012) and studies such as Noya (1997, 2004), Cicuéndez Santamaría (2017, 2018) and Gutiérrez (2020), the work analyzes the opinion of the Spaniards on the public spending, also relating it to other sociodemographic and economic characteristics on the one hand, and those linked to cultural values on the other hand. New features include: 1) The update of the analysis, using the most updated data of the Spanish Sociological Research Center (CIS), reaching the years 2019 and 2020 in different aspects. 2) The econometric analysis (focused since the years 2000s) that extends the bivariate to the multivariate interpretation, explores different specifications and insights, which show the significance of the different explanatory variables (some standing out among those found as important in bivariate analyzes, and others losing strength, possibly due to the important correlation between them). 3) The association of spending valuation with the fiscal spending implemented, also placing special emphasis on health and the changes in 2020. The results are quite robust to understand public spending especially focused on

welfare policies. These findings point out important recent sociological changes in the assessment of this and some other public policy, which may end up affecting the assessment of fiscal policy. Evidence is also added on the recent trend of "cultural values" gaining more weight than "self-interest" when explaining public spending, although there are differences between categories, which refine the insights on best predictors of Public policies.

Values in Crisis (ViC): Morphological findings of the Greek and Italian version of the research

Sokratis Koniordos

University of the Peloponnese, Greece

The overall distribution of moral values in a population shapes the patterns of human behavior that prevail and affects the overall societal development. Thus, moral values are crucial to the prosperity of a society. The new situation brought about by the Covid-19 pandemic raises questions about the stability of the values we observe in "normal" times. Does it remain the same in extremely unusual moments, such as the massive crisis we are experiencing, which is affecting entire societies? As the available data do not allow this question to be answered, an attempt has been made to collect related and relevant to societal values data. The vehicle for this effort is the transnational survey titled "Values in Crisis", which has been conducted in 13 countries including Greece and Italy; I have participated in the first of these two. The objective has been how the citizens perceive the Covid-19 crisis, what they think about its consequences for themselves, their relatives and their specific society as a whole. In the proposed presentation of the first round of the Greek and Italian version of this research that has just been completed (the first out of three planned rounds), a morphological analysis of selected data will be undertaken based on the information collected from a sample of 1540 and 2000 respondents respectively in order to identify and gauge the emergence of value shifts.

The Recovery Fund and the European Principle of Economic, Social and Territorial Cohesion

Fiorella Vinci

eCampus University, Italy

The recovery fund, if inscribed in the history of European cohesion policy (Piattoni 2016), promotes the exploration of the cohesion principle and its specific political efficiency both at Community level and at national and regional level.

How have the Community principle of economic, social and territorial cohesion and the related cohesion policy shaped the European integration process and, in an interdependent way, national political processes?

Placing ourselves in an analytical perspective, which is widespread among sociologists of public action (Duran 1999, Moini 2013), we propose a reflection on the evolution of the community principle of cohesion and its consequences in national and regional capacities to implement European policies.

In addition to being a set of purposes consistent with a specific political-cultural modulation of the effects of liberalism, it appears to be a set of conditions of possibility of the process of European integration (Vinci 2013). It is as if cohesion from the goal became a political-institutional condition for the implementation of cohesion policies, revealing the importance of the oligarchic composition of community interests and, at a national and regional level, the importance of coordinating multi-level forms of governance.

The analysis of the European principle of cohesion places the primacy of politics but at the same time raises the following questions: could the redistribution of central resources continue to be the prevailing form of European integration? How does the Recovery Fund transform the European cohesion principle established with the European cohesion policy?

Attitudes Towards Risks and the Financialisation of Day-to-day Life in Southern Countries

Matilde Massó, Nazaret Abalde

University of A Coruña, Spain

The objective of this communication is to analyze the process of financialisation of everyday life (Martin, 2002). More specifically, attitudes towards risk, indebtedness and investment are analyzed with data from the "Household Finance and Consumption Survey" (HFCS), developed by the European Central Bank in the euro zone. The methodological plan consists of a conditional multiple correspondence analysis, the purpose of which is to examine the determinants of individual socioeconomic behavior, as well as the differentiation factors between Spain, Italy, Greece and Portugal. The main contributions of research are grouped into two highly related processes: the financialisation of day-to-day life and the individualisation of vital risks. First, the data outlines a weakly financialized scenario of daily life, where protection strategies against vital risks focus on savings and move away from financial markets. Second, it is detected that the process of individualization of vital risks hardly crystallizes in financialized socioeconomic behaviors. Despite the significant cuts to the region's social protection regimes, the data suggest that financial markets are not seen as a source of protection in areas such as old age. This is not the case with housing, which, as a real asset or a liquid asset, continues to be the main channel linking households with global financial channels. The analyses, which have not detected significant differences between the four countries examined, question the financialization of individual economic action in the case of southern Europe, and point to the characterization of a homogeneous model of socioeconomic behavior in the region.

RN27_T11 | Cultural challenges in Southern Europe

Re-visioning Cultural Policies in Southern European Countries During the Post/pandemic Times.

Valerie Visanich

University of Malta, Malta

In various countries, the COVID-19 crisis has highlighted the needed structural reforms in cultural policies to increase the sector's resilience and competitiveness to protect its employees. This paper examines shifts in cultural policies, specifically in southern European countries, in view of the recent immediate state interventions in the cultural sector through the implementation of a number of emergency governmental measures. Due to historical trajectories and geopolitical position of countries in the South, their adaptation modes may be different from other cultural policies typologies. What are the cultural convergences, if any, in the re-visioning of cultural policies in southern European countries? Are we now, more than ever, looking at policies as institutional mechanisms of the welfare state? How accessible and equitable are the aid programs themselves to artists and arts organizations that come from different backgrounds and represent diverse cultural sub-groups? Is there, an ever need for decentralisation of cultural policies? To answer these questions, the paper makes sense of cross-national comparisons of cultural policies in Southern Europe.

The Values of Culture in Iberian Cultural Policies from a European Comparative Perspective

Mariano Martín Zamorano[1], Arturo Rodríguez Morató[1], João Teixeira Lopes[2], Sónia Apolinário[2]

[1]CECUPS, University of Barcelona, Spain; [2]University of Porto, Portugal

Following the classic typology of Welfare States by Esping-Andersen, Zimmer and Toepler (1996, 1999) identified three cultural policy models in Europe: the liberal, the central European and the Nordic models. Other authors have also tried to characterize Southern European cultural policies and even define a Southern cultural policy model (Dubois and Negrier 1999; Rubio Arostegui and Rius-Ulldemolins 2020; Rius-Ulldemolins, Pizzi & Rubio Arostegui, 2019). However, these characterizations are still hesitant and encompass a rather limited range of traits, not always consistent. In this presentation we will develop a focused comparison between Spain and Portugal from a pan-European perspective, regarding the values of culture that that cultural administrations mobilize. In doing so we will add a crucial dimension to the empirical characterization of the cultural policy commonalities between these two countries but also contribute to testing the consistency of this Southern model at large.

In the context of the European research project UNCHARTED (https://uncharted-culture.eu/), which aims to identify the plurality of values that emerge in cultural practices in all the different cultural sphere areas, we have carried out a series of case studies about 12 EU local, regional and national cultural administrations. In Portuguese and Spanish cases, we have developed extensive fieldwork. In a complementary way, we have also carried out a comprehensive documentary analysis about 8 cases belonging to other four contrasted European countries (UK, France, Hungary and Norway). Relevant differences and similarities between the Portuguese and Spanish cases have been taken into account in our comparative analysis. On this basis, the presentation will identify the singularity of values behind current Iberian cultural policies within the EU context.

936

Migrant Newcomers In Spanish Shrinking Areas: Challenges, Opportunities, And Not Just So.

Leticia Santaballa Santos

University of A Coruña, Spain

Southern European countries experienced since the 90s an increased arrival of migrants to rural areas, as a reaction to the transformations that occurred in the traditional occupational activities and the increased opportunities for human mobility.

After the settlement of non-EU newcomers, the Spanish shrinked rural areas, often perceived as stagnant and homogeneous, started an uneven process of reconfiguration, some even sprouting in form of "welcoming initiatives".

Their impact is yet scarcely acknowledged by the literature, mainly focused on migrant labour, international counterurbanization or migrant integration, emphasizing on the migrant dualistic "problem-advantage" view, rather than the communitarian spaces and imaginaries that have been created all along.

This paper, through the results of a qualitative fieldwork carried out in two shrinking Spanish regions, is based on the analysis of semi-structured in-depth interviews with relevant stakeholders (migrant and non-migrant). It offers a preliminary comparison on the impact of non-EU migrant newcomers that settled in those welcoming-shrinking areas, with a special reflection on the effect that the COVID-19 pandemic had on the selected initiatives, not always and not just resulting in challenges or opportunities.

Integrating Science and Technology into the Sports Field: A Sociological Analysis of Flemish Sports Innovation

Michiel Van Oudheusden[1], Kristof De Mey[2], Jan De Bruyne[1], Ine Van Hoyweghen[1]

[1]KU Leuven, Belgium; [2]UGhent, Belgium

This paper illustrates the growing entanglement of science, technology, and sports in Flanders (Belgium). Here, as in other contemporary knowledge-driven economies that invest in sports, the aim of integrating science and technology into sports is now a policy principle and innovation strategy. The article singles out sports innovations in the two leading Flemish sports-innovation clusters of Leuven and Ghent, where quadruple-helix formations between university, industry, government and sports-sector organizations enable the enrolment of sports sciences and technologies into sports-body monitoring and programs for sports talent detection and development. Building on these cases and using perspectives from the sociology of innovation, the article shows how sports innovations are shaped by the agendas, technologies, and organizational practices of participating stakeholders. Rendering these agendas and practices explicit can provide valuable insight into the development of contemporary sports and the ethical, legal and social implications (ELSI) inherent in sports-oriented research and development. This, in turn, can facilitate a more collective stewardship of sports innovation, in line with Flemish and European policy appeals to responsible research and innovation.

Intimancy Places In Sport Teams: From The Silence Wich Start The Vulnerability

Marta Eulalia Blanco García

UNIVERSIDAD COMPLUTENSE DE MADRID, Spain

Sport context is an essential part in society, as a place of socialization and education throughout life (Elías y Dunning, 1992). Because it's tradition, it has been made as a special context for traditional femininity and masculinity exaltation (Diez Mintegui, 1996) which, in these days, leads us to talk about gender labs. According to this concept, characteristic codes are made in which we doing gender (West y Zimmerman, 1987) with performativities crossed by power (Butler, 2001). This performativities are supported in this sport team on a vertical hierarchy organization, but furthermore in a special closeness and sensibility with teammates and coaches (Elías, 1986; Messner, 1992).
Approaching three team-sport disciplines that involve body contact in their practice (soccer, basketball and rugby) normalized dynamics where vulnerability and sexual assault spaces are being silenced, have been observed.
The main objective of this paper is to offer an approach to these contexts, making peculiarities of the mentioned traits and these dynamics that are being normalized more explicit.
This research pursues the following hypothesis:
These sport teams, built on stable and close dynamics, favor the exposure of power of gender hierarchy. Their dynamics intensify intimacy and affection ideals, closely related to romantic love, creating vulnerable spaces for intimate relationships that could lead into a normalized sexual harassment.
The methodology is based in an approach from the situated body (Haraway, 1988) and the discursive analysis through in-depth interviews with coaches and athletes.
We will be demonstrate how gender performativities (Butler, 2001) are empowered in these forms of hierarchy organization. Furthermore, the context's interaction and approach dynamics, provoke intimacy idealizations that can transform these scenarios into vulnerable spaces, mainly for young athletes.

"Half Man, Half Suit": The Ontological Separation Of Subject And Object

Cristiano Smaniotto[1], Julie Emontspool[2]

[1]Aarhus University, Denmark; [2]University of Southern Denmark, Denmark

This article explores the co-constitution of subjects and objects as separate ontological entities. Socio-material approaches convincingly argued that human and non-human actors associate within relational assemblages that create the social world. Despite their valuable contribution, these approaches build on the fundamental assumption of discreteness of being: networks are made of actors, which are made of networks, which are made of actors – ad infinitum. Drawing upon Barad's neo-materialism, we suggest conversely that all entities are originally part of the same ontological substance. In this light, the social ceases to be a problem of association and becomes one of separation: how are entities – such as subjects and objects – constituted as ontologically separate? To answer this question, we draw on a qualitative analysis of newspaper and magazine articles published between 2008 and 2020 about the case of polyurethane swimsuits. These suits were introduced in competitive swimming in 2008 and banned already in 2010 after a much-debated existence. The findings suggest that subjects and objects are progressively separated by three types of interruptions (i.e. events unsettling habitual subject-object arrangements): material, moral and institutional. The introduction of polyurethane swimsuits affected the embodied swimming experience (material interruption). This interruption was followed by a debate around the fairness of the new swimmer-suit configuration (moral interruption), which ended with the ultimate separation of the subject from the object through the enforcement of an institutional ban on the suit (institutional interruption). By articulating the process of subject-object separation, the article contributes to existing debates on the social production of embodied subjectivities.

The Social Construction Of The Gendered Body: The Case Of Women Practicing Sports In Russia

Claudia Patricia Santoliva

Higher School of Economics <<НИУ ВШЭ>>, Russian Federation

The present investigation proposes an approach regarding socially prescribed gender scripts, menstruation, and women who practice "male" sports. Girls are given special instruction in femininity maintenance at the onset of puberty which stipulates female docility through bodily subordination. Since menstruation is not only an organic aspect of women, on the contrary, it is a multidimensional phenomenon that relates social, psychological, economic, biological, and cultural factors, it involves ideas, beliefs, attitudes, practices that women internalize in their day to day and which impact them positively or negatively. Additionally, it establishes a differentiating character between the feminine and the masculine, generating in some cultures segregation, discrimination, and rejection towards the menstruating woman and femininity. This study aims to examine the influence of the menstrual cycle in women´s sports performance while they are menstruating by conducting an analysis in Russia by inquiring about the actions and behaviors of the society regarding these phenomena through a questionnaire. Although being good at sports is inextricably linked to popular perceptions of masculinity, women are expected to perform in a specific way, being professionals but at the same time, keeping their "feminine" characteristics. That is why this research aims to conduct interviews with Russian women who practice "male" sports, in order to understand how do they balance the identities of themselves of being a sports-woman and a woman? And also how do they reflect on their bodies as part of this balancing of being a sports-woman?

The Sporting Excellence Factory: Heritage, Transmission and Development of Sporting Capital

Lucie Forté[1], Christine Mennesson[2]

[1]CreSco - University of Toulouse 3, France; [2]LaSSP - University of Toulouse 1, France

This work addresses the question of the conditions of entering, maintaining and progressing in a high performance athletic "career" (Hughes, 1958) from the perspective of parental educational strategies and the management of dual careers in sport and school. It is based on both a quantitative (questionnaires) and qualitative (interviews and participant observations) survey to address the generic question of the role of family transmissions in intensive sports involvement as well as the limits of this explanatory model. Indeed, while the socialization contexts of " inheritors " (Bourdieu and Passeron, 1964) favor an early entry into practice and the acquisition of dispositions that foster the development of athletic expertise, the non-inheritors start their athletic career later, but are more likely to reach the last stages of the top-level sports career.

Precarity in Amateur Football League:The Turkish Case

Rahsan Inal

Erzincan Binali Yildirim University, Turkey

In general, amateurism in sport evokes sports activities based on purely sportive spirit with no pay. However, the situation in Turkey amateur football league, represents an exception of the general definition since 1950s. This "paid amateurism" practice became known to the public for the first time in 2020 following postponement of amateur football leagues due to Covid-19 pandemic by the Ministery of Youth and Sports of Turkey. Eight months after the decree, amateur football players held a protestation at the gate of Turkish Football Federation for the leagues to begin. The banner they carried at the protest which was an unprecedented event, first in the Turkish sport history were telling that 70 thousand amateur football players had been in starvation for 8 months.

The paper aims to discuss the "precarity" phenomenon among Turkish Amateur Football Leagues in terms of both amateur players' public manifestation and historical development of football in Turkey. The ampirical data of the study were compiled from local and national newspapers, comments of football players published in internet forums and social media sharings. As a result; study reveals that playing amateur football in Turkey is considered as waged work either in the form of fulltime or supplementary, rather than a purely leisure time activity. The most crucial problem for football players is the lack of secure job, public social security due to the lack of "written employment contracts", as is apparent during the Covid-19 epidemic process. Like the fractions of the working class working informal, a-typical and/or with temporary status amateur football players in Turkey too are highly vulnerable, invisible and deprived from an organized power.

How to become a CrossFitter

Bettina Bredereck

Goethe University Frankfurt, Germany

In modern societies, Fitness is not just a goal for a few, it is a way of life, that targets everyone. Fit people are recognized as intelligent, productive, and disciplined. "Fat people" on the other hand are categorized as lazy and unproductive. Furthermore, being fit means being healthy, people who are not fit, are "risking their lives".

Within this dispositive CrossFit has its own discourse. It is a fitness sport with varying functional movements, that uses elements from Olympic weightlifting, gymnastics, rowing, running etc. The workouts are done together in small groups that are guided by a coach. The goal is to work out as fast and as hard as possible. It is a group activity, but everyone tries to improve within their own possibilities.

In my research the question is: How are CrossFit subjects constructed? How can the CrossFit subject be defined? Inspired by the theory of Judith Butler, I analyze data about CrossFit from social media, books and movies, but mainly through ethnographic work and interviews with athletes. The research is framed by subjectivation analysis which is deeply related to discourse analysis.

First results show that CrossFit has an unique way of bringing together the concept of self-optimization and of a community that helps each other. Even though the idea of fighting against one's own limits cannot be made

940

visible by numbers it is the foundation of feeling connected to each other. So rituals and other practices are taking place to construct this specific idea of a community and the CrossFit subject within.

Judo As Social Practice

Valerio Zanardi

UB, Spain

A long term ethnogapich reasearch to Judo practice in a peripheral neighobrood, powered and strengthened with indeed interviews, is curiously able to reveal as the practice of practice of sport is able 1) to allows participants, beyond deep social and cultural differences, to build quite solid ties and 2) lead them to some kind of informal educational path to non-zero-games collaborative attitude 3) to make them more opened to accept race, status, income differences.

Surely these processes are indirectly fabricated through the ritualisation of every detail of this social practice and feeded with some kind of exoticism to ancient oriental wisdom, but the result of this ongoing research are oriented to check out if the institutionalisation of judo intended as a liminoid practice, can steer practitioners towards political and moral values.

RN28_T06 | Sport and contemporary societies

Weightless Weigh-ins: White-collar Boxing, Rationalisation, and Late modernity.

Edward John Wright

Nottingham Trent University, United Kingdom

This paper relays findings and theorisations from a six-month ethnography of white-collar boxing club undertaken in the Midlands of England. Here, white-collar boxing can be understood as a form of short-term engagement in the sport of boxing. Complete beginners to the sport of boxing undertake eight week training camps, culminating in a public fight night. As per most forms of boxing, these matches are preceded by weigh-ins. However, unlike most forms of boxing, white-collar boxing matches are not made according to weight. This brings to the fore the question: why do weigh-ins happen at all in white-collar boxing? Through engaging with

weigh-ins ethnographically (via participant observation and interviews) it becomes apparent that weigh-ins retain ritual purposes, whilst being shorn of their nominal meaning. Weigh-ins re-cast training as the past and allow for transition to fight night as present. They also serve the purpose of revelation: it is at the weigh-ins that white-collar fighters learn who their opponent is. That these are 'weightless weigh-ins' is also of broader significance, in that boxing became codified as a sport in and through modernity, with rationalisation of weight being a key facet of this codification. White-collar boxing weigh-ins, which do not operate according to such rationality, therefore allow for engagement with debates over whether we have surpassed modernity. To this extent, throughout this paper, I will argue that white-collar boxing is a subjunctive performance of modern rationality.

Not Just A Game: ESports, The Last Challenge For Mediated Sport in Global Era

Giovanna Russo[1], Barbara Mazza[2]

[1] "AMS" University of Bologna, Italy; [2]Sapienza -University of Rome, Italy

941

This paper intends to discuss the eSports topic as amateur entertainment, trying to analyse the differences compared to those to traditional media.

What drives an individual to became an esports spectator/consumer? What are the differences compared to traditional forms of use? Do the interpretative categories of fans and competition require a revision of the models or are they also applicable to eSports? Is it still possible to interpret the electronic game (its competitions and the fans) according to the traditional categories developed by Huizinga, Caillois, Bateson? And again, what impact do the spectacularization processes have in the interpretation of the phenomenon (following Debord, Baudrillard, de Knop)?

The scientific interest aimed at eSports spectators has focused above all on their profile and on the motivations that guide the user to gaming world. The growing interest in competitive video games is in fact confirmed by millions of viewers who watch the competitions every month (Keiper et l. 2017). This trend has further expanded during the Covid-19 pandemic. On the contrary, it is interesting to note that there is a loss of interest on the part of young people towards the spectacle of sport on traditional media and, more generally, around the logic of supporters and

participation that follow usual patterns. Are these changes only the expression of a specific phenomenon (esports) or do they denote significant transformations in following interests and passions and composing one's agenda in the entertainment sphere? The first results of an ongoing research among young university students indicate changes in this regard.

Playing Football Behind Closed Doors: A Natural Experiment on the Impact of Crowd Support on Home Advantage

Michael Weinhardt

Technische Universität Berlin, Germany

In Football, as in many other sports, home teams have a significantly higher chance of winning a game. This effect has been known about for a long time and exists basically all around the globe. However, while this effect has shrunk over the years, the exact causes have remained unclear. They may include familiarity with the field and stadium, travel burdens for the away team, and, of course, the crowd's support for the home team (either directly, by affecting players' performance, or indirectly, by pressuring referees). Since the start of the Corona-pandemic, all major leagues in Europe had to adapt to the challenge of playing football while simultaneously minimising the risk of spreading the virus. As part of the containment strategies set in place, playing in empty stadiums without supporters is now the new normal. The resulting artifical setting for playing league games creates a natural experiment on the effect of home crowd support on the match result: As no supporters are present, the home advantage should vanish or at least diminish significantly if crowd support is the major driver. Indeed, early analysis from various disciplines find that home advantage has clearly decreases in those games played "behind closed doors". However, these results may be biased, as the first full season without supporters will only finish in the summer of 2021. The current study will exploit this opportunity, comparing results after a full round of league games to those of earlier studies, and will explore which factors may mediate the overall effect. It will also discuss the challenges involved in using this artificial setting as a natural experiment.

RN28_T09 | Sport and Identities

Jewish Identity of Ajax Amsterdam, Tottenham London and Cracovia Krakow Fans: A Comparative Study.

Bogna Wilczyńska

Jagiellonian Univerity, Poland

The football clubs Ajax Amsterdam, Tottenham London and Cracovia Krakow and their fans are commonly referred to as „Jews". Interestingly, many of the supporters from London, Amsterdam and Krakow appropriated the Jewish image and embraced it as a part of their fandom identity. They use symbols and content which are clearly associated as Jewish even if their clubs have never been Jewish organisations and the vast majority of them are not Jews. The objective of this paper is to describe and explain the main characteristics of the phenomenon of what I call "Jewish identity" of the fans. It is part of an on-going study, funded by the Polish National Science Centre under the project no. 2016/21/N/HS6/02406. Field research in London, Amsterdam and Krakow was conducted from 2017 to 2020. The research was based on sociological and anthropological qualitative methods, above all in-depth interviews with the fans and participant observation in the stadiums during Tottenham, Ajax and Cracovia games. The analysis and interpretation of the material collected for the study will allow me to explore the questions of "how", "why" and "what" happens in the stadiums (and outside of the stadiums) from the perspective of the fans in the context of their "Jewish identity." I will also be able to investigate the role of the social memory about pre-war history of the teams in this identity construction. The most important goal in my project is to explain the motivation the fans have for developing this specific identity and disclose the stereotypes and notions about the Jews this identification is based on.

942

Nation Formation and International Sports Events: Olympic Nationalism in Early Republican Turkey

Yavuz Yavuz

Ankara University

The aim of this research is to understand the role of international sports in the process of Turkish nation building during the formative years of the Republican Turkey (1923-1950). The international dimension of sports was crucial for the construction of Turkish national identity in this period. Sports, with the competition between national teams and athletes as well as the emotive expressions of their supporters, provide lieus for the manifestation of nationalist aspirations. Sports mega-events such as the Olympic Games, through hosting the event or participation, provide the foremost platforms for such expressions due to their international and competitive characters. Since the emergence of a national consciousness among the Turkish modernists was mostly related to the encounters they experienced with nationalist movements and views in Europe in late Ottoman era, international sports events which facilitate such encounters constitute a significant topic of analysis for the intersection of sports and nation building during the early Republican Turkey. The aim of this study is to inquire how the sporting encounters in an international setting served as a means for defining the boundaries of the national identity, for the nationalist politics of the early Republican Turkey. Based on an archival research, this study examines the construction of the modern Turkish national identity through international sports, with a focus on the first four Olympic Games Turkey attended, which are the 1924 Paris, 1928 Amsterdam, 1936 Berlin and 1948 London.

The Meaning of Shooting Clubs as Social Spaces for Extremist Radicalization in Germany

Hannes Delto, Andreas Zick

Bielefeld University, Germany

Sports clubs are gaining significance in the public discourse on the prevention of extremism and radicalization. Although sports can unquestionably contribute to prosocial behavior and have time and again been conceived as a "social glue" of society, sports shooters or shooting club members in general are frequently described as nationalists and right-wing extremists. Apart from a rather fragmentary typology of "problematic shooters" that distinguishes between a "hard-to-influence," an "overly anxious," and a "withdrawn" type, we know little so far about right-wing extremism among sports shooters and the socio-structural embeddedness of shooting clubs.

To close this empirical gap, we have for the first time investigated shooting clubs. Our research is based on specific cases and includes socio-structural indicators in our comparative secondary analysis. We ask to what extent disparaging attitudes such as right-wing extremist orientations and socio-spatial specificities (climate of hate versus climate of diversity) allow any "deviation from tradition" at all.

Our presentation begins by focusing on deadly attacks motivated by racism and xenophobia that have been committed by sports shooters in the recent past in Germany and discusses the role of shooting clubs in the context of socialization, radicalization, and the increasing polarization of society. We conclude that the effectiveness of engaging in sports as a means of prevention (i.e., distancing and de-radicalization) is determined by multiple factors and does not depend on the extent to which an individual is involved in sports activities per se. To get to the roots of radicalization for the purpose of prevention, we propose that shooting clubs be much more extensively involved in local conflict and risk management.

943

Sport for Development, Social Change, and Double Reflexivity

Eva Soares Moura, Dino Numerato

Charles University, Prague, Czech Republic

In our paper, we use and elaborate upon the concept of reflexivity to analyse the capacity of sport for development (SfD) initiatives to foster social change. We argue that SfD initiatives represent an example of reflexive modernisation, underpinned by calls for social change in and through sport. By empirically focusing on two SfD initiatives in Brazil, this paper critically explores the SfDs' transformative capacity and contribution to social change. The data that underpin the analysis is drawn from eleven months of ethnographic research undertaken between 2017 and 2018 in two organizations in São Paulo, Brazil, which use sport to empower women and achieve broader societal objectives within low-income communities. Participant observations and semi-structured interviews with key stakeholders, managers, educators, and the participants of the projects were conducted. In addition to providing evidence of the transformative capacity of SfD initiatives and inspired by our previous research in the context of football fans activism (see Numerato, 2018), we demonstrate that the emancipatory potential of SfD initiatives imprinted in their reflexive nature is potentially hindered due to five specific processes: auto-referentiality, strategic appropriation, alteration, loosening, and anti-reflexivity. By introducing the notion of double reflexivity, we further argue that some of these processes that undermine the transformative potential of SfD initiatives are subjected to further reflexive scrutiny. In other words, we conclude that sport for development initiatives not only represent a vehicle of reflexive modernisation but, at the same time, have increasingly become an object of reflexive scrutiny.

RN28_T10 | Sport, Physical Activities, and Inequalities

The Law of Prevention and Fight Against Violence that generates Violence. The growth of the casual subculture in Portugal.

Daniel Alves Seabra

Fernando Pessoa University, Portugal

944

The casual subculture has grown considerably in Portugal since the beginning of the 21st century. The use of designer labels, the preference for a certain style of music and, above all, the condition of football club fans that leads them to travel in small groups to accompany the teams that represent them, seeking to engage in acts of violence against supporters of opposing clubs, characterize, in whole or in part, those who are part of the casual subculture.

It results from the convergence of former members of ultra-groups that support football clubs, in addition to others that, due to their behavior, can be considered hooligans. This communication stems from a "work in progress" and aims to identify the reasons for this growth. The semi-directive interviews already carried out showed that the successive laws approved by the Portuguese legislature with the objective of preventing and combating the violence of the supporters had, contrary to what was intended, the perverse outcome of creating conditions for the growth of the number. of supporters who integrate this culture to practice acts of violence against fans of opposing teams, even outside the context of a football match. The communication aims to make known the legislative measures to combat violence perpetrated by elements of ultra-Portuguese groups and, above all, the perverse effect of these measures in increasing the phenomenon they intended to combat. .

Why Sport? Understandings Governing the Provision of Physical Activities for Persons with Severe or Profound Intellectual Disabilities

Eero Olavi Saukkonen[1], Susan Marie Eriksson[2]

[1]University of Helsinki, Finland; [2]South-Eastern Finland University of Applied Sciences

Young persons with disabilities face many societal barriers to equal participation in society, ranging from inaccessible physical environments to negative attitudes and lack of necessary support. While research on these barriers has focused on some key areas such as education and employment, other areas of life deemed important in the UN's Convention on the Rights of Persons with Disabilities remain thinly researched. One of those areas is participation in play, leisure and sporting activities.

Ethnographic data gathered in our ongoing project on the sporting opportunities of youth with severe or profound intellectual disabilities (SID/PIMD) in Finland has corroborated the findings of earlier national and international studies. These showed that youth with disabilities have reduced options in how to spend their leisure time, including in physical activity. The data also show that youth with SID or PIMD, who require continuous assistance and may have little verbal communication, have reduced opportunities for participation in sport in contrast to youth with less severe disabilities.

We have seen that physical exercise in the lives of youth with SID or PIMD continues to be understood by institutional actors and medical professionals mostly within the framework of physical health, while the well-researched psychological and social aspects of physical activity are often ignored. Some actors are nonetheless challenging this medical dominance through a rights-based approach more sensitive to these issues. The Covid-19 pandemic, however, has shown how radically participation opportunities have been curtailed for these youth based solely on health considerations, in contrast to their non-disabled peers.

Women's Football and Inequalities: Analysis of the Logic of Feminisation of Clubs in the Hauts-de-France Region

Audrey Gozillon

University of Artois, France

Despite a feminisation plan launched in 2011, the feminisation rate in French football is struggling to exceed 7.4%. The literature review carried out on the issue invites us to explore an angle left blind by the scientific community, the so-called "meso" level, this intermediate level which concerns the social conditions for the supervision and practice of so-called women's football. Although they are subject to injunctions from the French Football Federation, sports associations often claim "a certain political and strategic autonomy" (Bayle, 2007) which could explain the gap between institutional decisions and their implementation.

The combined use of social change theory and resource mobilisation theory has made it possible to consider women's football as an 'innovation' that integrates more or less well into football society and to show to what extent this innovation, which is not 'adapted to local conditions, may not produce the expected benefit' (Mendras & Forsé, 1991).

Our empirical system is based on 111 semi-directive interviews conducted in the 83 women's associations or those which form part of the women's section of the Hauts-de-France League. The analysis of the discourse collected has brought to light a set of sporting and organisational variables which play a role in the structuring of different logics of feminisation. The typology to which it leads not only aims to assign football clubs to fixed categories, but also invites the development of a dynamic approach to the feminisation process.

Effects of Social, Demographical and Socialization Factors on Sport Activity of Students in Central and Eastern European Higher Education Institutions

Klara Kovacs

University of Debrecen, Hungary

Several national and international researches draw attention to the inactive lifestyle of youth, including higher education students, and also how sports habits are determined by the individual's sociocultural and demographic situation (Eurobarometer 2018; Nesic és Kovasevic 2011; Bichescu 2013; Perényi 2010; 2013; Ádám et al. 2018; Kovács 2019). Based on these researches and Bourdieu's theory of capital and habitus, the main aim of our presentation is to examine the social background of Hungarian and cross-border students', (mainly Hungarian minority students from Slovakia, Serbia, Romania and Ukraine) sports habits. Our main question is which sociocultural, demographical (gender, country, nationality, material status, parents' educational level, type of residential settlement) and socialization factors (sporting together with parents and friends) have affects. Based on students' leisure activities and cultural consumption three student habitus groups were created. The PERSIST 2019 research database was used for the analyzes (N=2005). The survey was conducted in 2018–2019, in the Northern Plains region of Hungary and in four neighbouring regions outside Hungary. In the neighbouring countries, primarily the students of ethnic Hungarian institutions of higher education were involved in the project. According to our results classical social background variables (such as cultural and economic capital or the type of residential settlement) do not play any role in frequency of doing sports, rather the habitus has an important influence. The more important the various sports programs play in the daily life of the family, the more parents have different experiences whit their children by doing different types of sports, the more likely it is that lifelong sports will take place and become an important part of their lives as students.

"Acting Together in Asymmetrical Ways: Towards a New Sociological Understanding of Asymmetrical Coaction"

Anna Engstam

Lund University, Sweden

How can we sociologically grasp asymmetries that permeate social life? By way of introduction, I would like to emphasize three dimensions of [a]symmetry: differences in resource holdings and [a]symmetrical resource distributions; [a]symmetrical distributions of tasks and responsibilities, rights and duties that follow from social differentiation and social positioning; and qualitative and quantitative differences when it comes to how entangled social actors contribute to the accomplishment of social events through interrelated social actions and reactions. My suggestion is that the third dimension is understood in terms of [a]symmetrical coaction: through more or less asymmetrical social coactions, social actors relating to each other in one way or another together accomplish all those social events that constitute social life. From an analytical distinction between social coaction and social interaction, I will proceed with the question of how social coaction is possible. Arguably, taking the plausible social responses and reactions of other social actors into consideration is crucial; so is imagining how other social actors might have taken plausible social responses and reactions into account when acting. The question, then, is how social actors do this. Via retroduction it is possible to arrive at social microprocesses that must go on for social actors to be able to accomplish social events. Theoretical insights into how social actors presumably relate to one another through their social actions and reactions may lead our attention to who makes coacting possible and how. Starting from a theoretical idea of enlarged mentality, I have distinguished four types of mentalization as well as

four types of enlarged mentality. Hopefully, these suggestions can further sensitization to asymmetries when analysing social coaction. Reciprocity in no way contradicts asymmetry.

Technoscientific Utopia. Problematizing the Crisis of Utopia

Roberto Favalli

University of Padua, Italy

Referring to the last few decades, several authors have spoken of "end" and "crisis" of utopia. Are we really facing a crisis of utopia? This paper aims to problematize these assumptions starting from the acknowledgement of the centrality of scientific pervasiveness and technological innovation in contemporary society. Moving between the fields of social history of science, utopian studies and sociology of the future, through the concept of "technoscientific utopia" it is possible to trace the features of a European utopian discourse, that is likely to share a tight, longstanding relationship with the technoscientific level. In the first place, through a historical-diachronic analysis of literary utopias it is possible to highlight this continuity. Secondly, through a discourse analysis of the languages and rhetoric adopted in the field of science fiction, future studies and within the arena of the public communication of science (PCOS), it is shown that in our contemporaneity there is still a utopian discourse and that it is mainly of a technoscientific utopian discourse. Furthermore, the question of the "crisis of the future" is not only a relevant from a sociological perspective, but also from a social and political one. With respect to this crisis, the technoscientific system is among the actors competing for a possible social delegation on the "direction to take". With respect to the Covid-19 pandemic, quoting a headline in The Guardian, "we need to reinvent ourselves"; and it is precisely science and technology that could play a key role in this general rethinking.

947

Archaica and Its Projection on the Future of Our Societies

Uliana Nikolaeva

The Institute of Sociology of the Russian Academy of Sciences (ISRAS), Russian Federation

The concept of linear progress for a long time dominated in social philosophy. It seemed that the agrarian society naturally replaced by industrial and then replaced by industrial society postindustrial. Progress is irreversible. The old and primitive always replaced by more sophisticated, new and efficient. However, as it turns out, the past does not disappear without a trace. Most modern processes - for example, the process of globalization - generate two opposite effects:

1)The worldwide distribution of the latest technical and economic progress;

2) Re-animation and spread throughout the world of the most archaic forms of social and economic interaction (criminal shadow economy, corruption, violence, and other).

Primitive, archaic social and economic relations under the influence of globalization are widely distributed around the world. It seems no one can stop them.

What are the 'archaic attitudes'? They are diverse. They are described by the major economic anthropologists in the twentieth century, namely Bronislaw Malinowski, Marcel Mauss, Karl Polanyi and others.

Firstly, it is the earliest - primitive, primordial, pre-class. It is a relationship of mutual aid, reciprocity (in terms of Karl Polanyi) and exchange of gifts.

Secondly, the period of transition from a primitive to a civilized society. It is a relationship of direct violence and physical pressure on the part of the militarized groups.

Thirdly, the so-called "eastern", "redistributive" societies (K.Polani), or "Asiatic", "Asiatic mode of production" (in terms of Marx).

The purpose of my paper is to emphasize how deep-seated social and economic processes, and first of all, the processes of globalization produces a contradictory impact on modern societies both Western and in non-Western societies.

Between Charisma and Utopia

Csaba Szalo

Masaryk University, Czech Republic

Both effective charisma and utopia are collective achievements. Collectively shared utopian consciousness is according to Mannheim oriented toward the transcendence of social reality. What more, utopias differ from ideologies because of their successful performance of a counter-activity that reshapes the concrete historical form of social existence in accordance with their wish-image. This paper discloses the cultural background assumed by sociological theories of utopian and charismatic performance. The hermeneutic concept of the horizon is addressed to reconstruct the ways we imagine radical cultural change sociologically.

RN29_T01_02 | Imagination and Social Theory

Imaginaries, Identities and the Social

Angelos Mouzakitis

University of Crete, Greece

Drawing on a wide range of theoretical perspectives this paper explores the complex and often indeterminate links between collective representations, symbolic systems and institutions on the one hand, and the processes of emergence, coagulation and change of collective and personal identities on the other hand. It also focuses on the effects of the symbolic/conceptual field on social action and on the emergence, maintenance and change of social systems. At the center of this investigation abides an interest in the elucidation of the relationship between "social imaginaries" and forms of "narrative", especially in conditions of modernity. This aspect of the problem is explored through the critical assessment mainly of the works of Ricoeur, Castoriadis, Charles Taylor and Suzi Adams that (with the exception of Castoriadis) are broadly related with phenomenology and hermeneutics. The paper also subjects the insights developed within the aforementioned theoretical perspectives to the critique of systems theory. Crucial in this respect is Luhmann's conception of the couplet

system/environment primarily in terms of difference, which allows us to also consider the problem of identity and (radical) alterity both from a sociological and philosophical point of view. Luhmann's views are also important in allowing me to juxtapose his positions with the role Habermas attributes to symbolic elements in the development of societies, as expressed in his rationalization/secularization of the lifeworld thesis. Finally, the paper explores Giddens's and Archer's positions concerning the importance of the body for the construction of self-identity and social action.

Images of Relations and How to Reimagine Them

Yasar Bukan

York University, Canada

This paper broadly explores and critiques the ways in which the phenomenon of relations have been pictured and theorized, particularly in the western and Islamic traditions, and proposes a new way of imagining them. To start with, I will examine how Aristotle theorizes relations in his Metaphysics and Categories where he generally imagines them in the form of 'than something' and then show how Ibn Sina, although heavily influenced by the Aristotelian conception, reimagines them. Next, I will explore how relations were pictured as 'in-between-things' in the modern sociological and logical traditions, particularly in the works of sociologist Max Weber and logician Charles Sanders Peirce. Finally, I will argue that relations as such should not be perceived purely in terms of relatives or as that which actualizes in between things, nor should they be simply pictured as lines or dots. I contend that such traditional theorizations of relations limit our understandings of relations and the scope of social theory. The imaginings and conceptions of relations should rather represent the ways in which relations exist in social and non-social realities where they exist in infinite forms, manifold representations, and indefinite actualizations. With such an open-ended and perhaps incomplete alternative imagination of relations I suggest that it is not only possible to enrich our understanding of relations it is also necessary for conceptualizing the present of social imagination and its future.

Speculative Literature and the Sociological Imagination

Daniel Davison-Vecchione[1], Sean Seeger[2]

[1]University of Cambridge, United Kingdom; [2]University of Essex, United Kingdom

Since 2019, Daniel Davison-Vecchione and Sean Seeger have been working on a series of journal articles and essays on the relationship between speculative fiction and social theory. In this paper, the authors will discuss their joint research, how it could be further developed, and what it so far has taught them about the potential fruitfulness of scholarly work at the meeting point of literary studies and sociology.

Davison-Vecchione and Seeger's research places works of speculative fiction – e.g. utopias, dystopias, science fiction – into dialogue with works by social scientists and theorists, including C. Wright Mills, Clifford Geertz, Daniel Bell, and Max Weber. It also looks at texts that straddle these genres, such as certain nonfiction writings by H. G. Wells, George Orwell, and Aldous Huxley. Its starting point, partly inspired by Mills' concept of the sociological imagination, is the insight that there is an irreducibly speculative dimension to all forms of theorising about society. To think critically about society involves taking an imaginative distance from the world as it is to begin to envision it otherwise. Accordingly, there is an overlap between social theory and speculative fiction that is yet to be fully determined, especially in how they attempt to envisage human social existence in both its variety and its interconnectedness via imaginative extrapolation. As such, Davison-Vecchione and Seeger's work provides one possible model for how a conversation between literary studies and sociology might yield a fuller understanding of the speculative aspect of sociology and the sociological potential of speculative fiction.

Civilizational Imaginaries and Interpretations of Modernity in Contemporary Russia

Mikhail Maslovskiy

Sociological Institute of FCTAS RAS, Russian Federation

The paper discusses the civilizational aspect of political imaginaries which became predominant in Russia in the 2010s. Overall the idea of Russia's unique civilizational identity occupied a central place in the discourse of the political elite during that period. It has been noted that in today's world different state and non-state actors are increasingly acting in such a way as if civilizations existed and relations between them mattered in world politics (Gregorio Bettiza). From this perspective civilizations can be regarded as a form of 'imagined communities'. Some commentators have stressed a 'Eurasian' civilizational component of the current state ideology in Russia and its impact on foreign policy. However, it has been demonstrated that this ideology presents Russia as a non-liberal European civilization that does not follow the Western path of development. But in order to make sense of Russia's political imaginaries we need to consider not only civilizational discourses but also interpretations of modernity. The present world situation can be seen through the prism of attempts at reinterpreting modernity with significant regional varieties (Peter Wagner). The paper substantiates using the concept of interpretation of modernity for the study of ideological trends in contemporary Russian society. It argues that the predominant ideological discourse of the political elite includes not only elements of various civilizational imaginaries but also a specific interpretation of Soviet historical legacies and a non-liberal interpretation of European modernity.

RN29_T02_01 | Epistemology and Social Theory

Beyond or Towards Epistemological Anarchism – Invoking Feyerabend's Dream or Awakening the Unknown Nightmare?

Krešimir Žažar

University of Zagreb, Faculty of Humanities and Social Sciences, Department of Sociology, Croatia

950

In his seminal book 'Against Method' (1975), Paul K. Feyerabend contested the privilege of modern science to monopolize the knowledge field, and advocated for 'epistemological anarchism' in which all types of knowledge would have equally relevant status. The main thesis of this paper is that nearly half a century later a sort of epistemological anarchism has indeed emerged. This point is anchored in the analysis of particular features of the ongoing global coronavirus pandemic, which is imbued with a proliferation of diverse scientific, pseudoscientific, astrologic, religious and other types of explanations, concerning the origins of the pandemic, strategies for coping with it, remedies, vaccination process etc. In a variety of approaches, science can barely be conceived as a homogenous entity, as disagreements, diametrically opposite standpoints and advice for pandemic mitigation strategies appear. While due to the inherently anti-dogmatic attributes of science nobody expects a consensus among scientists concerning these complex matters, salient incongruences in standpoints have severely undermined the confidence in science and even amplified the 'epistemic cacophony'. At least 2 positions can be taken as to how to evaluate the depicted circumstances: 1) epistemological optimism according to which the overall human cognition would advance, if it were more open to non-scientific ideas; 2) epistemological pessimism which suggests that dethroning science would represent a regression towards pre-modern ways of thinking with possible harmful social effects. Regardless of the preferred option, it is apparent that epistemology is becoming one of the most relevant discussion domains in societies of the 21st century.

Sociology Of Absences: Theorizing From The Margins

Vincent Kretschmer

University of Vienna, Austria

The Covid19-Pandemic has notably led to significant societal change and confronts Sociology with great challenges. This paper argues for introducing the absent as socio-theoretical category to understand marginalizing effects triggered by the current crisis theoretically. The sociology of absences seeks to show that the non-existent is actively produced through communicative action as non-existent, meaning an inconceivable alternative to the existent. In discussing the relationship between Communicative Constructivism and Decolonial Theory, it makes a case for a protosociological understanding of the phenomenology of the absent which is structuring communicative Life-Worlds. Consequently, every-day Communicative Action, which constitutes intersubjective Life-Worlds, must be understood and revised critically from a decolonial stance, emphasizing the importance of Communication Power and therefore discovering unequal impacts of "working acts" (Wirkhandeln). Then, emerging from this Theory of Action and based on colonial matrices of power and knowledge pervading the modernity, cultures of knowledge are formed systematically by epistemic absences and produce absent subjects. Considering the Covid19-Pandemic and the following shift towards the digital, processes of the production of absences within digital worlds have to be examined, going from the materiality of digital technologies to data epistemologies, and provoking marginalization. Finally, the Sociology of Absences wants to give an impulse to consider new socio-theoretical dimensions which provide a basis to image alternative futures and activist practices. Specifically, this paper seeks to contribute to a transversal north-south dialogue towards a transmodern future.

Socioneuroscience: Contributions From And To Social Theory

Garazi López de Aguileta[3], Sandra Racionero-Paza[1], Esther Oliver[1], Carmen Elboj[2]

[1]University of Barcelona, Spain; [2]Universidad de Zaragoza, Spain; [3]University of Wisconsin-Madison

Research in neuroscience is being very fruitful in providing evidence about the influence of social experience in the architecture and functioning of the brain. In so doing, neuroscience is posing new and fascinating research questions to examine in depth the social processes that produce those neural changes. To undertake the task of tackling such research questions, evidence from the social sciences, including social theory, are central to better understand how different types of social experiences produce different types of synaptic changes and even modify subcortical brain structures differently. It will be the dialogue between neuroscience, other natural sciences and the social sciences which will advance the scientific understanding of plastic changes in the brain which result from complex social experiences that have been traditionally studied by the social sciences. Socioneuroscience constitutes a new arena for such interdisciplinary dialogue and research that can both advance the scientific understanding of the human brain and provide evidence-based solutions to most urgent social problems. Socioneuroscience studies the relations between the human brain and social interactions taking into account knowledge from all social sciences and the natural sciences. This presentation will introduce the concept of socioneuroscience, and the important role that sociology and social theory play in it in dialogue with all the other sciences.

RN29_T02_02 | The Virus and the Pandemic

Pandemic and Paradigm Shift in Japan

Machiko Nakanishi

Chukyo University, Japan

The purpose of my talk is to discuss about paradigm shift after pandemic in Japan.

In 2020, coronavirus has been spread all over the world including South Pole. I believe this pandemic is one of the consequence of rapid globalization. In Japan, the rate of infected was increasing. Tokyo Olympic game 2020 was decided to be prolonged 2021. On 16th April 2020, Japanese government declared emergency over coronavirus all over Japan.

Pandemic has brought great worldwide economic recession including Japanese economy. Especially tourists, airlines and entertainment companies are so serious that some company went bankrupt. In addition freelance employee could not earn at all.

Pandemic has much changed Japanese system. As we obey rule without government order with collective reflexivity, increasing tele-work, restaurant and bar early closing etc. have made our life change. We have changed to focus on not only working but also domestic and local life. As online rapidly diffuse, it has made border between real and virtual ambiguous.

Paradigm in Japanese society has dramatically changed in 2020. I believe collective reflexivity, working better in Japan than rational reflexivity, working in the West sigificantly affects our paradigm shift. As a a result, we will take back to originally human life in association with others, living things including virus and AI after pandemic.

Spatial Moorings of Social Life and Coronavirus Crisis: Theoretical Debates and Changes

Margarita Barañano, José Antonio Santiago

Complutense University

The crisis triggered by the Corona-Virus has contributed to making visible the importance of the spatial dimension of social life, especially its anchoring in specific spaces. The importance of home has been evidenced, converted during confinement into the main area of daily life; the relevance of interactions in proximity spaces; of the recombination of face-to-face and virtual interactions; and of changes in mobility and immobility.

The objective of this communication is to show how the understanding of the possible futures associated with this crisis requires taking into account the relevance of these rooting spaces of social life, as well as their recent transformations. To this end, the theorization of roots and mobilities by the mobilities paradigm is debated (Urry, 2007; Sheller and Urry, 2018). The contributions from the feminist approach to the "spatial turn" are also taken into account (McDowell, 1991; Hyden, 1996; Ahmed et al, 1994), as well as those supported around the notion of home (Blunt & Dowling, 2006; Boccagni, 2017). Special attention is also paid to the transformations that these roots have registered in a context of globalization (Massey, 1994 and 2007; Cresswell, 2004), and of pandemic crisis.

Records Of The Virus: Envisaging Alternative Futures Through Testimonial Practices

André Marinha[1], Bruno Rocha[2]

[1]ISCTE-IUL, Portugal; [2]NOVA FCSH, Portugal

Social science research has historically been drawn alongside 'abyssal epistemological lines', for the formal systematic register and collection of knowledge about society emerged in articulation with the development of the modern State. The latter was fundamentally a stake of legitimate power and knowledge, whose articulation and existence was objectified in the emergence of national statistical institutes and archives. The centrality of these institutions as source providers for social sciences' foundational works (e.g., Durkheim's Suicide and Weber's sociohistorical study of religions) seems to confirm that knowledge about the workings of society have been foremost produced through a seeing like a state perspective. Such vision entailed both 'presences', those who underlined the legitimate modalities of scientific practice and cultural forms, and 'absences', those who challenged these epistemological postulates. Those who were absent were simultaneously those who developed alternative, testimonial modalities of engagement with social theory, as one finds in Du Bois's The Souls of Black Folk (1903).

This paper builds on an ongoing multi-sited ethnographic research that explores the potentialities and limitations of reconstructing testimonial practices as historically-bounded social practices that anticipate the need to integrate different social temporalities in sociological knowledge.

Hence, this work explores the temporal-simultaneity of individual testimonies or ego-documents (short audio and video records, poems, biographical literary forms, diary entries or social media posts, 'running' and auto-ethnographic reflexions) as reliable sources to grasp shared presents - restricted individual stories embedded in the same general sociohistorical plot - and alternative futures imagined within experiences of social distancing and isolation.

Can a Virus change Society? Modern Society from Durkheim to Foucault - and back again?

Frank Welz

University of Innsbruck, Austria

The coronavirus crisis has shown that our sociological knowledges were not well prepared for making sense of the ongoing changes (Connell 2020). My attempt will seek advice from two classical theorists: Durkheim and Foucault. My analysis proceeds in three steps: First, I will remind the key features of modern society according to Durkheim by applying them to the Keynesian welfare state of the golden age of postwar capitalism (1945-1975). If society succeeds in building organic solidarity despite the extreme division of labour, society will enable autonomous lives of its individuals. Second, I will discuss the change from welfare to neoliberal capitalism (1980-2020) under Foucaultian lenses. Self-governed 'Me Incorporated' individuals have replaced Durkheim's organic solidarity of social responsibility. A preventive health-care model replaced curative health-care. Finally, I will analyse whether the Corona intervention is challenging the established order by focusing on concrete practices in three respects: the economy (market vs state), social infrastructure (private vs public health care) and self practices ('me first' vs 'others first'). The direction the future will take will depend less on our sociological knowledges but more on the outcome of the last part of the analysis mentioned earlier: Which are the new and/or old conditions (and outcomes) for the ongoing constitution of contemporary subjectivities?

953

RN29_T03_01 | Social Distancing and Social Theory

Social Distancing And Forms Of Interaction – Bodily Movement In Space As Communicative Action.

René Tuma

TU Berlin, Germany

This presentation approaches the phenomenon of social distancing from a micro-sociological perspective. Drawing on empirical analyses of everyday interactions conducted in a comparative video data collection project in Germany in 2020, the paper discusses how the analysis of the changing social forms of spatial interaction can make theoretical contributions to theoretical discourses in sociology.

"Social Distancing" as a practical form of avoiding the spread of the virus interrupts the routinized and institutionalized forms of interaction in nearly every sphere of interaction in public spaces. Therefore, the practical doing of new "proxemics" and the adaption of new routines of interaction to forms of interaction can be seen as a practical challenge, but from the perspective of sociology it allows for insights into the often-overlooked methods of spatial movement, action and communication.

Based on empirical analyses of mundane interactions in different settings (ranging from participation in demonstrations to shopping in different venues) examples will be used to draw attention to the micro sociological unfolding of what the corona crisis is. The paper relates those phenomena to discussions in the sociology of space, the sociology of the body. Special attention is given to which new "forms" and roles of enforcing the distancing can be observed and how the different interpretations and conflicts of distancing are dealt with. Such a perspective is then used to compare, how movement in space needs to be understood as meaningful action, is related to identities and even political positioning of the subjects.

Frontline. Social Distancing And The Old And New Normal

Kornelia Hahn

Universty of Salzburg, Austria

Today's use of the term 'new normal' in reference to social relationships presumes an apparent clear understanding of an 'old', pre-pandemic normality whose traits therefore do not need further specification. In regard to this old normality, it is often implied that its predominately trait stems from immediate sensory perception, particularly in corporeal copresence of actors, whereas, in turn, mediated communication at a distance or communication applying distance technologies are not included into this type of old normality. Even before the pandemic, this presumed normality has been gained the status of 'natural' perception by frequent references to, for example, 'offline' or 'analogue' reality, thereby already quite misleadingly distinguishing it by the involvement of material digital technology. By implying that an essential change of normality has exclusively taken place in regard to corporeal copresence, this notion however neglects social theory approaches towards 'old' modern normality as emerged from the nineteenth century onwards which highlighted social distancing, self-isolation and (a recession of) contact tracing. A comparison of the new and old normal aims to shed light, particularly on the new normal, by adequately theorising it with classic approaches.

954

Zoon Politikon and Social Distance. Theorizing the Age of Intense Unintended Consequences of Modernity

Vedad Muharemović

Faculty of Philosophy, University of Sarajevo, Bosnia and Herzegovina

On the trace of the Aristotle's concept of Zoon politikon as a social being fulfilling its essence in a social and ethical community with others and following the notion of the purpose of the social entity to accomplish the life that is not a mere life but a good life and happiness (Eu zen – eudaimonia), the central issue of this analysis is theorizing the meaning of social life and social actors in the context of social distance. If the social distance is a necessary condition for the health of individuals and societies, what are the consequences of this epidemiological imperative for a good life? When we theoretize on Covid society as some type of transnational risk and the need for transnational solidarity, we also reflect on the possible transcendence of modernity and methodological nationalism on the one hand, and how much transnational/global experience of Covid as a global risk brings us to a state of reactualising the "instituitional dimensions of modernity", especially the very character of surveillance and social control? This theoretizing accents the new forms of social life in the age of pandemic unpredictability as a form of possible global/transnational trust and solidarity on the one hand and as a form of reactualisation (reaproriation) of a very modern characterisations of social life and societies (individualism, impersonal relations, surveillance, national or supranational monitoring, the role of state apparatus, etc.).

Futures and Pasts Through Identity Politics

Andrei Belibou

Freie Universität Berlin, Germany

Critical social theory is marked by a temporal tension between diagnostic and utopic thinking, between dealing with the past and maintaining an orientation toward futurity. Identity politics has often been denied a role in overcoming these tensions. It has been construed as too attached to the past, too reformist and dependent on existing structures of political recognition, or simply as coopted and neutralized by hegemonic neoliberalism In this paper, however, I argue that theories of identity provide precisely the tools and frameworks needed to make productive use of the critical tensions between past and future within contemporary sociopolitical formations. Arguing against its dismissal as static and reformist, I claim that thinking with identity can help open emancipatory futures out of oppressive pasts which continue to structure the present. My argument is supported by an analysis of two approaches to theorizing identity: post-positivist realist theories of identity, and theories of identity as a process of identification. The former conceptualize identity as locally situated, but nevertheless referring outwards – drawing from social structures and informing one's potential engagement with them. The latter emphasize identity's dynamic potential and its importance for social agency, while evading the essentialism of thinking with set identitarian categories. By reading these theoretical approaches in temporal terms, I hope to show that identity politics can contribute to a transformative, future-oriented social thought.

955

RN29_T03_02 | Horizons of the Future

Social Creativity, Cultural Sociology and the Future of Social Theory

José M. Pérez-Agote

Universidad Pública de Navarra, Spain

This paper aims to argue that cultural sociology is one of the most promising ways to continue advancing in the development of a theory of society capable of overcoming the typical limitations of the models that the 20th century made classical, such as those of positivist formalism, without abandoning itself to the nihilist excesses to which it is led by theoretical proposals inherited from postmodern radicalism, such as posthumanism. An important contribution of cultural sociology is its ability to show the role of creativity in human action and in the processes of institutionalization and social change, a role that the classical theories of society neglected. It is suggested here that the cultural sociology of Jeffrey Alexander and the theory of creativity of social action of Hans Joas - which can be considered as a different way of understanding cultural sociology - offer two new and complementary ways of approaching the cultural dimension of social processes and structures. Both illuminate the contingent nature of the great processes of social change (rationalization, differentiation, industrialization,…) and their relationship with the conditions, mediated by power, under which the actors give meaning to their action. And both proposals coincide in opening a new and promising path to social theory.

"Sociological Knowledges for Alternative Futures: The Strengthening Of The Theoretical Need In Times Of Uncertainty"

Ilaria Riccioni

Free University of Bolzano-Bozen, Italy

The present condition is complex and still on the way of its development.

If this situation will lead to a structural change is hard to say now, however, a possible change would be strictly connected with a number of elements, such as: the geopolitical dimension as the potential shift of leadership from USA to China will be in the hands of recovery and restoration to normality; it will depend upon the period of time for the economic recovery. The impact of pandemic on demography, in terms of generations and change of social structure but also the EU response in terms of recovery and re-organization, as well as a new solidarity approach in the decision process. A renewed dialectics between urban/rural is also changing the overall perspective in labour and its necessity. The social costs of pandemic became a boost for already present social dis-equalities. In other words, the principles of neoliberalism and grounds of cohabitation seem to show their limits.

Reflexivity is needed in sociology upon the new intersectionality of disequalities, the rising transformations within it and new approaches to knowledge and methodologies are necessary in order to deal with it. In this sense, E. Morin published in 1968 a "sociology of crisis" in which interesting insights can be found towards a "sociology of uncertainty", able to develop theoretical démarche in times of crises and new phenomena.

According to Morin this approach can on the one hand lead sociological knowledge to new approaches for a contextual observation, on the other hand can grasp social phenomena in their process of development and change. This paper will give a contribution in this direction.

Thought Rather Than Knowledge What Truly Matters For Theorising And Practicing Alternative Futures

Carlos Frade

University of Salford, United Kingdom

This paper questions the emphasis on knowledge(s) put in the ESA 2021` call for papers, knowledge understood essentially as objective descriptions and analysis of reality, of the given, what matters most in the contemporary world. The paper claims that it is thought, and therefore the subjective fidelity to truths and principles, and not knowledge(s), what matters most in the current world – after all knowledge in that sense of objective information and analysis of the given, of the world as the world is, has become the specialty of 'knowing capitalism', as some have dubbed the present form of capitalism, and a major resource thereof, based as it is on totalising surveillance, continuous data extraction and algorithmically-determined intervention.

The paper argues that it is that primacy of the subjective disposition, of thought and what is attached to the principles underpinning its unfolding in the world, what enables social theory (and not the state or the digital corporations) to determine that the truly necessary knowledge to be pursued is knowledge about what prevents people from becoming the thinking subjects they can be. The paper seeks to so that by thus doing, by giving priority to thought over knowledge and to the subjective disposition over the objective description of reality, social theory can offer not just a printout of the given, but a transformative view of the world – one that will enable it, in line with the Social Theory RN's call, both to theorise the future and to enquiry about the future of theorising.

The Future of Interaction and the Future of Theory

Ori Schwarz

Bar-Ilan University, Israel

Social life and social interaction are increasingly mediated by digital media, and the COVID-19 crisis has accelerated this trend. In Zoom meetings, just as in social media discussions or instant messaging, interaction turns into the production of durable data objects, its own documentation. Events and interactions used to be very different things with different roles in our sociological stories and theories, but they collapse into each other, a transformation which I call the interaction-object duality. Social ties undergo a similar transformation, as they transform from flows of interactions into digital maps of ties (such as Facebook friendship). Objectified interactions and objectified ties are analyzed by algorithms and used as a basis for automated decision-making. But what do these transformations mean for the future of social life and the future of social theory?

This new social reality challenges core underlying assumptions of different strands of sociological and social theory, including conceptualizations of social power and of labour; the view of social life as a sequence of well-bounded interactions; the notion of collectivity; and the Bourdieusian schema of the forms of capital. At the same time these transformations remould power relations and economic relations in surprising ways. In this paper I briefly present these challenges to theory and possible ways to address them. Whereas each of these dimensions is only addressed briefly, the main focus of the paper is on what these dimensions all share. This allows me to point to new sensibilities and foci that future social theory must acquire in order to theorize the changing social (or sociotechnical) realities; and specifically, to discuss the shifting role of consciousness and materiality in our theorization.

RN29_T04_01 | New Theories and New Theorizing

Generalization, Abstraction, and Level Analysis – Three Crucial, Interdependent, and Analytically Different Ways of Theorizing

Mikael Carleheden

University of Copenhagen, Denmark

Generalization, abstraction, and level analysis – three crucial, interdependent, and analytically different ways of theorizing
What do we mean by theory? How do we theorize? What is the specific role of theorizing in the social sciences? There are of course many answers to these questions, e.g., generalization, correlation, explanation, interpretation, contextualization, abstraction, and level analysis. In this paper, I will focus on three of these options; generalization, abstraction and level analysis. I suspect that these three are of special interest because their relative significance seem to be crucial for an understanding of the dominating subfields of the social sciences; quantitative studies, qualitative studies and social theory (Gesellschaftstheorie). Sometimes the differences between the three ways of theorizing lead to polemic fights over validity, sometimes to mutual misunderstandings and sometimes their different logics are mixed up. The hypothesis of this paper is that the specific role and significance of the three dominating subfields of the social sciences could be clarified if it would be possible to differentiate and re-relate the three forms of theorizing in the right way.

Society, Community and Being-With

Gallina Tasheva

University of Muenster, Germany

Being confronted with recent developments and phenomena as "globalization" and the singularization running parallel to it; "digital cultures", "infogenic social fields" and "networks"; "postsociality" of "internet of things"; "smartject", "cyborgs civilization" and "trans- and posthumanities"; "simulacrums" and "hyper realities" we experience and recognize how ground concepts of sociological knowledge as community and society are becoming less and less important as social orders for human live and existence. The question now concerning the future of social theory is how to rethink the idea of sociality beyond the exclusivity of the society even as world society grounding solely in human rationality, increasing growth and normative orders under "Cosmo-Europeanization" or "Westernalization".
Endorsing the idea of a new method of conceptualizing of sociality in terms of Existential Analytic of "Being-With" (Heidegger – J.-L. Nancy) the paper argues for an "other" or "third" social order as a "Being-with", different to the social orders of community and society. To this "third" social order of the "Being-With" belongs the manifoldness of human forms of existence and the sociality of human life, which go beyond the typical social interactions and communications in the community and society, based on the mediation by the common and general as shared values of belonging, historical roots, traditions, cultural dispositions, social habits of self-understandings or normative orientations. Even more unfolds this social order of "Being-With" a subversive character in relation to the social orders of societies and communities as inaugurating possibilities of new forms of micropolitics.

958

Bureaucratic Structures and Systems of Irresponsibility: Rethinking Maruyama Masao and Ian Kershaw

Yuki Nakamura

Waseda University, Japan

This paper explores the similarities that lie in Masao Maruyama's concept of system of irresponsibility and Ian Kershaw's social phenomena of the absent dictator. Modern bureaucracy has developed a social system that makes it possible to dissipate the accountability of individual and collective actions. The concept of "system of irresponsibility" developed by Maruyama, showed how this happens in Japan. The system of irresponsibility however, has been presented as a unique characteristic in both pre-war and post-war Japan. There is a psychological and physical distance between the individuals within the hierarchy of modern bureaucratic organizations which in one way or another results in the development of the system of irresponsibility. By comparing Maruyama's concept with the phenomena described by Kershaw as the absent dictator, it is possible to determine that the dissipation of accountability is an element inherently rooted in modern bureaucratic institutions.

Keywords: bureaucracy, sontaku, system of irresponsibility, absent dictator

Critical Theory from the Americas

Stefan Gandler[1,2,3]

[1]Universidad Autónoma de Querétaro, Mexico; [2]European Sociological Association (ESA); 3Universität Innsbruck, Austria (affiliated member: Research Center Social Theory)

In difference to Georg Lukács in "History and Class Consciousness", the former senior faculty of the Universidad Nacional Autónoma de México (UNAM) Bolívar Echeverría (Riobamba, Ecuador 1941 – Mexico City 2010), thinks that not only ideological forms awake the false objective appearance (Marx), that the today predominating and objectively unlivable capitalist forms are supposedly livable.

Echeverría's point is that beyond pure ideology exist in each region and time different forms of behavior, social institutions, ways of speaking/listening, constructing/living, sowing/harvesting, cooking/eating, etc. that make us think and feel that the unlivable is at the end of the day livable. The heart of the question lies in the fact that those forms of everyday life cannot be understood and analyzed simply on the basis of the abstract social form of commodity production (that is, the value relations), but must also be understood through the concrete form of use values produced and consumed in each case, in every region and in different historical moments.

At the same time, it is necessary to investigate whether Bolívar Echeverría had in fact been able to accomplish his fundamental goal: to establish a theory that was on the one hand universal but at the same time not Eurocentric, or whether he instead succumbed to a certain relativism, thereby depriving himself of the ability to issue a truly radical critique of society and ideology (Horkheimer, Marcuse, Adorno, Benjamin). Put more generally, what one has to ask is what is the price of trying to overcome abstract, false, and Eurocentric universalism?

In this conceptual field of tension, we try to put the foundations for a Critical Theory from the Americas.

Sociological Theory Horizons: Habermas and the Capability Approach

Spyros Gangas

DEREE-The American College of Greece, Greece

It is only recently that sociological theory considered various pathways (pragmatism, agency, alienation, normative systems theory) of future convergence with the capability approach (CA). Sen and Nussbaum, for their part, bracket sociological theory, focusing instead on political philosophy (Rawls) and economics for any normative reference points. Yet CAs scant welcoming gestures towards Habermas have not been adequately addressed by sociological theory. This paper hopes to mitigate this paucity between Habermas and CA. I argue that Habermas' relevance for CA bears primarily on the areas of deliberative democracy, public reasoning, discursive will-formation and the ideal of 'comparative broadening' that is endorsed by Sen as a cosmopolitan outlook, but also as the chief corrective against identity

fundamentalisms. Habermas, thus, is a potential ally to CA due to the normative breadth of communicative action and, secondly, due to the unfinished project of modernity, a programmatic outlook that is not unpalatable to CA. Thirdly, Habermas' recourse to pragmatism accommodates one more asset that informs CA and its flexibility, namely its ethical core of human dignity. Within this fruitful dialogue, I consider some strains: a) CA abstracts from Habermas' systems theory and its dualist logic of crises as if communicative action and universal pragmatics could be implemented without it; b) it pursues a civic humanism that is at odds with Habermas' de-differentiated dualism of 'system' and 'life-world'. While this is an enabling feature of CA, it jettisons a system perspective for steering a capabilities-based 'life-world'.

ILE: Culture and Social Theory. Salas i Ferrer, First Catedra of Sociology (1899)

Ramon Flecha, Elisabeth Torras-Gómez

Universitat de Barcelona, Spain

The Catalan sociologist Salas i Ferrer occupied in 1899 the first catedra of sociology in the world as far as we know; even before Durkheim. This event can be considered like an unexpected coincidence in a country in which there was not an important development of sociology. The idea that a country has a relevant scientific, cultural and artistic production when it has also an important economic, political and military power was broken in Spain from the later 18th Century until the Civil War in 1936. In this period, Ramon y Cajal created the discipline of neuroscience, Picasso made a revolution in arts, García Lorca did the same in literature, Gaudí developed his architectural style. All of them had relations with the "Institución Libre de Enseñanza" (ILE) and/or the libertarian athenaeums (part of the movement described by George Orwell).

The ILE developed a relevant public debate on interdisciplinary social theory and an incredible training of young middle- and upper-class people in the best scientific and intellectual developments in the world at that time, including debates with authors like Einstein. In the libertarian athenaeums, young and teenage workers, after a long working day, joined to debate books by Cervantes, Kropotkin, Zola and others. This Social Theory revolution created a cultural context where all those extraordinary productions were possible. The lack of democracy in Spain made all those people to focus

themselves in the social and political struggle and finally, they were destroyed by the Franco dictatorship.

Reflexivity And Reflection In The Workplace Versus Habitus

Jesús-Antonio Ruiz-Herrero

Universidad de Valladolid, Spain

Archer has vindicated the relevance of reflexivity against that of habitus or dispositions, which is a key concept in Bourdieu's theory. After analysing 40 interviews with workers of sectors that demand the application of knowledge to frequent unpredictable or demanding situations, we will see that, to be an effective professional, an unproblematic display of dispositions without explicit consciousness is not enough. In fact, in the studied sectors, the workers must resort to their reflective capacities almost compulsively while struggling with a complex production full of contextual discontinuities. At the same time, the use of these capacities is highly induced by firms' organisational mechanisms, which reap the benefit of such capacities to enhance quality in a context of increasing competence. In consequence, one cannot neglect the reflective capacities of subjects as a central aspect of social life, especially in connection with work, where reflexivity has not yet been sufficiently examined. A qualitative approach based on discourse analysis was used.

Dynamic Of Configuration Facing Axiological Uncertainty

Verpraet Gilles

sophiapol university Paris NAnterre, France

The first cognitive steps facing new social facts intends to frame the relevant collection of social facts as classification, as configuration (Durkheim, Mauss). Iteration and configuration contribute to formalize the axiologies of values inside social spaces (Weber , Jaspers, Joas).

The dynamic of configuration intends to stabilize the relevant axiology by two steps : a/ to specify the uncertainty and cognitive iterations inside existing configuration specifying ; ; b/ to formalize the old and new axiologies inside the emerging configurations. This moment scrutinizes the sociological imagination

The dynamic of configuration are proceeding between the current health crisis and socio economic configurations internet working, economic slow down,

960

reorganization of life styles. The dynamics of configuration proceed also between health crisis and environment crisis by the reorganization between short term and long term issues. Common issues on environmental health are facing the restriction of transnational solidarities. The task of sociology as theory of social change is to clarify and specify these dynamics between configurations.

RN29_T05 | Classical Theories and Their Future I

Durkheim's Theory of Religion, Contemporary Ecology, and the Postcolonial Critique of Sociological Ethnocentrism

José Juan Osés Bermejo

Universidad Carlos III de Madrid, Spain

The global expansion of pro-environmental sensibilities is a well-attested fact. However, this phenomenon presents multiple facets and forms, as well as varying levels of consistency around the globe. Ecological worldviews and ethical commitments seem to be more or less fragmentary or systematic, and they hybridize with different life-styles, ethno-cultural and religious identities, social class adscriptions, and collective memories. As it has been frequently noted, the contribution made by Durkheim in his classical work The Elementary forms of religious life (1912) goes far beyond the sociological understanding of what is commonly assessed as religious, providing tools for the analysis group identity-making, social cohesion and solidarity. However, can this theory facilitate the sociological analysis of a multifaceted and multiform phenomenon such as global ecology? This aspiration would have to face important criticisms, a good portion of which would surely recall the ethnocentric biases of Durkheim's attempt to formulate a universally valid theory of religion on the basis of arbitrary evolutionary postulates and one-sided interpretations of poor, incomplete, and questionable ethnographic evidence, all for the sake of rather "provincial" interests and concerns. Systematizing the results of previous research on contemporary ecology carried out from a Durkheimian approach, this contribution aims to critically discuss the relevance and

the limits of the sociological theory of religion presented in The Elementary forms of religious life (1912) as a sociological tool for the analysis of global ecology. Central aspects of Durkheim's theorization such as those related to the sacred/profane dichotomy and the socio-psychic dynamics of rituals as vectors of sociality and collective identity-making are problematized in the light of the postcolonial critique of classical sociology's ethnocentrism.

Towards a pataphysical theory of globalization. The case of Jean Baudrillard in light of Covid-19

Spiros Makris

University of Macedonia, Thessaloniki, Greece & Visiting Research Fellow, University of Oxford

Covid-19 tends to be a huge tragedy for the contemporary humanity. Nevertheless, it could be said that behind the big picture of this tragic human disease, one can see the thorny question of globalization itself. In this new difficult conjuncture, that fatally affects the whole planet, without exclusions, the content of neo-liberal globalization starts to obtain clear and specific characteristics beyond the triumphant voices of the monetary capitalists and the naive parole of the fierce supporters of a utopian globe village. Unfortunately, it seems that humanity has to pay a very high price for globalization. For this particular reason, it must be argued that globalization is not a simple idea either for a neo-capitalist-driven homogenization of the world or for a cosmopolitan-inspired proliferation of the masses across the globe. Without doubt, globalization as a whole must be considered as a special kind of a postmodern ontological and phenomenological situation that changes rapidly the traditional parameters of human life. Amongst the eminent social thinkers who investigate the features of so-called global era, undoubtedly Jean Baudrillard is the one who analyzes neocapitalist globalization and its bizarre consequences with true sociological imagination, bold spirit and a new conceptual edifice. Despite the fact that sometimes he has been misunderstood, it must be said that his prophetic and constructive discourse remains a fertile reflectional context within which we can grasp the ontological and phenomenological nature of hyperreal globalization. In this paper, I examine the current tragic human condition of Covid-19 pandemic by using Baudrillard's conceptual and theoretical toolkit, especially the pataphysical way that the heretic French thinker interprets the onto-

961

theological and phenomenological aspects of global politics in the 21st century.

Uses and Applications of Gilles Deleuze's Concept of "Rhizome" in Social Theory

Alvaro Malaina

University Complutense of Madrid, Spain

The French philosopher Gilles Deleuze (1925-1995) has seen a resurgence in social theory in recent times. Much of it comes from his concept of the "rhizome" (Deleuze and Guattari, 1987), as an "image of thought" that seeks to apprehend the multiplicity and expansive horizontality of the real and is opposed to the dominant arborescent epistemological models.

We understand that this interest comes from the recognition of the increasingly horizontal and non-hierarchical structure of the network society (Castells, 1996) and with the most recent transdisciplinary developments in complex systems science (Morin, 2008). At the same time, it links with a critical sociology of the new horizontal social movements without vertical leaderships, as in the theorizations of the "multitude" and the "assembly" by Hardt and Negri (2005, 2017). In our paper we make a synthesis of the potentiality and also of the limitations of the applications in social theory of the concept of rhizome.

Finally, we introduce our own application of the Deleuzian conceptual framework to construct an epistemological and analytical concept applied to cinema, the "ethno-cinematographic rhizome" as a para-ethnographic instrument for understanding non-Western societies in the current global era. We have mobilized this concept for the filmic analysis of the Thai independent cinema of Apichatpong Weerasethakul and Anocha Suwichakornpong among others, insofar as they offer us aesthetic fictional artifacts but also sociological and ethnographic knowledge presenting non-Western ethno-social worlds as rhizomatic assemblages of a multiplicity of heterogeneities, combining almost documentary realism with surreal fiction within non-linear and non-arborescent filmic structures.

Renewing Weberian Social Theory on Social Change: Genealogy Thorugh Liminality

Cesare Silla

University of Urbino 'Carlo Bo', Italy

The presentation aims to renew Weberian social theory by showing how the concept of liminality can be joint with his historical-genealogical approach, which is directed toward making sense of the genesis of social orders and the role they play in 'selecting' adeqaute human types, as conveyed in "The meaning of 'Wertfreiheit'". Specifically, I show how "liminality" helps to fully elaborate the dynamic of social change Weber expressed through the "Switchmen metaphor" in the Einleitung: "Not ideas, but material and ideal interests, directly govern men's conduct. Yet very frequently the "world images" that have been created by "ideas" have, like switchmen, determined the tracks along which action has been pushed by the dynamic of interest". "Very frequently" can be conceptualized in terms of liminality. In liminal conditions, that is in-between phases, the institutionalized pattern of material and ideal interests ceases to play its role in directly governing human agency, while the lived experience of transition pushes people toward a new form of stability. It is in the transition from a dissolving order to a not yet-established one that a different world image created by new ideas emerges as a decisive factor in the structuration of the new social order, defining the direction along which the dynamics of interests will directly lead action after institutionalization is secured, thus shaping specific "human types" with their motives (as it was for the "Protestant" bearer (Träger) of the new spirit of capitalism). In conclusion, I illustrate that this dynamics of dissemination and institutionalization of new ideas is understood better by recognizing the role of image-making, imitative behaviour and the theatricality of social performance rather than resorting to strictly rationalistic frameworks.

962

RN29_T06 | New Concepts and New Theories II

Solidarity In Pathologic Social Relations

Benno Herzog[1], Eva-Maria Klinkisch[2]

[1]Department of Sociology and Social Anthropology, University of Valencia, Spain; [2]Catholic University of Applied Sciences, Freiburg, Germany

Solidarity is often seen as a path of emancipation that helps to overcome situations of social injustices, inequalities and deprivation. Besides this moral aspect and from a sociological point of view, solidarity is mediated through individual and collective actions or through structural and institutional cohesion. However, social pathologies often not only produce unjust social relations but also can provoke delusionary perceptions about these relations. Within these delusions, solidarity runs the risk to become ideological in itself and to reinforce rather than to overcome social pathologies.
The aim of this presentation is to explore the (im)possibilities of solidarity within pathologic social relations.
In a first step, we present a typology of pathological social relations, analyzing in how far these relations produce suffering as well as ideological perceptions of the situation itself. In a second step we will present different logics of solidarity ranging from conscious acts of mutual aid to the implementation of social structures creating cohesion. Finally, we will analyze how these forms of solidarity are themselves affected by social pathologies, i.e., we will explore whether they can be a step towards social emancipation or, on the contrary, can even have a regressive outcome, amplifying and solidifying social injustices.
If pathologic social relations or the reasons for social pathologies are systematically invisibilized, then the possibility to develop emancipatory solidarity are strongly hindered.

Theorizing Status Liminality in the Context of the Posthuman Condition

Ilya V. Katernyi

MGIMO-University, Russian Federation

Drawing on the classical ideas of A. van Gennep and V. Turner about the nature of rites de passage, as well as recent sociological inquiries (S. Lyng, et al.), a new typology of status liminality is proposed, including (a) ascending, (b) descending, (c) recursive, (d) permanent liminality, as well as (e) liminoidity. Liminality is interpreted as an intermediate status position, characterized by status-role uncommonness, value-normative cardinality, and social reflexivity. Such an approach allows to refine the concept of liminality as applied to novel practices of status transformation. Posthuman condition gives rise to strange and hybrid statuses and identities with transgressive properties. Technologies such as cosmetic surgery, nanotechnology, cyborgization, digitalization, rejuvenation, cryonics, as well as new gender biopolitics create a domain of posthuman palimpsests with a reascribed viscerality. As a result, new human identities "break away" from the primordial ascriptive binaries and entail posthuman liminal statuses: (a) of neither male nor female sex, but of transsexual, polygender, two-spirit; (b) of neither juvenile nor senior age, but of "seeming young"; (c) of neither living nor lifeless being, but of frozen or digitized one; (d) of neither human, nor machine, but of cyborg; (e) of neither human nor monster, but of a bodmod. Alongside morphological freedom, post-tourist agency, digital afterlife, socializing of robots and animals are addressed as other manifestations of sanctioned liquid status ambivalence. Also, the elaborated status liminality theory seeks to be valuable for studying experience of cancer patients, the Roma people, the precariat and even risk-taking "edgework".

963

Hospitality as Lens of Studies: Immanuel Kant in Social Theory

Anni Greve

Roskilde University, Denmark

This paper presentation unfolds the notion of hospitality, not against, but with Immanuel Kant (1724-1804). It offers insight to Kant's three seminal essays on cosmopolitanism: Idea for a Universal History from a Cosmopolitan Point of View, written in 1784, the 1795 essay, "To Perpetual Peace: A Philosophical Sketch", and finally with Metaphysical Elements of Justice: Part I of the Metaphysics of Morals, generally known as the Doctrine of Right, published separately in 1797. It draws attention to the intellectual milieu of the late 18th century, and in particular to the pioneers of the Scottish Enlightenment, Adam Ferguson (1723-1816) and Adam Smith (1723-1790). Finally, the paper addresses the question of what hospitality in a Kantian sense of right can offer future social theory. Can the stranger's right to universal hospitality serve as a Pandora's Box for 'acts of citizenship'?

Towards Consilience: Constraints And Opportunities Of Contemporary Sociological Theories

Kristina Pejkovic

University of Novi Sad, Serbia

In the 20th century, the term "consilience" was popularized by Edward Wilson, who believes that it is possible to reconcile three major branches of knowledge: the sciences, the social sciences, and the humanities. The consilient explanation is based on the assumption of the possibility of unification of scientific knowledge and epistemological continuity. In the sciences, the problem of epistemological continuity is far less controversial than in the social sciences, and most scientists believe that there is a continuity between physics, chemistry, and biology. There are social and epistemological reasons why that problem is most often neglected in the social sciences. Today's popularity of postmodernism, poststructuralism, and similar relativistic orientations testifies to the lack of desire of social scientists to search for connections between sciences, and only a small number of scientists wants to make an analogous connection between fields. On the other hand, there are

ideas and fears that it is not even desirable to establish this intellectual continuity because it reminds us of the reductionism that is most often criticized in the field of social sciences. And finally, there is not a small number of authors who believe that it is not possible to achieve it due to the nature of knowledge of the social sciences. The thesis of this paper is that at least moderate consilience is possible in the social sciences as well. It requires the synthesis of knowledge from different scientific disciplines that explore the same problem to form coherent conclusions about the given phenomenon. In this sense, a possible perspective is an evolutionary approach that has great potential for unification with other sciences.

RN29_T09 | Classical Theories and Their Futures II

Risk between Action and Anticipation: An Application of Merton's Adaptation Types

Emiliana Mangone

University of Salerno, Italy

The sociological reflection has highlighted that the individuals' action in a cultural and relational context is a key to understanding society and dynamics related with future perspective. As pointed out above, however, attitudes towards the future do not appear dominated by purpose-oriented rationality (action based on the rational evaluation of purposes, means, and consequences). Rather, they seem ruled by the search for a balance between "goals" and "means". this starts with the very selection of the "goals", on a hierarchical scale akin to Maslow's which motivates an action with the universal tendency to satisfy certain orders of needs, differing in nature and complexity. To better understand the equilibrium processes between "cultural goals" and "legitimate means", we will recall Merton's theory on deviance, applying it to the concept of risk. On this premise, we can state that the taking of risks by individuals, are not due to biological or instinctive impulses badly suppressed by social control, but are a completely "normal" response to the social pressures with which societies affect their members. When the legitimate practices for reaching a strongly supported cultural goal are overshadowed, we witness a form of

964

"anomie". Possible solutions pass through action schemes that vary according to the person's position in the social organization, as the social status and its related sources of knowledge are the elements determining the opportunities to reach a given goal by legitimate means. Within this context, uncertainties are emphasized.

The Potential of Adorno's Materialist Hermeneutics for Sociology

Joan Gallego

Universitat de València, Spain

Th. W. Adorno's notion of "materialist interpretation" is of great interest as it proposes an hermeneutics that, in addition to opposing positivism, is equally strongly demarcated from the hermeneutics of meaning. Adorno assumes Weberian diagnosis of the modern world's lack of meaning, or, hegelianly, objective spirit's mythical character. In the face of this, materialist interpretation must build images or figures that make it possible to grasp the sense of the nonsense that is imposed upon us. Precisely because it is capable of making the social totality appear in its mythical, absurd character, it connects the possibility of its transformation. As recent works have pointed out, materialist interpretation opens a particular and fruitful path to link critical analysis of the rationalized world with the perspective of practice. The bond between theory and praxis is not that of the mechanical application of the former, but is embodied in a "praxification of theory". That said, it happens that in Adorno's thinking we find two different formulations of this idea of interpretation. In "The Actuality of Philosophy" is linked to the destiny of an actual philosophy, which has to construct its interpretative constellations on the basis of the material offered by the sciences, among which we find sociology. This auxiliary role of sociology disappears in sociological texts, where Adorno understands sociology as interpretive itself. We intend to highlight this apparent contradiction. This may not only contribute to Adornian exegetics discussions but also enable a reflection on sociology's role within the interdisciplinary project of "critique".

RN29_T10 | Theory and Social Change

The Critical Horizon Of Niklas Luhmann's Systems Theory And The Challenge Of Change

Borys Cymbrowski

Jagiellonian University, Cracow, Poland

The paper will discuss the development of Niklas Luhmann's thinking with special regard to his debate with Jürgen Habermas in the late 1960s at the University of Frankfurt. It is argued that despite the publication of a common book which finished the debate, both Luhmann and Habermas continued to refer critically to each other's concepts in the subsequent writings. Paradoxically, there is some evidence that despite strong mutual reservations they became inspired by some themes in the other's concepts. Thus, in later period of Luhmann's activity he developed his own systems-based version of social criticism. The paper traces this development and attempts to assess the critical potential of Luhmannian ideas. In my paper I will highlight the relevance of Luhmann's critical approach for the discussion of problems of climate change and chosen aspects of social activism.

965

Opacity and Transparency: Towards a Social-Constructivist Theory of Legitimacy

Daniel Hausknost

Vienna University of Economics and Business, Austria

The accelerating ecological and climate crisis poses new questions about the conditions of purposive societal transformation and its legitimation. Why are modern capitalist market societies so impressively stable despite their blatant destructiveness? What keeps them from transforming towards sustainable societies along robust normative principles? I provide the contours of an explanatory theory of legitimacy that goes beyond dominant approaches of hegemony or governmentality to explain the stability and resiliency of modern capitalist order. My account draws on the social-constructivist understanding of legitimation originally developed by

Berger and Luckmann (1966), revising and extending it in important respects. I introduce an analytical distinction between two types of legitimation: active (or what I call 'ontological') and passive (or 'epistemic'). Active legitimation is the realm of justification and explanation of a given ontology or 'world'. Passive legitimation, by contrast, pertains to the construction of the architecture of reality itself: it aims to minimize the scope of reality that requires active legitimation in the first place and has to do with the construction of the 'source' of reality and with 'authorship' of social facts. By constructing the capitalist market as an epistemically opaque source of reality, the transparent representative systems of politics relegate authorship of reality away from themselves and position themselves as 'receivers' and competent 'administrators' of a reality they have not authored. Thus, an 'epistemic bond' is constructed between representatives and represented that is much stronger than any bond that could be constructed by 'ontological' means. The modern paradox of representation (that people are at the same time rulers and ruled) is suspended by externalising the source of social reality. The consequences for purposive societal transformations are discussed.

Work, Precariousness and Reflexivity: A Theoretical Approach

Renato Miguel do Carmo[1], Rodrigo Assis[1], Isabel Roque[2], Jorge Caleiras[1]

[1]ISCTE - University Institute of Lisbon, CIES-Iscte Portugal; [2]CES-UC, Portugal

This communication is a result from the ongoing ART63 research project, funded by the Portuguese Foundation for Science and Technology (PTDC/DIR-OUT/32096/2017). Social theory has been increasingly dedicated to systematizing the social mechanisms of individual reflexivity. The concept of reflexivity is operated with autonomy and analytical status, being mobilized to perceive transformations in the context of advanced modernity, highlighting the agentive capacities of individuals regarding social structures involving them. Although the theoretical buildings derived from individual reflexivity analysis forged conceptual frameworks, which are intended to be generalizable, a critical reading of their diagnoses reveals that they privilege reflexive profiles related to individuals whose practices express lifestyles associated with social classes that tend to hold higher levels of economic and cultural capital. Most of the prevailing conceptions of reflexivity

little have said about the ways in which socially vulnerable contexts trigger reflexive skills to deal with deep social vulnerabilities. The main objective of this proposal is to suppress this gap. Based on 53 in-depth interviews conducted with individuals living in precarious working conditions during Covid-19 pandemic (in Portugal), we will contribute to improve and to deepen the discussion about the concept of reflexivity in order to capture the type(s) and the specificities of individual reflexivity(ies) existing among those living at the base of the social structure. The aim is to analyse how precarious workers face the difficulties they are subjected to and how they be able to monitor their actions based on their past, present, and future.

The Political Forms Of Modernity: The Gauchet-Badiou Debate Over Democracy And Communism

966

Craig Alan Richard Browne

University of Sydney, Australia

The debate between Marcel Gauchet and Alain Badiou in the book 'What is to done' addresses the central problem of political praxis: how can individuals autonomously constitute society and what are the impediments to both collective and individual autonomy Despite the major differences in perspective and analyses, Gauchet and Badiou share the general praxis orientation concerning the centrality of the nexus between the subject and history to modernity. The subject, though differently conceived, they agree, is distinctive in its universalistic orientation and constitutes a counterpoint to interpretations of freedom as simply individual agency and choice. Gauchet's and Badiou's respective approaches and visions of history diverge considerably, however, and this is manifested in their analyses of modern democratic and totalitarian political forms. Badiou contends that the 'communist hypothesis', which is open to different concretions and should not be equated with communism's previous forms, persists as the precondition of the radical transformation of capitalism. Gauchet likewise offers a diagnosis of the current crises of capitalist societies but contends that liberal democracy is the foundation and means of

capitalist society's reform. Namely, the regulation of capitalism can only be achieved in a non-authoritarian manner through democracy and what is required is the harnessing of this creative potential of democracy. My analysis will assess the viability and desirability of these contrasting images of social transformation and whether the tendencies they highlight in contemporary modernity, like neo-populism, liberal individualism, global capitalism, and democratic crises, are likely to generate alternative political forms in the future.

De-demonizing Extremism – Fascism and Totalitarianism as "Normal" Political Last Resorts in the Era of Experiential Politics

Michalis Lianos

University of Rouen, France

Contemporary forms of contesting capitalist democracy are spontaneously associated to totalitarianism in general and fascism in particular. However, our understanding of "extremism" seems to be rather static. Following extensive empirical work on social movements (Lianos 2019a) and theoretical work on conflict (Lianos 2019a), updating that understanding appears useful from various points of view including the following:

1. Fascism (or the extreme right) is probably not what it used to be. This may sound bold, counter-intuitive or overtly provocative, but several lines of analysis, including the re-composition of the lower-middle class (Lakner & Milanović 2016 ; Milanović 2016) converge towards considering that question seriously.

2. Left / Right syncretism. The eclectic combination of factual conditions, interpretations of reality, ideological elements and political positions of contesting movements is difficult to miss (see for example Mosca & Tronconi 2019) for anyone who does empirical work on them.

3. Autonomy and horizontal self-organisation. Until the proliferation of online social media, only anarchists claimed that contesting power was possible without some form of pyramidal leadership. Multiple occurrences all over the world have shown in the last fifteen years that the structure of contesting power has changed.

4. "Conspiracy theories", frequently adopted as means of expressing political distrust and increasing intolerance of power structures, thus enforcing a breakdown of the hegemonic framework of political debates and discourses.

The paper draws on such points in order to propose a sound conceptual and theoretical foundation for discussing this new era of "experiential politics" and introduce an understanding of extremism and totalitarianism as a last resort reaction to obsolete institutional arrangements.

The Asylum Procedure in Germany as Total Institution

Ahmad AL Ajlan

Bielefeld University, Germany

The current study applies the concept "total institutions", which is derived from the famous study called Asylums by Erving Goffman. The main characteristic of the "total institution" is that it takes away the inmates' ability to choose by forcing them into a deindividualized life, ending up with losing control of their lives. The current study argues that this feature is also present in the collective accommodations of asylum seekers since the asylum procedure as a "total institution" also enforces people to be under specific laws with specific implications, depriving them of a normal life as adult people. From this perspective, collective accommodations of the asylum seekers can be referred to as "total institutions". Based on this concept it explores how violence occurs among young adult asylum seekers in collective accommodations in the state of North Rhine-Westphalia in Germany. It provides an insider perspective to understand a phenomenon related to non-European people who were forced to leave their countries to seek asylum. Based on 16 qualitative interviews with young adult male asylum seekers from Syria and some African countries, seven interviews with social workers, and one interview with a German psychological therapist, the author finds that the asylum procedure in Germany as a total institution catalyzes violence among young adult asylum seekers in collective accommodations. The present study shows that collective accommodations are unhomely places, where "inmates" lack privacy and autonomy. In addition, the asylum procedure deprives them of essential human needs, such as the right to work and to have full access to the health care system. These circumstances make them uncertain and desperate, which leads to violence among them.

NEET Youths and Rural Areas: exploring perspectives on Green Jobs

Bernardo Baptista Fernandes[1], Francisco Simões[2]

[1]University Institute of Lisbon (ISCTE-IUL), Lisboa, Portugal; [2]University Institute of Lisbon (ISCTE-IUL), CIS-IUL, Lisboa, Portugal

This exploratory research focus on rural youths neither in employment, nor in education or training (NEET). Rural areas are at risk of becoming places of nostalgia, not fully understood neither by the urban population, nor by the younger generations that grow up in these territories and seek for alternative contexts. In Portugal, the proportion of NEETs is higher in rural areas when compared to (sub)urban areas, bringing up questions on how to address territorial inequalities regarding access to education and employment opportunities. We discuss the involvement of rural NEETs in the labour market, paying special attention to the agricultural sector as a job opportunity, as well as meaning-making business/ occupation. We explore the challenges and the possibilities of the European Green Deal in rural geographies, in order to understand how "Green Jobs" (typically present and mostly created in urban centres) could repurpose rural everyday life and function as vectors for settling younger generations in rural territories. Finally, we will try to apprehend how rural youths envisions agriculture as a vehicle for socio-ecological change.

Social Context Of Rural Andalusian Youth Using Synthetic Index of Development (IDR)

Rubén Martín Gimeno, Serafín Ojeda Casares, Luis Navarro Ardoy

UNIVERSIDAD PABLO DE OLAVIDE, Spain

The objective of the following communication is to explain the methodology and application of a Synthetic Index of Rural Development (IDR), elaborated to know the different situations that youth confront in Andalusia (Spain). It's part of an investigation with quantitative and qualitative research strategies that aims to study the relationship between the expectations of mobility or rooting of young rural student's in southern Spain, related to the social and economic characteristics of its local context and the fact of taking different educational itineraries after graduating from compulsory education. This addresses a key area in relation to the demographic and social sustainability of rural areas and responds to a public concern that affects a considerable part of the most vulnerable rural areas in Europe: depopulation.

The IDR is a synthetic index that includes relevant indicators on different dimensions of social reality affecting young people: sociodemographic characteristics of the population (demographic patterns, educational level, residential mobility ...), socioeconomic characteristics (unemployment rate, main economic sectors, economic development ...) and the business fabric of the area. Based on the IDR, a social map of municipalities and rural regions in southern Spain will be drawn up, based on their level of development and in relation to the contextual conditions and life opportunities for youth.

The objective of the communication will also be to show its capacity for reproducibility and transfer to other contexts, in which is convenient to investigate the role of young people in rural development and the dynamics of depopulation associated with these environments.

968

RN30_T01_02 | Transitions: Housing Trajectories

The French Boomerang Generation: Becoming Adult In Other Way

Sandra Gaviria

Université Le Havre Normandie, France

Young French adults return to their parents after a certain period of living independently. In the French model of becoming an adult, leaving once for all, this was not on the program. As they return, the young people have to learn again to live with their families, and feel being considered back as "child of". For parents, the return was not expected either and they should readapt to a common life after separated lives' time. We will consider to what extent relations they had in the past have evolved or have been reproduced when young people are coming back to their parents' home.

In extreme cases, both parents and young adults are verbalizing the burden of the situation. Parents retain power in the home through cooking and meal times, while young people, when they have a room, defend this room as personal space. This work is based on a field work of 60 semi-directive interviews with French young people who have been coming back home for several reasons: job loss, change in the course of studies, break-up with partners, money saving,.. For the greatest part of this young adults, coming back to their parents' home is experienced as a failure.

When Children Fly Back to Their Nest: Returning to Parental Home in Italy in a Context of Economic Uncertainty

Patrizio Lodetti[1], Francesca Tomatis[2]

[1]University of Florence, Italy; [2]University of Turin, Italy

Trajectories within family and working careers have gone from being very predictable and synchronised to complex and diversified. The transition to adulthood has become reversible and revisable, in fact transitional markers follow an irregular chronological order often characterised by an alternation of "steps forward" and "steps backwards". The paper aims to establish a foundational understanding of the phenomenon of young people returning to the parental home in Italy, unfolding its main determinants and observing whether and to what extent it was affected by the economic crisis started in 2008. Italy appears a perfect context since an extensive condition of economic uncertainty with a high youth unemployment rate and a spread of atypical jobs. Using nine waves (from 2006 to 2014) of the EU-SILC survey, we have compared the period of the crisis (2008-2012) with the one before (2006-2007) and the one after (2013-2014). The main results show that there is a significant rising trend in returning home during the period of economic crisis, especially in the most severe phase (from 2010 to 2012). What emerges is also that being or becoming unemployed/inactive has a strong positive association with the likelihood of returning to the parental home, as well as living in Southern regions. These results stress the essential role of the housing system. Indeed, the adoption of tailored policies may limit the role of the family of origin, encouraging young people to reach their residential independence and reducing the prospects of uncertainty about their future.

969

Feathered Nest and Gilded Cage Revisited: Resources and Pace of Leaving Home in Poland

Justyna Sarnowska, Paula Pustułka, Marta Buler

SWPS University, Poland

Changes in the intergenerational family relationships are typically seen through the prism of contemporary parents supporting their children long into adulthood, offering their households as 'feathered nests' during extended transitions to adulthood. However, the majority of research in this realm comes from established welfare states of Western Europe and the Commonwealth and less explicitly addresses inequalities that mark these processes. Drawing on qualitative longitudinal research on transitions to adulthood in Poland, we use a data set of 127 interviews with university students and graduates to illustrate the process of leaving home in the Central and Eastern European context. The paper accounts for both the objective (extensive/limited economic capital or resources) and subjective (fast/slow pace) dimensions crucial for how young people move out from parental homes. Our main contribution is a typology of Temporizers, Gymnasts, Runaways and Protectors as ideal types of pathways to leaving home in Poland.

Double Residence And Leaving The Parental Home In A Southern European Country.

David Gil-Solsona

Universitat de València, Spain

This paper studies the importance of double residence in the process of leaving the parental home in a Southern European country such as Spain. The goal of the analysis is to highlight the importance of this kind of arrangement as a source of complexity in Spanish youngsters' life courses.
A basic consensus among youth sociologists is that, across western societies, the transition out of the parental home is becoming increasingly delayed, complex and reversible. Nevertheless, many scholars suggest that in Southern Europe only the first would be clear-cut. In Mediterranean countries, young people would indeed leave home late, but complexity and

reversibility would be out of the picture: they would leave to quite "classic" family forms, and for good.
In this paper, this assumption is challenged, presenting double residence as a possible source of complexity within this transition, whose importance in contexts such as Spain or other Southern European societies may have been underestimated.
Using data from EU-SILC, Census microdata and the Catalan Youth Survey, the importance of double residence during the transition to adulthood in Spain is addressed. Our results show that, in 2019, around 7,5% of youngsters (aged 20 to 29) had a second household apart from their parents', a figure that has increased during last years (being 5% in 2015), and that reaches around 10-14% for people in their earliest twenties. Moreover, multivariate logistic regression models show that double residence is much more common among university students and graduates, those with higher family cultural capital, and those coming from rural areas.

Cultural Participation And Cultural Transmission Among Youth In Croatia

Marko Mustapić, Goran Milas, Vanja Dergić

Institute of Social Sciences Ivo Pilar, Zagreb, Croatia

This research combines the quantitative and qualitative research approach to study the presence of particular forms of cultural participation among youth and various patterns of cultural transmission. The data used for this presentation were collected in Croatia as a part of the H2020 international scientific project CHIEF (Cultural Heritage and Identities of Europe's Future) in 2019 and 2020. The quantitative part of this research is based on a survey of 2,147 year 2 and 3 students from 29 Croatian secondary schools, while the qualitative part contains 60 semi-structured interviews with students and 9 interviews with their teachers. In addition to this, 19 in-depth interviews were conducted with young people (between the age of 18 and 26) and older family members (mothers/fathers, grandparents) from 9

families. The survey showed that youth display highly limited interest in traditional forms of culture, including cultural participation related to history. The data collected through the semi-semi-structured interviews support these findings, showing that pupils have very modest, superficial knowledge of historical events, even recent ones. The data from the in-depth family interviews show that inter-generational knowledge transfer does take place, mostly reflected in the dichotomy of liberal and conservative world-view. However, both the quantitative and qualitative research suggest that the influence of schools and parents is very limited; it also shows that adolescents are mostly shaped by interaction with their peers, avoiding traditional culture and an analytical approach to history, and instead indulging in pop culture and entertainment.

"Growing Pains": Predicting the Adjustment of Youth Volunteers by Their Personal, Environmental and Organizational Resources

Amit Zriker

Bar-Ilan University, Israel

Objectives: Youth volunteering is drawing a great deal of attention from scholars and practitioners, as this volunteering can contribute to adolescents' personal and social development. In this study, we aspired to expand the knowledge of the contribution of personal, environmental and organizational resources to the adjustment of youth volunteers. We also investigated the changes in these variables on the course of time. During this period, adolescents are experiencing, perhaps for the first time in their lives, a prolonged period of volunteering.
Method: The study was based on questionnaires distributed to 112 adolescents who volunteered in a unique center of therapeutic riding in Israel. Data was collected in two time-periods. T1 was a month after the volunteers first started their volunteer action, and T2 was after roughly 7-8 months.
Results: Significant improvements were found in adolescents' subjective wellbeing, future orientation and leadership ability. We also found positive correlations between these three variables and self-evaluation, sense of mastery, growth, social support, and organizational factors. Supervisors' support was found correlated only to subjective well-being and future orientation, but not to leadership ability.

Conclusions: Youth volunteering is contributing to the development of subjective well-being and future orientation, and several other important attributes in their adjustment, such as leadership abilities. Hence, the volunteering of adolescents combines both personal and societal development, and as such – the social contribution of volunteering is manifested in building a strong and sustainable base of the future generation as active and involved citizens.

Counter-Protest - Young People's Political Engagement

Jonas Lieberkind

Aarhus University, Denmark

Based on a quantitative as well as a qualitative study of Danish young people born in the early 00s, the paper explores and discusses their political engagement both empirically and theoretically. The two studies show that the Danish youth possess an extensive political interest and an increasing engagement of the democratic society, but at the same time, the young people articulate a prevalent reservation about protesting and participating in public political activities. The argument of the paper is that their form of political engagement can analytically be reflected as a counter-protest. The term counter-protest captures an increasing political engagement, but an engagement that counteracts protest as a relevant form of political action and, furthermore, supports the conventional political system.
The paper is based on a secondary analysis of an international comparative quantitative study of civic and citizenship education (year 8 students, in 24 countries) (the International Civic and Citizenship Education study 2009 and 2016), and a qualitative study of more than 50 Danish year 9 students. The international study shows that young peoples' commitment to society in terms of knowledge, interest and engagement is increasing, but at the same time, that the content and form of their commitment are changing. The paper will focus on the Danish students, as they are significant in this context and enhance a cross-country tendency among young peoples' attitudes towards political engagement.

971

Political Participation and Social Activism Among Young European Migrants in Brexit Britain: Insecurities, Denied Citizenship and Precarious Futures

Daniela Sime

University of Strathclyde, United Kingdom

Since the Brexit referendum, EU migrants in Britain have been forced to think differently about their future strategies, as their rights, citizenship and migration status are reconfigured. For young people, Brexit is a major rupture to their identity formation and sense of belonging. It also has key implications for their everyday opportunities to engage in acts of civism, in the context of their increasingly denied citizenship and rights.

This paper reports on findings from an ESRC-funded study which involved over 1,200 young people aged 12-18, originally from Central Eastern European (CEE) countries, living in the UK, which examined their sense of belonging, experiences of citizenship and plans for future. It draws on data from a survey, focus groups and postcards young people wrote to UK politicians.

Using Yuval-Davis' (2011) understanding of citizenship as multi-layered and transcending local, national and transnational communities, we examine young people's engagement with 'acts of citizenship' (Isin, 2009) and how they think of their everyday political and civic practices. There are connections between civic participation, such as volunteering, and political participation, such as voting (Barrett and Brunton-Smith, 2014) and both are conditioned by one's sense of belonging to place. Our data show that young people were interested in politics, yet they did not feel they had the ability to shape government policies; these were important determinants of their future migration intentions. The study progresses existing knowledge by focussing on young migrants' insecurities and exclusion from everyday citizenship, in the context of current public debates on Europe.

RN30_T02_01 | Covid-19: Generational and Transnational Perspectives

The Asteroid-effect of COVID-19: The Born of a Generation in The Mannheimian Terms?

András Déri[1], Andrea Szabó[2]

[1]Eötvös Loránd University, Faculty of Primary and Preschool Education, Hungary; [2]Institute for Political Science, Centre for Social Sciences, Hungarian Academy of Sciences Centre of Excellence

972

The theory-oriented presentation argues that the COVID-19 pandemic provides an opportunity to refresh our conceptual and terminological understanding of generations. In line with the recent trends in the sociology of youth, we see a generational framework that builds upon the original theories of Mannheim as a way to reconcile the "twin-tracks" of youth studies: the structural context and the individual agency.

Building upon existing data and research on the social effects of the pandemic, we argue that while the popular generationalist theories are very much debatable, this pandemic does create a global generational location (a community of experience) and has all the potentials to form actual generations and generational units (identity groups). To consider and interpret the role and effect of structural inequalities, we propose comparing generation-forming historical events to an asteroid that impacts a planet. While the general trajectory of the planet might change, not all creatures are affected the same way. The concept of asteroid-effect allows us to integrate an intersectional approach (where intersectionality is understood as means to investigate the structure of relations) in analysing the possible formation of actual generations and generational units. The COVID-19 pandemic thus makes it possible to revisit the conceptual and analytical framework of generations and the sociology of youth, as a new generation is being formed.

Transnational Perspectives on Participation of Marginalized Youth in the Corona Crisis

Sonja Preissing

IUBH Internationale Hochschule, Germany

Young people in so-called marginalized urban neighborhoods have increasingly become a focus of attention in Europe. In France, for example, media attention has been focusing on the 'revolts' of young residents in the banlieues (suburbs) against their structural disadvantages and exclusion in French society. Regarding various processes of exclusion, the question of participation of marginalized youth is a big challenge for democratic societies in Europe.

In my presentation, I will present ethnographic findings (based on interviews and observations in the field) of my PhD thesis concerning the formation of participation in urban space by adolescents in marginalized spaces in Cologne (Germany) and in Lyon (France). Here, I will look at their strategies to participate in social and political fields.

In particular, I will underline the situation of marginalized youth due to the corona crisis. How does the corona crisis affect the life and future of marginalized youth regarding e.g. education, mobility and leisure time? What are their needs and concerns? In the political management of the crisis, the positions of young people are still not enough recognized and they cannot participate on decisions made by national and local representatives.

In my presentation, I will highlight their strategies and ways of dealing with the corona crisis and social inequalities. Finally, I will discuss the chances for (marginalized) youth to participate socially and politically in times of crisis.

Resilience And The Pandemic: A Generational Approach

Valentina Cuzzocrea, Giuliana Mandich

University of Cagliari, Italy

Youth scholarship has often used 'resilience' as a key conceptual lens to account for the often creative ways in which young people react to difficulties typical for their generation, such as an high level of youth unemployment. Yet, analytically the concept brings with it many conceptual shortcomings and pitfalls. In fact, the concept can be differently envisaged as a personal trait or a form of agency, as an individual capacity or a situated feature, as a form of 'resistance' or compliance with a neo-liberal ethos. Moreover, resilience is often used to elaborate on tactics in the present, but easily misses to look at a long term future; this is a weakness in an area of research (which confronts studies of time with studies of youth) that is otherwise very florid.

In this presentation, in the first place we try to investigate what it is that makes 'resilience' so apt to talk about young people in scholarly research. Is there anything with the concept that is generationally characterised?

In the second, we conduct a critical review of the concept.

In the third, we confront with empirical material recently collected within the project 'Mapping youth futures' (funded by Italian ministry of research). For the sake of this presentation, we focus on interview material with young people who were caught by the pandemic while planning to, or having recently returned, from a structured programme of mobility, and were therefore urged to reconsider their plans and possibilities.

973

Two Sides of Loneliness as Experienced by Young People in the Year of 2020

Henrik Groundstroem, Pia Elisabeth Nyman-Kurkiala, Jessica Hemberg, Yulia Korzhina, Lillemor Östman, Lisbet Nyström

Åbo Akademi University, Finland

Loneliness in adolescents is related to common mental health issues and as a major global concern it is important to investigate loneliness from the young peoples own perspectives.

Studies have found that loneliness most frequently may occur during adolescence (Hawthorne, 2008, Heinrich & Gullone, 2006). Loneliness can lead to serious, negative mental or physical health conditions such as depression, suicidal thoughts, aggression, obesity and heart disease (Cacioppo et al., 2015). Adolescents who experience long-term loneliness frequently develop highly depressive symptoms (Ladd & Ettekal, 2013). However recent research indicates that loneliness can be a positive resource with regard to developing a teenager's personality (Praizendorf et al., 2020). Solitude has been identified as being connected to the development and reflection of self (cf. Tammela, 2005). According to Baloyannis (2015) a person can long for solitude during certain life stages and even strive for loneliness with the desire to progress to self-concentration, self-evaluation and serenity in the search for a deeper self-knowledge.

The aim of this study was to explore how adolescents experience and describe negative and positive sides of loneliness. Data was collected through interviews with young Swedish-speaking Finns in the year of 2020. The data analysis was inspired by content analysis according to Graneheim and Lundman (2004).

Two main themes and seven subthemes were found. Negative experiences of involuntary loneliness were stressful and paralyzing giving rise to physical symptoms, emptiness, anxiety, fear and invisibility. Other negative experiences resulting from involuntary loneliness were shame, self-blame and self-contempt, as well as meaninglessness, hopelessness and exclusion. Positive experiences from self-chosen solitude were freedom, calmness and recovery, creativity and meaningfulness as well as reflection, recharging and personal growth.

RN30_T02_02 | Digitalization: Creative Uses

Who is Living in a Bubble? An Exploration of the Socio-cultural Profiles Associated to the Problematic Use of Information and Communication Technologies

Joaquín Rodes García, José Palacios Ramírez, Rainer Gehrig

Universidad Católica San Antonio (UCAM), Spain

Within youth studies, Information and Communication Technologies (ICT) are considered as framing youth culture. Terms such as digital natives or network generation describe young people as a separate group in society. In line with this, it is believed that their identity and lifestyle are shaped by technological means. Digital divide studies have questioned this view about youth, emphasizing differences on youth use of ICT according to their socioeconomic and cultural conditions.

Nowadays there is growing concern that technology may affect young people negatively. As a result, risky and addictive behaviours arise interest from scientists and social planners. This paper focuses on the problematic ICT uses and aims at knowing if youth behave as a whole. The main goal of the study is to explore differences within a sample of young people, attending to socio-cultural profiles and ICT use patterns.

Empirical data come from an ongoing research project on youth practices and opinions regarding ICT. Project field work combines a survey carried out in the city of Murcia (Spain) during the pandemic and in-depth interviews directed to young people and therapists involved in treatment programmes for ICT addiction.

974

Getting Caught in Gaming – Investigating Young Gamers' Loss of Control

Tea Torbenfeldt Bengtsson, Lars Fynbo

VIVE – The Danish Center for Social Science Research, Denmark

For many young people, online video gaming is an important and integrated part of everyday life. Online games often allow users to perform micro-transactions, i.e., relatively small and quick purchases of game-related material (for example, game currency and loot boxes). In the more popular games such as Fortnite, FIFA and CS-GO, some purchases are chance-based mechanism generating a randomized object or selection of objects to the player. The chance-based character of the purchases resemble traditional money gambling. Based on qualitative interviews with 105 young people (13-23 years) who have experience with online gaming, the study investigates the role of gambling-related elements in modern online gaming, including how young gamers relate to gambling. Through an empirical analysis of the young gamers' own experiences, the study finds that for the majority gaming, and also in game purchases, constitutes a controlled loss of control. However, the analysis also uncover several risks related to the use of gambling-related elements—such as the risk of losing control over one's expenditure and of uncontrolled sensation/thrill seeking. For some young gamers, uncontrolled use of money and increased thrill seeking becomes an embedded part of their gaming practices and relates to more extensive and general experiences of losing control. The in-game micro-transactions may intensify general losses of control in everyday life. When a loss of control accelerates, for example related to uncontrolled game-time and illicit drug use, the young gamers become at risk of developing other addictions, such gaming and drug disorders.

Internet Memes and Cultural Imaginary. Reconsidering Generational Belonging in the Digital Era

Giulia Giorgi

University of Milan, Italy, University of Turin, Italy

Taking Mannheim's (1952) sociological conceptualisation of generations as theoretical departure, this contribution concerns itself with the role of Internet memes in the construction of generational identities. While existing research (Urick and Hollensbe, 2014) still struggles to reach a consensus over a definition of generation, social media have become the privileged spaces where identities are globally expressed and negotiated. This tendency calls for an interpretation of generation, which recognizes the relevance of the web and its cultural products. As multimodal cultural objects, Internet memes rely on users' subcultural knowledge to be interpreted, manipulated, and circulated. Considering their role of gatekeepers to online communities, this study assumes that memes contribute to defining the identity of large segments of users, asking: in which ways are memes involved in the construction of generational identities? To this end, an analysis involving digital data and focus groups is undertaken. A dataset of 1000 memes collected on Instagram with digital methods is qualitatively examined using content and Discourse Analysis, so as to explore how popular memes are assembled to convey their message. The findings are then used to structure three focus groups of 5-6 participants (18-25 years old), seeking to understand what guides users in the interpretation of memes and in their judgment about memes popularity. It is argued that successful memes depict life situations resonating with teenagers and young adults and/or employ cultural references they are able to decode or they feel emotionally connected to (e.g. cartoons from their childhood). In conclusion, memes contribute to shaping a generational cultural imaginary that transcends the boundaries of age groups and may serve as a basis to reinterpret the concept of generation.

RN30_T02_03 | Intergenerational Transmissions and Dynamics

Horizons of a Generation: the becoming of ethnic minority Danish Children of Descendants in a Danish educational context

Steffen Bering Kristensen

Aarhus University, Denmark

In 2017 a new category was introduced to the enduring Danish debate on the schooling of migrants and their descendants – the so-called "third generation immigrants" (Jyllands-Posten). Due to bad grade averages, they became inscribed in the discourse on "failed integration" in Denmark, but the conceptualization also gave birth to a discussion on the categorizations of the coming generations of ethnic minorities in Denmark.

Based on ethnographic fieldwork in public schools in Denmark, I got to know more than twenty young adults between 13-14 years old, who ascribe to this new category, but with a great diversity in family- and migratory history, that in itself challenges the idea of homogeny in "generations" (Mannheim, 1970). Based on my observations and interviews, I will take a step away from average grades, and discuss how these children themselves construct unique identities in a generational, habituated perspective through the lens of "imagined horizons" (Crapanzano, 2004). I will discuss how my informants negotiate futures in intergenerational relations with parents who themselves are shaped by Danish society and the educational system, while at the same time they are being categorized by teachers and peers and caught in "absorbing" minority categorizations. I argue that markers of difference are transferred through generations within an educational context in racialized subjectivity challenging ideas of "integration" (Rytter, 2018), and I discuss how a focus on "generation", parental migratory history and intergenerational negotiation within an intersectional framework could contribute to a better understanding of my informants' identity constructions in a temporal perspective.

The Elephant In The Room: Post-war Generation In Ex-Yugoslavia

João Victor Pinto Dutra

Centre for Social Studies/University of Coimbra, Portugal

Nearly 25 years after the violent conflicts in the Balkans, an entire young generation has grown up without having had the experiences of their parents and grandparents. In some cases, war divisions or disputes remain alive, as in Bosnia and Kosovo, while forms of celebration and reproduction of nationalist and discriminatory discourses remain. Recently, in International Relations and Peace Studies, much has been discussed about the role of young people in peacebuilding and the sustainability of peace, since they represent a fresh beginning for inter-group conflicts.

This paper aims to understand how the post-war young generation relates to the memory of their families and the public discourse in relation to war and peace. A theoretical conceptual framework is suggested that combines the ways of the new generations understanding past traumas, through post-memory and embodiment to find ways to reproduce, live and resist war and peace. The sources are the literature review regarding youth and post-war in Balkans and the expected data gathered in the context of our Ph.D. thesis. This work commits to interdisciplinary movements through the contributions of International Relations to studies on generations and youth, as well as to reflexively think about youth transitions for the sustainability of peace. In the context of post-conflict societies, it is important to have an adequate theoretical standpoint that gives sense to the transmissions between generations and the role of the post-war youth in political and social matters.

Understanding Childhood Internal Mobility Patterns of Second-Generation Migrants in the Netherlands

Joeke Kuyvenhoven[1], Marjolijn Das[2], Helga A.G. de Valk[1]

[1]Netherlands Interdisciplinary Demographic Institute (NIDI)/KNAW/University of Groningen; [2]Statistics Netherlands
(CBS)

Moving during childhood is an important life event that is often stressful and potentially disruptive. There is, however, still limited knowledge on differential childhood mobility patterns. Since previous descriptive studies find higher internal mobility rates among migrant groups compared to the majority population, the main aim of this study is to understand the differential childhood mobility patterns (age 0-16) for different migrant origin groups and the circumstances under which these moves occur. It focuses on different clusters of childhood internal mobility (in terms of frequency, timing, distance and change in place-type) and looks at the (change in) family structure, family socioeconomic status and geographical context in trying to understand differential mobility patterns for children with different migrant backgrounds. Using longitudinal full population register data of Statistics Netherlands, internal mobility patterns are analysed for nine cohorts of children born in the Netherlands between 1995 and 2003 and living in the country at least until age 16 (N=1.079.399). First results of a multinomial logistic regression show that in general, children with a second-generation migrant background have a higher probability to be mobile during childhood. Children with a Moroccan or Turkish migrant background are more likely to move nearby, while children with a Surinamese and Antillean migrant background are more likely to move long-distance and move frequently. Family circumstances and geographical location explain the differences between the different migrant origin groups only partially, where especially family structure (dissolution and single parenthood) and urbanity seem important indicators in explaining differential mobility patterns.

Migration Behavior of Youth of Different Generations in Russia: Transformation Analysis

Svetlana Sivoplyasova[1,2], Maria Apanovich[3]

[1]Institute for Demographic Research – Branch of the Federal Center of Theoretical and Applied Sociology of the Russian Academy of Sciences (IDR FCTAS RAS), Russia; [2]Moscow Aviation Institute (National Research University), Russia; [3]MGIMO University, Russia

A person's migration behavior is formed under the influence of many factors: economic, environmental, socio-psychological and others. They are diverse, so their impact is extremely difficult to assess. The authors propose to consider the generational characteristics of the population as an integrated factor of migration. The object of the study is the youth of Russia, since it is this cohort that is distinguished by the hanged indicators of mobility. The aim is to identify similar and different in migration behavior of young people (representatives of different generations). Conclusions will be drawn about its transformation, a kind of "turning point" will be determined, and it will also be determined whether the model of the migratory behavior of the parent generation is reproduced in the child.

The research proceeds from the two approaches: demographic and socio-psychological. Generation length will be calculated based on demographics. Analysis is based on statistical data and patterns of the migration behavior of real generations of Russian youth. The assumption goes from the theories of Mannheim and Hove and Strauss. The characteristic features inherent in each generation will be determined and that in its respect that can have a significant impact on the migration behavior of the population. The results obtained will make it possible to draw conclusions about the possible vectors of development of migration processes in the country.

RN30_T03_01 | Values and Culture: Concepts, Politics and Globalization

Youth Cultures. Evolution Of A Concept And A Perspective

Carlo Genova

University of Turin, Italy

That of "youth cultures" is among the main concepts and approaches in youth studies. The label "youth culture" appears, in English, for the first time in the title both of a book and a scientific article in 1962, although yet in 1951 the label appeared in the body of an article. Since the early-1970s the label – and the concept – of "youth culture" had a wide spread, nevertheless, a shared definition is still lacking, and most of scientific publications don't even give any definition of it. But since the study of youth cultures often intersected the study of subcultures, actually the main subcultural interpretative models have often been adopted as instruments for the study of youth cultures, and as a consequence the label "youth culture" has been intended as synonymous of "youth subculture". But does any distinctive trait in the study of youth cultures can be found in literature? Does these traits allow to identify definitions and approaches of analysis which are different from the subcultural ones? Had the use of the concept of "youth culture(s)" a relevant evolution through the time? The paper aims at proposing some answers to these questions on the basis of a qualitative and quantitative analysis of the content of 356 article, in English (identified through intersection of the results emerged in the main international electronic databases), considering frequencies and co-occurrences of words, lemmas and topics, as well as adopting an hermeneutical reading of selected particularly relevant articles.

Anti-Immigrant Sentiment Within Families. Intergenerational Influence of Parents on Their Offspring's Migration Attitudes.

Marvin Marcus Brinkmann

University of Mannheim / Mannheim Centre for European Social Research, Germany

Investigating migration attitudes, the biggest driver of liberal attitudes toward migration, depending on the literature, is either educational attainment or the rate of contact with strangers. Though, there is no knowledge on which of these is the bigger driver and they are mostly used as confounders for negative migration attitudes. What shapes these attitudes and which part do their parents play in this process. The educational attainments usually depends on the parental home and depending on the economic resources, parents have more or less the chance to chose where their offspring will grow up, go to school and even on whom it will be friends with. Such decisions can shape a child's character. Clustered regression analyses were applied on long-term panel data, using the German Socioeconomic Panel (GSOEP). Merging dyadic information from parental indications, some of which were collected more than 30 years ago, to migration attitudes of children in 2018 leads to great insights in how these attitudes develop. The results lead to insights for intergenerational effects on attitudes, the outcome of different contact measures and to answer the question which path has the bigger effect on children's attitudes. Educational attainment and Contact with Strangers are the only drivers despite various sociodemographic variables. The attainment effect is minimally stronger than the contact effect. The contact in the neighborhood is the only contact measure that leads to opposite effect directions whereas the contact in the neighborhood in former times, indicated by parents, leads, according to the other contact effects to positive migration attitudes. The effect of parental education or parental contact is smaller, as expected, but only half as strong as the parallel offspring effects.

978

Cultural Globalization and Youth Consumption in Central Asia: A Case Study from Kazakhstan

Nazgul Mingisheva

Eurasian National University, Kazakhstan

The new generation has raised in Kazakhstan after the Soviet collapse in 1991. This study considers cultural globalization in Kazakhstan through youth consumption of social media and popular culture on global (Western and Asian), regional (Russian), and local (Kazakh) levels. Quantitative and qualitative approaches were used for this research in the universities of Central Kazakhstan from September 2019 to March 2020. There were three main parts survey and interviews: a) consumption of social networks and messengers; b) mass media and television; c) films, TV series, cartoons, and music. The present research covered 433 students - 137 (31.6%) males and 296 (68.4%) females - in the quantitative part as well as 35 students - 13 (37.1%) males and 22 (62.9%) females - were interviewed on social media and popular culture. Some research's results are the following: 1) increased access to Internet and spreading of smartphones complicated and diversified (individualized) youth consumption for the last decade in Kazakhstan; 2) social media and popular culture created new influencers for young generation such as bloggers, celebrities, scientists, civic activists, and others; 3) music consumption among youngsters is more complicated: if survey demonstrated the growth of locality and translocality (Kazakh and Russian) in popular music, the interviews represented the dominance of Western popular music for both young men and women; 4) Asian globalization is considerably feminized, and it is represented by two competitive discourses such as Turkish and Korean (K-pop) popular cultures in female consumption. Generally, young people in Kazakhstan demonstrated critical and conscious consumption of social media and popular culture.

Youth Politics Has Come of Age. Questioning an Old Concept's Ability to Understand New Developmens.

Andrea Felicetti[1], Martin Portos[2]

[1]Scuola Normale Superiore, Italy; [2]Universidad Carlos III de Madrid, Spain

Young people seem increasingly visible in contemporary politics and their role attracts growing research. Some celebrate youth politics as a vital source of democratic renewal. Others, instead, expose young people's lack of political involvement as a key driver of democratic deconsolidation. In this paper, we contribute to this debate. In particular, we do not take side, but acknowledge youth politics' central role in today's analysis and strive to explore in greater detail the very idea of youth politics. In particular, we ask the fundamental question of whether and to what extent it makes sense to talk of youth politics at all— and therefore of young people as a political subject in contemporary democracies. We use a devoted dataset with youth booster samples that cover nine European countries. We investigate and try to make sense of similarities and differences in the way young people conceive of democracy and the way they participate in democratic politics.

RN30_T03_02 | Body and Gender

"As If My Body Isn't Only Mine": Rethinking Hookup Culture and Sexual Vulnerability of Young Women

Rachel Levi Herz

Gender Studies Program, Bar Ilan University Israel, Israel

This paper analyses Israeli hookup culture that is performed in night clubs and parties. During the party, young men approach young women and touch their bodies, for the purpose of initiating sexual interaction. Although it has several violent characteristics, young people don't treat this hookup culture as violent or offensive.

Hookup culture is constructed in a neoliberal discourse that promotes autonomy and choice and is very central in the emergence of sexuality of young people. But in a time of growing uncertainty, interdependency and vulnerability, this paper offers the theoretical framework of vulnerability to revise hookup culture and sexuality of young women. This paper aims to answer the following: (a) how young women express their sexual agency when facing sexual vulnerability (b) what relational patterns emerge in the expression of sexual agency of young women.

Data is derived from in depth interviews with 39 young women, aged 18-22, and through observations in night clubs. The findings show how under conditions of sexual vulnerability, young women develop unique forms of relational agency that support their subjective sexual expression. The ability of young women to act as agents is supported relationally by the emergence of alliances that are based on joint vulnerability. This analysis offers an alternative to a neoliberal discourse that focuses on autonomy and breaks the boundaries of the examination of agency as individual. Recognizing expressions of relational agency illuminates narratives of sexuality of young women that continue presenting active coping in a vulnerable world. This analysis enables rethinking of other aspects of youth culture in general, at a time of an ongoing need to face vulnerability, uncertainty and risks.

The Material And Symbolic In Young Women's Negotiation Of Precarious Work: The Case of the Israeli Service and Care Sector

Roni Eyal-Lubling

Bar-Ilan University, Israel

For young women employed in the service and care sector, bad jobs often involve encounters with customer's humiliating behaviour and the breaching of labour law. Researchers have analysed young people's dependency on bad jobs, as either negotiated through material sources of support found in family relations or to a lesser extent on symbolic resources. The possibility that material resources are accompanied by symbolic resources has been less conceptualized thus neglecting the need to understand the relationship between the two and the circumstances where each or both become crucial. Analysing interviews with 22 economically marginalized young women working in the Israeli service and care sector we could validate earlier scholarly emphasis on the salience of material resources elicited from parental support, even in families with limited means. Those were topped however, by a range of symbolic resources. Particularly surprising was young women's reference to workers' rights and standard employment practices highlighting a division between resources that build agentic capacity to bear precarious employment as opposed to agentic capacity to question precarity and demand change.

980

Gendered Transition Structures: Life Course Patterns After Completion of Gender-Segregated Vocational Education in Norway

Thomas Lorentzen, Kristoffer Chelsom Vogt

University of Bergen, Norway

In this paper we present the results from a sequence analysis of two cohorts of young people skilled in gender-segregated vocational education in Norway. By using administrative registry data (monthly statuses in education, employment and welfare for two whole educational cohorts) we are able to map life course trajectories during the 11 years aftercompletion of apprenticeship tests. The results show that men skilled in male-dominated trades experience the most favourable trajectories in terms of labour market inclusion and income progression, whilst women skilled in female-dominated tracks have the least favourable trajectories. Perhaps more surprisingly, our analysis also demonstrates that the two gender minorities appear to "meet in the middle", displaying remarkably similar life course pattern. We interpret these results as providing a birds-eye view of the gendered transition structures through which vocational youth navigate. The patterns uncovered may contribute to explain why young men overall have been more reluctant to make untraditional choices within both education and employment.

RN30_T04 | Well Being

The Russian Youth's Priorities in Assessing Their Social Well-being

Nikolay Narbut, Irina Trotsuk

RUDN University, Russian Federation

In recent decades, Russian sociologists have become used to constant media criticism of quite positive assessments by the population of their lives in terms of well-being (people declare to be happy and to live a decent life) despite depressing social-economic and political realities. Such reproaches require a dual response: on the one hand, a study of methodological limitations of survey techniques; on the other hand, a comparative generational analysis that would explain differences in the younger and older generations' interpretations of happiness and social well-being. There are two traditions in the sociological study of well-being: based on objective indicators of the quality of life (living conditions, possibility of annual vacations, etc.) and based on subjective indicators (happiness, satisfaction with life, etc.). Certainly, all methods have limitations, but sociologists tend to take the traditional methods for assessing social well-being for granted, although they are far from being as clear and reliable as we think. Our methodological experiments show that even the most usual questions can be unclear for respondents: the traditional criteria for assessing well-being seem ambiguous for the younger respondents; in general, respondents' understanding of the wording of questions and answers is determined by age characteristics; the youth's interpretations of 'happiness', 'well-being' and 'justice' seem to be a mixture of very different socially typical interpretations. Thus, we need not only to test even the most generally accepted questionnaires on well-being, but also to clarify respondents' interpretations of words used in the questionnaire so as to provide reliable explanations of the generational differences in the estimates of social well-being.

981

Mental Health Problems: Acceleration, Performance and Shame in Young People's Lives

Anne Görlich, Mette Pless, Noemi Katznelson

Aalborg University, Denmark

In the past decade, like other western European countries, Denmark has witnessed a dramatic increase in the number of young people, who struggle with mental health problems. In this paper, we wish to step 'behind' the statistics and explore mental health problems from the perspectives of the young people themselves.

The analyses are based on qualitative in-depth interviews with 34 young people aged 16-25 conducted in a semi-longitudinal research project (following them for 2 years) exploring mental health issues as 'new forms of marginalisation'. We apply an analytical perspective on mental health issues in which institutional and social frameworks intertwine with subjective feelings of wellbeing and lack hereof.

In this paper, we wish to present three analytical points showing how sociological and socio-cultural phenomena seem to intertwine in the lives of young people struggling with mental health problems. Our analysis shows how the narratives of the young people are characterised by a pronounced self-critical introspective view on themselves which seem to enhance the young people's sense of shame (Skårderud 2010). Following this, and inspired by theoretical perspectives such as 'social acceleration' (Rosa 2014) as well as 'singularity' and the 'curated life' (Reckwitz 2019) we analyse how, and to what extent, these phenomena impact on the lives of the young people and on the narratives of self as they try to navigate in and create meaningful transitions to adulthood and engage in further education, moving out, starting work etc.

Where Are the Lonely People? A Quantitative Analysis of the Experience of Loneliness Among Young People in Barcelona.

Marga Marí-Klose[1], Sandra Escapa Solanas[1,2]

[1]University of Barcelona, Spain; [2]Ajuntament de Barcelona

982

Contrary to common stereotypes loneliness is not restricted to old age. According to a representative study of the city of Barcelona conducted in 2019 (N=1.000) the age distribution describes a nonlinearly trajectory with the most elevated loneliness levels among young adults. The focus of this research is on identifying characteristics and circumstances that increase or reduce the likelihood of experiencing loneliness analyzing data of a representative sample (Barcelona Youth Survey 2020) of young aged 15 to 34 living in the city of Barcelona (N=1.407). We consider that the experience of loneliness as well as the manner in which different age groups approach to it differ at various stages in life. We present profiles of young —collection of characteristics that can put young people at greater or lesser risk of loneliness— by exploring the relationship between loneliness and socio-demographic and socioeconomic factors. According to our results certain life events and changing circumstances associated to the transition to adulthood expose the young to a significantly greater risk of feeling lonely more often: economic inactivity, lower levels of income, and lack of a partner. Although this study did not investigate the extent of the occurrence of loneliness in various life states, the results are important to be used to target support more effectively toward young people who are at greater risk of feeling lonely more often and to evidence that loneliness requires a differentiated understanding across the life span.

'It's Just Performance All The Time': Early Adolescents' Accounts Of School-related Performance Demands And Well-being

Søren Christian Krogh

Aalborg University, Denmark

Recent decades have seen a rapid decline in mental health among early adolescents. Moreover, new patterns have emerged in mental health issues, as a higher number of children from more resourceful backgrounds are getting affected in ways previously unseen. This development has by some researchers been described as a "new form of marginalization", where mental health issues are no longer predominantly present among traditionally marginalized groups. A growing number of researchers have linked the decline in mental health among youth to a rise in experienced performance demands in general, but especially within educational contexts. The aim of this study is to examine early adolescents' accounts of the connection between school-related performance demands and their general well-being. The study was conducted among pupils in lower secondary education in Denmark. In selecting the four schools involved in this study, a maximum variation approach was applied, securing a great variety of the schools included in the study. Along with short-term participant observations, 38 focus group and individual interviews were conducted evenly distributed between the schools (n=80). Particularly within higher performing schools, clear links between experienced performance demands, self-critique and mental health issues were found among early adolescents, especially among older girls. On the contrary, lower performing settings tended to provide alternatives to high performance demands and less competitive environments. Findings of this study indicates how certain performance imperatives, and the strains hereof, are more assessable to pupils from more resourceful backgrounds.

RN30_T05_01 | Transitions: Occupational, Economic, Social

Caught In Between Metaphors. Skills Policies And Young People's Occupational Choices

Maria-Carmen Pantea

Universitatea 'Babes-Bolyai', Romania

Vocational education and training (VET) is reaching policy momentum in Europe. A commitment for making VET a "first choice" was part of the Skills Agenda in 2016–2020 and the emphasis remained. However, (re)instating VET attractiveness is neither easy, nor dilemma-free. This presentation examines the unsolved tensions generated when compelling policy goals intersect young people's choices. It interrogates the legitimacy of the policy agendas shaped from a structuralist standpoint that prioritizes 'the need for skills' at the expense of young people's own worldviews. The analysis is based on a large-scale qualitative study involving over 250 young people and 100 teachers in VET, employers and policy makers in Romania. The research discusses the main reforms of the Romanian VET system since the fall of the centralized economy and the recent efforts for reshaping its image. The presentation challenges the idea that the problem of VET is (mainly) one of image, as currently implied in the policy rhetoric. In doing this, it interrogates the quality of education in Romania's VET and the precarisation of employment. Ultimately, it engages with the ethical dilemmas attached to a functionalist view of VET. It argues that when policy goals rank high, career counselling is caught in between 'profiling for VET' and achieving emancipatory goals.

983

Temporal Patterns Of Occupational, Economic, Social And Spatial Autonomy Development – Timings, Sequences, Intervals And Reversibility

Julia Zimmermann, Prein Gerald

German Youth Institute/ Deutsches Jugendinstitut (DJI), Germany

In recent decades young people face increasing demands to make independent and individually meaningful transitions into adulthood. At the same time, life course patterns have become considerably diversified and biographical security has declined, especially with regard to educational and employment careers. Education and employment trajectories are of particular importance for the life course, as they traditionally set the pace for many other important life events in the process of reaching adulthood, such as attaining economic independence, establishing an own household or entering into a stable relationship. Our presentation shall take up the question, how young people manage to master the key steps towards adulthood under these conditions. By using event history data on educational and occupational biographies from the survey "Growing up in Germany (AID:A 2019)" of the German Youth Institute (DJI), we first examine the extent to which diversification of school-to-work-transitions has taken place. In the second step we analyze the conditional interdependencies between transitions into vocational training and work with other key steps in the process of autonomy development with regard to their timings, sequences, temporal intervals and possible reversibility. We identify factors that lead to an earlier or later occurrence of key events in the life course and investigate how these affect further transitions.

Designing an Extensive Approach to Precariousness

Nuno de Almeida Alves, Helena Carvalho

ISCTE-IUL, Portugal

The notion of labour precariousness is central in the popular, political, and scientific discourse as a condition increasingly used to characterize a relevant part of the employment available in current European economies and societies. Initially, it was considered as a stepping-stone for young people at the entry of the labour market, something that could be surpassed within a few years of experience. Today, reinforced with the COVID-19 pandemic and respective consequences in the economy and labour market, together with the platformization (Casilli and Posada 2019) and development of the gig economy (MacDonald and Giazitzoglu 2019), precariousness affects an increasingly significant proportion of the manpower independently of age, skills or educational attainment, with already noteworthy but still under-researched effects in youth transitions, labour relations and income and social inequalities throughout societies.

Despite its wide use in sociology and other social sciences, the concept of precariousness still raises several theoretical hurdles and operational difficulties, associated with the diversity of perspectives, analytical dimensions and methodological endeavours used to analyse the phenomenon. These circumstances have led research in the social sciences to invest especially in qualitative methodologies operations to address this issue, however quantitative and extensive efforts are also needed for obtaining a wider notion of the extension and features of the phenomenon. This presentation will discuss some of these theoretical and methodological difficulties in the use of the concept of precariousness, together with a proposal for its systematic operationalisation using the (Portuguese) Labour Force Survey micro-data.

984

Perceptions of Unemployment and Concerns About the Future Among the High School Youth of Istanbul

Ayşe Berna Uçarol

Mimar Sinan Fine Arts University, Turkey

While having a young population is generally considered an advantage for economic and social development, Turkey could not convert this demographic situation to its benefit. In recent years, youth unemployment, particularly among university graduates, is at a rate as high as 36%. Turkey's young graduate population is increasingly obligated to work in precarious jobs, and jobs which do not correspond to their university diploma. This presentation will address the problems of young people working in jobs that do not match their interests and skills. It will do this by taking into consideration the problems that derive from the gradual separation between the labor market and universities in Turkey. The presentation will also examine how perceptions of the future are being shaped among high school students.

This presentation is based on a qualitative research that was conducted in three high schools (metropolitan, semi-urban, and rural settings) in Istanbul and in Yalova, as a part of the Horizon 2020 Research Project. These schools stand out with their success in baccalaureate programs. Semi-structured interviews with 79 young people revealed that the anxiety of not finding a job started in the early years of high school education. According to our findings, the causes of anxiety formation are multiple; the causes include the existence of unemployment among people in the nuclear family or close environment, and the high coverage of unemployment news on social media. Anxiety regarding the future affects the vocational orientation of residents and re-directs them to university departments that were not included in their initial personal interests. These non-preferred departments are chosen rather for the chance to find a job after graduation, and are known as "guaranteed departments".

RN30_T05_02 | Values and Culture: Intergenerational Perspectives

Differences of Values Between the Current and the Late Soviet Cohorts of 18-25 Years Olds.

Vylius Leonavičius

Vytautas Magnus University, Lithuania

985

The study compares two cohort of young people (ages 18-25 years): the one of the late Soviet period (born in 1965-1972) and the one of independent Lithuania (born in 1995-2012). The society of the late Soviet period and it last youngest generation can be sociologically described as a society of first modernity (U. Beck), with characteristic values of material and physical safety (R. Inglehart). It was also a society of an authoritarian state, socialized in Soviet ideology, and expressing hypocritical dispositions. The cohort that was born and grew up in Lithuania, which had been independent for 30 years, was socialized in a democratic and open society. The study analyses and compares the data from the European Value Study (1989, 1000 respondents) with the data from a survey by the Department of Sociology of Vytautas Magnus University (2020, 3000 respondents). The study compares the data on the relationship between public and personal morality. The study allows to conclude that the youngest cohort of the Lithuanian society, as surveyed in June-July 1990, is not radically different in its value dispositions from the one surveyed in 2020. However, there are some differences. The cohort of 1990 had weaker priorities for postmaterialist values and stronger aspirations for emancipation. On the other hand, it expressed larger support for breaking public norms and were more likely to say that they pretend in public, than the cohort of 2020. A stronger interplay between dispositions of emancipation and hypocrisy would point to a stronger sense of ambivalence and probably to a comparatively stronger feeling of relativity of good and evil, in the cohort of 1990 compared to the cohort of 2020.

"What Have You Done to Our World?" Comparing Narratives of Intergenerational Injustice in 7 Youth Protests

Cécile Van de Velde

University of Montreal, Canada

At a time when intergenerational justice is emerging as a major social issue in the post-pandemic world, this paper aims to shed light on a new facet of the generational dimension of youth protests from the last decade: it identifies the main generational rhetoric present in the discourses of 7 youth social movements. Theoretically, it is based on the idea that we must bridge the gap between the sociology of youth and that of social movements to better understand the current claims of injustice between generations. It proposes a large-scale comparison of protest writings (n=1914) -slogans, signs, posters- directly collected during: the "Indignant" in Madrid (2011), the student movement in Santiago de Chile (2011), the "Printemps Erable" in Montreal (2012), the "Umbrella movement" in Hong Kong (2014), the "Nuit Debout" movement in Paris (2016), the pro-democratic movement in Hong Kong (2019), and the pro-climate march in Montreal (2019). The textual analysis shows that all the movements analyzed denounce a form of intergenerational injustice, whether it is economic in the student movements in Chile and Quebec, social in the European movements such as Indignant and Nuit Debout, political in the pro-democracy movements in Hong Kong, or environmental in the pro-climate movement. Economic threat, social sacrifice, political betrayal or existential condemnation: these movements therefore constitute a "generational moment", marked by a strong politicization of inequalities between generations. By comparing these rhetorics over time, we can understand how this discourse of generational injustice has asserted itself over the decade.

An Intergenerational Inquiry into the Cultural Participations of Young People in Turkey

Yıldırım Şentürk

Mimar Sinan Fine Arts University, Turkey

Based on the qualitative research conducted with the members of 27 families in Turkey as a part of our Horizon 2020 Research Project (CHIEF – Cultural Heritages and Identities of Europe's Future), this presentation aims to understand the cultural participation of young people in Turkey by exploring the dynamics of intergenerational relations. The socialisation among older and younger generations mutually affects each other, rather than being in one direction from elder to younger. In this regard, the transmission of values, beliefs, and skills does not take place smoothly. Instead, negotiation, re-interpretation, and contestation are all part of these transmissions. Every family presents a different pattern of intergenerational relations. The spatial configuration of prevailing intergenerational relations within a particular family requires special attention (Wyn and White, 2000; Hopkins and Pain, 2007; Vanderbeck and Worth, 2015; Vanderbeck, 2019). Therefore, the place (space), occasion (time), activity (practice) aspects of the intergenerational relations are necessary elements to examine. To elaborate our findings from this perspective, we pay specific attention to the way the families take part in and provide support in the cultural activities of their children according to the social setting of the family. In this regard, we identify two distinct family patterns among the interviewed families: Pioneer and supporter families. Such classification helps us to scrutinise how the family as a setting has an impact on the youth's cultural activities.

986

Acquisition of Intercultural Competencies and Cultural Participation among Young People in Latvia

Ilze Koroleva[1,2], Inta Mierina[1,2], Aleksandrs Aleksandrovs[1,2]

[1]University of Daugavpils; [2]University of Latvia, Institute of Philosophy and Sociology, Latvia

In the contemporary world, the increasing population mobility and European political and economic relations contribute to countries becoming multicultural. This leads to the necessity of intercultural dialogue that requires continuously applied and updated competences. Will multiculturalism support the development of Latvia, or will it fragment its society – this largely depends on whether young people will develop positive attitude are become capable of productive intercultural dialogue.

The aim of this paper is to analyse the way how young people acquire intercultural competencies through exploring the heritage in all its form variety and within diverse educational contexts: school, wider society, family, peers, etc. The analysis provides a classification of the cultural participation spectrum in young people in Latvia and establishes predictors of different types of cultural participation at both individual and school or locality level.

The empirical analysis draws upon a quantitative survey of high school students (16 years old on average). By applying multi-level regression analysis, we explore individual and contextual determinants of the cultural participation of youngsters. For example, we find that while cultural participation mainly depends on family and values, schools can facilitate young peoples' interest in museums and historical sites by organising extracurricular activities. The study also analyses the role of cultural literacy and participation in explaining European values and intercultural dialogue among youth, including attitudes towards migrants, minorities, environment and gender equality.

RN30_T06_01 | Belonging and Geography: National Identities

From Me to All of You – Young Danes, Privilege and Participation

Maria Bruselius-Jensen, Niels Ulrik Sørensen, Katrine Thea Pløger Nielsen

Aalborg University, Denmark

Young people's political participation is often associated with a generational opposition to societal norms and power structures based on the general idea of the 'youth rebellion' of the 60's (Bjurström 1997). Driven by this, the present generation of young people is often portrayed as unengaged, disinterested and unprepared for democratic citizenship (Loncle et al, 2012). This deficit perspective has been counteracted by recent research, which demonstrates that young people are often not uninvolved, but they use forms and means other than formal participation to engage in society and to influence politics (Quintelier, 2007; Pohl et al, 2019, Bruselius-Jensen et al. 2021). In a Nordic context, research has furthermore identified young people's forms of engagement as quiet and strategical (Lieberkin 2021).

This presentation is based on interviews with 86 young Danes engaged in twenty different organizations representing a broad selection, ranging from youth parties, NGO's to activist groups and covering diverse aims such as development aid, climate, animal welfare, special needs, sexuality, religious believes and education. Based on a triangulation that conceptualize engagement as a balance between a practical, a political and a personal dimension, the study, much in line with Lieberkin, identifies the idea of having privilege and feeling obliged to use this privilege to make positive changes for other young people to be the main driver for young Danes engagement in political and voluntary organizations. These findings constitute the starting point for a discussion of the need to develop new and more adequate concepts to grasp new forms of youth political engagement.

987

Spain, 21th Century: Transition to Adulthood in a Context of Emergency

Pau Miret-Gamundi, Nicolás Aros

Centre for Demographic Studies, Spain

In familistic welfare societies, remaining childless and unpartnered at parental home is the way to deal with economic recessions: public support for leaving home is insignificant. We use this indicator as a proxy for the column of survivals in a life table for family or household formation by gender and generation. Our source of data is the Spanish Labour Force Survey (LFS), a panel that allows to analyse the effects of a decade of expansion (1998-2007), another of recession (2008-2017) and how the economic recovery that started then has been truncated by COVID-19. Once the age range has been framed as a proxy of the biography on the process of leaving the position of being a dependent child, the factors that are related to the phenomenon are identified: in particular, those related with education and migration: on one side, schooling pull young people to stay at parental home as a dependent child for longer than expected (although public schooling is widely extended for compulsory education, medium and higher education still remains basically family supported); on the other, mobility (in particular, international migration) push them to leave. Using logistic regression techniques for panel data (with hierarchical nested random effects) the biographical patterns among gender and generations groups will be reconstructed. The LFS sample is structured with its two levels of analysis, namely, observations nested among individuals. In addition, through a multilevel analysis we add the province of residence, with which the territorial scale will be captured.

Conceptualizing National Identity Through Political Socialization of Young Students: How Greek Students Perceive Collective Identity in Times of Post-crisis

Katerina Iliou

National Centre for Social Research, Greece

The proposal attempts to deepen on previous analyses of data from a research conducted in High school Greek students (in Athens) during 2018. Research objectives focus on political socialization of adolescents, namely attitudes, values and persons that hold a key role on the formation of primary political thoughts and orientation. An exploratory factor analysis on the way students conceptualize the "good Greek citizen" highlighted the unexpected factor of 'Patriotism' except than 'Concern' and 'Duty' who constitute the predictable factors for perception of citizenship.

First, we will search for significant correlations between perception of citizenship and other variables such as 'Patriotism' (Blind vs Constructive) and 'National pride', but also data derived from an open question concerning what participants would like to become in the future. This last question states an unobtrusive measure for national identity since data include frequent references to geographical (im)mobility plans of students for the future they anticipate.

Second, we will apply a model of multiple factors that may predict perceptions of citizenship. Independent variables will consider Interest on politics, Political knowledge, Political self-determination as well as an indicator depicting socio-economic status of students' family.

Young students who participated in this research grew up in a potent economic crisis that deconstructed well established perceptions of Greek national identity and political reality in national and international level. This proposal highlights that young people perceive politics in new ways and express political behavior with non-conventional manifestations.

RN30_T06_02 | Participation and Activism: Critical Perspectives

Dairy as a Battleground: Environmental Values and Animal Rights Scripts Among Italian Youths"

Niccolo' Morelli[1], Tommaso Vitale[2]

[1]Università Cattolica del Sacro Cuore, Milano, Italy; [2]Sciences Po, Paris, France.

Cultural sociology has developed many analytical tools to cope with meaning attributed to choices and consumption. In this paper we mobilise the distinction between values, worldviews, frames, and scripts of behaviour as proposed by Michele Lamont and Mario Small to analyse the choices of dairy use among Italian youth.

The last 20 years have been characterized by a wide array of dynamics: massive reduction of milk and, to a lesser extent, dairy expending due to a development of a large conversation about the presumed risks associated with the intake of lactose; and semantic battles on non-dairy 'milk' products and their labels. This reduction has affected mainly young consumers but has been less studied by sociologists.

We explore here the links between environmental values, animal rights, personal health perception, and behavioural scripts toward dairy consumption choices. We designed an online survey of youth in Italy (N=1005; 18-34), implemented in november 2020, and control for worldviews related to trust in science, civic engagement and political attitudes (conspiracy theories included).

Data highlight that dairy use shrinking is higher between those who share a preoccupation with their health and a high attention to animal and environmental equity. Compared to just a few years ago, we see an increase of environmental and animal advocacy concerns, the latter being more developed as scripts thus more effective in influencing youth behaviour. The main result of our paper is explaining why animal advocacy is becoming a cultural script mobilised by Italian youth, beyond veganism and vegetarianism.

An "Actively Disengaged" Youth? A Typology of Political Participation Among Young Italians

Paolo Gerbaudo[1], Mirella Paolillo[2]

[1]King's College London; [2]University of Naples Federico II

In recent years there has been much debate on the nature of political participation of young people (Kitanova, 2020). On the one hand there is a perception of disengagement of young people from politics, on the other young people are seen as engaging with politics in unconventional forms (Chou et al. 2017). To explore young people's political participation, we analyse a panel survey of young Italians (n=405) conducted in the aftermath of the 2018 national elections. We develop a typology of young participants based on a number of indicators including: news consumption, social network use, voting and participation in protest action. We identify 4 groups: anti-political non-participants; civic participants; apolitical non-participants; hyper-political participants. Focusing on the largest group - anti-political non-participants (48%) - we argue that the reason for their low participation is down to distrust towards politicians; perception of distance from political institutions and of excessive political polarisation. Furthermore, we find that the intensity of participation is strongly related to political partisanship, meaning that the supporters of some parties display higher levels of participation. These findings call for a revision of our understanding of youth political participation. First, they highlight that, among young people, political participation is the preserve of a minority of highly politicised citizens - what we call hyper-political participants - whose priorities may not be representative of majority opinions. Second, it highlights that low participation is not necessarily due merely to lack of education or low access to information, but can derive from conscious distrust at institutional politics.

Young People, Generations, and Political Activism in the Pandemic Crisis: Pragmatic Reconfiguration of Utopia and Future Perspectives

Lidia Lo Schiavo[1], Paola Rebughin[i2]

[1]University of Messina, Italy; [2]University of Milan, Italy

Currently, young people political action seems to be characterized both by a pragmatic approach, to adjust to a manifold crisis, and by utopian aspirations coping with precarity and uncertainty. Different forms of mutual and "direct social actions" have been carried out to cope with the pandemic crisis, based on formal and informal solidary organisations already experimented during the economic crisis of a decade ago when, as a consequence of neoliberal polices, young people faced decreasing social mobility and social exclusion. Recently, new forms of intergenerational actions have been experimented in the sphere of care and reproduction, and these are regarded as prefigurative forms of sociality and politics. Young people are experimenting new connections between society and politics, by building societal infrastructures (such as "do-it-ourselves politics"), that is new forms of sociality to project a renewal of the political in different fields, spanning from social care to environmental issues. The pandemic crisis is deeply challenging both institutions and society impacting on everyday life. In response to this, a "Manifest for the reconstruction" has been created by young activists. They enact mutualistic practices and informal political participation with the aim of being able to transform utopias in concrete and everyday life practices, as realistic/pragmatic actions devoted to overcome the crisis. After a theoretical introduction, the presentation will focus on a recent research about these new initiatives, with the aim of analysing young generations' reinvention of both the social and the political, and of fostering a critical reflection on individualisation and subjectivation processes.
Keywords: generations, youth, utopia.

Disengagement or Different Engagement: Social Change and Young People's Political Participation in Turkey

Kayhan Delibaş[1], Aynur Çam[2]

[1]Aydın Adnan Menderes University AYDIN-TURKEY; [2]Aydin Adnan Menderes University AYDIN-TURKEY

Sociologically, the youth is a separate social layer within the social structure. As a historical social construct, this phenomenon has always been a controversial issue. One of the most common aspect of this controversy concerns the issue of youth politics. There has been widespread concern about the young people's lack of political awareness, political apathy, to a disinterest in politics and to their lack of participation in the political process. Especially, since early 1980s declined levels of political involvement among youth have been a cause for concern in a number of countries as well as in Turkey. It is usually claimed that the low-level political participation in the elections and general disinterest in politics among young people is that they are apathetic and part of a 1980s generation that does not care about political matters. It is the aim of this paper to test these common assumptions as well as will try to address these areas: the perception and involvement levels with politics? Do they disinterested or they perceive politics differently? What is the level of political involvement? How do they perceive current/traditional politics, political elite and political parties? What are the commonly shared political affiliation and value system? And finally, which political socialization environments and opportunity structures can foster participation? Attempting to grasp and explain the youth political involvement, we consider result of surveys and interviews (N=750) exploring political attitudes, awareness, participation and level of involvement carried out three different universities in Turkey.

RN30_T07_01 | Covid-19: Engagement and Practices

Social Mobility of Young Scientists in the Pandemic- and Post-Pandemic-Era

Roman Smirnov

State University of Management, Russian Federation

COVID-19 pandemic and related anti-epidemic measures have affected the opportunities and trajectories of social mobility of young people. The object of the research is a social group of young scientists (in Austria, Germany, Russia): doctoral students, and Ph.D./candidates of science under the age of 30. The study's Purpose: to analyze the problems of social mobility of young scientists during the COVID-19 pandemic (using the qualitative interview method (N = 50)).

Young scientists are vulnerable to new challenges. Among the respondents, negative emotional reactions and assessments of the possibilities of social mobility during a pandemic predominate. In several interviews, young scientists spoke of depression, feelings of despair, and indeterminacy. An increase in the importance of the family, educational and professional status and social ties of parents as factors of social mobility of young scientists was revealed: according to estimates of the young scientists, family capital makes it possible to "smooth out" the negative impact of the pandemic on their careers. The estimates of respondents from families with low resources were the most pessimistic. Respondents also showed a pessimistic view of the future. Many of them want to take "time-out" from scientific work or even leave it altogether, and only a few plan to continue scientific work.

Thus, the pandemic distorts the trajectories of social mobility of young scientists, demotivates and disorients them, which makes it possible to predict a decline in scientific activity both during and after a pandemic.

Inertia And Protagonism In The Cultures Of Youth Participation - Before And After Lockdown

Andrea Casavecchia

Università di Roma Tre, Italy

The study proposes the results of a research that identifies and compares styles and attitudes of participation among young people and how they were influenced before and after the experience of the lockdown lived in Italy between March and May 2020.

In the first phase a questionnaire was administered - through a survey monkey - to 623 young Italians.

The data collected made it possible to outline a profile of participatory styles obtained from the correspondence analysis, which relates from three indices: involvement in public debate, membership of civil society and presence in civic-political initiatives.

Three groups are identified: the first is composed of the inerts people, which take on a passive style reminiscent of Durkheim's anomic behavior; the second is made up of actives people who shows interest and participation in initiatives but have a weak membership; the last one contains enterprising people, who are involved and integrated into civil society and show a style that is close to Mannheim's integrative behavior.

The three styles that have emerged are correlated to different opinions: on average the members of the first group are closer to a sovereign national culture, while the other two groups are closer to a cosmopolitan culture.

After the first lockdown, the questionnaire was re-proposed to the same young people to verify if the pandemic crisis had influenced the attitudes observed previously. Although the responses to the second phase were lower (203 young people), it was possible to recompose the three groups, which however have differences, among which a generalized growth in the public debate and the lower frequency of opinions relating to a sovereign national culture.

991

Spectral Practices: Engaging Youth With Contemporary Art Institutions During Lockdown

Carolina Silva

Institute of Social Sciences, University of Lisbon, Portugal

Europe's cultural and creative sector was one of the hardest hit by the coronavirus crisis, with an estimated loss of 31.7% in 2020 compared with 2019. Museums were among the main cultural venues forced to close and suspended most of their programmes during the strict lockdowns imposed across the globe. Nevertheless, examples of resilience emerged, especially initiatives involving younger participants, including youth collectives and internship programmes.

Focusing on the Portuguese context, I will analyse the planning, delivery and outcomes of three youth programmes developed with and for young people, aged 15 to 25, during lockdown – BoCA (Biennial of Contemporary Art) Sub-21 (Abril – June 2020), Calouste Gulbenkian Foundation Imagina 15-25 (January – May 2020), and MAAT (Museum of Art, Architecture and Technology) internship programme (October 2020 – April 2021). The first is a biennial youth collective, the second a pilot youth advisory board, and the third an established internship programme. They were all affected by and responded to the Covid-19 pandemic in different degrees.

Based on interviews with a selected group of participants and the organizers of each of these initiatives, as well as the creative outcomes they produced, including an online group performance and a series of online talks, I will discuss the impact of lockdown in museums' engagement with youth. What were the challenges, limitations and opportunities of an imposed digital existence, how has it led to a renewed sense of togetherness and how can it inform future practices with youth in museums?

The Impact of the Coronavirus Pandemic on Young People and Youth Work in Europe

Andreas Karsten[1,2,3], Andrea Horta[1,2], Ashley Pitschmann[1,2], Johanna Böhler[1,3]

[1]RAY Research Network, Europe; [2]Youth Policy Labs, Germany; [3]Generation and Educational Science Institute, Austria

Young people's development is not only shaped by formal education through schools and colleges, but also by non-formal education through youth work. In a European-wide research project, the RAY Network has explored how young people involved in youth work as well as youth workers have experienced the pandemic, and how the relations of both to youth work have changed. Quantitative and qualitative data was gathered through a rolling multilingual online survey (available in 25 European languages), three literature reviews (following each wave of the pandemic), interviews with youth researchers and youth experts, and case studies of youth work responses, conducted in 10 European countries. Firstly, our findings show that, and showcase how, the pandemic has led to severe economic repercussions for European youth work, and has provoked large changes to the structures, working methods, spaces, timings, and tools of youth work across Europe. Our findings secondly also document the quick adaptation of the field to the new realities, and detail its supporting role for young people during these times of crisis. Thirdly, our findings reveal how long-standing systemic deficits framing and restricting youth work have led to an increased marginalisation of young people from disadvantaged backgrounds. Finally, our research concludes with the post-pandemic support needed to help youth work recover from the severe effects of Covid-19.

RN30_T07_02 | Qualitative Methods

Italian Youth Between Geographical Mobility and Socio-cultural Trajectories. A Qualitative Longitudinal Study

Mariagrazia Gambardella, Ilenya Camozzi, Barbara Gruening

University of Milano Bicocca, Italy

The study of contemporary youth condition is closely intertwined with the rapidity of socio-cultural change and, more recently, with the outbreak of the Covid-19 pandemic. Youth scholars have shown the discontinuities within modern transition to adulthood, which used to be mainly characterized by a linear sequence of public and private steps. By investigating the new 'turning points' and 'critical moments' (i.e. geographical mobility) marking the transition to adulthood, they also question the very concept of it. Transition to adulthood is therefore a strategic research perspective for highlighting the ways in which young people's lives and understanding are now continually reshaped by the changing historical conditions.

In our paper, we will present the results of the first wave of a five-year qualitative longitudinal study on youth and transition to adulthood in Italy, based on 120 narrative interviews with both women and men aged 23-29, with diverse educational and professional paths and of various regional origins, and 6 dialogical workshops with 60 undergraduate students of both hard and soft sciences from three large universities (Milan, Rome, Naples). Among the themes we tackled – intergenerational relations (including family relations), future plans, uncertainty, educational and professional projects and experiences, political participation – we will focus here on geographical mobility, career paths and aspirations, and their role in the transition to adulthood. We will then shed light on the meanings our respondents attributed to both interregional and international mobility, the expectations they linked to mobility and, above all, the relation between mobility projects and socio-cultural trajectories.

The Many Aspects of Qualitative Longitudinal Youth Research

Sinikka Aapola-Kari[1], Päivi Armila[2], Tarja Tolonen[3], Kaisa Vehkalahti[4]

[1]Finnish Youth Research Network, Finland; [2]University of Eastern Finland; [3]University of Helsinki, Finland; [4]University of Oulu, Finland

In this paper, we discuss the advantages and challenges of qualitative longitudinal research with young people. We start with our own research cooperation and develop a broader argument on the epistemological aspects of qualitative longitudinal research.

In a qualitative follow-up study, we can catch the dynamic character of young people's lives as they unfold. We can consider the constant changes in their circumstances, thoughts and attitudes; young people's lives do not stay the same for long. We also pay attention to the stabilities of their lives. Ethical considerations are especially sensitive in a longitudinal project with young people.

Youth in Time is a qualitative longitudinal research project and conducted since 2015 as cooperation between the Finnish Youth Research Network and the universities of Helsinki, Oulu and Eastern Finland. We follow the life-paths of a hundred young people, born in 2000, from various backgrounds and living around Finland.

The aim is to produce holistic and sustained knowledge about young people. The main research question concerns how varying life-environments and resources shape young people's life-choices. Other themes include family and social relations, everyday life, schooling and work, educational choices and local identities. We utilize various participatory research methods.

993

Revisiting Middle Class in Poland: a 20-years After Study of Parents and Children. Qualitative Insights into Intergenerational Transmission of Lifestyles.

Magdalena Bielińska

Polish Academy of Sciences, Poland

The paper proposes a qualitative, intergenerational perspective on middle-class reproduction in terms of lifestyles. This study demonstrates how socio-cultural values affect and are shaped by a social structure. Taking contemporary Poland as an example, I explore patterns of intergenerational transmission of lifestyle elements.

The paper concerns the middle-class crystallization by inheriting its cultural distinctiveness. Thus, in a broader perspective, it regards mechanisms of stability and change of the social structure. Hence, through an analysis of lifestyles among first and second-generation middle-class representatives, the study aims at enhancing understanding of the broader middle-class transformations in general.

Building directly on the previous work of Hanna Palska (2002), I apply reanalyses and reinterpretations of interviews with youth conducted in the late '90s. I compare this material with data from my research revisit to 'old' interviewees ('parents') and new interviews with their children (today, young adults). Using data collected through in-depth interviews, I trace intergenerational continuity and change of lifestyle components. By analyzing leisure practices (cultural participation, health-relevant behaviours, environmental attitudes) and consumption patterns, I attempt to identify tastes differences between generations. Moreover, in the spectre of my interests, there are also socio-political activities and collective identity.

Testimonies of both generations indicate the mechanisms of lifestyle' inheritance. This empirical evidence sheds light on the lifestyle elements transferred between generations and - for understanding more fully youth identities – on lifestyle changes in the subsequent generation. I demonstrate that 'children' are dominated by the consumption of experiences rather than goods and services, which is characteristic of 'parents' and that the youth are involved in making consumption-related aesthetic choices and self-manage their lifestyle.

How Morality Shapes Youth Political Behavior in Germany and in Czech Republic: A Mixed Methods Study.

Tomáš Dvořák

Charles University, Czech Republic

Based on the mixed methods study of how Czech and German adolescents reflect their political engagement, the paper aims to examine the cultural model structuring these people´s understanding of political agency. Building upon a theory of dyadic morality (Schein, Gray 2018) we argue that there is a tight relation between morality and youth political engagement.

We argue that perceived (social) harm is a basis for political agency. Even though Czech and German adolescents reflect on the similar variety of social problems, that (potentially) need to be taken care of, the ideas whose fault it is and therefore who should do something about it are very different in countries under study. Respectively, where Germans see the harm, they usually also identify the clear culprit. On the other hand, Czech young people do not connect the perceived harm with neither nor abstract culprit, which together with their understanding of politics as the government of state institutions, is logically not followed by any demands to politics, nor any need to act themselves. Our data shows, that the Germans recognize themselves as political actors, they consider politics as to be serving their (society, local and global) aims, so they thematize the urge to engage politically themselves. The Czechs on the other hand see politics as one of the hobbies one can have. They thematize their political agency as limited to the social obligation stemming from the pressure of conformity rather than as a vessel to change something. The results of semi-structured interview-based research were tested also quantitatively using the European Social Survey data from 2018 corroborating some predictions of the theory.

994

RN30_T07_03 | School to Work Transitions

Educational Choices Of Polish Youth In An Intergenerational Perspective

Paula Pustulka, Justyna Sarnowska

SWPS University, Poland

This article investigates the parental role in educational decisions of young adults in Poland. The country-context is vital due to the profound impact of the 1989 transition on educational aspirations and subsequent 'degree boom' in the younger cohorts. Using data from two qualitative studies, we deploy an intergenerational lens to examine how young men and women are affected by their mothers and fathers when making choices about their educational pathways. We propose a matrix of four types of educational aspirations framed by parents, pointing to the importance of resources (capitals/socialisational conditions) on the one hand, and the notion of socialisation influences linked to pragmatism and experimentation, on the other. Based on thematic and comparative analyses of 129 interviews gathered through Qualitative Longitudinal Research projects, we discuss four ideal-types of Successors, Questers, Trailblazers and Hustlers. Accounting also for the gender dimension, we contribute to the broader debates on the reproduction of inequalities and unpack 'critical moments' in youth transitions, specifically in the realm of education.

Young Bulgarian Graduates In The Process Of School To Work Transition. The Youth Between Individual Agency And Family Support

Darena Dimitrova Hristozova

University of Plovdiv "Paisii Hilendarski", Bulgaria

In the contemporary conditions of social insecurity, rapid rates of scientific and technological development and new forms of educational training and employment, young people are becoming more inclined to experiment with their educational and employment careers, looking for a satisfactory and secure career in a desired professional field. This paper focuses on two groups of young people - those graduating from high schools and those graduating from universities in 2020. The analysis aims to outline the specific situation of young people in Bulgaria – the interlacement between educational attainments, access to the labor market and formed life values in the family. The quantitative data used is part of an online survey conducted in 2020 by the method of respondents (121 young Bulgarians in total). It was developed for the purposes of a dissertation with title: "Youth life transitions in the context of globalization." The results enable defining the vision of young people about the successful transition from education to employment and to be brought out the specific new lifestyles that they follow. Youth views are summarized through the prism of their relationships with parents. That allows to draw a conclusions about the extent of their independence in the process of making an important life decisions and formulating clear plans for the future.

995

From Learner To Laborer During A Global Pandemic: Concerns And Vulnerabilities Among Nordic Graduates During COVID-19 School-to-work Transitions

Julia Nuckols, Anu Sirola, Jussi Nyrhinen, Terhi-Anna Wilska

University of Jyväskylä, Finland

Background: Transitioning from school-to-work (STW) is an important yet vulnerable life stage characterized by uncertainty and risks. However, many risk having those concerns and vulnerabilities amplified due to the pandemic, which has induced financial turmoil and job loss. Since the outcomes of STW transitions are definitive for future career prospects, it is crucial to acknowledge the crucibles of vulnerabilities in this meaningful life stage amidst a crisis.

Objectives: The aim of this study was to explore COVID-related concerns and vulnerabilities amongst Finnish and Swedish young adults who are embarking on STW transition during the coronavirus crisis.

Method: The data consisted of focus group interviews of Finnish and Swedish university students (N=50) who graduated during the pandemic. The groups were divided by field to enable comparison between fields and countries. Interviews covered students' thoughts related to the pandemic and their future. The data was analyzed by using content analysis.

Results: Results revealed differences between fields in terms of pandemic uncertainty levels, future concerns, and vulnerabilities. For instance, adaptation to digitalization of everyday life was easier for those enrolled in the IT-field. There was also a strong presence of worry amongst those in the humanistic field.

Conclusion: It is understood that the pandemic has amplified inequalities, and graduates are no exception. The results highlight that graduates from certain fields may be especially vulnerable and in need of additional support when going through their STW transitions during the pandemic. There are further concerns about a future degree division into the "useful" and "useless".

Keywords: coronavirus, school-to-work transition, young people, generations, crisis

Condition of the Educational and Labor Potential of Russian Youth and Factors of Its Implementation in the Economy (at the Case of the Novosibirsk Region)

Irina I. Kharchenko

Institute of Economics and Industrial Engineering of the Siberian Branch of the Russian Academy of Sciences (IEIE SB RAS), Russian Federation

The paper concerns such directions of the research as a social process of transition of young people from educational institutions to the labor market, problems of graduates' (un)employment, realization of professionalism in the economy, and others in the conditions of instability and global challengers. The research methodology was based on recognizing sociological theories in these issues.

The results were obtained using empirical data of a sociological survey of the economically active population in the age of 18-45 in 2018-2020 (N=1302), also monitoring ones of high school students, of university and college senior students. All surveys were conducted by IEIE SB RAS in the Novosibirsk region (under the author's leadership).

To construct a typology of labor behavior methods of factorial and cluster analysis and others was implemented.

The study revealed unfavorable trends in the regional labor market, such as the spread of jobs that require increased physical and moral stress (working time of more than 8 hours, shift work, temporary and additional employment, work where professional competencies are not in demand, etc.). The problems of low economic advantage from the received professional education, from the main work, from job-related training are not overcome. In addition, at all considered levels, the problem of unreasonable choice of a profession is relevant both for post-school education and for subsequent employment. On the contrary the level of human resources is quite high: the formal educational level of the working population, labor motivation, life-long learning motivation, involvement in the common affairs of the organization.

996

RN30_T08_01 | Transitions: Emerging Self

Self-determination and Job Choices in Emerging Adulthood

Sylwia Wioletta Barakeh

SWPS University, Poland

In industrialized societies transition to adulthood became a phase of exploration and instability characterized by prolonged decision making. One of the most important decisions in this age of feeling in-between called emerging adulthood (Arnett 2000; 2004) concerns career choices. According to the self-determination theory (Ryan, Deci 2000; 2006), the best decisions are the autonomous ones, as autonomy is linked to better planning and time management skills, less procrastination, more mindfulness, effectiveness, goal orientation, and general well-being.

The presented study aims to explore needs and career expectations among young, educated people in Poland and examine whether sociodemographic data and self-determination-related variables can predetermine the types of career choices young people make.

The study included a sample of 678 Polish university students aged 19 to 30 (F=508, M=170), representing various disciplines. The participants were asked an open-ended question about the factors they consider when looking for a job. Next, they rated the importance of the job choice factors from the already prepared list based on a few national studies. The participants were also asked to fill in questionnaires measuring the satisfaction of the basic psychological needs (the need for relatedness, autonomy, and competence), self-awareness, and perceived choice.

During the presentation, I will describe both quantitative and qualitative results of the study as well as introduce the initial findings of its narrative continuation.

keywords: emerging adulthood, youth, transition to adulthood, career, decision making, self-determination, autonomy

Emerging Singlehood: Implications For Work, Family And Personal Life

Libby Bear

Bar Ilan university, Israel

The purpose of this study is to explore how singlehood is experienced among various groups in Israeli society and the extent to which singlehood is perceived to be the result of individual choice or life circumstances. To examine these questions, the study analyzes in-depth interviews conducted with 37 men and women between the ages of 21 and 42 among different population groups who are neither married nor partnered. The findings show that the overwhelming majority of the participants viewed singlehood as the result of various life circumstances and thus needed to justify it. Moreover, most of the interviewees, men and women alike, felt that being single prevented them from developing themselves in other aspects of life, such as, having children, developing a career, and improving their social and economic conditions. The participants also talked about the positive experiences related to being single, such as freedom, independence and self-realization, but these benefits were often obscured by severe feelings of loneliness. However, a minority of the participants, all women from traditional backgrounds, viewed singlehood as a legitimate and even desirable alternative to a conjugal relationship and the result of free choice. These women perceived singlehood as allowing them freedom of choice and self-realization.

997

Human Agency as a Basic Psychological Recource of Social Changes. A Multi-generational and Longitudinal Approach

Krystyna Szafraniec

Nicolaus Copernicus University, Poland

Each change, especially one that establishes a new social order, brings new opportunities and threats. One of the factors determining the chances of coping with them is human agency, which can be considered in terms of individual and group resources that help or prevent the active use of new institutional opportunities.

Agency is understood as a causative subjectivity, e.g. the ability to influence the environment with the awareness of being the subject who creats change. Its essential basement is individual freedom (feeling that we have a free choice), perceived influence on reality and self-efficacy (the belief that we can achieve goals that are important to us and that we can shape our own lives).

The context of the analyzes are the political changes in Poland started in the 1980s, including the process of systemic transformation. The research group are two generations representing different historical epochs and different links in the genealogical sequence – parents and children.

In my presentation the subjective dimension of agency will be confronted with objective actions, competences and individual achievements, related to different generations and different social contexts. The analyzes are aimed at answering the following questions: Does agency change with age? Does it change with time (social context)? Does it differentiate between generations? What are the social, worldview and political correlates of agency - are they the same or different in different generations and different social context?

The empirical basis is provided by a 45-year longitudinal research started in 1972 among over 6,000 15-year-olds born in 1957. Repeated many times and including (in 90.) adolescent children, it was completed in 2017 with the sample of 600 people aged 60 and 35+.

Designing One's Life Course – How to Fit Conscription?

Eleri Lillemäe

Estonian Military Academy, University of Tartu, Estonia

After the Cold War most European countries moved away from draft and towards military professionalism, but for reasons like cost-efficiency and security situation, conscription has been maintained in smaller European countries, including Estonia. Compulsory military service poses yet different challenges, as from the life-course perspective, the conscription is often seen as disruptive and difficult to adapt to. The aim of this study is to explore how young males incorporate conscript service to their individual life-course, therefore two research questions are followed: (1) which aspects support perceiving conscription as a compatible part of a young persons life course; (2) what characteristics mitigate the transition and stressful conditions. These questions are approached through the theoretical framework of life-course theory, with focus on agency, lifelong development, timing and linked lives, and psychological resilience, which is analyzed using the hardiness scale. Based on the data collected in Estonian conscript survey (n=3000), regression analysis is used to explore these effects. I argue, that various aspects of life-course theory and hardiness have a different contribution on how conscription is perceived, however, the more active role a person has in their life, the more positive views they have towards conscription and the more meaning is given to it. This study makes two theoretical contributions: first, by looking at conscription through the prism of life-course theory it is addressed from a new, previously uncovered viewpoint; second, by adding hardiness to the model, it is demonstrated how agency, lifelong development, timing and linked lives shape the perception of conscription and adaptation to it.

RN30_T08_02 | Digitalization: Critical and Political Approaches

Different Agencies Of Digital Space Capturing Digital Social Inequality Of Youth In Finland

Päivi Armila, Ville-Samuli Haverinen

University of Eastern Finland, Finland

In our paper we present results from an analysis where structural factors (gender, socio-economic background, home region) are used as grouping variables in tracing differences in young people's digital agencies. We widen the scrutiny also to differences in ownership and usage of digital communicating devices, services, and platforms, as well as in factors limiting usage. One theme of our analysis is constructed by views of one's own digital skills and influence, digital self-expression and group experience, digital bullying, and its impact on live.

Digitalization has been a project with strong imaginaries: it has been legitimized by promises of equality in access to education, welfare services, social interaction, and communitarian affection. Finland as a context for analysis represents a crystallized idea of a digital society that has been developed around technological imperatives and socio-technical imaginaries. However, socio-technical imaginaries and equality-based political promises of digitalization have not been realized among youth. Statistics in Finland prove that, in fact, there has been an increase in the number and complexity in, for example, youth's learning difficulties, even illiteracy, as well as growing inequality in leisure possibilities, welfare conditions, and wellbeing experiences. It is obvious that some users benefit digitalization over others. Our analysis is an aim to understand this new complexity of inequality among young people – who often are called as "digital natives".

Our data have been collected with a questionnaire from three different localities with very different concrete opportunity structures for their youth to live their everyday lives and make their future-plans. The questionnaire consisted both closed and open questions, but in this paper our focus is in statistical group comparisons.

Key words: digital natives, digital promises, youth inequality, group comparisons

Youth Political Participation Via Social Media

Airi-Alina Allaste

Tallinn University, Estonia

There has been a lot of discussion about falling voting rates and the general apathy of the younger generation. Though youth has been approached as alienated from politics, an alternative explanation is that conventional political participation has been replaced by new, more individualized forms of political sensibility. Young people simply express themselves differently and social media in particular is thought to open up new means of being political, albeit with strong criticism of participation via this means also noted. On the on hand there is unprecedented access to information and diversification of political participation, on the other hand, the spread of disinformation and algorithmically engineered communicative fragmentation might feed political polarisation.

Tik-Tok, video sharing platform known for dancing, lip-syncing, and challenges, has been one of the biggest hits of lockdown. Recently user videos expressing political views have become increasingly common: dancing and lip-syncing are used for critical speeches and challenges to make an political point. Based on data from social media networks, especially Tik Tok, the paper investigates how new forms of political subjectivity are made online using examples from Estonia and Finland.

Critical Environmental Educators in Digital Times: An Exploratory Discursive Approach

Inês Vieira

Lusófona University, CeiED, Portugal

The active role of youth in environmental movements and non-formal education has been greatly identified in diverse contexts around the world, namely since the 2019 Climate Strikes and demonstrations. In the digital sphere, particularly in pandemic times that refrain from more presential modes of association, demonstration and education, we can observe interesting and diverse youth investments focused on environmental attitudes and knowledge so as to promote reflection and develop skills for pro-ecological action. We propose to grasp these

999

young environmental educators' visual and written discourses by analysing their digital channels, particularly Instagram. The selected accounts propose diverse but interconnected ways to engage in what can be considered as a critical environmental education movement, crossing environmental issues and educational approaches with the comprehension of intersected social inequalities and the promotion of emancipation and social justice. Beyond fixating a youth subculture of critical environmentalism, the proposal is to shed light on ways of seeing, explaining and answering to the identified social-environmental problems, relativizing the influencers' subjectivism with their networking activity and recognition by environmentalist youth community groups and channels.

RN30_T09_01 | Transitions: Emerging Interpersonal Selves

New Paths to Couple Formation in Contemporary France

Marie Bergström, Léonard Moulin

Ined, France

In France, as in other European countries, the age at first union formation has risen over the past decades, a result of longer school enrolment, structural economic changes, and new family norms. While the median age at first co-resident couple was 23.8 among the generation born in France in the beginning of the 1950s, it was 26.0 among the generation born in the beginning of the 1970s.

Among young generations, it is common to experience several romantic relationships before settling down with a partner. This tendency is often referred to as a postponement of couple formation. The purpose of the present study is to test whether this trend corresponds more to a gradual transition to conjugality.

We examine the nature, duration, and articulation of the successive periods that make up romantic relationships using the French survey 'Study on individual and conjugal trajectories'. To analyze trajectories in their complexity, we use optimal matching methods. Using logistic regressions, we then seek to determine the extent to which the ideal type of couple formation trajectory may be related to the socioeconomic characteristics of the individuals.

We observe three major recent developments in first couple formation (between the generation born after the Second World War and that born in the 1970s and early 1980s). The first, and most obvious, development is the weakening of marriage, which is either abandoned or postponed, reflecting a deinstitutionalization of unions. The second is a stronger diversification of trajectories, with paths to couple formation having become more diverse for the youngest generation. The third is that couple formation has become a more gradual process.

Social Capital and Unstable Youth Career Paths in Spain

Alejandro González Heras, Joan Miquel Verd Pericás

Universitat Autònoma de Barcelona, Spain

Unemployment has severely affected young people in Spain (and in other countries in Europe) during the latter years, especially since the last economic recession. The global pandemic situation does not seem to ease this situation, but rather it makes it worse. It is known that personal contacts are highly used in Europe by young job seekers, and even more in situations of job scarcity (economic recession periods). In this way, social capital has proven highly important for accessing a job, although there is an important methodological discussion about measuring used and accessed social capital.

The aim of this research is analysing the relationship between the use of social capital and career paths of young people with unstable working trajectories. When a quantitative approach is used, usually two different types of databases are used for these purposes: on the one hand, huge sample sizes (even multi country) but poor in detail and, on the other hand, small sample sizes but with a lot of detail. The dataset that will be presented in the communication is of the second type: we study a quantitative sample of 150 unstable career paths, where detailed information for every employment situation in the trajectory is obtained. The instrument to collect the (pre-pandemic) data was a hybrid survey, including a life history grid to collect information about (a maximum of) 20 labour events and (a maximum of) 3 social contacts (per labour event) that have somehow helped to access the job.

Economic Inequality And Friendships Of Adolescents And Young Adults In Germany

Kien Tran, Nora Gaupp

German Youth Institute (Deutsches Jugendinstitut), Germany

Socioeconomic terms affect various aspects of the everyday life of youth and young adults. While issues such as education, housing, or mobility are well researched, the impact of economic deprivation on friendships received less attention. Within the framework of Bourdieu's (1992) theory of capital and the resource approach (Foa et al. 1995), we examine the role of socioeconomic inequality in friendships of adolescents and young adults in Germany. This study aims to explore several aspects of friendship relations. Thus we consider the composition as well as the associated places and practices. These factors are linked to an economic deprivation index (Mack/Lansley 2015; Andreß et al. 1999).

Analyses (reverse regression) using recent data from the survey "Growing up in Germany (AID: A 2019)" indicate that adolescents and young adults (age 12 to 25) who are more affected by economic deprivation shape their friendships differently than their non-deprived peers. For example, they find their friends less often through leisure activities (like sports or music) but more often online or through mutual friends. The places where they meet their friends also differ, by less frequently visiting locations that entail costs such as cafés, bars, discotheques, cinemas, or theaters. Preferably, they use public places (parks, shopping malls, etc.) to get together with their friends.

Beyond that, however, the findings cannot identify differences in some aspects of friendship quality, regarding how dense their friendship networks are, or how often they talk with their friends about personal things.

Youth, Individualization and the Spanish Labour Market: Supporting Oneself within a Context of Crisis

Matthew Lee Turnbough[1], Antonio Álvarez-Benavides[2]

[1]Complutense University of Madrid (UCM); [2]John Jay College of Criminal Justice, The City University of New York
(CUNY)

In 2007 Spain began to experience the effects of a deep economic crisis, which would generate a situation characterized by instability and uncertainty. This has been an obstacle especially acute for the youth of this country seeking to enter the workforce. Currently, Spain leads Europe with the highest youth unemployment at around 40%. As a result of the impact of COVID-19, the Spanish youth are now suffering the effects of a new crisis that has exacerbated an already precarious labour market. In this presentation, we approach this panorama of social change in Spain and the notion of vulnerability from the perspective of the individuals or young adults who find themselves immersed in this transition from one crisis to another. Utilizing a discourse analysis approach, we consider the strategies they employ to respond to the institutional demands for individual responsibility basing our analysis on the VULSOCU ("New Forms of Socio-Existential Vulnerability, Supports and Care in Spain") research project, specifically the results of nineteen in-depth interviews and three discussion groups with young adults in this country. We analyse how the process of individualization tied to a self-sufficient model of human agency may contribute to an increased reliance on individual solutions to social problems. Furthermore, we underline how these individualized pathways paradoxically require a dependency on multiple supports which are characterized by a series of tensions that the individual is compelled to navigate. Consequently, we seek to elucidate the manner(s) in which young workers confront the trials of social life and the expectations associated with individualization within a context of crisis.

RN30_T10_01 | Time and Future

Time Pressure? Young People's Perception Of Not Being Able To Afford Time Off And The Feeling Of Having To Grow Up Fast

Anne Berngruber, Nora Gaupp

German Youth Institute (DJI), Germany

The transition from youth to adulthood is a process that is not always stringent in the direction of greater autonomy and independence, but may well involve detours and loops. Previous discussions about de-standardization processes and yo-yo biographies in the transition from youth to adulthood have been going on for a long time. In contrast, newer discussions are about a youth phase, which is speeding up and more compressed. There is the assumption that young people today have more time pressure and therefore less free time available. With regard to this debate, our aim is to examine how young people themselves perceive these requirements.

In our presentation, we would like to investigate questions about the subjectively perceived time pressure of having to grow up as fast as possible and not being able to afford time off or periods of inactivity. How much is the idea of a standardized life course in the minds of young people? Who of the adolescents and young adults feel more time pressure than others?

For this purpose, the survey AID:A 2019 ('Growing Up in Germany: Everyday Lives') of the German Youth Institute (DJI) provides questions about subjectively perceived time pressure. We will focus on the age group of 12 to 32 year olds (n = 6,116). We will differentiate between different aspects of the private life situation and socio-demographic characteristics.

Multiplicity and Youth Transition: Young People's Temporal Orientations in Navigating Biographical Projects

Ziyu Wang

University of Helsinki, Finland

Temporality is a central but under-examined issue in youth studies. There is an emerging attention to take a temporal rich way to explain young people's transition towards adulthood, which however is much less focused in China. Given the 'special' case of modernization process, the individual experience from China could entitle us to rethink our knowledge about young people's navigations of temporality and biographies. This study takes up this task by examining how young Chinese people experience temporality orientations in planning their transition towards post-compulsory education. The theories of temporality and youth transition have been used to frame young people's individual experience about time. Drawing on the interview (N=25) and open-ended data (N=479) from the field work in a Chinese town, content analysis has been used to analyze the participants' school arrangements, plans for their educational futures, parental involvements and aspirations and daily interactions with their teachers and peers etc. The analysis points out the multiplicity of temporalities, highlighted by future-and present-centered temporal orientations, in the participants' navigations of their biographical projects. The varied sense of temporality further unfolds the mixed understanding of education, life-time, labor market and family involvement in this generation. Such an inquiry of temporality experience thus not only adds the evidence of young people understanding of temporality as such but also is valuable for uncovering other fundamental social perspectives of youth. The article concludes by inviting a re-consideration of the possibilities for a renewal of a temporal rich understanding of youth studies.

Mapping Young Norwegians' Self-projects and Future Orientations

Ingunn Marie Eriksen[1], Kari Stefansen[2]

[1]Oslo Metropolitan University, Norway; [2]Oslo Metropolitan University, Norway

This paper investigates how we can identify young people's "projects of the self" – their self-presentations and orientations towards the future, using a longitudinal, qualitative approach. We analyse the first wave of interviews from an ongoing study set in Norway that comprises interviews with 81 young people, recruited from four significantly contrasting communities. Based on young people's degrees of surety and levels of aspirations, we describe a typology with four different projects of the self for the 12 year-olds: the assured optimist, the local thriving youth, the youth on a narrow path and the loosely anchored youth. These projects are closely linked to young people's family resources and to a large extent map onto traditional social class positions. However, they are also profoundly shaped by relational resources, which to a certain extent cut across formal class divisions. When young people's project of the self aligns with resources in the family and the local community, this greatly enhances their well-being here-and-now and their surety of the future. Young people who experience a rift between the project of the self and available resources experience a shakier foundation from which to carve out their life project. We also reflect on changes over time from the participants were 12, 14 and 16 years old.

Youth Mobility In The Context Of Disimagined Futures

Ewa Krzaklewska, Karolina Czerska-Shaw

Jagiellonian University in Krakow, Poland

This presentation offers an insight into young people's rewriting of mobility trajectories – reflecting on the moment when mobility trajectories are being reconstructed and reframed. The pandemic situation of 'disimagined mobilities' where mobilities are being cancelled, becoming impossible or potentially ineffective in relation to one's life goals, creates a new context for youth transitions that cherished the spatial dimension as a chance for new resources or openings. Today's desert of immobility creates a space for debating the social construction of mobility as a precondition for success.

The discussion around the costs and risks of hypermobility comes in even stronger in pandemic, making visible pertaining challenges and cleavages. The data are the narratives of super-mobile students at diverse European universities, actively engaged in mobility notwithstanding the context of pandemic and resulting costs and limitations of it. We utilize the concept of waithood (Honwana) to grasp this particular moment of impossibility to plan's one future, not diminishing though the agency of young people trying to navigate this new condition. Our analytical aim is to search for the emerging framings of im/mobility in pandemic-impacted youth transitions.

RN30_T10_02 | Reconsidering (A)typical Work-School Transitions

Social Innovation And The Entrepreneuralisation Of The Third Sector. A New Opportunity For Young People In Time Of Crisis?

Anna Reggiardo, Luca Raffini

University of Genoa, Italy

For the first time since the post-war period, the younger generation has a life perspective, in terms of economic well-being and existential security, much different from their parents. If uncertainty and risks are a hallmark of late modernity, the 2008 economic crisis radicalized this trend and The Covid-19 pandemic acted as a detonator. The effects of the crisis are stronger in Southern European countries, such as Italy, already characterized by poor economic performance and growing social imbalances. In this context, the third sector is increasingly seen as a privileged area of social innovation, capable to provide innovative answers to unsolved social needs. In Italy, there is a professionalization and entrepreneuralization of the third sector, which is the only sector capable to create new job opportunities for young people. The 2016 third sector reform tried to strengthen its capacity to integrate the social and the economic dimensions and established new provisions on volunteering, civil service and social entrepreneurship, which should primarily benefit the youth. The paper

1003

critically analyses the goals and effects of the reform. Our hypothesis is that it may represent an institutionalization of the European rhetoric on third sector and social innovation, which is double faced. On the one side it testifies that institutions are trying to recognize emerging grass-root practices which combine social involvement, professional fulfilment and political action in order to respond new societal challenges. On the other side, the risk is to reproduce the "doing more with less" approach, generating jobs that are under-protected and under-paid.

Superstar or Troublemaker? Young Players with a Migration Background as the Great Hope of Finnish Football

Marko Kananen, Jussi Ronkainen

South-Eastern Finland University of Applied Sciences

Players with a migration background have risen rapidly to the top of Finnish football over the past two decades. Although in the Finnish society immigration has often been dealt with through problems and challenges, within the context of the football the tone has been very different. Young migrant players have been regularly depicted as the great hope of Finnish Football. This presentation takes a closer look at how this discourse of hope is constructed in the Finnish media. The results of the media analysis highlight a balance between a praise speech, which emphasizes the exceptional football skills of the young migrant players, and a critical speech, which refers to their attitude problems and difficulties of adjusting to the Finnish way of playing. The way the media frames the young migrant players thus limits their career options to two: a potential superstar or a potential troublemaker. Based on these findings, this presentation raises a broader question of whether exceptionality has become an entry requirement for the participation of young migrants not only on the football field but also in society in general.

Early-stage career of Italian Doctorate holders: does mobility pay?

Alessandra Decataldo, Noemi Novello

University of Milano Bicocca, Italy

We develop a secondary analysis of data provided by the Italian National Statistical Institute (ISTAT) on the doctorate holders who graduated from Italian universities in 2004, 2006, 2008, 2010, 2012 and 2014. Special attention is directed towards those who were not employed before obtaining their PhDs. The proposal investigates the transition of PhD graduates into the job market in terms of employment outcomes over a period of increasing financial hardships that started in the new century. Furthermore, it describes the relationship between some socio-demographic characteristics of those doctorate holders and the distinguishing features of their job. We are also interested in the effect of the geographic location of the PhD course on employment conditions.

One of the central purposes of our proposal is to verify whether geographical mobility during graduate and postgraduate studies as well as during early-stage employment have a positive impact in terms of employment outcomes.

The cohorts that earned their PhDs later are more mobile with regard to their educational and job paths, but are disadvantaged regarding employment outcomes. The economic crisis requires top human resources to be more geographically mobile than they were in the past. However, this constraint, as emerged from our research, may double as an opportunity, as mobile PhDs obtain better outcomes in comparison to stayers.

1004

Critical Reconversions Of Highly Skilled Youth Under Socio-Cultural and Economic Change

Sophia Stavrou, Panayiotis Achniotis

University of Cyprus, Department of Social and Political Sciences, Cyprus

This contribution discusses the issue of education-employment mismatch from a different angle, through the lens of current socio-cultural, political and economic changes that impact the way young people engage with work. The research focuses on the case of young graduates who actively choose to engage with critical reconversion processes in their relationship to work, abandon a relevant field of study and embark on self-made projects in other areas, motivated by meaningfulness, freedom and creativity, even remaining in the administrative category of 'not in employment, education or training'. It is based on a qualitative in-depth interview research with young people aged 25-35, with high level university qualifications, currently unemployed or in mismatch. The study took place in Cyprus in 2020, which combines a particularly high proportion of high skilled youth in the EU, but at the same time is seriously affected by the financial crisis and austerity measures that followed, which have mostly impacted the young and highly educated. The findings reveal how new fluid relationships with work are being negotiated by high qualified young people, as a compromise between an agentive stand of resistance and embodied neoliberal imperatives of the knowledge society. The results also reinforce the argument for the development of a holistic approach to young people's relation to work, bringing together in a common analytical framework transformations at the level of organisation of work and the labour market, youth cultures et policy imperatives.

RN30_T11_01 | Belonging and Geography: Mobility and Immobility

Youth and the Skills System in Bulgaria. Can Lifelong Learning Policies on the Regional Level Compensate for the Mismatches in the National Skill System?

Siyka K. Kovacheva[1], Valentina Milenkova[2]

[1]Plovdiv University, Bulgaria; [2]Blagoevgrad University, Bulgaria

1005

The paper examines the opportunities and constraints for youth transitions from education to employment vis-a-vi the structural relationships (of compliance and discrepancy) between the sectors of education, training and the labor market. The analysis focuses on the deficiencies in the coordination of the demand and supply of skills in Bulgaria, which hinder the successful employment integration of the present young generation. The mismatches in the system are highlighted on the national and the regional level where we compare the contextual cases of Blagoevgrad and Plovdiv functional regions. The analysis is based on official statistical data and interviews-in depth conducted under the framework of the international research project "YOUNG_ADULLLT – 'Policies Supporting Young Adullts in their Life Course'. In each of the regions in Bulgaria 8 experts and 11 young participants in various programs and initiatives in the LLL system were asked about their views and experiences. The analysis reveals that there is a discrepancy between labor supply and demand in the skills systems in both regions where less than half of the university graduates work in the specialty they have acquired during their studies. One of the conclusions of the paper is that social changes under way require new strategies and approaches of lifelong learning policies that should go deeper into the regional and local level taking into account both the needs of young people for training throughout their lives and the needs of the regional labor markets.

(Dis)ordered Social Sequences Of Mobile Young Adults: Spatial, Social And Return Mobilities

Dominika Winogrodzka, Izabela Grabowska

SWPS University of Social Sciences and Humanities, Poland

International mobility has become a significant part of the life experiences of a growing number of Polish youths since the enlargement of the EU in 2004, influencing young people's transitions from education to work or transitions across different labour markets. The key aim of this paper is to explore socio-occupational sequences of young people considering spatial and temporal dynamism of the process of mobility. Focusing on the intersection between youth and migration studies, we aim to answer the following research questions: (1) What are the socio-occupational sequences of young people 'on the move'? (2) How mobility capacities and imperatives determine the flow of sequences and (3) How mobility patterns collocate with sequences' shapes? Based on Social Sequence Analysis, we have distinguished four types of 'mobile sequences' of young adults: (1) the 'upward sequence' when spatial mobility accelerates social mobility; (2) the 'yo-yo sequence', where transnational mobility causes 'return social mobility'; (3) the 'zigzag sequence', involving up-and-down patterns in social mobility; (4) the 'flat sequence', where spatial mobility has no impact on the objective dimension of socio-occupational sequences, but mobility strongly influences human capital.

Brexit, Place and Generation: Young People's Perceptions of Brexit in Northern Ireland

Colin Leonard

Queens University Belfast, United Kingdom

If one considers the Brexit vote in overall terms, the UK voted by a narrow margin (51.8%) to leave the EU in June 2016. However, this obscures regional variations as Northern Ireland voted to remain by a majority vote of 56% suggesting that place played a core role in voting preferences. Analysis of the referendum results in Northern Ireland attribute voting preferences to traditional nationalist/unionist loyalties as twice as many

who identified as Catholic voted to remain compared to those who identified as Protestant. While the vote differed according to age with almost twice as many of those age 18-24 voting to remain compared to over 65 year olds, analysis continues to locate this along the traditional nationalist/unionist lens. The purpose of this paper is to move beyond this narrow framework to explore the extent to which young people may be less likely to embrace traditional conceptions of national identity and hence may be more open to wider EU identities. The paper is based on the perceptions of 20 young people (age 18-24) to the Brexit referendum and its aftermath including attitudes to a future referendum on a united Ireland. Since young people will be the ones who will have to live through the deep societal changes that emanate from the UKs withdrawal from the EU, engaging with young people's perspectives enables us to understand more fully how nationalism is lived and felt in the context of post-Brexit Northern Ireland.

Migration Experience in the Transition from School to Work: Young Adulthood in a Post-communist Setting

1006

Mădălina-Elena Manea[1,2]

[1]Research Institute for the Quality of Life (ICCV); [2]University of Bucharest, Romania

Across Europe, the changing socio-economic context in the last decades increased uncertainty in the transition to adulthood. The transition from school to work for many generations in post-communist countries was affected by at least one major disruptive event: the regime transition accompanied by economic hardship in the 90s, economic recession in the late 2000s and the current pandemic. These developments are accompanied by spikes in unemployment with a greater impact on youth. However, faced with such challenges, young people developed their own coping strategies. This paper asks about the influence of migration experience as one such strategy in configuring transitions from school to work in a post-communist setting and it has two aims. The first aim is to uncover and illustrate the patterns of transition from school to work in young adulthood. The second is to investigate the influence of migration experience on the configuration of these patterns. The first goal is addressed with the help of sequence analysis followed by cluster analysis, while for the second one results of a multinomial logistic regression are examined. Using data on returnees and non-migrants from the TEMPER survey in Romania, the paper looks at the succession of three

types of activities between ages 15 and 35: studying, working, and not studying, nor working. Three major classes of trajectories are identified (classical - work follows immediately after the end of studies, complex, and homemakers), each with particular subtypes. Results suggest that the odds of following these trajectories are different between migrants and non-migrants.

RN30_T11_02 | Covid-19: Life Under the Pandemic

Education To Work Transtions In Post-Pandemic And Post-Brexit Britain

Ken Roberts

University of Liverpool, United Kingdom

This paper examines how the UK's young people have fared since the Covid-19 pandemic began in 2020 and since Brexit was completed at the end of that year. When possible and appropriate, there are comparisons with other European countries. We see that the UK was a middling European country in its pre-pandemic rate of youth unemployment, and in the rise that occurred subsequently. However, the paper shows that levels of employment and unemployment among 18-24 year olds who had completed full-time education remained stable throughout 2020. This can be attributed to:
•'No detriment' policies in education.
•The government's job retention measures (mainly state-funded furloughing).
•Maintained recruitment to elite upper middle class careers.
•A buoyant supply of precarious jobs.
The paper argues that the young people whose transitions will be most vulnerable during and after 2021 are the middling group in terms of educational attainments and the upper working class and lower middle class occupations that most have entered. It is argued that their prospects will depend on whether the UK government reverts to fiscal conservatism during and following 2021 or continues to spend 'whatever it takes' which will amount to a 21st century new deal, comparable to the measures that enabled Europe's economies to recover after 1945.

Home Is Where The Youth Is: Intergenerational Lockdown Practices During The Pandemic In Portugal

Ana Sofia Ribeiro, Ana Nunes de Almeida, Maria Manuel Vieira

ICS, Universidade de Lisboa, Portugal

The COVID-19 pandemic brought an unprecedent social and economic global crisis, forcing protective public health measures such as lockdowns and social distancing. For young people, such measures are particularly painful, as they entail an interruption of the adulthood turning points, which generally require taking the public space and emerging as a recognised social peer, either through leaving the parental home, initiating an intimate relationship or getting a full-time job. Even in Southern European contexts, where such transitions are postponed and young people cohabit with parents until a later age, lockdowns meant a return to a familiar collective life, causing challenges and tensions.

On a first instance, some may refer to the confinement as a suspension of life as we know it, since macro level policies shape civic rights and curtail some freedoms. However, a more attentive look may reveal that life continues inside the home, where people adjust to the circumstances (Schatzki 2016) of the new normal, through everyday practices of resilience and (self) care that renew and remake social bonds.

Based on the results of an online non representative survey on the impacts of the COVID-19 pandemic in Portugal, this presentation analyses a sample of 1125 individuals aged 16-24 years and their answers to open questions about their daily life in confinement: routine activities, communications and their future concerns. Our results conclude that familialism remains a key support system in adversity, evidencing intergenerational solidarity, and that young people still manage to perform their individuality and maintain their social networks through distance communication platforms.

1007

How The Lockdown Affected Young People's Lives During The First Phase Of Covid-19? A Cross-Cultural Analysis Of Italian And Colombian Youth On Pandemic Related Topics.

Miriam Della Mura, Andrea Orio

University of Study of Salerno, Italy

The advent of the pandemic and the resulting restrictions have greatly changed everyone's life, especially of the younger generations (Banaji & Buckingham 2013). The lockdown has given no choices but to use technology – not without remarking pre-existing socioeconomic inequalities - to keep in contact with society: allowing the improvement of online home learning and mediating the social distances (Couldry & Hepp 2013) through digital interactions. During the first lockdown some core topics have been enlightened by sociological perspectives: digital, social relationship, news and fake news (Lovari & Righetti 2020), equality and inequality. The paper offers a cross-cultural analysis of the perception of four conceptual dimensions that - we could suppose - have been affected by Covid-19 changes: digital, physicality, inequality, media information. The empirical study is based on a qualitative web survey on a sample of 200 young people living in Italy and Colombia; the data were collected between March and May 2020. We discuss the following research questions: a) How is the current youth perception of the four themes compared to pre-Covid and is it changed? b) What differences emerge in countries with different socio-economic and cultural conditions such as Italy and Colombia? From the first results emerge interesting aspects with respect to the diversification of perception on: the digital considered for its professionalizing function by some and as a socializing tool by others; the different views of inequality with respect to various issues related to the cultural diversity of the two examined countries.

The Reinvention Of Everyday Life In Times Of Covid-19: Staying Grounded, Finding Purpose And Keeping Hope Amidst "Hightened Uncertainty Scenarios"

Benjamín Tejerina, Ignacia Perugorría, Joseba García

Basque Country, Spain

Over the last decade, uncertainty has become a pervasive concept in the analysis of contemporary societies. In the studies of young people's lives, uncertainty is presented as a series of challenges in the form of volatilities, risks, ambiguities, complexities, mutations, fluidities and precariousness. However, we so far lack a systematic analysis of its functioning as a social artifact with which to operate in, while simultaneously making sense of, everyday life (Ramos and García Selgas, 2020).

The purpose of this paper is to present the results of an ongoing investigation on young people's experiences since the inception of the COVID pandemic. Over the last year, constantly revised norms regulating spatial confinement and physical distancing have disrupted and rearticulated the main spheres structuring the everyday life of youngsters: education, work, and leisure – as well as their most basic social interactions.

By reconstructing their confinement and post-confinement days through their ordinary accounts, we intend to trace young people's "art of doing" (De Certeau 1979) in these exceptional circumstances which —added to the insecurities inherited from the 2008 crisis— have generated what we call a "heightened uncertainty scenario." In doing so, our study focuses on the creative and reflective individual and collective practices youngsters have generated and engaged in to make sense of their continually mutating "new normality," while simultaneously finding purpose, keeping hope, and staying grounded.

Data come from a qualitative study based on 20 in-depth interviews and 8 focus groups with young men and women aged 18-34 living in the Basque Country.

Experiences of Racism and Discrimination Among Ethnic and Religious Minorities in Britain During the Coronavirus Pandemic

Nissa Finney[2], James Nazroo[1], Natalie Shlomo[1], Dharmi Kapadia[1], Laia Becares[3], Neema Begum1, Dan Ellingworth[1], Harry Taylor[1]

[1]University of Manchester, United Kingdom; [2]University of St Andrews, United Kingdom; [3]University of Sussex, United Kingdom

Stark evidence now exists that ethnic minorities have been disproportionately affected by the Coronavirus pandemic, with higher rates of death among Black and Asian people in Britain. Commentators have pointed to structural inequalities as underlying causes, including deprivation, occupational segregation and racism (e.g. Nazroo and Becares, 2020).

However, a severe lack of data has hindered investigation of the experiences and causes of ethnic inequalities during the pandemic. This presentation will report on the new Evidence for Equality National Survey (EVENS) which will provide unrivalled data for 17,000 ethnic and religious minorities across Britain. Data collection will run from February to April 2021 in a project led by the Centre on the Dynamics of Ethnicity (CoDE) at the University of Manchester. Patterns of discrimination in institutional contexts including education, employment, policing and public spaces will be presented, enabling conclusions to be drawn about whether experiences of discrimination and unfair treatment have increased from the beginning of the pandemic and in relation to the Black Lives Matter movements and lockdown restrictions.

Anti-vax And Antisemitism. Jew-hatred In German Anti-vaccination Activism Around 1900 And Today

Mathias Berek

Technische Universität Berlin, Germany

From its beginning, vaccination in Europe has been facing opposition. In Germany, the anti-vax movements became a mass movement when the parliament of the Wilhelminian Empire passed a bill on compulsory vaccination of all children against smallpox in 1874. And since then, declared and organized antisemites have been among the activists, even in high-ranking positions of anti-vax organizations. Antisemitism and vaccination opposition, however, were not only connected through shared personnel. The paper will discuss where both movements shared motives, thought styles, arguments, images and stereotypes in history - and which of those commonalities can still be found in today's anti-vaccination movements and where they differ from the past. While, for instance, explicit Jew-hatred is only rarely shown today at rallies against the anti-pandemy measures, activists rather frequently play down the Shoah by equating themselves with Jews under National Socialism. Other parallels between anti-vax and antisemitism persist, most prominently in conspiracy fantasies, a Social Darwinist belief in nature and biological fate, material interests, the lack of (self)-reflexivity and the reality disfunction which Horkheimer and Adorno have called false projection.

Racial Scapegoating during a Pandemic: A comparative study of Romania and the US

Annegret Staiger[1], Sorana Constantinescu[2]

[1]Clarkson University, United States of America; [2]Babes-Bolyai University, Romania

If the beginning of the Covid-19 pandemic was a fertile environment for racism towards Asian people and people of Asian descent, as the pandemic advanced, different countries turned to more familiar scapegoat groups onto which the majority population could project the blame for spreading the virus. Anti-Roma racism portrays Romani people as a source of contagion, casting them as having poorer hygiene and generally being "unclean"

(Kovats, 2004), racist tropes that have been also deployed in countries with a significant Romani minority during the current pandemic. This is part and parcel of the dehumanization of Romani people, as they are at once seen as vectors of disease, as well as having a higher level of endurance to these diseases. Moreover, we find similar stereotypes operating in the US, although with a more ambiguous racial target and and a less transparent racial discourse. In the proposed paper, we are interested in exploring the ways in which the pandemic produced specific racial discourses. In drawing parallels between Romania and the US, two very different countries but both with entrenched racial histories, this paper explores parallels and differences in scapegoating of historically and racially discriminated groups. To this end, we examine mass media discourses about Covid in minority groups in Romania and the US, to develop a comparative understanding of race relations during a pandemic crisis.

Coping with Anti-Asian Racism During COVID-19 – Microinterventions, Agency and Social Change

Kimiko Suda, Jonas Köhler, Laura Juds

DeZIM Institute, Germany

Around one million people migrated from Asia or are descendants of such migrants in Germany (Destatis, 2020). But so far, the perspective and agency of affected communities has been neglected, resulting in a lack of visibility of anti-Asian racism in scientific and general discussions of racism in Germany.

This changed since the COVID-19 virus has strongly been associated with "Asia" in German media, contributing to a biased coverage of the pandemic (korientation, 2020; ADS, 2020). Although origins of today's anti-Asian racism can be traced back to (colonial) history (Lynteris, 2018; Kong, 2019) and the model minority myth (Chou, & Feagin, 2015), US based research suggests that the current pandemic exposed and intensified underlying patterns of racialized discrimination (Reny & Barreto 2020; Tessler, Choi, & Kao, 2020).

Our research identifies coping strategies pursued by the Asian German diasporic communities, differentiating between first and second generations. For our analysis we combine quantitative survey data (n=703) and a qualitative 14-day diary study (n=65), conducted within the said communities in 2020. Building on the work of Sue et al. (2019) on microinterventions, we focus on problem-focused individual coping strategies as political acts. We conclude that a politically engaged second generation,

new possibilities for protest on social media and a higher awareness for racism since #BlackLivesMatter have the potential to transform atomized individual coping with anti-Asian racism into a collectivist, political framework, contributing to social change in Germany's emerging "postmigration society" (Foroutan, 2019).

RN31_T02 | Conspiracy Theory and Othering

'Us' and the 'Others': Conspiracy Myths in 'Chemnitz' and 'Querdenken'

Anja Schmidt-Kleinert

Philipps-University Marburg, Germany

The broad mobilization in Chemnitz, Germany, in the summer of 2018 was largely achieved by addressing the supporters as a 'people'. At first glance, extreme right-wing organizers used familiar enemy constructions – refugees, Muslims, and people and groups identified as political opponents – to mobilize 'concerned citizens'. However, a closer analysis shows that the enemy images used are hierarchically organized via conspiracy myths against the 'people' and point to a deeply anti-Semitic core of the worldviews shared: superficially, 'Islam' or Muslims are the focus of the so-called New Right as enemy constructions; only at second glance does it become clear that 'America' or anti-Semitic enemy images are constructed as the 'true enemy'. Similar conspiracy myths are used at current 'Querdenken' demonstrations. At least in 'Chemnitz', the utilization of enemy images culminated in questioning "the system".

In the two cases mentioned, references to "1989" are also made in order to create an 'us'-feeling via the slogan "We are the people", and to mark 'them'" to fight against. That the mobilization via a nationalist appeal has been so successful in the context of both cases is not a coincidence but, I claim, historical continuity centred on anti-Semitic conspiracy myths. A central question that emerges from current observations is: (how) are nationalism and anti-Semitism organized in a relationship to each other, and what function did this setting in relation take on against the background of extreme right-wing mobilization attempts, especially for the so-called New Right?

1010

National-populism: Patterns of Creating the Enemy

Ireneusz Krzeminski

Warsaw University, Poland

My studies will concern with analysis of the real processes of creating the "national enemies" by anti-democratically oriented governments in Poland and in Hungary, but Poland will be my main subject.

I would like to show that the main direction was to create the double image of the "nation" enemy, initially understood as a majority of citizens. The main enemy had had two faces: one located in-nation and second – outside of the country. But it was conjunction, acting against a more and more ethnically defined "nation". The main important in-group enemies were politicians of a party which previously governed the state and the main accusations thrown at this party representatives concerned a suspected, covert cooperation with the nation's enemy. In the case of Poland it was Russia and its engagement in the organization of the presidential plane catastrophe in 2010, with some kind of a presumed deal with Polish government. The own government and party, which had crated it, were "strangers" and "outsiders". This figure was used later on for producing more enemies during the continuity of destroying the democratic institutions.

My main thesis is simple: the basic pattern of constructing the "nation enemies" was originated in the anti-Semitic, historic paradigm, present both in the pre-war political ideology as well as in its social-cultural stereotypes. "Political history" of the leading the country was oriented towards updating the content of the old ideology according to present political needs.

The Vic Model: From Immigrant Students Redistribution To Xenophobic Voting

Ana Toledo, Lena de Botton

University of Barcelona, Spain

In 1997, Vic's authorities, a municipality with one of the highest immigration rates in Spain, implemented a programme called the Vic Model, which was a plan for the geographical redistribution or desegregation of immigrant students. The programme aimed to avoid the concentration or segregation of immigrants, defined as a problem, and dilute their ethnic and cultural differences. According to scientific research on previous similar experiences, implementing such measures intensifies xenophobic and discriminatory attitudes among local populations. For instance, the US's busing experience in the 1950s that redistributed black students from black neighbourhoods among white schools in mostly white environments increased rejection and racism among the later. Knowing these precedents and because of the similarity between both redistribution practices, one of our purposes was to gather evidence of rejection and racism increasing. A way of doing so was by observing the xenophobic vote's evolution during the implementation of this policy. Thus, to analyse the relationship between this redistribution approach, which views immigrants as a burden, and xenophobic voting, we first documented the examined case and then performed a quantitative analysis at both the regional and local levels by using demographic and electoral data. We likewise relied on in-depth interviews with some privileged institutional witnesses, to give more proper and nuanced meaning and interpretation of the data. The results show an association between the assisted dissemination of immigrants throughout the municipality and increased xenophobic voting.

Half-Empty or Half-Full?: Psychosocial Study on the Role of 'Nation' in the Mind of a Far-right Activist

Yutaka Yoshida

The University of Manchester, United Kingdom

The rise of the far-right movements has become a major concern in Japan since the mid-2000s. Xenophobia in Japan is characterised by the correlation between international conflicts between Japan and its neighbouring countries and the rise of xenophobic discourse (Higuchi, 2014). Not much is known as to how some individuals relate themselves to conflicts between nation-states to the extent that they join in xenophobic movements. The current study explores this issue using psychosocial analysis as devised by Wendy Hollway and Tony Jefferson (2000). Through examining the life-story interview of a Japanese far-right activist, the present study investigates how personal experiences and the situation related to the nation are connected in his mind to produce antipathy to those regarded as national others. Rustin (2000) argues that 'race' works as an empty category: one can project a wide range of fear and anxiety to racial others precisely because of the emptiness of the concept. The current study argues that 'nation', on the other hand, works as a half-full, half-

1011

empty category. While an individual can project their fear and anxiety to national others, their choice of enemies and how they legitimise antipathy can be also influenced by phenomena associated with their nation, such as history, conflicts with neighbouring countries, or status in the international sphere. Due to the everydayness of nationalism in contemporary society, an individual can easily invest themselves in the nationalist discourse and project uncontainable negative feelings onto 'national enemies'.

RN31_T03 | Nations and Exclusions

Anti-Jewish Racism in Sweden: Processes of Inclusion and Exclusion from "Swedishness"

Hansalbin Sältenberg

Lund University, Sweden

In this paper, contemporary antisemitism in Sweden in explored from a Critical Race Studies-perspective. Based on in-depth interviews with 19 self-identified Jews in Sweden, conducted during the fall of 2018, the paper explores the research subjects' experiences and understandings of antisemitism. Theoretically engaging with works of Eduardo Bonilla-Silva, Etienne Balibar, Nandita Sharma and David Theo Goldberg, the paper focuses on processes of racial exclusion and inclusion in relation to constructions of "Swedishness", particularly secularism and Protestantism, which in turn challenges understandings of contemporary liberal secular society as "philosemitic", but also discusses the relation between anti-Jewish and anti-Muslim racisms. Moreover, the paper elaborates on the complex relationship between whiteness and contemporary Jewishness in Sweden. Finally, by focusing on everyday experiences of antisemitism, the paper challenges the hegemonic understanding of antisemitism as coming primarily from the extremes of the political spectrum, and argues instead for the necessity to recenter the (Swedish) nation-state for explorations of contemporary antisemitism in the Global North.

I'm not Swedish Swedish

Caroline Adolfsson

Malmo University, Sweden

Belonging within a society is an essential element for positive mental health. For the children of migrants, ethnic and national identification, as well as ascriptive identity, can pose challenges to feelings of belongingness. In this article, survey data was collected from 889 Swedes whose parents were born in the following countries; Somalia, Iraq, Poland, Vietnam, Pakistan, and Turkey. Results showed that Poles were significantly ascribed as Swedish more than any other group. However, despite not being ascribed as Swedish, most group members (regardless of ethnic origin) had high feelings of belongingness to Sweden. Further, individuals across groups showed a positive correlation between their national identification and ethnic identification, indicating a feeling of membership to both. These results mirror previous research in Sweden where individuals' ethnic and national identities were positively correlated (Behtoui, 2018). As a country of high migration, Sweden presents an interesting case. The ability to inhabit multiple forms of identity as a member of different groups is the choice of an individual within a pluralistic society. Multiple memberships between groups need not be contradictory but rather an expression of different spheres of inhabitance.

1012

Ignoring Antisemitism? French Sociology facing contemporary Antisemitism

Sebastien Mosbah-Natanson[1], Paul May[2]

[1]Sorbonne Université, France; [2]Université du Québec à Montréal, Canada

Since the beginning of the 2000', a surge of anti-Semitic acts and opinions has been observed in French society. It has been labeled "New anti-Semitism" or "judeophobia" and has entailed numerous debates and controversies in the public sphere. But sociology as discipline has largely been silent about this. If a number of (prominent) French sociologists such as Dominique Schnapper, Michel Wieviorka or late Didier Lapeyronnie, have written about this issue, very few young scholars tackled it with innovative works and field research. Few academic books, almost no articles in French academic sociological journals have dealt with contemporary forms of anti-Semitism while journalists and essayists have covered the

topic. This communication will try to understand this relative silence of sociology by focusing, first, on the rare sociological works about anti-Semitism and then on the silence of mainstream form of contemporary sociology. What are the theoretical and methodological obstacles to a scientific study of antisemitism in the French academia? Are new forms of racism such as islamophobia, competing with anti-Semitism, more legitimate in contemporary French sociology? What does it tell us about the state of French sociology and about anti-Semitism in French society?

Exploring Ways of Measuring Color-blindness in Sweden: What Happens when we Translate Color-blind Discourse and Color-blind Racial Attitudes Scale?

Carolin Schütze[1], Sayaka Osanami Törngren[2]

[1]Copenhagen Business School, Denmark; [2]Malmo University, Sweden

Racial color-blindness is a prominent concept in the field of Critical Race Studies in the US but is less prominent and still an emerging and underutilized conceptual tool in the European and Swedish context. Existing research measures color-blind attitudes defined as "a belief that race does not and should not matter" qualitatively and quantitatively. Frankenburg (1993), Bonilla-Silva (2008) and Neville et al (2000)'s work can be named as some of the scholars whose work are central to the theorization of color-blindness and color-blind attitudes in the US context. What happens when we translate these US measurements and understandings of color-blind racial attitudes in Swedish context? What are the results that we can obtain and observe from there, and do we see different patterns of attitudes? In this article, we present results from various qualitative and quantitative research we have conducted which employed the aforementioned theoretical frameworks during the period of 2009-2020 in Sweden. Based on the results we discuss the possibilities, limitations and implications of replicating the theoretical concepts from the US to the Swedish context and propose possibilities in measuring color-blindness quantitatively. The article not only contributes to the theoretical and methodological discussion on understanding color-blind racial attitudes in the European context, but also highlights the prominence of racial color-blindness in Sweden.

RN31_T04 | Conspiracy Theory, Measurement and Opposition

„5 Grams of corinna"- Conspiracy Myths by Right-wing Influencers on Youtube During the Corona Pandemic

Sandra Rokahr

University Groningen, Germany

In my contribution, I would like to give an insight into the right-wing scene on YouTube and introduce current metaphors and narratives of conspiracy myths during the corona pandemic. My focus is on the radicalization of the 20-year-old Naomi Seibt, also known as "Anti-Greta". Exemplified on her video "5 Grams of Corinna", which stands for the 5G conspiracy in the wake of the Corona pandemic, I would like to take a look at the structurally antisemitic conspiracy myths, which in Seibt's case extend to the QAnon conspiracy. With her videos for "Andersdenkende", Seibt is an unconventional example of right-wing actors in Web 2.0. As a young, attractive woman, she stands out from the male-dominated political public sphere. Besides, she is relatively unagitated, elaborate, knows which ciphers to use, and by that reached an international audience within no time. In my lecture, I would like to answer the question: How does her self-victimization and at the same time self-idealization in her corona conspiracy narratives are connected with her hostility towards refugees, her antifeminism, and agitation against the political left. Furthermore, I would like to discuss these as bridging narratives and ideological pieces of a "new anti-modern movement" to which the authoritarian syndrome is essential.

My lecture is based on my Ph.D. project "Conformist Rebellion 2.0", in which I examine authoritarianism and digital identity through the self-enactment, narration, and agitation of right-wing influencers on YouTube. Theoretically, my project is grounded in the social-psychological insights of critical theory. In addition to the rise of antisemitic conspiracy myths, my research is gaining importance due to the increasing significance of social media platforms, especially in the radicalization of right-wingers.

1013

The IHRA Working Definition of Antisemitism, and its practical application in research

Kim Robin Stoller

International Institute for Education and Research on Antisemitism (IIBSA), Germany

The presentation discusses the possibilities of a practical application of the IHRA working definition of antisemitism in academic research. Based on a concrete research project on antisemitic images in social media, concrete application possibilities will be shown and methodological challenges will be discussed.

RN31_T05 | Race, Class and Gender

Racial Contract – Whiteness Contract

Bolaji Balogun

The University of Sheffield, United Kingdom

This paper examines Charles Mill's 'racial contract' theory in a different context to its usual applications in the West. In doing so, the theory is opened to a new global application, able to re-centre understudied questions of race in Central and Eastern Europe. To make this effective, I reflect on the region's polity that is often considered race-neutral in terms of its social configuration. I consider the ways in which the 'racial contract' serves as a key historical study of race through three major manifestations – Economics, Colonial association, and Eugenics – that are often neglected in racial discourses in Central and Eastern Europe. To this end, I reroute The Racial Contract (Mills, 1997) beyond the normative liberal Western hegemony, showing that Mills' concept has not been marginal to the histories of race and racism in the West.

#Black Lives Matter - a global movement for change?

Shaminder Takhar

London South Bank University, United Kingdom

We are living in disrupted times with COVID-19 and the #Black Lives Matter movement colliding at the intersection of race and class. The #BLM protests are viewed as anti-racist and have been described as a specific response to inequality and oppression, temporarily freeing people to give voice to demands for race equality in the UK. Racial inequality is a deeply political issue forcing governments to respond in specific ways such as the UK Government's Race Disparity Report (2017) which found overall inequalities and disadvantage amongst minority ethnic groups in education, housing, employment, policing and the criminal justice system (CJS). This year it was the compelling evidence of the impact of COVID-19 on minority ethnic groups which finally prompted the government to set up a Commission on Race and Ethnic Disparities. This paper examines how the #BLM movement has firstly, provided an impetus for us to take action against racial inequality, secondly how it has become a global movement, thirdly, the multiracial composition of protests and finally the extent to which policy making can be influenced. This is looked at in the context of a hostile environment in which the oppressed voice and urgency for change is questioned at the highest levels of government. The #BLM movement presents a challenge to cultural hegemony which seeks to define common-sense positions on race by claiming that institutional racism is a myth, that diversity divides and that anti-racism is merely ideological.

Race, class or gender - Complex Inequality in Europe

Florian R. Hertel

Universität Hamburg, Germany

The presentation investigates the role of race, class and gender in the quantitative description of inequality in Europe. The object is to contribute empirically to the increasing number of quantitative "intersectional" analyses but, at the same time, investigate critically whether the idea of intersecting dimensions of inequality can be productively applied given available data and a quantitative research design. The empirical analyses will draw on various surveys of Europeans to study differences between white and Black Europeans of

1014

various classes and genders. Outcome dimensions will be mostly labor market indicators (access to employment, employment conditions, unemployment risk, etc.) but where possible also measure of subjective wellbeing. The analysis will be based on loglinear modelling to investigate concrete hypotheses about the interaction of the three dimensions. While the main aim is to describe and map multidimensional inequality as well as the interaction of inequality dimensions across Europe, I will also investigate possible country differences along migration histories and integration regimes.

I am an experienced stratification researcher when it comes to class and social mobility but never tried to study intersectional inequality – mostly because I believe this is one of the fields where qualitative research clearly outperforms quantitative designs because of the former's sensitivity to the constructions of subjectivities. Motivated by the recent BLM protest, however, I believe that quantitative research may contribute to the subject by mapping and quantifying the distribution of multilayered inequalities. To investigate whether the concept of intersectionality can be put to productive use (as compared to more standard concepts of cumulative advantage) in this regard, I suggest this presentations.

RN31_T06 | Antisemitism and Critical Theory

Gender, Race, Jewishness – Constellations Of Alterity In Intersectional Approaches And Critical Social Theory

Christine Achinger

University of Warwick, United Kingdom

In a time when the theoretical engagement with, and the political struggle against, racism, antisemitism and sexism are increasingly hampered by deep identity-political divisions and antagonisms between different scholarly and political camps, it seems particularly important to highlight the interconnectedness of such forms of discrimination without denying their specificity. My paper attempts to approach the question which theoretical frameworks might help us understand the complex interrelations between constructions of Jewishness, race and gender without downplaying their differences in content and discursive function, but also without losing their shared social origins out of sight. With reference to case studies from German and Austrian culture in the 'long 19th century', I seek to illustrate that such constructions of different 'others' can be understood as historically changing responses to the challenges generated by the rise of capitalist modernity. In the light of these findings, my paper then goes on to discuss the respective merits of intersectional approaches as opposed to approaches in the tradition of Critical Theory/the Frankfurt school in analysing such common social origins. I also engage with the related question how experiences of inequality and exclusion can inform progressive political practice without reifying the identities they produce in essentialist and exclusionary forms of identity politics.

The concept of 'the Jews' in the Antizionist Imagination.

David Seymour

City, University of London, United Kingdom

This paper advances my work on the continuities and discontinuities within the discursive practices of antisemitism and antizionism. Focusing on the presentation of 'the Jews' in both, it identifies two distinct but negative developments. The first falls is where pre-existing antisemitic images of 'the Jews' are applied and replaced by 'Zionists'. Conversely, the second development works in the opposite direction. It does so by attempting to draw a sharp distinction between 'the Jews' and 'the Zionists'. However, as the paper explains, this attempt by antizionism to distinguish 'Jews' from 'Zionists' falls. It fails because the distinction rests on the inversion of negative characteristics attributed to 'the Jews' within antisemitism into positive values and which 'Zionists' are said to either lack or 'betray'. Consequently, not only does this approach leave antisemitism uncriticised but in its inverted form, becomes incorporated within an antizionism that treats it as a benchmark against which 'zionists' and 'zionism' cannot but be found wanting.

1015

Robert Fine: Theorising the Potential for Terror

David Hirsh

Goldsmiths, University of London, United Kingdom

Robert Fine's work focused on the relationship between the critique of existing conditions and the 'critique of the critique'. Fine argues that a shared concern for the dangers posed by radical movements for change, as well as the freedom promised by them, was a common thread running through the work of Hegel, Marx and Arendt. Fine insisted that when such movements ended in a new tyranny, social theory needs to take serious account of this. Fine's work had a focus on the tendency for some ostensibly liberational social movements to reproduce that which they existed to oppose. Fine draws on Arendt's analysis of 20th century totalitarianism to understand what characteristics are typical of movements, or of traditions within movements, which turn out to be anti-democratic. Antisemitism often appears as a key indicator in this context. This paper examines this aspect of Robert Fine's work in particular with the aim of understanding how the conceptual tools that he crafted may help us in our efforts to understand what may be thought of as 'The New Populism'.

RN31_T07 | Europe and anti-Roma

How are Roma Students doing in Spanish Universities? Some Evidence From the UNIROMA R+D Project

Olga Serradell, Ainhoa Flecha, Jelen Amador

Universitat Autònoma de Barcelona, Spain

The low proportion of Roma university graduates in Spain affects their social inclusion opportunities, hindering their access to employment, especially in qualified positions. This collective suffers from a multiple discrimination, both due to their belonging to an ethnic minority and due to their frequent non-academic background. In the case of women, they also face gender-based discrimination.

Horizon 2020 Strategy of the European Commission, within the target in Education, fixes as a priority the increasing of the youth population that completes higher education. In front of this objective, Roma people are one of the most vulnerable groups that face greater difficulties both to accede higher studies as well as to complete them.

Studies focused on the situation and experience of Roma population in Spanish universities are still scarce. UNIROMA project analyses the experience of Roma first-generation college students with the aim to identify the difficulties they face when studying a bachelor or master's degree and identifies measures that contribute to overcome those difficulties.

The methodological design combines daily-life stories, discussion groups, in-depth interviews to key informants; and a longitudinal study with Roma first-generation college students. The present contribution will focus on the results of the initial survey, that has been administered to 100 Roma university students in Spain, and the qualitative fieldwork developed. The final aim is to formulate recommendations to orient policies addressed at increasing the graduation rates of Roma university students and to improve their academic results and their graduation rates.

SARTUCUE, case study Iglesia Evangélica Filadelfia

Jelen Amador, Olga Serradell

Universitat Autonoma de Barcelona, Spain

Internationally, there is scientific research that shows how Gender Violence is a social problem that affects many women, regardless of age, ethnicity and culture. In accordance with this social issue, the following communication is part of the SARTUCUE project. Prevention and overcoming of gender violence in the Roma people (National RTD Program, Ministry of Economy and Competitiveness, 2016-2019), analyzes the barriers that hinder the overcoming of gender violence, in this case, focusing in the Roma community. Specifically, the contribution in this communication revolves around the role of Iglesia Evangélica Filadelfia so the aim is to analyze the strategies developed to prevent and overcome gender violence. In this sense, it presents the strategies identified in this context that are helping to prevent violence in relationships and that promote victims of violence to break the silence. The project has been framed in a communicative perspective of research to create knowledge, all enhancing the active involvement throughout the research process of "community researchers" (Gómez and Sordé, 2012), that

is, in this case of Roma women themselves. Two study cases have been carried out in two churches of Iglesia Evangélica Filadelfia. As an impact of this analysis, we can point out that especially Roma women are empowered.

The vicious circle of Roma heteroidentification: analysis of the National Roma Integration Strategies of the European Union countries

Lluís Català-Oltra, Francisco Francés-García, Daniel La Parra-Casado

Universitat d'Alacant, Spain

As part of the EU's social policy, the National Roma Integration Strategies (NRIS) have been in force until 2020. It was a pending task to systematically observe how these strategies define the Roma population and what element of the definition is prioritised. This is useful in understanding the limits of a unitary policy within the European Union concerning the Roma and also to analyse the orientation of said policies in each country. In this sense, we have previously defined what the Roma heteroidentification components are and we have selected the terms and lexemes that are associated with them. By using content analysis techniques, we have pinpointed the components in the NRIS and we have conducted a statistical analysis with the obtained data. The majority of EU countries define the Roma in their strategies as an ethnocultural, disadvantaged and discriminated group and, to a lesser extent, as foreigners or nomads.This heteroidentification is established based on the geopolitical bloc (East and West) to which the country belongs and the department in charge of the NRIS (mainly social departments or specific departments for minorities).

RN31_T08 | Racism and Ethnic Discrimination

"But We're Cleverer Now": Whitesplaining Racism and Racial Gaslighting in Primary School

Belinda John-Baptiste

London School of Economics & Political Science, United Kingdom

Over the past year, the increased prominence of the Black Lives Matter movement has led to demands for increased antiracism efforts across all social institutions. However, one key site has generally been overlooked in these calls – the primary school. Despite discussion about decolonising primary school curricula, there has tended to be an absence of discussion about how the topics of race and racism are negotiated with primary school pupils and among the teaching professionals (particularly veteran teachers). This lack of discussion is often seen as justified by many people who believe the "sincere fictions" which characterise young children as racial blank slates (Van Ausdale & Feagin, 2001, p.155) and those who believe in notions of teaching professionals as "colourblind" beings (Modica, 2014).

This paper seeks to address the dearth of empirical discussion on how primary schools contribute to young children's understandings of race and racism. It draws on data from my two-year school ethnography, where I was a participant observer in two schools and interviewed 5-year-old to 8-year-old pupils using visual methods to generate story-telling and discussion. I argue here that commitment to a colourblind thesis (Bonilla-Silva, 2018) can stymie antiracism in the primary school learning environment and beyond. I focus on racial gaslighting and whitesplaining by primary school teaching professionals as colourblind strategies that deny and minimise racism and racism's harms, ultimately helping to maintain the racial and racist status quo in education and in wider society.

1017

Whom do We Trust? Addressing Ethnic Discrimination in a Multicultural Society by a Field Experiment

Jorge Rodríguez, Clara Cortina, M.José González

Universitat Pompeu Fabra, Spain

Stereotypes and prejudices against minorities may lead to discrimination and have clear negative consequences for minorities. They deserve major attention from policy makers in multicultural societies but are seldom studied due to the intrinsic difficulties to measure them. Using experimental research, we investigate the prevalence of discrimination against ethnic minorities in Spain's main online second-hand market platform. These platforms have entailed a true revolution in these markets, with a substantial increase in the volume of private transactions between strangers. The experiment consisted of buying or selling products under fictitious names clearly indicating the ethnic origin of the buyer or seller (Catalonia-Spain, Latin-America, Arab countries and China) and analyzing real individuals' behavior. We find that when a seller receives an offer from (fictitious) buyers, she discriminates against the latter if they are of Arab and Chinese origin, but not Latin-American, and only when the offer is at the listed price. However, buyers do not prefer the products of (fictitious) national sellers over those of (fictitious) minority sellers. We interpret this difference as possibly indicating the presence of statistical discrimination based on stereotypes about culturally distant minorities' behaviour as buyers, as compared to their behaviour as sellers. We have uncovered evidence of discrimination against minorities in market exchanges between private individuals, but only against minorities perceived to be culturally distant. This complicates minorities' assimilation into the host society, encouraging segregation and the social problems associated with it.

RN31_T09 | Antisemitism and racism in Western and Central Europe

A Story About Silence

Karen Frostig

Lesley University, Assoc Prof, United States of America

1018

The Jungfernhof concentration camp is a story about a forgotten camp that is now teeming with competing agendas ranging from outright denial, to mild curiosity, to multiple claims for ownership over an emerging story yet to be written. After more than 75 years of silence, the camp was recently converted into a recreation park! The site's picturesque landscape dotted with crumbling ruins inspired city councilors to develop the property into a network of volley ball courts, bird watching sanctuaries, an outdoor arena for large music festivals, replete with a winding promenade by the majestic Daugava river for anyone seeking quiet refuge from Latvia's nearby capital city. At the park's entrance, visitors encounter a large sign depicting the site's history. The camp is mentioned in passing but not by name. Also missing is any reference to the 3984 victims, a history of starvation and disease, regimes of forced labor, public hangings and random shootings at the site. As the granddaughter of murdered victims, a cultural historian, and a public memory artist, I presented a new memorial plan for the site in 2010 and again in 2019, inclusive of a non-invasive search for a mass grave. I received permission to pursue a collaborative, interdisciplinary multi-media memorial project unfolding in three phases: Research, documentation and memorialization. Based on a generative model of participatory engagement, the project introduces thirty-three different methodologies encompassing the disciplines of history, art, science and technology, in an effort to promote a reflective analysis of a country encased in silence.

Latent antisemitism in contemporary Hungary

Ildikó Barna[1], Tamás Kohut[2]

[1]Eötvös Loránd University, Faculty of Social Sciences, Hungary; [2]Independent researcher

In 2021, the Tom Lantos Institute carried out a representative online survey about present-day antisemitism in the Visegrád countries supported by the European Commission. The sample consisted of approximately 2,000 respondents. The research measured the different dimensions and types of antisemitism. Accordingly, we measured the cognitive, affective, and conative dimensions of antisemitism. In addition, the prevalence of religious anti-Judaism, conspiratorial, secondary, and new antisemitism in today's Hungarian society. However, in our presentation, we instead focus on latent antisemitism.

One of the major difficulties in the sociological measurement of prejudice is that some respondents, fearing normative stigmatization, do not reveal their genuine emotions. This is especially true for antisemitism, where several studies have revealed strong latency pressure. In order to actually estimate the prevalence of antisemitism, not only its explicit but also its latent forms must be measured. Nevertheless, the last detailed measurement of latent antisemitism in Hungary took place in the turn of the 2000s. András Kovács (2002) then found that about 10 percent of Hungarian society belonged to the group of latent antisemites. In our research, we followed the detailed methodology developed by András Kovács to measure latent antisemitism. In our presentation, we present the process of estimating latent antisemitism and its prevalence in contemporary Hungarian society.

The Spanish New Right and the Jews: Recent Developments, Perceptions, and Responses.

Alejandro Baer

University of Minnesota, United States of America

This presentation addresses the changes and discursive realignments among the Spanish right and far-right regarding Jews, Judaism, and the State of Israel. Seeking dissociation with traditional neo-fascist groups, the ultranationalist party Vox, which burst onto the political scene in 2019, renounced two of the traditional Spanish far-rights identity traits: the nostalgic endorsement of the Franco dictatorship and explicit forms of antisemitism. At the same time, Vox traffics in veiled forms of antisemitism –such as anti-globalist conspiracy theories–, rants against immigration and adopts anti-Muslim rhetoric reviving the "Reconquista" myth. These characteristics coexist with the embracement of national Jewish communities as posterchild minorities and the demonstrative propping of Israel as a stronghold of civilization and beacon of democracy. I seek to present the specificities of this case, its ramifications in the activist sphere of Spanish anti-antisemitism and discuss with my colleagues at ESA parallelisms and connecting threads with similar developments concerning right-wing populist platforms in other European countries.

Similarities and Differences between Two Rumors with Racist and Antisemitic Overtones in France

Charlotte Corchete

Sciences Po Paris, France

Drawing on an ethnographic research conducted on a rumor described as a media buzz in 2017 in "La Chapelle" neighbourhood in Paris, compared to Edgar Morin's 1970 survey "Rumour in Orleans", this paper examines the similarities and differences between the two cases. Indeed, in both cases, ethno-racialized and altered men are the target of rumors related to sexuality, and accused by white women. We will see from the interviews conducted in the ethnographic survey in Paris that the various positions of the women correspond to the reactions gathered by Edgar Morin in his Orleans survey: there are those who support the rumor and find a "causal-latent foundation" in racial stereotypes, those who express a "verifying caution" with regard to these cases, and finally those who oppose them by denouncing the racist or antisemitic character of the rumors. We will also point out the correspondences and variations between these two cases, particularly with regard to the historical and political context (from a period of "sexual revolution" to a period of "sexual democracy"). Finally, we will note the differences and contrasts between these two cases, be it in the age and purpose of the persons at the origin of these controversies, in the spread of the rumor, in the status of the men targeted as well as in the content of the stereotypes linked to these men. Indeed, if these stereotypes are both gendered and ethno-racialized, they vary in their content depending on the real or supposed ethnicity, religion and race of these men.

RN31_T10 | Racism, Labour and Class

Class, Racism and Work: The Importance of Class for Understanding Racist Practices in a Racialized Labor Market

Mikael Svensson

Södertörn University, Sweden

Research concludes that working-class people in general exhibit more negative attitudes towards immigrants. However, whilst primarily drawing on quantitative methods, these studies often fail to explain how class comes to matter The aim is not to determine which class is the most racist, but rather to explore (i) class differences with regard to which racist practices mainly occur in relation to different class positions and (ii) to identify generative mechanisms of importance to the practitioners, with particular attention to the workplace and the Swedish labor market. The empirical findings consist of two qualitative case studies (mainly interviews) close to Stockholm; (a) people in working class positions who are living in a working class area, and (b) people in more privileged class positions living in a socioeconomically more favorable area. The sampling relies on a combination of Marxian and Weberian class criteria (conditions of production, occupation and income)

The study shows that categories of practice vary between class positions; e.g. exploiting and corrective practices are characteristic for those in more privileged class positions, while excluding and avoidance practices are more common among those in working class positions. The result also shows that the class structure is a mechanism in itself and has different effects on people in different class positions. Perceived class interests in relation to workers of 'immigrant background' and the degree of authority in the workplace are both examples of this. Moreover, several other mechanisms will be discussed; negative notions of persons of immigrant background underpinned by imagined and actual norm circles, exclusion mechanisms linked to profession and language and the pursuit of class and upward status mobility in a hierarchically racialized labor market.

Racism Structuring Austrian Society – Entangling the Labour Market, Opinions Toward the Welfare State, Exclusionary Solidarity, and Sensationalism in Media.

Andreas Schadauer

University of Vienna, Austria

In this contribution I address the question whether racism can be seen as structuring Austrian society in a specific and lasting way. Or asked differently, whether varying social, economic, and political sites bear resemblances and are interconnected via comparable practices of homogenising, essentialising and hierarchising members of societies into antagonistic groups. For this, I refer to the outcomes of different research projects I participated in in the last years. This encompasses projects on discrimination at the labour market, on opinions toward the welfare state and toward solidarity in general, and on media reports on refugees - here now combining the outcome of qualitative as well as quantitative studies on racism in Austria. Racism plays a significant role in all of these social sites but has just been analysed separately in the projects so far. The individual findings considered separately do not, however, suffice to argue for racism as constitutive and structuring element of the Austrian society in general.

To exemplify racism as potentially entangling the different social fields or sites I draw upon the understanding of racism as (flexible) symbolic resource, as separately discussed by Anja Weiß and Karin Scherschel, among others. As symbolic resource racism may influence the value or evaluation of varying resources (e.g. language skills), and seen as flexible, it can be used and reproduced in the different social positions and dispositions (e.g. by entrepreneur as well as journalists) and for different goals and purposes. If in this way seen as structuring the Austrian society, this may also further the already often raised argument to (more strongly) consider racism in analysis of social structures without disregarding or downplaying classism and sexism.

Forms of Value, Geo-capitalism, and Racism: a Critical Perspective

Alfredo Alietti[1], Dario Padovan[2]

[1]University of Ferrara, Italy; [2]University of Turin, Italy

This contribution aims to deal with these processes of global racialization and racism and how they are rooted in the concrete and abstract process of value production in the context of geo-capitalism. For geo-capitalism we intend the current form of capital that has been globalized and increasingly depending on the appropriation of nature and fossil fuels. Moreover, many researchers avoided to link racism to processes of personification, corporealization, phenotypification of differences, that, as noted by Moishe Postone, is rooted in the contrast between the concrete and material dimension of the mode of production and the abstract one. The starting point of this paper acknowledges that for each form of revenue (wages, profits, interest, and rent) in a capitalist society, there is an attendant form of racism (Caffentzis, 2005). Different varieties of racism can be categorized according to different forms of value. Both the abstract forms of the commodity - that of labour and that of money - find a corresponding scapegoat: on the one hand, the quasi-human, unproductive, inoperative but inexpensive body of the "Negro"; on the other hand, the parasite, dishonest, rogue, conspiratorial "Jew". On the one hand the sub-human who steals work, on the other hand the superhuman who steals money. Finally, also the "Muslim" founds is role coming to be considered as the cruel actor of fossil fuels prices volatility, the brutal manipulator of the energy market. Here the Muslim becomes the abstract racialized core of fossil energy.

RN31_T11 | Conspiracy Theory/Boundaries

Conspiracy Myths, Antisemitism And Racism Among The German Reichsbürger-Scene: Conceptualizing The Reichsbürger-Worldview As An Attribution Of Agency

Niklas Herrberg

Heinrich-Heine-University Duesseldorf, Germany

The sociological study of the "Reichsbürger-Scene", a popular segment of the far right in Germany, is still in its infants. Generally speaking, this scene comprises of different groups and activists, who are claiming that the German "Reich" never ceased to exist and that therefor the Federal Republic must be regarded as a mere construct of conspiratorial forces. A broader discussion in the German media about this segment of the German far right started as early as 2016 when a man with ties to the scene killed a police officer. The coverage of the scene reached a new high during the so called "Corona-Protests" in 2020 in which different groups and persons, who were affiliated with the scene, where not only participating but shaping the ideological positions of the movement. Interestingly, until today a deeper understanding of the Reichsbürger-ideology is still lacking, especially the relationship and interaction of its different aspects.

Based on the results of a qualitative content analysis of online publications of twelve major Reichbürger-groups the presentation will show how the overarching antisemitic and conspiratorial worldview is linked to elements like anti-Muslim resentment, a general "critique" of the media and a "liberation fight" against the "dictatorship of Merkel". I argue that the attribution of agency and the perceived antagonism between a "natural" self-agency and an "artificial" agency of the conspirators constitutes the core of the Reichsbürger-ideology: It is based on the idea of a Manichean battle between the sovereign German citizens and the conspirators, who are often pictured as Jews using Muslims and the media to establish a totalitarian system.

Conversations about Jews and Israel on Twitter. What does it tell us?

Gunther Jikeli, Daniel Miehling

Potsdam University/ Indiana University, United States of America

We have tracked conversations about Jews and Israel on Twitter over two years. This has resulted in a database of millions of tweets. We manually went over thousands of tweets or representative samples and evaluated if the tweets are antisemitic according to the IHRA Definition, if they are related to the Holocaust, if they are calling out antisemitism, if they are ironic, and what kind of sentiment they include towards Jews, Judaism, or Israel. We will present the first results of this analysis, together with an analysis of the metadata that includes information about important influencers, popular retweets, and timelines that relate to offline events.

Patterns of online conversations about Jews and Israel emerge, a majority of which are related to the Holocaust or antisemitism.

Warm Bonds Or Functional Transactions? Being Neighbours During Ethnic Pogroms In Delhi 1984 And Ahmedabad 2002

Raheel Dhattiwala

University of Oxford, United Kingdom

Stories of courage and friendship abound during mass civilian violence. Of people saving their neighbours and giving them refuge at a cost to their own lives. However, there is extensive evidence that perpetrators of mass violence are often neighbours. Neighbour-on-neighbour violence contradicts the 'contact hypothesis' (Allport 1951) which postulates that intergroup friendly contact can reduce prejudice—and violence also (Varshney 2002). But there are gaps in our understanding of contact. Existing studies have failed to systematically examine the moderating impact of contact (Paluck, Green and Green 2018). Does the nature of contact, prior to violence, have a bearing on who rescues and who kills during mass violence?

This paper builds upon previous ethnography in mixed neighbourhoods of Ahmedabad (India), one of the main sites of attacks during the anti-Muslim pogrom of 2002. I draw upon literature on neighbour relations in the context of the Rwandan genocide and anti-Jewish pogroms and provide new data from Ahmedabad and also Delhi (India), where at least 3,000 Sikhs were killed in 1984, to emphasize the complexities underlying the nature of contact and its association with violence and peace. Relationships between Hindus and Muslims in Ahmedabad and Hindus and Sikhs in Delhi were remarkably similar in violent and peaceful neighbourhoods, before violence in 1984 and 2002. Low level of differences between groups and warm bonds between neighbours did not guarantee peaceful coexistence just as functional social relations did not necessarily lead one neighbour to tell on another. By implication, the nature of contact can assuage or escalate everyday triggers of conflict, but not when violence is state-orchestrated.

Beyond Ethnicity: Redefining the Boundary Construction Mechanism Operating in Interethnic Settings

Ana Kirvalidze

Ilia State University, Georgia

The well established formula of ethnicity concerning it's constructing in-group and deconstructing out-group power have been extensively challenged in social sciences and humanities. In the era of global migration guarded by rising nationalist appeals and particularistic ideologies, when certain discourse of collective identification (ethnic, national) do not appears disenchanted from primordial constraints, the importance of empirically enriched theoretical paradigms becomes vital. This paper addresses the question of boundary construction mechanism between different ethnic groups. It demonstrates how interethnic boundary lines are drowned beyond ethnic and other primordial differences and how this is harmonised with the logic of double boundary making mechanism in everyday life. By exploring this substantive issue, I utilize relatively new theoretical perspective in the study of interethnic boundary construction by concentrating on its multilevel operational character. Drawing on a rich data sources from mixed method approach I try to provide empirical evidence how ethnic, religious and other primordial codes of identity becomes eliminated and substituted in everyday interethnic settings. The focus of analyses are three ethnic groups residing in the republic of Georgia – Georgians, Armenians, and Azerbaijanis.

Keywords: ethnicity, ethnic boundary, Identity, religion, interethnic cohesion

RN32_T01_01 | Multiple Crises 1

An Intersectional Perspective on Extreme Political Masculinities in Times of Crises

Ov Cristiam Norocel

Lund University, Sweden

To date, there are few explanations concerning the paradoxes of the extreme right in times of crises: privileged white men proclaiming themselves the true voices of white working class (men and women) against allegedly corrupt political elites, and threatening migrant Other (men). In my study, I suggest a way to address these paradoxes by employing superordinate intersectionality as a theoretical perspective to examine how extreme right discourses depict political masculinities through the interactions between several axes of difference and inequality: gender (masculinities); sexuality (heterosexuality); social class (elites); and race (whitenesses). In so doing I focus on the critical junctions that political sociology offers, between the critical study of masculinities and that of extremism research, which enables an analysis of the gendered nature of these ideologies in times of crises. I illustrate these theoretical articulations with examples from the US and Sweden.

Civil Society And Gender Knowledge In Pandemic Crisis Management

Pauline Cullen

Maynooth University, Ireland

In this paper I draw on emergent feminist critique of crisis management and Covid-19 and using empirical data from Ireland detail state and civil society crisis response. Analysing case studies on gender based violence, homelessness and care I ask: What forms of gender knowledge underline state pandemic crisis management ? How can we explain the resonance of some forms of gender knowledge and expertise, and lack of traction for others at a time of crisis ? Pandemic crisis management is driven by rationalistic, masculinist and behavioural scientific approaches that engender thin and calculative forms of societal solidarity at best. Civil society crisis response can in contrast be informed by experiential data and gender knowledge that reflects complex intersectional realties of communities some of whom experience forms of permanent crisis. Crisis management including strict lockdowns secured public compliance under the trope ' we are in this together' yet reproduced gendered, raced and classed divides. At the same time non-routine forms of state action, significant popular mobilization and deployment of additional public funds enabled extraordinary forms of state and civil society crisis response that generated innovation and collaboration. State crisis management remains indifferent to the deep gendered effects of the pandemic, yet under specific conditions gender knowledge can compel states to act. However, state narrative of 'exceptional circumstance' and a commitment to a return to 'normal' may recreate less hospitable climate while women (especially minoritised women) continue to experience disproportionate pandemic related social suffering.

Surviving a Decade of Crises: EU Institutional Adaptation and Societal Responsiveness

Hans-Jörg Trenz[1], Asimina Michailidou[2]

[1]Scuola Normale Superiore, Italy; [2]Arena, University of Oslo

In this contribution we review how public communication and legitimation strategies of EU institutions and governance have evolved over the last decade in response to crises. We ask: How did EU institutions publicly frame crises-derived socio-economic challenges? How were these perceptions brought to the attention of and contested by EU publics? What were the implications for the democratic legitimacy of the political order at national and European level? The argument we wish to unfold is that EU crisis communication has been both facilitated and constrained by new digital communication infrastructures and the formation of new critical publics. The double challenge EU institutions and governments need to face is first, the sustainability of EU institutional modes of governance threatened by crisis, differentiation and an erosion of legitimacy, and secondly, the cohesion of the EU social space threatened by ruptures, cleavages and enhanced conflicts about values. As Europe and the rest of the world remain under the grip of the Covid-19 virus crisis in mid-2020, EU institutions are once again hard-pressed to provide robust support and post-crisis solutions to and acceptable by all member-states. At the same time, they face accusations of not having learnt the right lessons from the past decade of crises to not only uphold fairness and solidarity during turbulent periods but also ensure the union's very existence. All the while, they must communicate and defend their actions in a public sphere whose borders are fluid; participants are highly interconnected yet not necessarily bound by a collective identity, vision or mission; and both information and misinformation flows are constant.

Urban Politics: (Re)Searching Democratic Alternatives to Nationalism and Globalisation

Monika De Frantz

University of Vienna, Austria

In search of responses to a complex and uncertain world, cities have long been the focus of studying the societal conditions of crises as well as developing political visions and shared practices for improving our lives. As states seem to retreat from public politics, societies open to diversity, and markets come to dominate unequal transformations, cities have shifted into the focus of globalization. Due to their local concentration, physical density, open multi-scalal relations and transnationally interconnected problems, urban spaces manifest diverse contemporary challenges e.g., of markets, environment, technology, communication, migration, culture, governance, international development etc. Acknowledging the political relevance of cities, since 2016, also the UN and the EU have officially embarked on urban agendas for the transnational governance of global sustainable development. However, globalisation has also incited a retreat to nation states and populist politics whereby anti-cosmopolitan discourses mobilise rural-urban cleavages in support of radical right parties. While urban symbolisms have long served political representations of monarchs and national heroes as well as democratic governments, iconic urban spaces are now turned to stages not only of corporate economic branding but also of anti-democratic movements and political terrorism. Most recently the Covid public health crisis has fostered a return to stronger state interventions limiting and regulating social life in public spaces, thus giving rise to creative new urban practices and mobilising contentions of democratic governance. Embedding, mediating as well as contesting diverse transnational transformation pressures in different local and national paths, these various emerging fields of urban politics thus offer emblematic cases for contributing critical, interdisciplinary research on the diverse spectrum of political agencies and democratic legitimacies in contemporary institutional change.

How Civil Servants Evaluate Citizens' Initiatives. The Role of Social Status of Initiators

Vivian Visser, Willem de Koster, Arwin van Buuren

Erasmus University Rotterdam, Netherlands, The

Governments increasingly stimulate and invite citizens to participate in public service delivery via self-organization in citizens' or community initiatives. In practice, when citizens self-organize themselves in initiatives, a certain level of cooperation with the government is required, for example in the form of financial support, information or institutional contacts. Hence, self-organizing citizens that want to take on an initiative, turn to governments for approval and support. Although the rise of citizens' initiatives is frequently praised as a democratizing force, scholars warn that this breeds a new societal divide, because less-educated citizens are underrepresented in such initiatives.

Our study aims to analyze whether and how the social status of initiators plays a role in the evaluation of citizens' initiatives, by civil servants tasked to advise on what initiatives to support or not. We expect that, due to a perceived sociocultural distance and the activation of class stereotypes, the social status of initiators influences the evaluation of their initiatives.

To identify both 1) a causal effect of the initiator's social status on the evaluation of the initiative; and 2) its underlying mechanisms, we use a mixed-method vignette experiment. This research design combines experimentally controlled variation in vignettes (i.e. descriptions of hypothetical but realistic citizens' initiatives) with semi-structured in-depth interviews. We select neighborhood managers and networkers - who play an important role in the evaluation of citizens' initiatives - in a large city in the Netherlands that is taking the lead in stimulating citizens' initiatives.

Mixed Research Approach: Simulation Of Methodological Design To Be Applied In The Analysis Of Different Levels Of Scientific Literacy Both In Administration And In The Community

Maria Ferro Serrano

University of Évora, Portugal

Analyzing the State of the Art, it is possible to find surveys that evaluate different attitudes towards science, however, most of them are related to a formal context of the educational system, with very few of those that aim to analyse the understanding of science in the community outside the school environment. Although there are countless studies on the use of scientific knowledge by administration in decision making, there are no known published works that assess the importance that the Local Administration (LA) attributes to science that allow to assess different patterns of scientific literacy both in administration and community, and understand how this categorization can contribute to a greater perception of the role of science in the well-being of the community. It is intended to diagnose what kind of diversity is found in the community and LA in relation to different levels of scientific literacy, as well as to understand the role that both attribute to science and, consequently, what they demand from it. LA is endowed with autonomy and authority to act in the territories, however, it is necessary to understand whether there is an understanding of scientific information on the part of this actor and, if so, what importance it attaches to the role of science as a determining factor for well-being of the community. Not always those who reach such positions of influence and power have had an essentially scientific education, however, their academic level will presuppose an understanding of science so that they can give it meaning. Qualitative and quantitative methods are used, using characteristics of grounded theory.

1026

Local Democracy: Empowering Dalits or Reinforcing Caste Hierarchies?

Komal Singh Chauhan

Indian Institute of Technology, Kanpur, India

Local Caste Histories Shape The Local Panchayat Level Elections In A Way That The Scheduled Castes Are Still Not Able To Wield Meaningful Power From Them. Drawing On A Year Of Ethnographic Field Work In Two Villages Of Muzaffarnagar District Of Western Uttar Pradesh In India, This Paper Seeks To Bring Forth The Culture Of Manipulation And Clientelism In The Local Panchayat Level Elections In Uttar Pradesh. By Discussing Various Strategies Adopted By The Upper Caste Landed Rural Elites It Is Being Argued In This Paper That These Powerful Sections Of The Village Society Hijack The Election Processes To Their Favour Which Strengthens And Reinforces The Caste Hierarchies. The Purpose Of Panchayat Level Elections Which Ensure Representation Of Marginal Groups (Lower Caste And Women) In The Local Level Democracy Through Reservations Is Tactically Subverted By The Upper Caste Landed Rural Elites. The Political Economy Of The Region Is Such That The Scheduled castes Are Landless Or Own Meagre Landholdings And Hence Often Engage In Irregular Agricultural Work As Labourers Or Migrate To Brick Kilns In Punjab And Haryana. The Vulnerability Generated Due To Unequal Distribution Of Resources Which Is A Manifestation Of The Oppressive Caste System And Lack Of Stable Livelihoods Often Push The Scheduled Caste Households In Relations Of Debt With The Upper Caste Landed Rural Elites. The Paper Demonstrates How This Relationship Of Debt Is Often Exploited By The Upper Caste Landed Elites To Maintain Their Powerful Position In The Rural Affairs And Continue Their Dominance In Village Level Panchayat Elections.

Italian LGBTQI+ Community Resistance Against the Populism Storm. Strategies, Actions and Achievements

Antonella Cammarota, Fabio Mostaccio

University of Messina, Italy

In recent years, one of the main targets that the populist storm hit, in many European countries, was the so-called "gender theory" or "gender ideology" (Kuhar, Paternotte: 2017; Kováts: 2018). In the Italian case, especially before the approval of civil unions for same-sex couples, and, recently, during the process for the approval of the law against homophobia and transphobia, there were many attacks by ultraconservative Catholic movements (Ozzano, Giorgi: 2015; Prearo: 2020), connected with Right-wing parties, against the LGBTQI+ community.

In this context, it becomes interesting to investigate the strategies and actions through which the Italian LGBTQI+ movement reacts to these attacks, whilst continuing to work towards the recognition of its their rights. In particular, we show the first results of a research focused on various organizations within the Italian LGBTQI+ community, about their activities to address populism; on their ability to create intersectional alliances and coalitions (Ayoub: 2019) also with organizations involved in other issues and/or with other political players such as politicians belonging to parties not identified as populists; and, finally, the analysis of the outcomes obtained or intended to obtain in the short and medium term.

This study was carried out using a qualitative approach: it used desk analysis (mapping and collection of more relevant Italian LGBTQI+ organizations; law proposals about LGBTQI+ issues; official reports by these organizations) and in-depth interviews with activists and key informants who played a role within the dynamics analysed.

RN32_T02_01 | Multiple Crises 2

Prefiguration and World-Building in Response to Multiple Crises: 'Abeyance' and Russian Disability Organising

Philippa Mullins

London School of Economics (LSE), United Kingdom

Social movement abeyance was initially conceptualised to theorise social movement response to external, political institutional conditions which are unreceptive to mass mobilisation and protest (Taylor, 1989). The concept has been further developed to theorise the role of internal processes and culture in social movement abeyance (e.g., Holland & Cable, 2002). However, a greater shift in social movement studies has in fact reframed abeyance variously as part of everyday claim-making, micro-politics, and prefigurative action (e.g., Fröhlich & Jacobsson, 2019; Véron, 2016; Yates, 2015b, 2015a). This literature criticises the theorisation of abeyance for restricting reflection on prefiguration to emphasise decline, failure, quiescence, and movement preservation. In contrast, it proposes prefiguration as a strategic response, 'politicized and politicising', which 'not only underpin[s] mobilization, but [is also] politically expressive and prefigurative' (Yates, 2015a, p. 236).

Without rejecting this renewal, I propose that – in a climate of 'multiple crises' – returning to the concept of abeyance highlights the contribution of political sociology to analysis of diffuse power and the complex interactions between characteristics both internal and external to social movements. Through this paper, I aim to stimulate discussion about how researchers can better explore this interplay. To do so, I take the case of my own research on grassroots, civil society organising for disability rights in Russia. I analyse how actors discuss their negotiation of myriad factors, including legislative change, burn-out and illness, and extended repressive policing. Their strategic negotiations reframe abeyance practices as (a) an act which is strategic, prefigurative, and engages in creative world-building and (b) motivated by and responding to individual and external, structural crises.

Datafication and Crisis

Michele Grigolo

Nottingham Trent University, United Kingdom

This paper aims to explore the relationship between, and the politics of, datafication and crisis. While digital technologies and the associated production and circulation of data are not a new phenomenon, datafication addresses the rapid trend towards 1) the measurement of different dimensions and practices of our everyday life and 2) the use of these data for social control and economic profit. The 'epistemic crisis' that is induced by surveillance capitalism and from which capitalism benefits poses multiple threats to democracy and equality, and the liberal institutions that have governed Western societies for a long time (Zuboff 2021). Eventually, moving from a political sociology perspective, the paper discusses critically the relationship between datafication and crisis, inviting attention to competing social, economic, and political projects emerging at their intersection, and the different scales of government that are invested in these projects.

What We Can't Talk About: Political Taboos And The European Parliament

Alberta Giorgi

University of Bergamo, Italy

Absence and silence, in political discourse, are as significant as what is salient and topical, because they identify what "does not matter" or "does not belong" to the political sphere. What we don't talk about is indeed a wide category, which ranges from neglected topics to what is unspeakable, to hidden information. Also, it varies over time: the salience of one topic fades as another gains centrality in the agenda, political morality changes, and information is leaked or revealed.

In this contribution I focus instead on what we can't talk about: the topics that, according to the MEPs, can be labelled as political taboos, by means of content analysis of the European Parliamentary minutes [1996-2020]. Adapting the approach of discursive taboos, the analysis shows that the use of the label decreases over time, and that the topics and concerns greatly vary. The label "political taboo" evokes what is missing from the debate and ought to be there instead. MEPs variously invite to respect or (more often) break the taboo, making an opening for neglected, unspeakable or hidden elements.

1028

In this sense, the word "taboo" may be conceptualized as a ghost, as it marks what is, at the same time, missing and present, haunting the political debate, and connects the world of what we talk about with the world of silence.

RN32_T02_02 | Pandemics Politics and Policy

Powerful Manifestations of Legitimation in the National COVID-19 Strategy

Pelle Korsbæk Sørensen, Nicole Thualagant

Roskilde University, Denmark

Facing the pandemic situation of COVID-19, governments in Europe developed national responses to the health crisis. Our analysis sets emphasis on the initial legitimation and proposes a model of different phases in the respective responses to the crisis. Denmark was one of the first countries in Europe to propose a general lockdown. Denmark, as a paradigmatic case of a mix of a universal and liberal welfare state, developed an interesting response based on a presumption of solidarity and social-mindedness.

We present a discourse analysis of the communication with inspiration from Foucault's view on power and knowledge, and his understanding of how certain regimes of knowledge constitute health policies.

The aim is to analyse how the national strategy and the measures taken were discursively legitimised. The findings will be compared to other formats of response in Europe. This offers a sociological insight into the management of health as a welfare good for all – and sheds light on the public micro negotiations of possible subject positions.

The empirical material is full transcripts of the Danish Government's press briefings held from February 2020 to February 2021. The analysis proposes an analytical design of four complexes of legitimation, each building on a specific understanding of knowledge: political, economical, scientific knowledge, ethical. We argue that this specific design can be used as an analytical frame for analysing health initiatives generally in contemporary welfare states.

Fear, Freedom and Restrictions in Time of Crises: lockdown and social distancing in Italy

Maria Cristina Marchetti[1], Emanuele Rossi[2]

[1]Sapienza University of Rome, Italy; [2]University of Rome

The need to stop and defeat the coronavirus epidemic has made it necessary, in most of the countries involved in the health crisis, to resort to tools for controlling and limiting individual freedoms. To combat the spread of the virus we have relied on a variety of tools. Some more traditional, like the lockdown, which derives from a disciplinary control logic typical of Bentham's Panopticon; other more sophisticated ones that are part of a surveillance system typical of the Ban-opticon (Bauman) model: drones, body scan temperature, contact tracing app, capable of monitoring people's movements to know with whom we came into contact and in what area of the city, in order to stop any outbreak of infection.

The debate emerged in the first phases of emergency and in the subsequent ones considered the fact that the pandemic has brought back the associated life to its original dimension within which fear plays a fundamental role. In this condition, social norms, law, and institutions are characterized by high levels of social consensus, leaving little room for conflicting positions.

Citizens responded in a rather diversified way, willingly accepting some of the limitations (lockdown) and less the use of control technologies, in front of which concerns emerged regarding an increasingly pervasive power capable of taking over every aspect of existence.

Analyzing the Italian case, the paper will focus on:

-Fear, freedom, and restrictions in time of crises: a theoretical approach

-Societal responses to Covid-19 restrictions: lockdown and social distancing official data

-Contact tracing: App Immuni in the Italian case

Political sociology, Social Europe, and the multiple crisis. On the invisible audiences of the Western Balkans

Tatjana Sekulic

University of Milano-Bicocca, Italy

What does political sociology have to say today about the Social Europe? How have EU institutions and elites addressed issues concerning the boundaries of European solidarity politics in times of crisis? What solidarity mechanisms and devices have been employed regarding the different causes and audiences of the current multiple crisis?

The paper aims to tackle these complex questions through the lenses of the enlargement process' dialectics towards the Western Balkans (WB6), in order to shed light on the less transparent ways in which EU agency, with its power of bordering and ordering specific European space-sets, influences the social rights of their citizens. Since 1989, the WB6 countries experienced several waves of specific crises. After the violent conflicts of the 1990s, they gained the EU membership perspective in 2000, only to be afflicted by the enlargement crisis after the 'Big Bang' in 2004 and 2007. During the 2008 financial crisis, the EU provided limited support to the region in accordance with its former austerity politics. After several years of deceleration, it was the 'Balkan route' migrant crisis in 2015 that revived interest in integrating the region, mainly for reasons of border securitization, further reinforced in view of growing geopolitical threats to the EU. Will the current Covid-19 pandemic crisis affect the further inclusion of the WB6 into the Social Europe, and how? The inquiry focuses on the EU's support agency towards these countries, their citizens, and the people on the move, in the context of the pandemic and the migrant crises.

Conservative Closure or New Solidarity? Changing values and ideas about the future in times of the Corona crisis

Wolfgang Aschauer[2], Anja Eder[1], Franz Höllinger[1]

[1]University of Graz, Austria; [2]Paris Lodron University of Salzburg

Current analyses widely assume that the Covid 19 pandemic could bring about profound changes in societal value orientations and views. However, the assumptions and conclusions are not consistent: On the one hand, they point to a societal shift toward greater solidarity, a stronger welfare state, and ecological and economic sustainability, but on the other hand, they also point to the resurgence of the nation-state, social division, and alienation.

In this paper, we investigate whether a change in values can be observed with regard to the value concepts of Shalom Schwartz and Ronald Inglehart by means of data from the Values in Crisis survey in Austria (May 2020) and in conjunction with Austria-specific data from other representative surveys (European Social Survey and European Values Study). Moreover, we explore the Austrians' future visions of society after Corona.

The results show a broad stability of the relative importance of certain values, but at the same time a shift toward basic values such as security, traditionality and conformity and a strengthening of material security needs in times of crisis. For the time after Corona, Austrians would like to see more national and, to a much lesser extent, transnational solidarity, but they believe that economic, social and ecological development will essentially continue as before. These ideas about the future vary among the population, and are largely shaped by the fundamental values held, generational affiliation and political orientation; education, income and the subjective impact of the Corona crisis play only a minor role.

Polarization of Opinions on Political Measures in German-Speaking Countries – A Comparison between the COVID-19 Crisis and the Climate Crisis

Beate Klösch[1], Markus Hadler[1], Markus Reiter-Haas[2], Elisabeth Lex[2]

[1]Institute of Sociology, University of Graz, Austria; [2]Institute of Interactive Systems and Data Science, Graz University of Technology, Austria

The world is currently facing two major issues – the COVID-19 pandemic and the climate crisis – both are polarizing. Policymakers focus now primarily on implementing protective measures to contain the virus, but will also need to address climate change. Considering public reactions to these crises and measures, we see two opposed reactions: Protests against COVID-19 measures and protests for climate action. The successful combating of the pandemic and the climate crisis ultimately depends on the acceptance and adoption of those measures by the population. In this paper, we investigate the polarization of opinions on selected COVID-19 measures (compulsory vaccination, contact tracing, wearing of face masks) and on various environmental protection measures (paying higher taxes and prices, cutting back on living standards) in the DACH-region, i.e., Germany, Austria, and parts of Switzerland. Our analysis is based on a representative online survey in said countries (n = 2560), which was fielded in 2020. We examine predictors of support for these measures, particularly general concern due to the pandemic or the climate crisis, assessment of future consequences at country-level, and attitudes towards the origin of the SARS-CoV-2 virus or the reasons for climate change. Our analysis shows a higher public polarization regarding COVID-19 measures than regarding climate protection measures. Furthermore, we also consider the tweets of all respondents who shared their Twitter handles with us to compare opinions on measures between the two data sources. The Twitter analysis indicates a strong overlap between opinions expressed in the survey and on Twitter regarding COVID-19 measures.

RN32_T03_01 | Populism and Science 1

Populist Framings of the COVID-2019 Pandemic and their Opponents in the EU Parliament

Carlo Ruzza, Carlo Berti

University of Trento, Italy

Globally, and especially across Europe, a broad range of populist forces has attempted to exploit the pandemic-related emergency to gain momentum and increase consensus, while national and supranational institutions were trying to cope with the consequences of the new virus. Despite the limited Europeanization of the health policy field, the European Union, in particular, plays a fundamental role in the management of the COVID-19 emergency and the post-pandemic period that will follow. The reputation of the European institutions, and of the EU itself, may be, now more than ever, at stake. In this paper, we explore how populists and non-populists have discursively constructed the COVID-19 emergency in the European Parliament. Using a database of speeches and debates held at the European Parliament during the period 1 January-31 December 2020, we carry out a content and framing analysis of discourses. What emerges is that there are three main dominant frames about the coronavirus pandemic: the health emergency frame; the economic emergency frame; the political/democratic emergency frame. In all these frames, the struggle between populists and non-populists emerges with certain specificities. In particular, the health emergency frame shows the disagreements (but, to a certain degree, also the agreements) of populists and non-populists regarding the nature of, and necessary measures against, the pandemic. The economic emergency frame shows a very clear-cut difference between populist and non-populist forces in the assessment of the economic measures to be taken to face the economic consequences of the pandemic. However, this frame also shows the internal fractures and contradictions of the two blocks and the fact that in some instances populist actors appear to embrace conspiracy theories.

1031

Populism, Sovereignism and Conspiracy: Right-wing Populist Discourse in Covid-19 Anti-lockdown Mobilizations

Cecilia Biancalana, Oscar Mazzoleni

Université de Lausanne, Switzerland

During the pandemic, street and web mobilizations against lockdowns, masks, social distancing and vaccines spread in Europe and elsewhere. Protesters claimed for constitutional and economic freedoms, as well as individual and national sovereignty, in opposition to medical and political elites and economic corporations, often accused of hiding the truth from the people. In some cases, right-wing populist parties and leaders used this kind of mobilizations in order to adapt their own discursive strategies to take advantage from the crisis (Bobba and Hubé 2021). This paper addresses the question of the link between populism, sovereignism and conspiracy narratives. Thus, our goal is twofold. From a theoretical point of view, we will discuss the literature on populism and link it with that on sovereignism (Kallis 2018; Blühdorn & Butzlaff 2019) and conspiracy theories (Bergmann 2018; Uscinski 2018). In order to illustrate our argument, we will consider a set of discourses produced by right-wing populist parties during the pandemic crisis. Through the examination of the parties', leaders' and representatives' discourses, we will try to understand whether and to what extent populism, sovereignism and conspiracy narratives are combined in actors' discourse, how the discourse is constructed, and examine the variations between different actors and contexts.

Populism and Science

Hande Eslen-Ziya

University of Stavanger, Norway

As public irrationality, conspiracy theories and anti-science movements are gaining momentum we observe what Porpora (2020) refers to as the 'crisis of truth'. It is a distrust of expertise and scientific knowledge and post-truth populism speeded with fake news. The crisis of truth refers to an era where evidence and objective facts go missing in sentiment, emotion and personal beliefs. Relying on emotions, creationism, religious beliefs and common sense over expertise, purposefully creates a counter knowledge referred as pseudo-science (Dawes 2018), troll-science (Eslen-Ziya 2020) or fake-science (Edis 2020). It is projected politically and ideologically

charged alternative knowledge and has changed the way science and experts used to inform political decision making. As the worth of scientific expertise is devalued, the counter scientific discourses supported through right-wing political rhetoric help produce not only a culture of resistance to science, but also create new grounds for digital populism and pseudo-science. In this chapter I seek to explore how the development of counter knowledge serves as a catalyser of producing and disseminating public sentiments on populist discourses.

Populism and Conspiracy

Manuel Anselmi

Unitelma Sapienza, Italy

In recent decades, in parallel with the increasing success of populist movements, conspiracy theories have also spread. From the smallpox vaccine to chemical trails or, more recently, to the conspiracy theories on the origins of the Covid-19 pandemic, it seems that a conspiratorial attitude characterize more and more citizens' beliefs in different political contexts. In this paper, we will present a review of the most important theoretical approaches to the study of conspiracy theories, in order to provide a multidisciplinary background for the empirical study of the phenomenon. We will examine sociological and political as well as psychological approaches, and we will present the main theoretical findings and their empirical applications. On the one hand, we will consider the literature that relates conspiracy theories with populism; on the other hand, we will explore what have been defined as "paranoid" tendencies in the political realm. The goal of this paper is be to frame the emergence and spread of conspiracy theories in a wider framework, taking into account long-term social changes such as secularization, individualization, the weakening of social ties, the crisis of the concept of community, the crisis of ideologies and the increasing difficulty for citizens to understand the political and social complexity determined by globalization. As it has been done for other macro phenomena, such as populism, this paper will provide an analytical framework in order to facilitate the study empirical cases, in a multidisciplinary perspective.

RN32_T03_02 | Depoliticisation

Emergency Politics And Democratic Crisis In The Era Of Authoritarian Neoliberalism

Fabio de Nardis

CCPS - University of Foggia, Italy

Pandemics, economic defaults, natural disasters, wars, terrorism require democratic governments to act quickly to deal with emergencies. "Necessity" and "haste" have become the ordering principles of politics. This leads us to reflect on the ways in which decisions are made in this historical period. The pandemic has led Governments to take decisions that restricted the spaces of freedom connected to certain fundamental rights - mobility, meeting, work, leisure, social relations. Partial limitation of freedoms, centralization and personalization of political power are therefore the traits that characterize this historical phase in which emergency politics seems to have become an endemic feature of contemporary democracies. In the paper, these transformations that signal a clear process of de-democratization will be connected, on the one hand, to the dynamics of de-politicization - that is, to how institutional politics operates today within the confines of neoliberal governance; on the other hand, to those dynamics well described by the by literature which has problematized the concept of "authoritarian neoliberalism", understood as that set of state strategies through which the parameters of the neoliberal system are kept away from any possible pressure popular. We therefore assume that neoliberalism takes shape and strengthens itself, firstly, through coercive state practices aimed at disciplining, marginalizing and often criminalizing the opposition forces; secondly, through the juridical-administrative apparatuses that limit the paths along which neoliberal policies can be questioned and challenged. Neoliberal policies in fact need a strong state, but a weak democracy in terms of the relationship between institutions and citizens.

The Politics of Discourse, Knowledge and Expertise in a Decade of Crises
On the Usage of Evidence in Diverging Narratives About Asylum

Francesca Messineo

University of Rome, La Sapienza, Italy

The contribution draws upon the Gramscian concept of hegemony and the recent scholarship on (de)politicisation, and explores the role of "advocacy" think tanks and the media in producing evidence that contributes to shape policy narratives about asylum seekers and forced migrants.
The research focuses on SAR operations in the Central Mediterranean Sea, involving Italy and the European Union, and selects two events as case studies. The first is the discovery of an alleged direct connection between humanitarian rescuers and smugglers, a discourse created and popularized in 2016 by Gefira, a think tank linked to the European far right. The second refers to the collusion between the Maltese government and Libyan traffickers reported by the Italian progressive catholic newspaper Avvenire in spring 2020.
The two cases are examined through the lens of critical discourse analysis, focusing on (1) the modes of validation of the information, and (2) the impact they have had on policies and institutional discourses. The contribution also observes (3) the dissemination practices and (4) the networks of relevant actors involved.
Overall, the aim is to improve our understanding of the (differential) capability of influencing public narratives and actions shown by the two discourses. The results also contribute to the analysis of the political and cultural processes through which hegemony is established, contested or reinforced, and "common sense" is built.

Depoliticisation And Politicisation of EU: the contribution of Mario Draghi as political leader

Elania Zito

Sapienza University, Italy

European Union is considered the most important archetype of depoliticisation, both in terms of its institutional architecture, structured on a a multilevel governance, and about the integration process, continously interrupted in these years in a climate of uncertainty and distrust towards EU and its institutions. What EU is today is partially the product of how EU came out of the financial and debt crisis: in the moment when european governance has given space to economic bodies and technocracy to tackle the crisis, EU faces with a total lack of leadership. In this scenario Mario Draghi, former ECB president, seems to be the unique leader able to cope with the crisis: starting from the questions on "is Mario Draghi a political leader?" and "how Mario Draghi managed the euro crisis?", this paper aims to provide a new contribution about the EU depoliticisation and politicisation process through the analysis of the Draghi's political language, during his mandate (2011-2019), conducted with the politolinguistic method. The contribution argues that with Mario Draghi European Union started a new process, framed as a politicisation process.

RN32_T04_01 | Populism and anti-populism: questions of political identity in the Post Covid era

Populism And Anti-populism In the Representation of Gender-based Violence. The Cases of the Italian Newspapers "Libero" and "Il Manifesto"

Rosalba Belmonte, Flaminia Saccà

Tuscia University, Italy

1034

Media play an important role in spreading cultural models. Through their narratives they contribute to create and reinforce stereotypes and prejudices about the role of women in society, thus favoring the persistence of those relations of material and symbolic domination, that still too often lead to gender-based violence.

Starting from these assumptions, the aim of our work is to understand how political orientation of media shapes their representation of gender-based violence. To this end, focusing on the Italian case, we will investigate the representation of gender-based violence in two Italian newspapers that reflect opposing political orientations and identities: "Libero Quotidiano", the main daily newspaper that supports the positions of the populist right-wing, and "Il Manifesto", a newspaper that supports left-wing and non-populist political positions.

Specifically, the research questions we aim to answer are: a) How is gender-based violence represented in newspapers that support the positions of the populist right-wing parties and in newspapers that reflect left-wing and non-populist political positions? b) How do "Libero Quotidiano" and "Il Manifesto" represent the victims of gender-based violence and the authors of such violence?

In order to answer these questions, we will analyze and then compare the articles related to gender-based violence published by the aforementioned newspapers between January 2017 and December 2019.

Populism and Expertise in Pandemic Times: A Comparative Analysis of Conte and Macron

Donatella Selva, Flaminia Saccà

Tuscia University, Italy

The Covid-19 has enhanced the role of experts in contemporary democracies. Phenomena like populist governments, the refusal of traditional (i.e. representative) politics and the myth of direct democracy, often supported by digital platforms, are typical of post-representative democracies. The role of political leaders during the pandemic is further complicated by the need to rely on experts' advice and scientific data that can be obscure to the wider public.

The paper addresses these issues by focusing on two European cases: Giuseppe Conte in Italy and Emmanuel Macron in France. The modalities through which they have upsurged to power are somewhat similar: besides the slightly different biographies, they both can be considered as "technicians" overcoming the typical pathways of political career and, at the same time, they embody different gradients of techno-populism. This peculiarity allows us to trace a comparison between how the two leaders have faced the pandemic on a communicative ground. The paper relies on an extensive analysis of their speeches during the first wave of the pandemic to highlight the argumentative strategies and rhetorical repertoires used by Conte and Macron. We focus on how they have justified the presence and influence of experts in managing the crisis and how they have represented the changes occurring to State power, popular and parliamentary sovereignty, and personal freedoms. The paper offers a contribution to the reflection about techno-populism and argues that discourses and institutions that have dominated the scene during the pandemic are structuring the post-Covid democracies.

Populists Against the Virus. Boris Johnson and Viktor Orbán's Leadership during the COVID-19 First Wave

Luca Massidda, Michele Negri

Università della Tuscia, Italy

The paper analyses leadership styles adopted by the two main populist European heads of government during the pandemic's first wave: Boris Johnson and Victor Orban. Through the content analysis of their official speeches (March and April 2020), our work aims to identify themes, topics, moods and styles that have characterized the political communication adopted by European populist governments struggling with the coronavirus. The analysis is also focused on verifying whether this health crisis has also produced an intensification of populist rhetoric's traditional characteristics (starting from its main ideological dimensions: appeal to "the people", attacking the elite, ostracising the others) or if it has rather led to a change of its argumentative structures. The collected data are part of the work from the Tuscia University Research Unit, coordinated by Prof. Flaminia Saccà, within the Research Project of National Interest, funded by the Italian Ministry of Education and coordinated by prof. Carlo Ruzza: «The Transformations of Democracy: Actors, Strategies and Outcomes in Opposing Populism in Political, Juridical and Social Arenas».

1035

Populisms and Anti-populisms in Gender Issues: a Comparative Study Between Italy and Bolivia

Valentina Raffa, Milena Meo

University of Messina, Italy

Contemporary populisms should be interpreted as "the social manifestation of popular sovereignty in particular conditions of crisis of a political regime" (Anselmi, 2019, p. 113) united by a "family of attributes" (Mény, Surel, 2001; Ruzza, 2017; Canovan, 2005) of which the main ones are anti-elitism and the constant reference to "the people" in Laclau's (2008) sense (of plebs, the so-called underprivileged).

Starting from this characterisation, our contribution questions the ambiguous relationship between populisms and vulnerable social groups in the neo-liberal era, focusing on the connection between populisms, female identities, and women's rights, in an engaged comparative perspective between Italy and Bolivia.

On the one hand, we'll analyse the representation of women that emerges from the narratives of two different populisms (one right-wing, the other ranging from the "ethnopopulism" of Morales, to the right-wing populism of Anez, to the populism of the current president Arce), with attention to the consequences these have on women's rights. On the other hand, we study the anti-populist action of feminist organisations and movements in Italy and Bolivia, focusing on their strategies of opposition to populism.

The comparison between the two cases reveals clear similarities in the representation of women (women-mothers-wives) by populist political discourse and the erosion of women's social rights, but interesting differences in terms of gender policies. Also, it stimulates interesting reflections on the identities of the new feminist movements and their political action. Finally, it confirms the complexity of populist phenomenology, whose characteristics depend on the social and cultural context in which it takes root, and of the socio-political category of anti-populism, which remains, as yet, little explored.

RN32_T04_02 | Educational Futures

Politics in Spite of Adversity. Imagining Social Change at the Margins of Polity

Evelyne Baillergeau[1], Gerlieke Veltkamp[2]

[1]University of Amsterdam, Netherlands, The; [2]University of Amsterdam, Netherlands, The

This paper explores the social, cultural and political circumstances in which alternative futures can be imagined. According to Appadurai (2004 & 2006), the capacity to aspire is unevenly distributed in society. In spite of high levels of adversity, socially and economically disadvantaged sections of society are less likely to 'plan, hope, desire and achieve socially valuable goals'. However, the uneven distribution of the capacity to aspire is no fatality. What are the social, cultural and political circumstances in which individuals faced with high levels of adversity start thinking about social change?

Building on some earlier work on the social processes involved in the development of the capacity to aspire (Baillergeau & Duyvendak, 2019) and a discussion of the concept of emergent aspirations as framed by Zipin and colleagues (2015), this paper examines the research findings of the mixed-methods CO-CREATE project as carried out in a middle-size city in North Holland. In a local vocational school, socially and economically disadvantaged young people have been involved in a youth-led participatory action research geared at coming up with policy ideas for the promotion of healthy environments and childhood obesity prevention, testing and discussing these policy ideas with policy-makers and other stakeholders in the local context. The paper focuses on the ways in which the involved adolescents have looked at politics, youth participation and collective action toward social change and sheds light on the micro-social processes at stake in the exploration of problems that matter and in the formulation of alternative futures.

1036

Partnerships Under Pressure. Working Together In Communal Educational Landscapes During The Corona Pandemic.

Alexander Kanamüller, Tabea Schlimbach, Ronald Langner, Christine Steiner

Deutsches Jugendinstitut, Germany

For some time, there is increasing attention towards so-called welfare-mixes, especially in local social policy: partnerships between actors from state, economy and civil society are expected to contribute towards local welfare increase.

In the field of educational policy, these forms of welfare co-production are discussed under the term „Bildungslandschaften" (educational landscapes). The project ZivilKoop, funded by the German Federal Ministry of Education and Research, looks at how civil society actors are involved in regional educational policies. The project started just before the beginning of the Covid-19 pandemic and thus, was able to trace it´s impact through the eyes of the respondents.

With this contribution, we ask if, and how, the far-reaching restrictions on public and private live influence cooperation between communal administration actors and civil society actors in the educational field. Both perspectives are being captured by applying a mixed-methods approach. In a qualitative study with 17 communal actors and an online survey with 324 civil society organisations, both taking place in the second half of 2020, we asked respondents on their involvement in local partnerships and networks.

Results indicate that the corona pandemic thwarts personal networking, pushes inequalities and slows down conceptual-strategic agenda-setting. At the same time, the pandemic works as a magnifying glass, revealing urgent topics in the educational field. Insofar, the pandemic can be seen as a "stress test" for partnerships in communities. Whether these socially demanding partnerships are able to withstand the hindrances and to unfold their potential, can only be assessed in retrospect.

Local Policies on School-to-Work Transitions. How Best to Include Civil Society Organisations?

Tabea Schlimbach

German Youth Institute, Germany

Transitions from regular school to vocational training and studies are biographical key passages that decisively co-determine young people´s social inclusion. How youth manage the entrance to working life is also dependent on the local conditions they face.

German school-to-work transitions are framed by a complex, multi-institutional setting which is cooperatively governed by actors from different levels of state administration and the economy. Effective cooperation between these key actors has long been identified as important element of successful transition systems (Durand-Drouhin & Sweet, 2000). In many places, communities show great commitment in the active design of better local transition schemes. Against the backdrop of (controversially discussed) participative governance formats, they increasingly rely on building local partnerships between the involved actors. However, there is still little knowledge on the functioning of these partnerships. And while, by now, actors from the economic field (e.g. chambers, employers) are established partners, the potential of civil society actors, which offer support to young people in transitions (especially to those at risk), is still neglected.

From the different perspectives of key actors involved in German transitional systems, this paper looks a) how communities define, and shape, their role among the different responsible transitional actors; b) the processes of communal cooperation and networking with specific focus on the involvement of civil society actors and c) the role of civil society organisations in local transitional support structures.

The analyses are based on qualitative interviews with local actors and civil society institutions in four German communities. The data derive from an ongoing, government-funded project on the involvement of civil society actors in communal educational policies.

1037

Institutional Rationales and Enactment Dynamics of Educational Reform. A Policy Instrumentation Approach to the 2015 Italian School Autonomy with Accountability Reform.

Giulia Montefiore

Universitat Autònoma de Barcelona, Spain

School Autonomy with Accountability (SAWA) regimes are now globally endemic but research in Southern European countries is scarce (Verger, Fontdevila & Parcerisa, 2019). The 2015 Italian education governance reform introduced four SAWA instruments: principals' expanded powers, teachers' direct recruitment by principals, the Enhancement teaching Staff for pedagogical school autonomy, and a teacher merit-based bonus. The research unpacks instruments selection and retention processes, and analyses school enactment and how and why it differed from institutional expectations.

A political sociology perspective of policy instruments (Lascoumes & Le Galès, 2007) and enactment theory (Braun, Ball, Maguire & Hoskins, 2011) are employed. Methodologically, this research is based on 8 semi-structured interviews to policymakers, Members of Parliament, and technical working groups members, and on the analysis of 7 legal and policy documents. 24 principals, vice-principals, and teachers were interviewed in 4 public schools differing by socio-economic context in the city of Rome, in a highly heterogeneous district.

Structural problems, insufficient political backing, and institutional mechanisms mediated the instrument selection phase, while implementation issues and teacher unions' contestation affected retention. Policy makers' expectations and school enactment matched only partially. Structural scarcity of economic and staff resources offset the merit-based bonus and Enhancement Staff, and teachers' professional culture rejected competition and economic incentives as drivers of quality. Thus, schools absorbed these tools into the existing regime, mitigating its problems. Only principals with strong instructional, managerial, or transformational leadership embraced their stronger role, while others avoided internal conflict due to uncertainty of policy durability. The fragmented and turbulent policy instrumentation process mirrors Napoleonic administrative tradition, while enactment

RN32 | Political Sociology

results validate the impact of interpretation and translation in transforming instruments within situated contexts.

RN32_T05_01 | Contemporary Urban Challenges to Democracy

Post-Democracy Before and During the COVID-19 Pandemic. The Echo of a Popular Diagnosis in Recent Election Programs of Vienna's Governing Parties.

Harald Schweiger, Nina Görgen

University of Vienna, Austria

In a context of rising democratic discontent, the COVID-19 pandemic brought yet another challenge to political systems around the world. We ask how the governing parties of Vienna (Austria), SPÖ, GRÜNE and NEOS reflect this new constellation in their party programs for municipal elections in 2020 compared to 2015. Applying the popular yet disputed concept of post-democracy (Crouch 2005), we acknowledge the present-day standing of social-democracy in Vienna and create a way to examine the co-occurrence of the COVID-19 health crisis with different symptoms of crisis in democracy. A qualitative content analysis of the election programs of 2015 and 2020 shows that the discourse on a democracy in crisis is echoed in the election programs in all three of the examined programs of 2015, but in contrasting ways and that the programmatic points of the studied parties seem to be more similar now than previously. These findings allow various interpretations, spanning from reasonable reactions to COVID-19 over tactical reasoning concerning the formation of coalitions to an ongoing narrowing of the leeway of decision-making. In conclusion, our research shows the use of the concept of post-democracy for reflecting on multiple dimensions of crises and pragmatic styles of politics.

Urban Struggles Over Spatial Justice: The Covid-19-Crisis As Constraint And Fuel For Civil Society Initiatives

Beate Steurer

University of Vienna, Austria

What becomes of the right to the city during a global health crisis? Once a Marxist claim in line with the 1968 movements targeting spatial injustice, the concept has experienced diversification in the following decades and has recently become problematic in the light of Covid-19-containment measures as well as uprising Covid-skeptics-movements. In cities, the pandemic has thus increased civil society struggles that address urban space in two ways: urban space as a sparse resource that poses questions of (re)distribution and as a field of active citizenship and democratic action. In this paper, I am therefore taking a look at the ways civil society initiatives have been raising these issues concerning spatial justice (Fainstein 2014). Drawing on Della Porta and Diani (2020), I am analyzing the groups' self-positioning as legitimate actors in the political process, their symbolic production of norms and meanings as well as organizational and strategic factors. Subject to the empirical investigation are the three initiatives "Platz für Wien", "System Change not Climate Change" (tbc) and "Covid-19 Watchgroup" (tbc) based in Vienna that have been reacting to the ways the city is built, operated and made resilient in the course of the crisis. Through interpretative textual and visual analyses of the initiatives' claims and actions as well as qualitative interviews with representatives, I examine how the initiatives could form, obtain and extend their agency. This will support an understanding of the crisis as a magnifier of social problems and democratic deficits but also as a potential catalyst for new opportunities and conflictual impulses for civil society to claim the right to urban space.

How To Deal With Anti-Semitic Legacies In Urban Public Space? The Case Of Karl Lueger In Vienna

Miriam Haselbacher

Austrian Academy of Sciences, Austria

In the course of the Black Lives Matter movement, monuments all over the world were damaged, daubed with paint or brought down. Protest activities were followed by public debates on the adequate handling of historical legacies in urban public space raising questions on hegemonic symbols in the city on the one hand and historical and normative pathways on the other. Following this, the paper raises the question how burdened historical legacies in the city can be interpreted in the context of (trans)national movements which are questioning urban symbols of repression and hegemonic power relations? In Vienna, preceding debates got revived when the monument of Karl Lueger, former mayor of the city of Vienna (1897 – 1910), was damaged in 2020. With its anti-semitic past, a Social Democratic rule and the strong degree of institutionalization of cultural policies, the city of Vienna provides an interesting example to study the interconnectedness of history, cultural heritage and anti-semitism in the city. Taking the example of the highly controversial figure of Karl Lueger, this paper focuses on public negotiations of burdened legacies in urban space at the intersection of movements, institutions and politics. Three moments in time are of particular interest: The renaming of Dr Karl Lueger Ring (2012), and protest activities regarding the Lueger monument in 2009 and 2020. Through an interpretive analysis of newspaper articles, protest material and policies, strategies and discourse coalitions in different points in time will be analysed to see how power struggles over contested places convey and (re)construct meaning.

1039

RN32_T05_02 | Populism Religion and Gender

Right-wing Debates on Female Muslim Body-covering In Austria. Between Biopolitics And Necropolitics

Birgit Sauer

Universität Wien, Austria

In the mid-1980s the FPÖ 're-invented' itself as a populist party, mobilizing with two antagonisms, first against 'the elite', i.e. the two dominant parties SPÖ (Social democrats) and ÖVP (Christian-conservatives), and second against 'Others', mainly migrants. The anti-migrant mobilization targeted since the turn of the century the intersection of gender and religion by focusing on veiled Muslim women and thus fostering anti-Muslim racism. Election campaigns focused on forced veiling, oppressed Muslim women and patriarchal Muslim communities. The paper analyses these campaigns of the FPÖ (party programs and publications, parliamentary debates on the prohibition of Muslim body covering) with a focus on the one hand on the dimension of biopolitics, i.e. constructing an Austrian 'pure people', and on the other hand of necropolitics, i.e. racist constructions of Muslim migrants as non-belonging and to be excluded. The aim of the paper is to detect how exclusive intersection of gender and religion feeds into forms of governing which at the same time includes racist politics and the self-affirmation of the Austrian population in times of multiple neoliberal crises.

Mobilising the People Through Gender and religion—The Veil as an Object for Populist Politics

Ebru Öztürk[1], Ayşe Serdar[2], Katarina Giritli Nygren[1]

[1]Mid Sweden University, Sweden; [2]Istanbul Technical University

In this paper, we comparatively analyse radical right-wing parties' intervention into the veil debate in Turkey, France and Sweden which are characterised by different understandings of legal and normative secularism. We explore the intersection of gender and religion in the dynamic formation of populist categories and how they can be mobilised differently along the vertical and the horizontal axes by the example of the veil. In all three countries we have analysed capitalise on gender, religiosity and secularity, and the veil is exploited in drawing boundaries between the People and non-People but also between the People and the Elites. In this way, the meanings attributed to the veil are used as a mechanism of exclusion and of drawing the boundaries through gendered narratives of who belongs to the People.

Constructing Homonationalist Identities in Relation to Religious and LGBTQ+ Outgroups: A Case Study of r/RightWingLGBT

Briar Dickey, Niels Spierings, Marijn Van Klingeren

Radboud University, Netherlands, The

Recent research on homonationalism addresses the ideological and electoral combination of LGBTQ+ politics and radical right populism. However, right-wing LGBTQ+ identities remain seemingly paradoxical, as right-wing Christianity-rooted conservatism is generally hostile to LGBTQ+ empowerment. Grounded in literature on both off- and on-line radical right populism and its relationship with both religion and sexuality, as well as Tajfel's (1979) social identity theory, this study argues that right-wing LGBTQ+ people must resolve identity tension, by creating a positive group image. To understand this process, we analysed over 2,500 posts on a prominent (new/alt/populist) right-wing LGBTQ+ Reddit community, r/RightWingLGBT, focusing on the presence of ingroup-outgroup categorisations and identity management strategies. We found that right-wing LGBTQ+ users maintain a positive self-identity by positioning themselves against 'degenerate, liberal, non-binary queers', thus limiting themselves to narrow iterations of acceptable queerness which are congruent with hetero- and cis-normativity. Islam replaces Christianity as the primary anti-LGBTQ+ outgroup, which, given the normalization and naturalization of religious-rooted moral selves, helps to reconcile LGBTQ+ identities and right-wing populism.

Framing 'Gender Ideology': Religious Populism in the Croatian Catholic Church

Ivan Tranfić

Scuola Normale Superiore, Croatia

This paper explores the role of the Catholic Church in the articulation of populist discourse. By analysing the frames in Catholic doctrines and their dissemination by the Croatian clergy, I make three contributions to the field. Firstly, in contrast to research on the populist radical right, which argues for a manipulation of religion committed by non-confessional actors, I identify the Church as an influential source and producer of the populist master frame. Secondly, I demonstrate how the bridging of the 'gender ideology' frame to the populist master frame allows the local Church to articulate traditionalist stances on morality policies. Thirdly, I identify the local-level argumentation strategies, empowered by frame bridging with anti-communist, nationalist, and sovereignist themes typical of radical-right populism. Focusing on religious actors' agency allows us to improve theories rooted in the non-confessional world of populist politics that neglect churches as important sources of populist discourse and mobilisation.

Support for and Opposition to Populist Right Anti-Immigration Stances in Austria and the UK: Results of a New Survey

David Herbert

University of Bergen, Norway

This paper will report on the findings of a survey (n = 1000 in each country) conducted in May 2021 examining the extent and causes of public support for and opposition to radical right populist (Mudde 2007), far right and 'defense nationalist' (Gillespie 2021) parties, rhetoric and policy positions in the UK (in the aftermath of Brexit) and Austria (in the context of radical right populist electoral successes). The survey will investigate authoritarianism, Islamophobia, anti-Semitism, anti-feminism, religiosity, social isolation, solidarity in the context of the Covid-19 pandemic, sense of threat and sources of information on politics and society, enabling us to address hypotheses formed from psychosocial and media consumption theories concerning propensity to support and oppose far right, radical right populist and defense nationalist positions and actions. The paper will address the panel themes of the social politics of pandemic crisis management, societal responses to Covid-19 restrictions, and the role of new media in resistance and mobilization.

A Revolt of the Deplored? The Role of Perceived Cultural Distance in the Educational Gradient in Anti-Establishment Politics

Kjell Noordzij, Willem de Koster, Jeroen van der Waal

Erasmus University Rotterdam, Netherlands, The

Anti-establishment politics have become part of contemporary Western democracies. Less-educated citizens in particular have been found to display political distrust and populist attitudes, support populist parties, and abstain from voting. We advance a novel explanation for these patterns, drawing on extant theoretical insights to hypothesise that less- and more-educated citizens differ in the extent to which they perceive politicians to be culturally distant to them. Informed by our earlier in-depth qualitative research, we developed novel indicators of such perceptions and included them in a survey fielded among a high-quality panel representative of the Dutch population. We found: 1) positive associations between perceived cultural distance to politicians and anti-establishment political attitudes and behaviour; and 2) while taking conventional, alternative explanations into account, that perceived cultural distance substantially underlies the educational gradient in political distrust, populist attitudes, voting for a populist party, and non-voting.

Fighting Fire With Fire? The Effect of Mainstream Parties' Accommodative Strategies on Immigration on Voting for Right-Wing Populist Parties

Francesco Marolla

University of Trento, Italy / Tilburg University

Right-wing populist parties are undoubtedly one of the principal political actors in Western European democracies, constituting a challenge to the old mainstream parties. However, after years of a steady increase in their consensus, these parties experienced setbacks on some occasions. Across Western Europe, a growing number of mainstream parties are co-opting the policies on immigration adopted by right-wing populist parties during electoral campaigns. In these circumstances, right-wing populists reported considerable electoral losses at the ballot box. Nevertheless, little research has focused on how these strategies on anti-immigration issues influence individuals' support for right-wing populist parties. In other words, do these strategies affect voters' decision to support right-wing populist parties? Using multilevel models with combined data from the ESS (2002-2018) and the Manifesto Project, this study examines these strategies' effect on voting for right-wing populists across Western European countries. This study focuses on party-positions on the two core dimensions of right-wing populist parties' campaigns: cultural nationalism and economic nationalism. The former involves party-positions regarding the need to defend national culture from the threat represented by immigrants; the latter emphasises all the positions highlighting the need to protect the national economy from foreigners. The expectation is that when mainstream parties co-opt these parties on their core issues, they undermine their issue-ownership and, consequently, their electoral support. The results show that accommodative strategies on cultural nationalism decrease the likelihoods of voting for right-wing populists, especially among those showing negative attitudes towards immigrants. Differently, these strategies on economic nationalism do not affect voting of those manifesting high anti-immigration attitudes. These findings have important implications for future studies about right-wing populist support.

The European Green Deal – An Inclusive Moonshot For A Climate-Neutral Yet Prospering Continent?

Vincent Gengnagel[1], Katharina Zimmermann[2]

[1]University of Flensburg, Germany; [2]University of Hamburg, Germany

In December 2019, the European Commission presented the 'European Green Deal' (EGD): a marriage of environmental sustainability, social wellbeing and financial gain, envisioned as climate-neutral prosperity. Presented as "Europe's man-on-the-moon moment" by Ursula von der Leyen, the EGD's ambitions to gain political traction and societal momentum in European eco-social transformation processes is obvious. However, becoming the first continent to achieve climate-neutrality can only compare to sending the first man on the moon if policies align with public sentiment that sees climate-neutral prosperity as an extraordinary goal worth the historical and collective effort – in other words, that "all of us must work to put him there" (Kennedy 1961).

Though, while the ambitious language of the EU's "symbolic commitment" (Baker 2007) invokes a universal goal – uniting Europe for the sake of humanity – it also mobilises social fields that have specific and potentially conflicting interests vis-a-vis eco-social transformations that promise a green future for some but pose an existential threat to others.

In our paper, we bring together perspectives on eco-welfare regimes and a field-analytical approach, according to which the legitimacy of the EU's EGD agenda relies on complex constellations of political, cultural and social authorities. Using topic modelling analysis, we draw on public statements from a large variety of policy actors and the civil society at the European level and in two member states (Germany and Ireland). On this basis, we identify existing and emerging coalitions and major lines of conflict within the responses to, demarcations from, and engagement with the EGD.

Values In European Politics: The Cases Of Greek And Bulgarian MEPs From The Migration And Refugee Crisis To The Management Of The Pandemic Crisis

George Kordas

Panteion University of Social and Political Sciences, Greece

The European Parliament represents a prototype of supra-national parliament for Europe. While it challenges the traditional concept of representation and political legitimacy, it also clears the road for the EU's constitutionalisation. Simultaneously, the EP is responsible for promoting the 'European values', a core characteristic of European integration, which has gained less importance across the bibliography. Covering such a gap could offer us the opportunity to examine better the 'less at stake' nature of the second-order election category, in which the European Parliament elections belong.

As a result of the above, our main research question is: How have the 'European Values' been imprinted in the Members of the European Parliament discourse?

Having constructed our research question, we will specify the time and the sample of our study. Therefore, we shift our interest to the last two terms of the European Parliament, meaning the periods 2014-2019 (8th term) and 2019-2021 (9th term). The coincidence of those two periods with the peak of the migration and refugee crisis and the breakout of the pandemic crisis will offer us the ability to understand those political and cultural collisions regarding the 'European Values'. Furthermore, by extending our research period, we will better understand the supply-side of politics, acknowledging the crucial role the Parliament has in shaping the European policies. To achieve that, we will analyse the members of the European Parliament's official discourse, specifying our research to Bulgaria and Greece. The two countries present similarities in their crises' handling and the degree they have been affected. We will use the grounded theory methodology combined with the MAXQDA software to proceed with our research and manage our results' validity.

Borders of Ideology or the Ideology of Borders. Comparison of the Party Affiliation and Nationality as Factors Shaping Voting Patterns in the European Parliament - a Formal Model Based on Empirical Data.

Mikołaj Jasiński, Marek Bożykowski

University of Warsaw, Poland

Members of the European Parliament (MEPs) have double allegiance - on the one hand, they represent their country, and on the other hand - the European party they belong to. Although the MEPs are grouped by their political affinity, not nationality, they become MEPs based on the elections on the national level. This observation leads to a question - which of this allegiance has stronger influence on their voting decisions? In our presentation we use formal models to answer the question. We use the maximum likelihood estimation method to reconstruct the ideological structure (the partial homogeneity structure) of the European Parliament 8th term and the beginning of 9th term on the basis of all votings in the terms. For the purpose of the analysis we have extended our concept of games with very large number of players (oceanic games) to the situation with numerous distinctive large groups of players (oceans) within ideological structure. We compare the political power of each of the Member States in situations when the MEPs coordinate or do not coordinate their votes within the state structure. Analogically, we compare the power of each European party in situations when the MEPs coordinate or do not coordinate their votes within the political structure. We also compare patterns during traditional votings and online votings introduced during the Covid-19 age.

The presented model allows to predict which actors will push towards national or party consolidation in the European Parliament.

Populism and Marginal Neighborhood. An Ecological Analysis of Naples Case

Ciro Clemente De Falco, Antonio De Falco

Federico II, Italy

The paper analyzes the social geography and territorial distribution of the vote for populism parties in the Italian city of Naples. Marked by strong socio-spatial inequalities and a serious financial crisis of the local government, which has impacted on the welfare system and public services provided to citizens, the city of Naples – the largest city and metropolitan area in Southern Italy – can be considered an important case study to study and evaluate the connection between populist vote and socio-economic connotation of the urban space. In the last few years voting behaviour in Italy's large urban areas has brought out a significant territorial characterization in terms of center-periphery cleavage, as highlighted by the 2016 municipal election held in Rome and Turin. Districts which present higher rates of socio-economic deprivation register a significantly higher percentage of votes for anti-system and populist parties (Lega Nord and Movimento Cinque Stelle), while both the traditional left- and right-wing parties (PD and Forza Italia) get the best results in the central and more affluent neighborhoods. The findings of ecological analysis show that the electoral behaviour of Naples' sub-municipal units, based either on administrative borders (inner-city wards) or on homogenous socioeconomic profiles (marginal areas) confirm this growing national trend: the electoral support for the populist force in Naples in 2018 was broadly correlated to specific socio-economic contexts and concentrated mainly in the marginal and disadvantages areas of the city.

What Kind Of Democrats? Democratic Support and Substantive Views of Democracy in Europe Following Hard Times

Emmanouil Tsatsanis, Nicolas Demertzis, George Papadoudis

National Centre for Social Research (EKKE), Greece

A good many political sociologists, and political pundits alike, agree that liberal democracy and republicanism are currently at odds with de-democratizing derails instigated by backlash politics in Western developed societies and competitive authoritarianism in less developed states. Data from the World Value Survey suggest that overrating democracy is a common trait in many publics worldwide but the value basis of this preference can significantly vary from society to society. Somewhat less documented is the path dependency affecting nominal and substantive support for democracy and its underpinning values thereafter. This paper comparatively examines support for democracy and views of democracy (e.g. liberal vs. social, minimalist vs. maximalist) among the European countries included in the EVS/WVS database. We examine the influence of different macro-level variables associated with institutional legacies (e.g. maturity of democratic institutions, strength of civil society, welfare state regimes) and recent exogenous shocks (e.g. depth of economic crisis) in terms of both direct impact on overall national levels of democratic support and understandings of democracy, as well as their indirect effects through their interaction with individual-level variables. On this basis, we hypothesize that a) differences in democratic support between European countries can be partially accounted for by the timing of democratization (e.g. second vs third wave democracies) as well as the timing of political socialization at the individual level; and b) patterns of democratic support among European publics are influenced by the absence (or presence) of deep-rooted political liberalism.

Ethno-Territorial Mobilization In Western Europe. Measurement, Varieties, And Causes Of Political Regionalism From 1945 To 2020.

Nico Tackner

University of Graz, Austria

While movements for regional autonomy are on a peak of success throughout the peripheries of Western Europe (e.g. Scottish and Catalan independence referenda, electoral success by the Lega Nord), there has been a neglect on this issue in sociology. The early sociological perspectives (e.g. Rokkan & Urwin 1983; Smith 1981) were replaced by the interdisciplinary field of regional studies, occupied by political scientists (and economists). The present study tries to reemphasize a genuinely sociological take on stateless-nationalist and regionalist movements, also considering the neglected works by Ludwig Gumplowicz in the yet untranslated "Allgemeines Staatsrecht" (1877/1907).

The empirical investigation followed essentially four sequential steps: First, a cluster analysis on stateless-nationalist and regionalist parties (SNRPs) was used to develop an inductive typology of regional forms of nationalism, using data from the Chapel Hill Expert Survey (CHES) of 2014. The typology consists of an ethnic, cultural, and civic type; and was replicated in all five other waves of the CHES (1999-2019), not used for the initial analysis. Second, these types were used to create an original dataset of electoral success for the different types of stateless-nationalist and regionalist parties (SNRPs) for regional elections in Western Europe from 1945 to 2020; the types were attributed using content analysis on the materials available (e.g. manifestos) for all SNRPs not covered by the CHES. Third, different commonly used indices were validated and compared for systematic bias for the first time. Lastly, after aggregating the original data with the external indices, the different causal dynamics underlying the three types of regional nationalism were investigated using structural equation modelling.

Perceived Social Inequalities and Vote for Populist Political Parties in Czech Republic and Slovakia

Jozef Zagrapan

Institute for Sociology, Slovak Academy of Sciences, Slovak Republic

Social inequalities are often claimed to be one of the important factors behind electoral success of the non-mainstream political parties. Using the data from International Social Survey Programme module Social Inequality, this study focuses on voters of two populist political parties – We Are Family (Slovakia) and Freedom and Direct Democracy (Czech republic). Both parties are led by former businessmen, who gained popularity by promoting the idea of the divide between "the traditional (corrupt) politicians" and "the (pure) people". Results from previous studies, focusing mostly on Western populists, suggest that unemployed voters, those with lower income, those that come from lower classes, or those with lower education are more likely to vote for this kind of parties. Results from Czech Republic and Slovakia do not fully support these hypotheses and, moreover, do not show obvious similarities between voters of both parties, suggesting there is no universal populist voter. They do, however, imply that people more likely to elect populists are those who think that government is not successful in reducing the differences in income between people with high incomes and people with low incomes (Czech Republic) and those who feel angrier about differences in wealth between the rich and the poor (Slovakia).

EU Support Comes in All Shapes and Sizes. Grasping Different Meaning Structures on EU Support in Dutch Survey Data

Elske van den Hoogen[1], Stijn Daenekindt[2], Willem de Koster[1], Jeroen van der Waal[1]

[1]Erasmus University Rotterdam, The Netherlands; [2]Ghent University, Belgium

What does it mean to support the European Union (EU)? While ample research has scrutinised the causes and consequences of support for or criticism of the EU, a pressing question remains: what do citizens actually mean when they express these attitudes? Applying the novel statistical method Correlational Class Analysis (CCA), we inductively assess how the meaning of support for the EU differs across different segments of the public. Our analysis of high-quality survey data collected in The Netherlands (n = 2,142), including novel items informed by insights from previous in-depth qualitative research, reveals three distinct meanings of EU support: federalist, non-federalist and instrumental pragmatist. Evidently, support for the EU comes in different guises. Interestingly, we find that people who differ substantially in their attitudes towards the EU — i.e., opposing or supporting it — may do so from an identical meaning structure. Subsequently, we investigate the social bases of the different meanings of support, and show that the way of thinking about the EU associates with media consumption, political orientation, and socio-demographics. The implications for ongoing debates are discussed, and explicit attention is given to the need for more meaning-centred approaches to EU attitudes research.

The Many Faces of EU Support: Elucidation of a Concept

Rosita Garskaite

Vilnius university, Lithuania

Brexit has made clear that public opinion of the European Union (EU) matters. Scholars have long attempted to define popular support and understand the reasons for it. Four main theoretical explanations, namely utilitarian, reference, cue-taking and identity, have dominated the field (Hobolt & Vries 2016, Ejrnæs & Jensen 2019). Support has been conceptualised in various ways by object (EU membership, EU enlargement, euro, community, free movement) or nature from specific/diffuse (Gabel 1998; Boomgaarden et al. 2011; Armingeon & Ceka 2014) and utilitarian/affective (Lindberg & Scheingold 1970; Gabel & Palmer 1995; Kolpinskaya & Fox 2019) to input/output oriented (Scharpf 1999; Lindgren & Persson 2010; Schmidt 2013). As an analytical category 'support' enabled to capture a broad range of empirical research, yet these studies have seldom gone beyond statistical analysis of standard responses to standard questions. This article provides a critical overview of the properties implied by operationalisation and measurement of the 'support' by survey researchers and adopts a semantic approach to identify other attributes of the concept. Drawing on in-depth interview material, close attention is paid to the language which illuminates the shared salient meanings ascribed to the EU. An interpretive technique called ordinary language interviewing (Schaffer 2015) allows to go beyond the existent conceptualisations and to propose new ones, for example blind/constructive support. The article contributes to the strand of academic literature researching the EU attitudes by using a novel methodological approach and advancing our understanding of the ways EU legitimacy is perceived.

1047

The Core-periphery or Centre-periphery Cleavage in the EU?

Nikola Petrović

Institute for Social Research in Zagreb, Croatia

The division of the EU into core and periphery reflects not only the deep-rooted economic differences between member states, but also the historical and geopolitical contexts under which they joined the EU. While numerous analyses in the wake of the Eurozone crisis dealt with core-periphery relations, it is argued here that the interpretation of various crises that shook the foundation of the EU should also include the analysis of historical cleavages within newer member states and their relations with the EU. Southern enlargement of the 1980s followed after the fall of right-wing dictatorships and Eastern enlargements of the 2000s followed after the fall of communist dictatorships, and these heritages are still reflected in the positioning of political actors towards the EU. The notion of Western betrayal is an important factor in explaining the rise of radical right and radical left Euroscepticism in European Eastern and Southern periphery, respectively. The development of social movements and political parties that acted as carriers of historical grievances and their changing relations towards European integration will be presented.

This paper compares European economic integration of Eastern and Southern periphery and their national identity building in relation to European integration. The comparison is based on various economic indicators, party manifestos of leading parties and interviews with political and intellectual elites and country experts. In the conclusion, this paper tries to answer whether the current pandemic crisis contributed to the polarisation of an emerging European society and to the creation of a centre-periphery cleavage in the EU.

RN32_T07_01 | Discourse Interests and Actors

'The People Have Decided': National Consultations, 'Anti-foreignness', and the Justification of Anti-immigrant Policies by the Hungarian Government

Akos Bocskor

Corvinus University of Budapest, Hungary

The paper focuses on the ways the Hungarian right-wing populist government applied a new and innovative political tool, the so-called 'national consultations' to publicly justify its anti-immigrant and 'anti-foreign' policies. Since coming to power in 2010, the government has launched nine such consultations on a variety of topics including pensions, immigration, or economic policies. The questionnaires, which are delivered to every adult citizen, have been widely criticized as being manipulative and only serving as legitimation for the already decided governmental policies. The present paper, drawing on the author's earlier work dissecting the Hungarian Government's anti-immigration discourses of 2015-2016, focuses on three such consultations, the consultation on 'immigration and terrorism' (2015), the consultation about 'the Soros plan' (2017), and the consultation called 'Let's stop Brussels!' (2017). These three documents, besides being the most controversial ones, all outlined different but interrelated aspects of an allegedly imminent and dangerous 'external threat' to the nation's traditions, lifestyle, culture, security, well-being, and ethnic and racial homogeneity. In the governmental narrative, 'culturally different' migrants and refugees pose a threat both to the security and the 'traditional culture' of the native population, while leftist and liberal 'Brussels bureaucrats' and international 'interest groups', in particular the Hungarian-American philanthropist and businessman George Soros, are presented as promoters of 'illegal migration' with the aim to weaken European traditions, and thus to weaken the nation states and national governments. Human rights and anti-corruption

1048

watchdog NGOs are presented as 'local agents' of these foreign interests (members of the 'Soros network'). The paper provides an in-depth historical discourse analysis of the three consultation documents and embeds them in the Hungarian social, political, and historical contexts.

Transparency and Redistribution in Transitions to Democracy

Vanessa Damiano Sánchez

University of Barcelona, Spain

The available analysis of transitional justice processes show data from more than 80 transitions that have occurred in the world, from which conclusions have been drawn, comparing similarities and differences. At the moment there is no existence of consensus in the relation that exists between transitional practice and the redistribution of wealth in the long term, but recently, it has been described how the transitions led by the elite are less redistributive than those that are carried out through a process of rupture or revolution.

This study is a historical comparative research of the evolution of Southern European countries after democratic transitions in terms of redistribution of wealth. The research illustrates that Spain deviates from trends exhibited by countries such as Portugal and Greece. The causal analysis is based on Nalepa ¨skeletons in the closet¨ model, suggesting that lack of information transparency regarding previous authoritarian regime collaborators determines democratic quality.

In southern Europe, two opposite models (concealing-disclosing) have been followed in the treatment of information from the old repressive apparatus. This comparative illustrates how concealing information from the previous regime has derived in the strengthen of the position of certain elites, through clandestine power networks originating from the previous authoritarian state in the case of Spain. The study reveals secret information as a structural element that enables the elites from the previous regime to avoid redistribution.

Identifications and Values in Political Persuasion: Aspect of Interrelations in the Logic of Appropriateness

Hanna Rautajoki

Tampere University, Finland

My paper investigates discursive strategies in political persuasion, focusing specifically on the relevance of identifications and values as rhetorical assets in argumentation which I call the 'relational scaffolding of persuasion'. This research is part of my postdoctoral project European Solidarities in Turmoil (Academy of Finland, 2018-2021) studying political rhetoric in European political discourse in its contemporary challenges. I approach identities and values from the perspective of sociological neoinstitutionalism and its further elaboration discursive institutionalism, acknowledging the relevance of cultural factors in policy-making processes (Boli & Thomas 1999) and emphasizing the relevance of local discursive practices in the way social change is negotiated (Schmidt 2008; Alasuutari 2015). Taking it that the scene of decision-making involves much more complex set of components than just those of rational calculation and utility-maximation, neither values nor identities are approached as pre-given entities which determine action (Finnemore & Sikkink 1998). Instead, knowledge and rationality itself are generated processually and value-laden preferences are formed in interactive practices, whereby political actors struggle to convince each other (Alasuutari & Qadir 2014). The focus of this research is on the 'strategic character of social construction', highlighting the aspect of institutional legitimacy and the 'logic of appropriateness' political actors follow in the activities (March & Ohlsen 1998). I introduce three policy cases and a policy paper debate which each sheds light on different aspects of the interplay between identifications and values, ranging from horizontal to hierarchical settings, and from strategies managing simultaneity to those of organizing temporal trajectories in political debate.

Punishing without Punishment? The Case of Civil Forfeiture in the U.S.

Andrea Beltran-Lizarazo

Boston University, United States of America

A growing body of empirical literature examines the multiple sources of punishment outside criminal codes and its implications for power distribution and rights allocation. My study touches on an unexplored figure within this framework: civil forfeiture, a legal innovation of the drug war. Civil forfeiture laws allow the government to seize property for its alleged connection to illegal activities without having to charge or convict the owner. My research examines how courts negotiate and produce tenuous notions such as "facilitation of crime" or "negligence" when they work with the legal fiction that property itself may be guilty of facilitating illegality. From my analysis of a multi-state sample of real estate cases heard by lower federal courts between 1984 and 2016, I argue that the use of civil forfeiture introduces a novelty in the way the law interprets the responsibility of individuals, for example, concerning the actions of other individuals. By establishing an essential feature of civil forfeiture's empirical phenomenon—the argumentative staging when it is at work—my research sheds light on how the limits of the power to punish outside the criminal framework are constructed, legitimized, and negotiated.

RN32_T07_02 | Populism and Science 2

Anti-vaccinism. Between populism and subpolitics.

Luca Raffini[1], Clemente Penalva[2]

[1]University of Genoa, Italy; [2]University of Alicante

The spread of anti-vaccinism cannot be considered merely as an effect of the change in communication dynamics promoting disinformation and fake news: it is caused by a plurality of political, social and cultural factors.

Conspiracy, anti-scientism and delegitimization of the "mainstream" political, economic and media actors, find nowadays expression in the growing consensus towards populism, which combines criticism of the political elites with an aversion to the economic and scientific elites, mostly considered subordinate to the interests of the former. The core idea is that the obligation to get vaccinated is functional to the interests of pharmaceutical companies, and that vaccines are harmful.

According to the theory which identify a clear relation between anti-vaccinism, conspiracy and populism, the anti-vax attitudes should be more prevalent in the lower social classes, and among less educated individuals. Indeed, anti-vaccinism, or at least a critical attitude over vaccines, is widely spread in highly-educated, medium and upper-class individuals. Our hyphotesis is that some manifestations of anti-vaccinism may also be interpreted as expression of a critical attitudes toward science and as an example of subpoliticization of every-day life. That is, the anti-vaccinism spread as expression of different political phenomena, which have common roots, but diverge significantly in their redefinition of the relation between every-day life, science and politics.

Qanon and conspiracy theories – the Italian case

Maria Francesca Murru

University of Bergamo, Italy

1050

The social unrest and the uncertainties experienced during the coronavirus pandemic have enhanced the visibility of QAnon, a baseless internet conspiracy theory alleging that a cabal of Satan-worshipping Democrats, Hollywood celebrities and billionaires is running the world while engaging in a global child sex-trafficking.

QAnon followers consider President Donal Trump as their paladin, the only antagonist of this cabal and its "deep state" collaborators who are secretly struggling to expose the malefactors and send them all to Guantánamo Bay. The chapter will analyse how this conspiracy theory primarily based in the USA is spreading and taking root in Italy. More specifically, the focus will be placed on how and why the main narrative has been able to acquire meaning and social strength within a social and political context apparently different from the breeding ground where it was originally conceived. By considering mutual implications between populist attitudes and conspiracy frames, the contribution will explore how QAnon has succeeded in bolstering local-based conspiracy theories and articulating pre-existent and widespread feelings of discontent, mistrust, and enmity. The phenomenon will be examined as a cluster of cultural practices (Fenster, 2008) – 1) media practices of sharing and circulating QAnon propaganda, 2) interpretive practices of QAnon narrative and other local based conspiracy theories associated to QAnon and with a strong anti-intellectualist

attitude, 3) relational practices of engaging and mobilizing citizens - that gives shape to specific epistemological communities with a strong political stance.

Populism And International Energy Politics. Influence On The Sustainability Transition Via Changing Energy Paradigms?

Thomas Michael Sattich

University of Stavanger, Norway

States are largely seen as being constitutive of international energy politics. Moreover, due to the international nature of the energy industry, the relevant literature, by and large, agrees that the evolution of the world's energy systems is strongly influenced by the dealings between individual states. Populism as a political phenomenon has its roots on the domestic level, but it may as well have an influence on international energy politics. To discuss this influence, this paper asks to what degree populist movements have influenced the constructed realities that structure international energy politics. To do so, the dealings between states are being portrayed as a four-stage communication process. First, national standpoints are being formulated domestically. Second, these standpoints are being transmitted via different channels. In turn, the receiving states interpret the message, and, finally, develop their own counter-message based on that interpretation. To analyse the influence of populism on these processes, this paper takes a number of archetypical energy paradigms as its starting point. Reflecting the core ideas, values, and beliefs of the actors involved with formulating national energy standpoints, these paradigms highlight the understandings of energy that are being communicated in inter-state dealings. While some states have historically emphasised particular paradigms, the latter also vary considerably across time due to the changing configurations of political forces at the domestic level. To discuss the impact of populist movements on the sustainability transition via international politics, examples will be used to study their leaning in terms of existing energy paradigms. Examples will also be used to discuss their actual influence on states changing their energy paradigm, as well as the actual outcomes of international energy policy.

The Framing Processes And Reactions Of The "Antagonist Left" To The Covid-19 Pandemic Crisis In Italy

Gianni Piazza

University of Catania, Italy

Answering the question of how social movements have framed and reacted to the pandemic and the measures taken by governments to counter its spread is relevant to understanding society's bottom-up responses. In this paper, I focus, in particular, on the reactions and framing processes to pandemic crisis of the so-called "antagonist left" in Italy, which is the anticapitalistic movement sector, made up of social centers, autonomous, post-autonomous, communist groups and networks, etc. At first glance, they refused the Covid-19 denial and conspiracy theory (No Mask, No Vax), and accepted some limitations, but criticised the government policies, like the military and police control on society. They organized self-managed services for lower classes and claimed for public health as a collective good not for profit, basic income and a radical change of system. In fact, antagonists tried to connect the pandemic crisis, which increased pre-existing socio-economic inequalities, to the ecological and climatic crisis, identifying the responsibility in the capitalist mode of production. In this paper, first, I will analyse how the antagonists took part in protest events during the last year. Then, using the framing perspective, I will identify the diagnostic, prognostic and motivational elements, if a masterframe emerged and if the frame alignments took place between activists and the populations they intended to mobilize. I will use the daily online press, the online documents from their websites and conduct some semi-structured interviews to key informants of the more relevant national networks: a) Infoaut/ autonomists; b) Global Project/post-autonomists; c) Contropiano/Communists Network.

1051

The Re-elaboration of the Social and Political Revamping

Andrea Fabrizio Pirni, Marco Libbi, Anna Siri

Università degli studi di Genova, Italy

The paper is aimed to investigate Covid-19 considering it as an accelerator of already existing processes – oriented towards the reinvention of the social and the re-elaboration of the political.

The key words/processes that we consider are: individualization, as the background dynamics of the reinvention of politics; the hybridization between fields and spheres of action (moving its meaning from the context to the individuals); the reconfiguration of boundaries and relationships between individual and collective.

These processes are the foundation of a revamping of participation, as shown by experiences such as social direct action (Bosi, Zamponi 2018), new mutualism (De Luigi et al. 2019), collaborative economy (Pais 2017), social enterprise (Pirni, Raffini 2015) and the emergence of new styles of volunteering (Eikenberry 2019; Monforte 2019).

Specifically, we analyze the role and the activities of the Third sector, social entrepreneurship and civil society as an experimental field of innovative territorial strategies to face the health crisis. Our hypothesis is that it is possible to find new combinations of social and political participation, generating both risks and opportunities.

Nowadays, social reinvention seems to involve 1) a wide-mesh model that leaves out several subjects, 2) shifting responsibility from institutions to individuals, 3) reasserting the local dimension, promoted through concepts such as innovation, activation and resilience.

The Influence of the Covid-19 Pandemic on Political Attitudes in Austria

Dimitri Prandner, Martina Beham-Rabanser, Johann Bacher

Johannes Kepler Universität, Austria

Sociology and political science traditionally argue that attitudes towards the political sphere – e.g. interest in formal political procedures; acknowledging the relevance of politics for one's own life – are strongly tied to socialization. However, studies also illustrate that attitudes towards the political sphere can be potentially reshaped by specific events as well as societal changes.

Coming from this understanding the paper discusses how the particular experiences during the Covid19-Pandemic and the ongoing political responses influenced societal attitudes towards the political sphere in Austria.

Following (1) a general analysis how attitudes towards the political sphere changed over the years and the immediate effect the Covid-19 restrictions had on these, it will be explored, (2) if individuals who are particularly affected by the Covid19-pandemic – due to their living situation and/or socio-economic circumstances (e.g. social responsibilities, presence or age of children, socioeconomic situation) – are now paying particular attention to politics and take a greater interest them, or at least recognize their relevance to a greater extent.

To do so we draw upon the concept of political involvement from German political-scientist Van Deth and his co-authors as well as Austrian survey data collected via an online access panel during the pandemic of 2020 (n=1500; structurally identical with the Austrian resident population aged 14 and older). Accordingly, the paper uses a recent crisis to illustrate the relevance of specific life circumstances on political attitudes and how the discussion of such can move beyond socialization-based analysis. An aspect that has not been systematically explored via quantitative in the Austrian yet, despite strong claims that recent social and political crisis influenced the outlook on politics significantly.

The Impact of Gentrification on Housing Struggle in Lisbon. Everyday Interactions and New Urban Identities

Guya Accornero[1], Tiago Carvalho[2]

[1]ISCTE-IUL, Portugal; [2]ISCTE-IUL, Portugal

The city of Lisbon is in the midst of a perfect storm for housing generated by the intersection of the long wave of economic crisis and austerity with recent touristification, gentrification and massive real estate investment. At the same time, urban mobility is reshaping neighborhoods' fabric, with effects on the housing activism's identity, frames and claims. Between 2011 and 2013, Portugal experienced the largest protest cycle since the 1974 revolution. In connection with anti-austerity movements, housing activism has significantly strengthened in the country, and especially in Lisbon, introducing relevant innovations in the identities, forms and content of the housing protest. New actors mobilized initiatives such as the Caravana pelo Direito à Habitação (Caravan for the Right to Housing) and the demonstration Rock in Riot, which gathered poor tenants, minorities, and new inhabitants such as young researchers, professionals or Erasmus students, which could be consider as gentrification's pioneers. As such, the paper aims at understanding to what extent the interaction between different players is a result of the gentrification process itself, how it works, and what its impact on the protest dynamics, specially, on the interaction with institutions. For this we rely on: a) participant observation during activists and tenants' meetings, demonstrations and other actions; c) interviews with activists and scholars; d) frame and protest event analysis.

Civil Society Challengers in the European Union Gender Policy Field

Eva Karlberg[1], Kerstin Jacobsson[2]

[1]Södertörn University, Sweden; [2]University of Gothenburg, Sweden

The European Women's Lobby (EWL) is one of the key actors in the EU gender equality policy field. Claiming to represent 2000 women's organizations across Europe, the EWL is regularly consulted by the European Commission and the European Parliament for its "gender expertise" (Cullen 2020; Seibicke 2019; Strid 2009), being legitimized and financially supported by the Commission. However, other transnational civil society organizations representing women also organize at the EU level, including ethnic minority women, migrant women, disabled women, religious women and women within various professions. The EWL's position has also been questioned by conservative women (Rolandsen Agustín 2012). Moreover, women's organizations are not the only ones active in this "field of gender"; LGBTQ, human rights, SRHR organizations and others also participate, making it a diverse and contentious field. This paper investigates how the elite position of the EWL is challenged by other civil society actors and by ideological differences and contentious issues, conceptually approaching this gender field as a "field of contention" (Crossley 2006). Given that civil society organizations mainly have discursive power, the analysis focuses on how they participate in a discursive space and struggle in which they try to produce meaning and contest who the gender experts are. We explore this question through the contentious cases of transgender issues, prostitution/sex work, and how to represent such a diverse group. The analysis is based on interviews with organization representatives and experts as well as textual sources.

Addressing Social Impact in Political Sociology During Pandemics and Beyond

Gisela Redondo-Sama[1], Liviu Catalin Mara[2]

[1]University of Deusto; [2]University of Barcelona

Recent advancements in the field of evidence and policy highlight the increasing challenge to include political and social impact in social sciences, which is relevant especially in a pandemic context that challenges states worldwide. Although sociology has addressed how to achieve such social impact, there are fewer developments in political sociology. The objective of this work is to present and discuss the advancements and effective strategies that enhance political and social impact of social sciences and humanities research, which can be potentially replicated in political sociology. Among the effective strategies to consider, the methodologies in political sociology can be further explored in the light of the relevance of the meaningful stakeholder involvement throughout the project lifespan or the need of articulating from the beginning of a project the objective of realising social impact and a strategy to do so, among others (Aiello et al., 2021). Social sciences have made progress and political sociology research is also called to advance in the area of political and social impact.

The Art of Nationalism: Social Solidarity and Exclusion in Contemporary Latvia

Liene Ozolina

Latvian Academy of Culture, Latvia

The surge of populist and nationalist movements over the recent years can be seen as an effect of several decades of neoliberalism. The detrimental effects of neoliberal reforms – socio-economic polarisation, dismantling of welfare structures – can be observed especially clearly in the Baltics. These reforms have contributed to high socio-economic inequality and poverty rates and prompted large-scale emigration. In this context, nationalist cultural policies and everyday displays of national belonging have emerged in Latvia as key instruments of social solidarity and security. There has recently been a drive of state initiatives in the field of cultural policy promoting national identity (e.g. Latvia's Centenary cultural programme 2017-2021). Artists and cultural industry workers are emerging as "performers of sovereignty"

(Hansen 2006) as they engage in state-commissioned projects. In this paper, I map and conceptualise emergent discourses and practices of cultural policy and art in the aftermath of neoliberalism in Latvia as potential vectors of both solidarity and symbolic violence. On the basis of this empirical material, the paper seeks to contribute to a theorisation of contemporary European nationalism as an ambivalent phenomenon – an "encompassing" as well as exclusionary discourse (Calhoun 2002, 2012, 2017), a source of solidarity as well as symbolic violence (Bourdieu 1999) in neoliberal democracies.

RN32_T09_01 | Leaders and Politics

Winners or Losers? The Image of Italian Politicians on Social Media during the Covid-19 Emergency

Enzo Loner

Università di Trento, Italy

The aim of this work is first to study what effects covid-19 has had on the public image of the main Italian politicians. Secondly, it intends to understand whether the analysis of social messages related to the virus can provide useful information to track the appreciation of politicians in the population. These questions are relevant because Italy has been one of the countries most affected by the pandemic and the debate on the virus has dominated the speeches in social media. The analysis, both quantitative and qualitative, focused on the tweets about covid-19 containing the names of the leaders of the main Italian parties. Almost half of the tweets extracted cite Prime Minister Giuseppe Conte. Most of these messages relate to the anti-covid measures of the government and therefore assume a protective and positive connotation. This is also the case for the leaders of the parties of the governing coalition. Among the opposition parties, the leaders of the two right-wing populist parties, Salvini (Lega Nord) and Meloni (Fratelli d'Italia), are often associated in the debate on the social, but the words with negative meanings relate mainly to Salvini. Little mentioned is the leader of Forza Italia Silvio Berlusconi. Although they should be confirmed by further research, the results show an impact of the virus related themes on the public image of the leaders and, at the same time, that the debate on social media can be used

as a proxy to study the trend of popularity of political figures.

Leader Democracy and Populist Democracy: Two Different Paths of Political Personalization?

Lorenzo Viviani

University of Pisa, Italy

The aim of the paper is to consider the concept of plebiscitarism, the different ways in which this process develops, and the relationship between leadership and democracy in contemporary societies. The clarification of these concepts is far from nominalistic considering that they point out the different substance that plebiscitary disintermediation assumes in the relationship between leadership and democracy. Just this is the premise that allows to distinguish the difference between the personalization in liberal-democracies, the charismatic personalization and the populist personalization. Within the wider process of disintermediation that modifies the bond between voters and institutions, populism takes the form of a politics of "unpolitics" and it seems to be a particular declination of plebiscitarism that is not the same of personalization in liberal-democracies and neither the same of the charismatic personalization in the Weberian perspective. Although a large part of the literature on populism tends to equate the populist leadership with the charismatic one, there is however a more recent questioning of the overlapping of the two phenomena. The paper aims to analyse the difference between the populist personalization and the charismatic personalization, not only because of the presence of non-charismatic populisms, but also because of the constitutive difference between the conceptual cores of the two phenomena.. If political personalization modifies the linkage between people and institutions, then the effects of populism on representative democracy are different from those of the transition from party democracy to leader democracy as a development of the Weberian and Schumpeterian perspective.

Populist radical right as gendered performance: The case of Marine Le Pen

Feyda Sayan-Cengiz

Manisa Celal Bayar University, Turkey

It is widely argued that gender is increasingly a key analytical category to understand contemporary populist radical right, and that the surge of populist radical right politics goes hand in hand with a macho style of leadership. Scholarship that studies the role of gender in the construction of populist radical right leadership thus mostly focuses on the political style of male leaders, especially delineating the performances of "hegemonic masculinity" by such leaders. However, the gendered discourses, political style, and performances of female radical right leaders attracts less scholarly attention. This study focuses on Marine Le Pen, the leader of France's populist radical right party, Rassamblement National (RN-formerly Front National), and investigates the gendered political performances and symbolisms she has employed since she has taken over the party leadership from her father Jean Marie Le Pen in 2011. Through a discourse analysis of Marine Le Pen's speeches, interviews, media performances, as well as her representation in the media, the study explores the discursive and stylistic repertoire of Marine Le Pen. Employing the conceptual framework of hegemonic masculinity and hegemonic femininity, I attempt to answer the following questions: How are performances of femininity and masculinity utilized and articulated in Marine Le Pen's political style? More importantly, what does the case of Marine Le Pen uncover about the role of gendered symbolisms and performances in populist radical right politics?

Sociological Knowledge of the Revolution: Testing to Turkey's Change under AKP Rule

Hasan Yeniçırak

Siirt University, Turkey

The idea of revolution is perhaps one of the most rooted and controversial concepts in thought history. There are theories that studying and analyzing revolutions that have occurred throughout history. These theories of revolution provide sociological information to make it easier to understand revolutionary transformation. In this study, I will examine the transformation that took place under AKP rule in Turkey, based on sociological knowledge of the revolution.

I look for the answer to the following question: Is Turkey in a revolutionary transformation under the AKP rule? To answer this question, it is first necessary to reach the sociological knowledge of the revolution. In this direction, based on the theories of revolution, I first arrive at the sociological knowledge of the revolution. Then, based on the sociological knowledge of the revolution, I try to understand and explain the transformation that is taking place or intended to occur under AKP rule.

Accordingly, I assert that there have been many developments under the AKP rule that should be categorized as a revolutionary transformation. Turkey has been rebuilt under AKP rule, which lives and reminds the culture and values of Ottoman-Islamic heritage. In this direction, I discuss this revolutionary transformation in terms of institutional, structural, and social values.

Key Words: Revolution, Sociological Knowledge of the Revolution, AKP Rule, Ottoman-Islam

Transformation of Kurdish and Islamist Parties in Turkey (and Consequences on Regime Change)

Pelin Ayan Musil

Institute of International Relations, Czech Republic

The ethnic (i.e. Kurdish) and religious (Islamist) parties have historically been subject to repression by the Turkish state elite. Particularly in the 1990s, many of these parties had been closed down by a court decision while their members had been arrested. Each time, these parties returned back to the electoral arena through their successors. Yet, in the national elections of 2002 and 2007, the Islamist-successor party (the AKP), and in 2015 national elections, the Kurdish-led party (the HDP) thrived and gained record-high votes, through building coalitions with social groups that were not part of their traditional constituency. How was this possible considering both the Kurdish and Islamist parties were once treated as the anti-system parties of Turkey? What kind of political contexts allowed these parties to expand? And what were the motivations of these parties while they were broadening their support base? Did these motivations differ from one another? How did these differences affect the regime change? In this project (which I hope to publish as a book), I argue that in a semi-democratic context where the repressive acts of the state such as banning parties or arresting politicians have been subject to a considerable degree of public criticism; 'confronting the state' becomes a salient issue. Ethnic and religious parties turn into populist parties, framing this salient issue as 'an issue of democracy' and become the owners of it, which helps them reach out to broader constituencies. An ownership of the issue of democracy does not yet necessarily democratize the regime when the party comes to power. Democratization is conditional on whether the party motivation is office-seeking or policy-seeking.

Left-wing Populist Foreign Policy: Kirchnerism and the Politics of Discourse in Argentina

Rodofo Colalongo[1], Stellamarina Donato[2]

[1]Universidad Externado de Colombia; [2]LUMSA University

Populism is not a new phenomenon. Historically, it has been associated with the malfunctioning of democracy and it has been considered the result of institutional weakness with reference to underdeveloped countries. For this reason, Latin America has always been seen as a pioneer in the emergence of populism – understood either as "post-democracy" (Crouch 2004) or "disfigured democracy" (Urbinati 2014). It is precisely because of this geographical and social variety that populism must be approached by taking into account the context where it arises, given that "the complexity of populism must be read and analyzed in conjunction with the respective social processes of democratization" (Anselmi 2017: 1-2). Despite it has mostly been a Latin American feature, populism became a global issue when it appeared in the consolidated democracies of the West, therefore we cannot dissociate reflection on contemporary democracy and decades of crisis from consideration on the populist phenomenon (Anselmi, 2017). This article addresses the issue of populist foreign policy in Argentina and employs multi-methods research that combines discourse analysis, foreign policy analysis, and historical political reconstruction of Kirchnerism. Theoretically, we refer to populism as an "Ideational Approach" and we consider Destradi and Plegaman's thematic lines in order to investigate populism in world politics. Throughout the paper, we argue that left-wing populist foreign policy does not discriminate against international cooperation and globalization per se but in a Manichean vision of the world, it criticizes western rich countries and proposes the creation of new regional alliances and political systems.

RN32_T10_01 | Populism, Concepts and Debates

Deweaponizing populism: A conceptual debate.

David Murillo

ESADE, Spain

Populism as a theoretical construct is perhaps one of the most ideologically charged concepts to be used in academia (Berezin, 2019). Using the critical lens of political sociology and contentious politics, in this piece I unfold some of the recent controversies to be found on the literature on populism and try to set up a distinctive sociological approach to the concept. Using the Catalan case as an illustration of the problematic nature of what constitutes populism in populism studies (Cossarini 2020; Tobeña, 2020; Barrio et al. 2018; Casado 2019; Ruiz 2020) in this text I lay out some theoretical hurdles pending clarification. Amongst them: the collapse of populism with nationalism and identitarianism; the framing of populism mostly as a negative (or reactionary) force; the collapse of top-down and bottom-up populism; the misuse of contentious politics as an equivalent of anti-politics; the conflictive nature of setting boundaries to the constituent demos; and the intertwined relation between supply and demand of populism.

To deweaponize populism studies (De Cleen et al., 2018) this article suggests a few avenues to deal with the previously identified problems by making use of the distinctive lens of political sociology. Namely, unveil the ideological charge of populism studies as a form of motivated cognition, problematize the performative nature of some theoretical elaborations on populism; see anti-populism as skewed towards epistemological conservatism; reinsert emotions to political theorisation; and treat populism as a complex phenomenon that hardly can be isolated from the context-rich depictions brought about by contentious politics scholarship.

1057

Populisms: Divergent Articulations of Political Futures

Marko Ribać

The Peace Institute, Slovenia

Presentation continues to develop early arguments of Paul Taggart (2000) on the "chameleonic nature" of populism and shows how populism is an inextricable part of today's differentiated and hierarchically organised societies. I examine how an interplay of professional institutional practices is to be considered when accounting for differences in populisms manifested in rhetoric, content and numerous styles of populist discourse. Thus I show that populism manifests itself according to the institutional framework, prevailing principles and mechanisms traversing the differentiated (national and international) social fields. First, populism is conceptualised as a primarily communicative or discursive (i.e. rhetorical) articulation, an argumentative Manichean logic with its dyadic antagonistic structure (elites vs. the people). I argue that this verbal articulation is to be understood as the product of the internalized (populist) linguistic and interpretative scheme (see habitus in Bourdieu 1997). "Thin" populist interpretative scheme, prevailing in left-wing ideological variants, is in its nationalist and nativist versions complemented by (xenophobic) fear or hatred of foreigners. Second, presentation shows how populist interpretative scheme is influenced by its immediate (professional and educational) environment and how populist speech is systematically disseminated following the logics, mechanisms and organising principles of differentiated social fields: political field, journalistic field, artistic field, space of social movements etc. Commercial logic and competitive principles (maximization of votes, appealing to wide audiences, closeness to "the people" etc.) underlie the production of populist discourse, however an interplay of narrow professional institutional routines in specialised fields (personalisation, episodic events, neutralism, scoop) account for important differences in its rhetoric and especially its styles.

Emotions In British Politics – A Trend Analysis Of Conservative And Labour Party Speeches From 1900 - 2019

Sheena Fee Bartscherer

Humboldt Universität zu Berlin, Germany

The deep interconnection of emotions and politics has been acknowledged by philosophers as early as Plato or Aristotle. Guided by a Kantian or Rawlsian rationalism, modern Western democratic societies however seem to perceive this relationship differently, rather following the idea that politicians (in the West) are rationally motivated and controllable actors. Only in recent years this perception has been challenged by figures such as U.S. president Donald J. Trump or British Prime Minister Boris Johnson. With their less than rational conduct they obtruded the topic of emotionality or pathos back into the discourse of (western) politics. Analysts were quick to point out these political figures' populist demeanor, accusing them (alongside other politicians of a similar fabric) of having emotionalized the political sphere to gain political influence. A problem posed by these assessments is that they too often conflate 'emotional' (political) communication with (right-wing) 'populist' communication.

In an attempt to untangle this conflation and to provide much-needed historical context for emotional political speech in the west, I therefore scrutinized this alleged 'novel' emotionalization through 'populist' actors by conducting a comparative trend analysis of political speeches from British Labour and Conservative party leaders over the course of the past 100+ years, beginning in 1900. Alongside hand-curated neurolinguistic dictionaries representing three key emotional stimuli (sex, fear, and violence), I established a neopragmatist discourse analysis to determine the distinct argumentative patterns of the sampled speeches and the role emotional stimuli play within them. Additionally, I conducted a sentiment analysis and tested several 'populist' identifiers that were retrieved in a previous study of mine on the 2016 U.S. presidential elections.

Keywords: British Politics, Populism, Emotion, Pragmatic Sociology, Trend Analysis

What Do People Mean When They Express Welfare Chauvinist Attitudes? Evidence From A Correlational Class Analysis On Dutch Survey Data.

Thijs Lindner[1], Stijn Daenekindt[2], Willem De Koster[1], Jeroen Van der Waal[1]

[1]Erasmus University Rotterdam, Department of Public Administration & Sociology; [2]Ghent University, Department Sociology

Extant research on welfare chauvinist attitudes primarily scrutinizes which citizens are more likely to be welfare chauvinist and for what reasons by analyzing citizens' social backgrounds. But what do citizens mean when they express welfare chauvinist attitudes? Because welfare chauvinism taps into various issues, related to economic redistribution, interethnic differences, and anti-institutionalism, it is not straightforward whether it means the same thing for different people. In order to better understand welfare chauvinism, we need to go beyond this and also explore the meanings citizens ascribe to that attitude.

The novel statistical technique Correlational Class Analysis (CCA) was used to inductively reveal different meanings of welfare chauvinism by analyzing how welfare chauvinism associates to attitudes on other socio-political issues. Analysis of a recent survey held among a high-quality sample of the Dutch population (n = 2,218), including validated items from the literature, reveals three understandings of welfare chauvinism. These are: (I) a mainstream conservative welfare chauvinism (39% of the respondents), (II) an alternative secular-populist welfare chauvinism (32%), and (III) an isolated welfare chauvinism (29%). Subsequent regression analysis showed that those with different understandings of welfare chauvinism differ with respect to political party preference, media consumption, religious denomination, and level of education.

In effect, the same level of welfare chauvinism has three fundamentally different meanings. We discuss implications for ongoing scholarly debates and provide suggestions for future research.

Impeachment, Lawfare and Fake News in Brazil

Rafael Böcker

Universitat Rovira i Virgili, Spain

The purpose of this article is to analyze the powerful mechanism of impeachment, lawfare, and fake news in Brazil. These mechanisms have been decisive in other electoral processes in recent times. This will allow us to think about the actual Latin-American political circumstance, that is characterized by a majority of liberal right-wing governments, conservative or populist, identified with neoliberal politics.

Fireside Chats: from Roosevelt to today

Jessica Camargo Molano[1], Daniele Battista[2], Alfonso Amendola[3]

[1]International Telematic University "UniNettuno", Italy; [2]University of Salerno, Italy; [3]University of Salerno, Italy

The present research aims to analyze the role played by artists in the recent campaign for the American presidential elections and in particular it focuses on the "Artists in President" project. The project is inspired by the fireside chats, a series of evening radio addresses given by U.S. President Frank D. Roosvelt during the Great Despression. Just as Roosvelt sat by the fireplace and spoke to the nation, so did 50 artists recording a podcast as if they held the office of President. Each artist focused his/her speech on the subjects, which he/she considered most important, with the aim of becoming the spokesperson for different issues.

The podcast, the form of communication they chose, recalls the great radio speeches given by the main political leaders during the periods of crisis and stresses the use of a medium that is becoming more and more popular.

The aim of the research is to understand the role of art in the complex contemporary political scenario and the potential power of persuasion and penetration of podcast as a new medium of communication.

1059

Ethnic Parties and Democracy in Nepal

Jhakendra Gharti Magar

Department of Sociology, Saraswati Multiple Campus, Tribhuvan University, Nepal

In a democracy, political parties are the most important connecting link between state and society. In this sense, ethnic parties are also working as a bridge to connect their respective societies with state power. The paper argues that ethnic politics and ethnic parties are contributing to the process of democratization in Nepal. As a manifest product of democracy, the ethnic politics primarily concerns for inclusive democracy and ethnic demands so far have been seeking to compete for resources within the system. However, there is a possibility of more aggressive expressions, even violence, and irredentism, if legitimate demands for social justice and political equality are not entertained by those entrenched in power. Thus, the relationship between democracy and ethnic politics depends on the context. The ethnic politics supports democracy in certain conditions. For instance, extremist expression of ethnic leaders tends to divide society. However, historical suppression led to the extremism of ethnic leaders or activists but they must show democratic character, i.e., ethnic leaders need to raise their voices from the democratic format. Likewise, the state also needs to provide a democratic environment for ethnic politics. There are two conditions: if state and other political parties can properly address the ethnic concern, ethnic politics can also support to the democratization process. But if the state fails to provide democratic space to ethnic forces, it can be a violent expression that will threaten democracy too. Based on close observation and in-depth interviews with ethnic leaders and scholars in Kathmandu in May-July 2020, this paper attempts to explore the relationship between ethnic politics and democracy in the Nepali context.

RN32_T11 | Distribution and Redistribution

Perceived Inequality and Biased Political Demand: Taxing Wealth and the Role of the Media

Ursula Dallinger

University Trier, Germany

According to a recent discussion in social sciences the attitudes of citizens on distribution policies are guided by inaccurate, biased perception of economic inequality. The presentation examines, whether this is confirmed regarding wealth taxes. Is the perceived tax burden of wealthy households – measured as the estimated tax rate on top incomes – biased and does this have consequences for public support of wealth taxation? I draw on Germany, where the re-introduction of wealth taxes is currently debated in politics. Based on data from an online survey the effects of possibly biased perceptions on the one hand and media framing of a wealth tax on the other are tested. We see that top income taxes are overestimated, which reduces political support of re-introducing taxes on wealth.

Taxing the rich is not a matter of objective inequality, but of tensions between images of privileges of the rich on the one hand and the thread of capital and jobs withdrawn from the country. The mass media are the channel by which political parties and interest groups get access to public opinion and deliver their images. The struggle for dominance is conducted by frames, who's influence on political support for wealth taxation is tested. Even if attitudes are in favour of taxing the rich, the menace of job losses is a strong frame. By making it available via media, interest groups and parties contribute to the power of a liberal script.

An Unexpected Helping Hand: Ideological Consequences of Redistribution

Simon Bernhard Alfred Egli, Rost Katja

University of Zurich, Switzerland

Literature on redistributive preferences has proliferated in past decades. A core assumption behind it is that variation in redistributive preferences can explain different levels of redistribution. In contrast, this paper considers the reverse. What if it is redistribution that changes redistributive preferences? The core assumption behind the argument is that if self-interest - which we label concrete preferences - and ideology - which we label abstract preferences - come into conflict, the former will prevail and lead to an adjustment of the latter. To test the hypothesis, data from a survey conducted in Switzerland during the first wave of the COVID-19 crisis is used. A significant portion of the workforce at the time unexpectedly received state money through the short-time working program. We test the effect of short-time working on the support given to hypothetical, ailing firms during the crisis as well as on the prioritization of justice principles guiding state action. We find moderate to strong evidence that unexpectedly finding oneself at the receiving end changes redistributive preferences if one's ideology is antithetical to redistribution. We discuss the implications of our findings on the study of populism, individual ideologies and political change.

The Peculiar Fate of Europe's Austerity Poster Child: Irish Political Culture and the Barriers to Collective Learning

Richard Milner

University College Cork, Ireland

Set in comparison to its peripheral counterparts, Ireland presents an exceptional case in the imposition and experience of austerity over the past ten years. Held aloft by European political elites as a success-story – the 'poster child' for austerity – in responding to the financial crisis of 2008 and the subsequent Great Recession, this portrayal obscures a more complex and problematic story. As traditional political loyalties and identities begin to shift and transform – as reflected in the 2020 Irish General Election and the response to COVID-19 – this paper develops a critique of Irish political culture and considers the implications of this for ongoing processes of democratic legitimation from the perspective of the theory of collective learning. The looming prospect of permanent austerity regimes, followed by instances of populist convulsion, provoke this search to specify those mechanisms that prevent the public thematization and crystallization of legitimate democratic alternatives. In the Irish case, justification narratives that emerged in the aftermath of the 2008 crisis, which promoted the need for austerity, while discursively containing and/or obstructing the exploration of alternatives, constitute what are understood here as an example of a collective learning pathology. The paper identifies and explains, taking a methodological cue from Theo Van Leeuwen, the resonance of these narratives, pointing towards a peculiar underlying political culture – characterised by a distinct form of Catholic conservatism and a fragile national identity – as a key generative mechanism. Although the paper develops a negative critique, its conclusions are strongly reconstructive, anticipating the emergence of innovative discourses carried by new social movements aimed at a deeper and more secure sense of social justice in Ireland.

Gender and Covid-19 Crisis: Adaptation, Individualisation and Isolation of Women in Compressed Times and Spaces

Sandra Burchi, Şahizer Samuk

University of Pisa, Italy

The inequalities regarding gender roles and gender beliefs were already prevalent, Covid-19 domesticating lives of everyone, it has shown that the inequalities in the domestic life are even more evident. The patriarchal structures were already dominating the domestic lives, but they became more accentuated when the house became a workplace. Why did gender become more essential and less influential at the same time during Covid-19? In this article, we attempt to focus on two theories: Rosa's time and capitalism theory and Hakim's preference theory in the context of McRobbie's post-feminist individualisation. As a result of the face to face focus group interviews conducted with 50 women who had smart working or teleworking experience in Tuscany in Italy, we have done coding with Atlas. ti. We have observed diversified strategies amongst women who deal with smart working from home during the pandemic. Our interviews reveal an excellent differentiation level regarding how the women responded to these challenges and the exigencies of work lives. It was observed that some women thought that smart-working was fitting their jobs whilst others not. The justification of inequalities and acceptance of inequalities has become a part of the daily life of women, and they fought against the unequal distribution of time and space via negotiation, via showing evidence, via adaptation and creativity, in some cases and also via returning to the office(s). The women in work life are searching for space to have their recreational activities and satisfy their work-related exigencies. Therefore, how can we redefine and rearticulate this micro political space at home?

Women at the universities and Covid-19 pandemic. A preliminary comparative research among Italy, Germany and Poland

Aneta Ostaszewska

University of Warsaw, Poland

The pandemic of Covid-19 has been affecting drastically social and economic life in many dimensions. At the same time existing inequalities including gender inequality are amplifying and magnifying. Considering what has been said, exploring the impact of Covid-19 on women's lives is of major importance now.

This paper focuses on the topic of "Women, Men and the Covid-19 Crisis". It is a review of the international project conducted in autumn 2020 in three European universities: Heidelberg University, University of Milan and University of Warsaw (4EU+ Alliance). The research questions were:

1) What is the pandemic impact on the situation of women at European universities?

2) How Covid-19 is changing women's lives?

3) What are the differences / similarities in the experiences and issues caused by the pandemic and raised by women at universities in Warsaw, Milan and Heidelberg?

To answer these questions the focus-group interviews (FGI) were conducted, both at the national and international levels. The term "women at universities" implies female faculty members: academic staff, i.e. teachers and researchers, administration staff including librarians as well as doctoral candidates and students.

The research shows that the Covid-19 pandemic has influenced women's professional career as well as their family and social life. The pandemic brought many challenges, including those related to remote work, increased working hours, workload and changes in the organization of everyday life. Depending on the group of affiliation, women pointed various issues: technical problems related to the home office, lack of support from universities and superiors, or loosening social relations. Among the positive experiences they mentioned, among others reorientation of one's own life priorities.

The Impact of Pandemic Containment Measures on Women's Careers in Academia - the Case of Slovenia

Jasna Podreka, Milica Antić Gaber

Faculty of Arts, University of Ljubljana, Slovenia

Pandemic measures have largely led to a shrinking (almost vanishing) of the public sphere and to an enlargement of the private sphere. This has meant that the tasks of many public services and educational institutions, which play an important role in reconciling work and family life, have fallen almost entirely on the shoulders of families, or more precisely on women, who still do most of the work in private life.

In many professional fields (including academia), women face a specific androcentric structure that, even before the pandemic, posed many challenges and obstacles in terms of work-life balance. As various studies have shown, women progressed more slowly in academia than their male counterparts. Considering this, we hypothesize that the pandemic situation affected the academic scientific production of women to a much higher degree compared to their male colleagues, especially in Slovenia, which has a world record of school closures in the second wave of the pandemic. The aim of the paper herefore is to analyze the data from preprint repositories of the five highest ranked journals in the field of social sciences and humanities in Slovenia and to find out the gender differences in scientific production during the declared pandemic in 2020 and compare them with the previous year. In addition we will deepen the analysis on this topic with the insisghts from the interviews with few female scientists and their partners on how they experienced pandemic containment measures and their influence on division of labor in their private lives and consequently their scientific production.

Gender Equality and Feminist Politics at the Crossroads of Neoliberalism, Conservatism and Illiberalism

Oana Băluță

University of Bucharest, Romania

The newly established gender equality and feminist political projects have been challenged both by neoliberalism and conservatism. The financial and economic crisis was an important setback, it deterred Romania from a progressive democratic road, and opened avenues for democratic backsliding (Krizsan, Roggeband, 2018, Băluță, 2011, 2016, 2017).

During the last couple of years we have also witnessed an intensification of conservatism and right-wing populist parties and movements promoting "family values" and traditional understandings of gender. Scholars have already reflected on the effects of the neoliberal austerity measures on gender equality and a resurgence of conservatism in private life, however the role of the Orthodox Church in challenging gender equality and feminist political projects have not been systematically analyzed.

In 2021, we witness a still ongoing international health crisis caused by the coronavirus pandemic. The periphery of gender equality policies, the neoliberal vision of the government and conservative backlash weakened the institutional reactions during the pandemic, especially the protection of women against gender based violence and access to sexual and reproductive rights.

My argument is that parliamentary initiatives, policies, public discourses are underpinned by three political projects —neoliberalism, conservatism, and illiberalism. I explore these overlapping and their mutual enforcement in one political context, namely Romania. These gendered projects pose serious challenges for gender equality and feminism and their convergence can help us understand both the slow progress and the rather newly consistent backlash against gender equality. The paper dwells more on the role of the Orthodox Church in fueling illiberal policies and rhetoric. Feminist analysis benefits if we move beyond compartmentalization,that is if we move beyond focusing feminist critique of either neoliberalism or conservatism or illiberalism.

Work From Home: A Boon or Curse? Reflection on IT Working Women in COVID pandemic in Kerala, India

Lekha Bharathan

Sree Narayana College, Chempazhanthy, India

Working from home has suddenly become the new normal as most of the IT organisations switched from 'work from office' to 'work from home' amidst the spread of the COVID-19 virus. In the Indian state of Kerala, women enjoy uniquely high status as reflected in the development index. IT industry also became an agency for the empowerment of women as it contained a high level of female work participation in Kerala compared to the National level. But at the same time, Kerala women operate within an intersectional space between Western individualism and acquired patriarchal traditional gendered roles. Most of the IT women, especially those married resorted to the help of helpers/ maids to get household chores done. However, during the lockdown, no one except health workers, police force & people providing essential services, were allowed to go to their workplace and so all household works have to be get done by women themselves. The paper attempts to study the challenges that IT woman faced during the outbreak of Coronavirus and the accompanied lockdown and investigate the psycho-social cost that working women had to incur. The purpose is to examine whether this new normal has changed the gender relations within the household. It also intends to examine whether there is any relationship between "Being women, it is more challenging to work from home than work at the office" and "Working more as that of normal hours". It seeks to employ a mixed methodology, wherein qualitative data will capture the experiences of IT working women and the quantitative data will throw light on the general gendered aspects of the new normal.

Desperate Working Mums In The Covid-19 Crisis: Is Homeworking The Solution Or Part Of The Problem?

Aurore Jeanne Stanislava Dudka, Cinzia Meraviglia

University of Milan (Italy), Italy

The Italian labour market is known to be disadvantageous for women, especially mothers: in 2019, 37 000 mothers left the labour market (17 000 in 2011). The Covid-19 crisis reinforces this trend, with women being more likely than men to quit their jobs to achieve the flexibility required by Covid-19 related issues, such as school closures.

Scholarship has shown that having children remains the variable that explains most gender inequalities in labour market (Kleven and Landais 2017). Unpaid work in general, and children's care in particular, are mostly done by women (Duffy 2007), although younger generations show a more balanced division of labour.

Our paper investigates how the Covid-19 crisis affected the division of unpaid labour among heterosexual dual-earner couples with children in Italy, particularly those who switched to homeworking during the lockdown. We analyse the data of an online web survey we ran in Italy between April 29th and 22nd June 2020 (N=934).

Our results show that women were overloaded with unpaid work, even when both spouses were homeworking during the lockdown, and the more so when having children. Actually, male partners' involvement in domestic chores was little sensitive to changes in the work mode, always doing much less than their female partners. As for childcare, we found that some work arrangements tended to result in a more equitable tasks sharing among spouses, particularly when the male spouse (but not his partner) switched to homeworking and when the couple had more than one child.

Men, Fatherhood And The COVID-19 Pandemic

Ewelina Ciaputa, Ewa Krzaklewska, Marta Warat

Jagiellonian University in Krakow, Poland

The COVID-19 pandemic has affected every sphere of our lives, posing challenge to practices of motherhood and fatherhood. Lockdown, introduction of remote work in many sectors, distance schooling and social isolation required adopting new strategies and solutions related to caring responsibilities, and in particular - caring for children. Based on the qualitative interviews conducted as part of the Men in Care project with male employees in international corporations and their partners, we will consider whether, and to what extent, the COVID-19 pandemic in Poland impacted men's approach to care and parental roles and raised questions/triggered reflections in relation to caring masculinities. Since our study captures the situation of post-outbreak months where suddenly care duties became delegated almost exclusively to parents we try to gather their impressions/reflections on their care engagement as perceived between March and August 2020. Simultaneously, we will draw on the experiences of male employees to show how the "interweaving" of care and work has influenced the involvement of fathers and the division of care between partners. As our case study relates to a specificity of employees of international corporations in Poland, we will also try to discuss to what extent the organizational culture of a company and specific measures offered by it may support men who want to engage more actively in caring work. Results from Poland will be presented in a context of other European countries case studies (Norway, Austria, Spain, and Slovenia) to present a broader picture of father's care practices during the pandemic.

The Men in Care project received financial support from the European Commission under the Program for Employment and Social Innovation "EaSI" (2014-2020).

Mothers' Mental Wellbeing During the First Covid-19-related Quarantine in 2020

Nikolett Ivett Somogyi[1], Orsolya Gergely[2], Réka Geambașu[3], Beáta Nagy[4]

[1]University of Antwerp, Belgium; [2]Sapientia Hungarian University of Transylvania, Romania; [3]Babeș-Bolyai University, Romania; Centre for Economic and Regional Studies - Eötvös Loránd Research Network, Budapest, Hungary; [4]Corvinus University of Budapest, Hungary

During the lock-downs that were introduced by the governments in connection with the COVID-19 pandemic worldwide, working parents of young children were in difficult situation when having to manage the multiple burdens of home-schooling, childcare, household work and paid employment. In Hungary and in Romania, time spent on unpaid household work has been gendered before the quarantine, therefore our qualitative research (N=52) aimed to get a glimpse into the daily experiences of mothers in these two countries amid the home-leaving restrictions in spring 2020.

Our findings showed, that despite the difficulties, many participants considered the quarantine – in general – as a good period. In the present study, within the framework of social stress and gender role theories, we analyze the circumstances, strategies and coping mechanisms that allowed these women to preserve their positive outlook. Four groups were identified in the study sample. Mothers in the first two groups, due to advantageous circumstances, could decrease the time spent on one of the three main domains. Those, who had older children, could minimize the time spent on home schooling, while those, who could or had to cut down the amount of paid work, could fully devote themselves to their families. The third group shared the tasks or renegotiated the division with their partners, whereas women in the last group carried out everything themselves and derived satisfaction from meeting the role expectations.

This paper delivers important evidence for the discussion of the impact of the COVID-19 pandemic on social roles and mental health.

RN33_T01_03 | Gender Based Violence and the Media

Factors Associated with Acceptance of Violence Against Women and Rape Myths

Ksenija Klasnić, Đurđica Degač

Faculty of Humanities and Social Sciences, University of Zagreb, Croatia

With global rising of social movements empowering women to speak about sexual violence and sexual harassment, regional and national responses are taking place. In 2021 Balkan version of the Me Too movement started with the slogan "I didn't ask for it". The general public is exposed to more information on different types of violence against women, manifestations of victim blaming and other types of myths about violence against women. At the same time, the rise of right-wing political ideologies and extremist movements in Europe which, among others, advocate reduction of women's rights and status pose a new challenge. In that context, a cross-sectional study was conducted among quota sample of Croatian residents (N=600) with primary objectives to (1) assess the acceptance of violence against women myths and specifically rape myths, and to (2) determine types of sexism and political ideologies as predictors of their acceptance.
Results showed that the majority of respondents does not accept violence against women and rape myths, however men are, compared to women, more prone to accept most of them. Some myths, especially those about rape, have a significant share of acceptance, which goes as high as 30% among male respondents. The strongest predictor of both types of myths acceptance was traditional sexism, while right-wing authoritarianism was the strongest predictor among political ideologies. Hierarchical multiple linear regression analyses have led us to some interesting conclusions that shift the established focus in explaining beliefs in myths about gender-based violence.

Digital Gender Based Violence Against Women of Public Relevance. Intersectionality, Violences and Responses

Jordi Bonet-Martí[1], Núria Vergés Bosch[1], Eva Cruells López[2]

[1]Universitat de Barcelona, Spain; [2]Fundació SURT

Gender based violence affects all kinds of women, but digital gender based violence (dGBV) becomes especially visible against women with public relevance. In recent years, there has been a growth of dGBV associated with the digital dissemination of hate speech and the rise of the new populist right, hand in hand with misogynist and homophobic ideologies. At the end of 2019, we carried out an exploratory and descriptive survey in Catalonia to identify the main dGBV, as well as their impacts, the responses of women and their demands. 270 women responded and 31.3% of them declared to be of public relevance. This allows us to investigate particularly women with voice, and ask to what extent we observe differences with the rest of the women. Our results highlight, first, that women with public relevance received a great diversity of dGBV with serious impacts, especially economic, labour and public. Second, these women suffered, above all, sexist insults, threats, cyberharassment and discredit and, on the other hand, less control, access to their accounts and gaslighting. Third, dGBV was aggravated due to their ideological position, sex-gender diversity and functional diversity. Therefore, intersectionality and intensity needs to be addressed. Finally, women with public relevance stand out for a greater use of public reporting, as well as a slightly higher use of prevention and digital identity management measures. Finally, the study shows that women demand more training and information on dGBV, legal improvements, a greater response from technology platforms and more institutional resources. Thus, more research and action are still needed to address the rise of dGBV, its impact, and meet the demands of women.

Media Representations on Domestic Violence against Women in Greece Under Crises

Anna Daskalaki, Katerina Acheimastou, Christina Botsou, Amalia Frangiskou, Dimitra Kalabaliki, Ioanna Kourou, Konstantina Kyprioti, Joanna Tsiganou

National Centre for Social Research, Greece

For the past decade, contemporary Greece is witnessing multiple and successive crises as many countries globally: the economic crisis from 2008 onwards, the humanitarian crisis due to the refugee question and the pandemic (hygiene) crisis due to COVID – 19 spread. It is in the scope of the proposed paper to address an important social issue, that is, media representations on domestic violence under circumstances of these successive and interconnected crises. The theoretical foundations of the research upon which the proposed paper is based, lie within the gender perspective of the social representations on domestic violence against women through the contemporary media rhetoric in Greece. The proposed paper is based on press narratives of domestic violence against women through a sample of daily press clippings for the past decade. The emphasis is placed on images of victims and perpetrators as well as domestic violent acts scenes in order to understand more fully the mediating impact and influence of the daily press of distinct political affiliation towards perceptions, beliefs and stereotypical representations of the issue at stake. The aim is to "read behind the lines" and unmask things and thoughts "'unspoken" which help the collective consciousness to emerge almost automatically and guide or verify audiences accounts on domestic violence. Our task is not an audience oriented approach, of course but a rather "source" of information oriented undertaking. To this end qualitative research was most fruitful.

A Virtual Ethnography On Toxic Masculinities During The Covid-19 Pandemic. Italian Incel And Red Pill Communities' Hate Speeches And Violence Against Women

Annalisa Dordoni

University of Milano-Bicocca, Italy

Today, online groups sharing violent language and hate speech are spreading and multiplying. The Incel and Red Pill groups are part of an active and growing manosphere, in Italy as well as in other countries. The aim of the study is to analyze gender representations and symbolic discourses related to gender identities and models of masculinities, proposed and co-produced in the Italian Incel and Red Pill virtual communities. After a long virtual ethnography, carried out covertly in closed online groups on social media from January 2020 to February 2021, we identified three intertwined dimensions: male aesthetics and self-narratives; reification and dehumanization of women; violence against women. The results show that violence is immanent and integrated into the lexicon and imagery of this virtual community. Violence is justified by a self-victimization narrative, which calls into question the economic crisis and the lack of work, as well as aesthetics: these boys and men declare themselves lonely, ugly, precarious or unemployed. Instead of questioning a rigid and extremely normative binary view that traps them in unattainable patterns, and instead of reconsidering the extent to which their legitimate anxieties and fears are caused by economic policies that increase inequality, precariousness and unemployment (Kimmel 2013) - above all during the Covid-19 pandemic -, members of this groups implement a backlash (Faludi 1991) against women who, in their view, do not respect traditional roles and models (Köttig et al. 2017). Moreover, these online groups are a relational context which could act as a justifying ground as well as a trigger for transitions to violent practices offline, as emerges from the various episodes of terrorism that the authorities have linked to online Incel groups.

1067

RN33_T02_01 | Violence, Harassment and Consent

The Consent Project: Incorporating Young People's Voices to Delve into the Analysis of the Communicative Acts

Esther Oliver, Lidia Puigvert, Ana Toledo

University of Barcelona

To progress in the construction of knowledge about consent is crucial to better understand and overcome many situations of gender violence and sexual harassment. The consent in law is defined by academic jurists as "affirmative consent" which means affirmative, conscious and voluntary agreement to engage in sexual activity. From the "no means no" law and campaigns to "anything other than yes means no" until the consideration that only an explicit "yes" means "yes", these advancements are based in the verbal language. The existing debate is not providing enough insights to avoid gender-based violence in stable and sporadic relationships. More scientific knowledge is needed to make a shift in the analysis from the focus only on the speech acts to the study of the communicative acts. The CONSENT project is aimed at studying which communicative acts, in both stable and sporadic sexual relationships among young people, are coercive and which are consent. This paper is oriented to present the CONSENT project and its preliminary findings. Methodologically, the project is based in an analysis of scientific literature and previous research on sexual consent and coercion, in an analysis of laws, policies, campaigns and initiatives and in the implementation of communicative methodology techniques to incorporate the voices of different social agents, including young people, to analyse the elements of communicative acts which enable consent or coercion. The main results are oriented to create new knowledge to fill in the gap of the current understanding of consent versus coercion in sexual-affective relationships in young people.

Judicial Treatment of Sexual Aggressions and Abuses

Estibaliz de Miguel

University of the Basque Country, Spain

In the last fifty years, there has been a shift in the understanding of sexual assaults, from attacks on honour to address them within the framework of sexual freedom, based on the idea of consent. International and national legislation has modified both the concept of sexual aggression and its treatment through instruments such as the Istanbul Convention, Resolution 35 of the CEDAW Committee, or the Statute of the Victim of the crime in Spain. These legislative changes open up a new way of conceptualising and dealing with sexual violence. Yet, it has not been studied in what way the legislative changes have meant a different treatment in legal practice, nor whether sexist stereotypes or limitations in the understanding of sexual violence have been overcome. The multidisciplinary research (currently underway) Ius-Philosophical Keys for the Analysis of Judicial Treatment of Sexual Aggressions And Abuses (JURISAGREX) aims to understand the factors that influence the application of criminal legislation on sexual aggressions through the analysis of case law on sexual aggressions in various autonomous communities in Spain and in-depth interviews with judges and legal operators. The paper will present preliminary results of the analysis of judgments on sexual assault and will reflect on the analytical tools of feminist legal sociology to address the analysis of court rulings.

1068

Sexual Violence and Consent: An Approach to the Perception of University Students in Catalonia

Anna Mª Morero Beltrán, Màrius Domínguez Amorós

Universitat de Barcelona, Spain

This presentation analyzes Catalan university students' perceptions of sexual violence occurring within heterosexual relationships. Since 2017, the social, political and legal debate in Spain on the issue of sexual violence has intensified. In this context, there is clearly a need to analyze the prevailing imaginary when it comes to sexual violence and to the closely related concept of consent.

The specific objective of this paper is to deepen our understanding of the prevalent ideas of consent held by university students. The notion of consent has long been a "naturalized" social phenomenon. The socially constructed idea of consent, in other words, is the product of a lengthy process of patriarchal dehistorization, privileging the notion of consent as an autonomous, individual and rational choice and confusing the causes with its effects. The ultimate goal here is not so much to arrive at a definition of consent as to record the gender inequalities identified by the students. These inequalities underlie the contemporary concept of consent, and they often serve to justify or naturalize sexual violence.

To accomplish this, we have worked with data gathered in the study "Violencia de género en las universidades catalanas: diagnóstico y herramientas de prevención" (Gender violence at Catalan universities: Diagnosis and tools for prevention). As part of this study, 8,434 students at private and public universities in Catalonia completed a self-administered online survey, and 30 in-depth semi-structured interviews were conducted.

RN33_T02_02 | Gender and Politics

A European Agenda? The Supra-National Dimension Of Anti-Feminism In Europe

Judith Goetz[1], Stefanie Mayer[2]

[1]University of Vienna, Austria; [2]FH Campus Wien, Austria

Research on the global rise of right-wing authoritarian tendencies has increasingly pointed to the role anti-feminist ideologies. Anti-feminist movements can rightly be described as local embodiments of a transnational phenomenon and their ideologies as local articulations of a global discourse, but the transnational dimension of current anti-feminism does not only evolve in the spaces between nation states and cannot always be adequately captured by the image of informal transnational networks. While the Catholic Church as global institution is of course an important factor, it cannot account for the activities of the secularised political right, which has become an important player in some contexts.

Therefore, our paper explores the supra-national European dimension of current anti-feminist movements with a focus on discourse, ideology and strategy. We want to find out, which role activities in the supra-national European context play for anti-feminist movements. Findings from several European countries point to a convergence of different actors from religious to politically conservative, far right or even neo-Nazi groups that find common ground in their rejection of gender equality and sexual emancipation. Although European institutions have repeatedly been targeted by anti-feminist campaigns we know little about their activities on the supra-national EU-level. Empirically our paper is based on an analysis of the discussion paper 'Restoring the Natural Order' authored by the right-wing conservative network Agenda Europa, which provides rich material for the analysis of anti-feminist ideology as well as strategic propositions. The findings will provide a clearer picture of the role the European supra-national political sphere plays for anti-feminist movements, thereby adding to our understanding of how transnational ties within these coalitions are actually created.

Women, Nations and Punitive Repression from Feminist Perspectives

1069

Elisabet Almeda Samaranch[1], Clara Camps Calvet[1], Dino Di Nella[2]

[1]Barcelona University, Spain; [2]La Plata National University, Argentina

It is key to analyse the role played by women in national liberation processes and to relate it to the criminal justice system that controls and punishes dissidence. In the study of national liberation movements such as the Kurdish or Palestinian or, in the case of Europe, the Irish, the Basque Country or the Catalan, it is often forgotten that women are also persecuted, criminalized, prosecuted, exiled and imprisoned. With this paper, we want to focus from critical and feminist perspectives on the punitive and control measures over women, especially those that are subject to political repression. And to do so, taking into account the processes of recovery and memory of the various oppressions and discriminations suffered by imprisoned women and their families, especially political prisoners, during the Franco regime. Lately, these processes have been emerging strongly and are very relevant to Catalan recent history to understand the continuities and ruptures with the current situation of all incarcerated women.

War as A Gendered Phenomenon: Women's Experience of War in Diyarbakır, Turkey

Sibel Bekiroğlu

Middle East Technical University, Turkey

This study aims to examine the gendered feature of war by focusing on a field study conducted in Diyarbakır, 2019. After the security operations and armed conflict between the Turkish army and PKK (Kurdistan Workers' Party), the Southeastern part of Turkey, including Diyarbakır, became the venue of organized violence named "ditches war." The war in Diyarbakır resulted in the destruction of the city, especially the Suriçi settlement, and many deaths in the region. Throughout the times of organized violence, women had a unique and ambivalent role in the context of war. They had many different identities like fighters, mothers, daughters, officials, and both the subjects and victims of the war. Using the interviews with women conducted in Suriçi in September 2019, this study set out to investigate the relationship between gender and war through women's experiences. As Laura Sjoberg puts it, "it is only possible to fully understand gender in the context of war and conflict, and it is only possible to fully understand war and conflict considering their gendered aspects (2014: 3-4). Thus, this study should be seen as a continuation of war as a gendered experience.

Women's Political Representation at Local Level in Spain and the Orientation of Policies

Maria del Carmen Navarro Solano, María Jesús Rodríguez García, Ángel Ramón Zapata Moya

The Urban Governance Lab (CSPL). Universidad Pablo de Olavide, Spain

Gender political representation studies suggest that an increase in women's descriptive representation (critical mass) implies an improvement in their substantive representation (Dahlerup 2010). Based on this suggestion, there has been a debate in gender studies with two perspectives. The first argues that the increased presence of women in political life leads to substantive policy changes. The second approach argues that the presence of women in political institutions is not enough to produce transformations in institutional culture, values, forms of participation and/or in the policy agenda (Mazur, 2002; Cellis,2008). Analyses of political representation and gender tend to focus on the national or regional level, and there are very few empirical studies at municipal level (Andrew, 1995), even though it is a level of government where the presence of women seems to be higher, which may lead to a more evident interaction between descriptive-substantive representation. Previous studies at the local level in Spain have shown a clear trend towards the 'feminisation' of political representation, and thus the possibility of women's demands, and interests being incorporated into the local policy agenda (Rodríguez and Navarro, 2012; Rodríguez 2013).In line with this previous evidence, we rely on the analysis of local spending, to test whether the increase in women's representation has produced a greater orientation of local policies towards welfare areas than economic actions. Hierarchical (multilevel) linear regression models were estimated to analyse both cross-sectional (N=8.108 municipalities) and trends effects since 1999 till 2019 in women's representation and influences on local spending orientation.

RN33_T02_03 | Reproduction: paid and unpaid Work

From Critique of Paternalism Towards "New Orthodoxy": Professional Groups and Women in Discussion on Reproductive Loss

Daria Litvina

European University at Saint Petersburg, Russian Federation

Reproductive health and choices of women comprise the interest for many groups, including the state, professional communities, various social movements, church. In this context reproductive losses (miscarriages, stillbirths, abortions for medical reasons) set a new dimension in the conflicting debate on ambivalent social/ moral/ cultural status of pregnant women and unborn. Many professional groups participate in the process of production of knowledge and policies about the reproductive loss. Their perspectives can greatly vary, as they refer to different logics (biomedical, moral, psychological, bureaucratic) and concepts of care.
In recent years we can observe a rise of criticism against 'obstetrical aggression' and paternalism. But at the same time new 'caring' agents in professional field of maternity care (psychologists, doulas, etc.) offer a framework where reproductive loss is assumed to be 'essentially painful' and highly traumatizing, unborn is mandatory personalized, and prolongation of (complicated) pregnancies has significant psychological and moral benefits. An emotional management provided by adherents of this "new orthodoxy" (Komaromy 2012) can be perceived as no less disciplining and objectifying (pushing women towards 'right' feelings, decisions and actions). The personalized women-centered care remains beyond these two extremes.
In this paper I will explore how different professional groups produce knowledge about women and unborn, what practices of care they implement, and how women perceive it.
The paper is based on 25 in-depth interviews with women who experienced reproductive loss, 15 interviews with professionals, and analysis of discourse.

Intersections of the Solidarity and Resistance in the Biographies of Rural Women Negotiating Postmodern Family Models in Poland.

Sylwia Urbańska

University of Warsaw, Poland

Exploring contemporary diversity through families experiences of individuals and communities living in rural areas are not a common perspective. This is especially true for public discourse in Poland, where after the collapse of socialistic regimes in 1989, village people have been increasingly marginalised and othered by various, racialised categories of class inferiority and have been stereotyped as a fortress of traditionalism. Such phenomena encourage looking at rural communities in different ways, as laboratories of relationships' changes in diversifying world.
Firstly, I will discuss the class and gender dimensions of negotiating post-modern patterns of family life. I would like to look at the chosen ways and strategies of negotiating the axio-normative system in the process of (un)becoming wife. Secondly, I would like to analyze how in these processes mediate homosocial circles - what in fact is the question about sisterhood solidarity and resistance in the countryside' everyday family lives. The above analysis will allow me to discuss processes of exclusion that are reproduced around traditional and postmodern patterns and also the strategies of positioning others in "village's voices" and practices.
The analysis will be based on data who comes from ongoing empirical, qualitative study (6 months of etnographies, autobiographical narratives). The aim of the study is to identify and explain whether and how the traditional models and gender roles in rural families change in the context of the socio-economical transformation of rural areas, and the broader transformation of the family after 1989 in Poland.

The Advances And Challenges Of The Policies That Promote The Labor Participation of Women in Latin America, The Caribbean And Europe

Raquel Edith Partida Rocha

Universidad de Guadalajara, Mexico

Now there is also a strong need to understand how the dynamics of gender inequality intersect with other social inequalities including ethnicity, religion, age, disability, and class. In this paper we propuse
care in two region EU/LAC. Its analysis comparative with the context del Covid-19. This objetic is evalue the impact difference the gender, the gap in the domestic work and the lost the job. In Checa Republic, Spain, Italy and México, Chile and Argentina. This analisys is that reflect upon feminist approaches to building knowledge and responses to current gender challenges in post-covid 19.

What Decides How Do I Spend My Time? An Analysis Of Unpaid Care Work In Heterosexual Couples In Colombia.

Michelle Vernot-López

Universidad de Barcelona, Spain; Universidad Externado de Colombia, Colombia

The purpose of this article is to advance in the analysis of the gender gap in time spent in unpaid care work (UPCW) in Latin America. Using the Colombian National Survey of Time Use (ENUT- 2016/2017), we analyze the distribution of time between heterosexual couples and explore the main individual, household and socio-economic factors that influence the unfair proportion of unpaid care and domestic work done by women. Our empirical strategy uses an original gender role representation index and is supported by specific logistic regressions. The results show that 75% of women do at least two-thirds of this work and highlight the importance of time availability and income as the main contributing factors in this study. But they also reaffirm that, in order to change the unequal burden of unpaid domestic work, we need more public policies that aim at transforming gender norms. In

fact, in the context of Colombia, where there is a strong traditional model of families, the gender role representation of men and their level of education seems to have a high influence in time distribution among heterosexual couples. Furthermore, the amount of UPCW and the presence of young children play a role in shaping this unequal distribution, thus highlighting, once again, the regional challenge regarding care policies.

RN33_T03_01 | Feminism, Ecology and Climate Change

At The Junction Of Feminism And Ecology, Towards More Inclusive Urban Public Space

Elsa Koerner

Université Rennes 2, France

As more cities and local governments resort to gender sensitive approaches to urban planning, it is insightful to address gender and the environment as crosscutting issues (Levy, 1992). Indeed, the greening of cities is a widespread response to climate change, as mitigation and adaptation to its microclimatic effects in cities. This creates opportunities to reassess the gender inclusiveness of urban space, as projects of greening school yards show. Yet if the conversation on gender inclusive public space is not well rooted in the local government, policies to protect the biodiversity might impede the appropriation of the city by women and LGBTI people.
Our paper is based on the empirical work conducted as part of an ongoing PhD thesis on that matter, in three French cities of more than 100,000 inhabitants. We question how gendermainstreaming translates into tools and solutions for urban green spaces, as well as re-vegetated public places.
The paper will show how civil servants working on the conception and maintenance of such green spaces understand and familiarize themselves with the gender sensitive perspectives and the challenges they face doing so. We will describe what hinders the production of more gender inclusive public green spaces. We will also explain to what extent civil servants and elected officials regard at the right to the city for women and LGBTI people as a security issue. Then we will discuss the implications of

such a framing of the public problem on the emerging solutions.

Levy, Caren, 1992, "Gender and the Environment: The Challenge of Cross-Cutting Issues in Development Policy and Planning". Environment and Urbanization 4(1): 134–149.

For Land, Communities and Rights. A Global Overview on Women's Opposition to Mining

Francisco Miguel Venes

Universidade de Coimbra, Portugal

The paper explores women's participation in socio-environmental conflicts associated with large-scale mining activities across the world. Women's involvement in collective struggles over natural resources has been defined as one of the critical themes within Feminist Political Ecology. However, existing literature on women's opposition to mining is limited and mostly explains their involvement as a reaction to the gender specific impacts of the activity. At the same time, little attention has been paid to the actions and strategies they use in anti-mining mobilizations.

The paper examines 151 mining conflicts present in the Environmental Justice Atlas database, in which contributors have identified women as a mobilizing group. Whenever possible, available data is complemented with additional information coming from existing research on the selected conflicts. The paper offers both a systematization of the information available on women's participation in mining conflicts and a critical reflection on the main arguments advanced by existing literature. More specifically, it looks at why and how women organize in opposition to mining, the challenges they face, and whether they transform both gender and territorial dynamics through their activism.

It aims to broaden current knowledge on women's opposition to mining activities by paying attention to common patterns on a global scale without losing sight of context-specific aspects and differences among women activists.

Making Knowledge With The New Materialisms: Human Responsibility For The Materialising World

Stefania Chihaia

University of Bucharest, Romania

Any possibility for coexistence in the twenty-first century demands of us that we rethink our understanding of nature, matter, and our ways of relating within a more-than-human world. As a multidimensional approach to the challenges we are facing, this paper presents an overview of the new materialisms, a movement in social theory largely inspired by ecological feminisms and dense with feminist scholars. The new materialisms propose a new, monistic ontology where all materialising entities are co-constitutive, meaningful, and 'entangled' in the flux of materialising life. They reject the Cartesian subject-object, mind-matter dualism, together with the Newtonian conception of matter as passive and inert, for their resultant axes of domination that cut across dimensions of social life: culture/nature, human/nonhuman, self/other, naturalising domination by opposing fixed sets of identities. The new materialisms propose a new onto-epistemology that reflects the creative generative capacities of nature/matter, the entanglement of material entities, and the discursively-material implications of our knowledge-making practices. They argue for a unified, post-anthropocentric view of the world in which all bodies, human and nonhuman, have agency in the production of the world. This paper joins their call to human responsibility and ethical accountability for the effects our practices have in the world's process of becoming, across dimensions of social life, thus implicating questions of knowledge, power, and social justice.

RN33_T03_02 | Global and Local Feminism

Transgender Youth During COVID-19 Pandemic: "I Miss Us"

Nina Perger

University of Ljubljana, Faculty of Social Sciences, Slovenia

As Europe has stepped deeply into the second wave of COVID-19 pandemic, the professional communities across various fields increasingly call for a more differentiated approach concerning the research, design, implementation and communication about the COVID-19 related protective measures and their wider social effects. As it is becoming evident by mostly quantitative research, the negative effects of the pandemic situation, either in terms of illness or in terms of secondary effects of the pandemic (i.e. unemployment, mental health issues) are disproportionately distributed across various social categories. It is said that the pandemic situation appears to amplify already-existing inequalities, and LGBTIQ+ community is one of the communities that has been hit particularly hard. In this paper, we present the results of a research on Slovenian transgender community's experiences of a pandemic situation in terms of general experiences of COVID-19 protective measures, with a special attention given to the health care system access, given that the protective measure of cancellation of the elective health care services was put into practice in order to avoid overburdening the health care system. In the research, 11 transgender people participated either in focus groups (3) or in in-depth interviews (2). In addition, interviews with transgender experts from LGBTIQ+ related nongovernmental organizations (3) were conducted. This enabled us to gain in-depth insight into individual experiences and general overview of how the transgender community has experienced pandemic situation. Data show that COVID-19 protective measures are experienced in a negative way, especially by younger individuals – those who extensively rely on LGBTIQ+ community support, and those who have yet to complete gender affirmation procedures.

Towards a Feminist Approach to Supporting Refugee Women

Inga Hajdarowicz

Jagiellonian University, Poland

The ongoing military conflicts in the Middle East and the growing number of refugees pose new questions to academics and activists. Gaps in institutional aid and the critique of humanitarian assistance and development work have encouraged new initiatives that analyse existing mechanisms and create spaces of cooperation between those who are in need of support and those who provide it. Referring to the post-colonial critique, the initiatives opt for more grassroots and horizontal approaches that include diverse voices from marginalised communities and strengthen their feeling of subjectivity and agency. Such approaches can be found in the work of some of the feminist organizations working with Syrian refugee women in Lebanon. Beside psychosocial support and basic education training, they open a space for women political participation that can be practised on the grassroots level, even in the precarious and temporal context of exile. Who are the main actors behind those grassroots organization? How do they support refugees women's political participation? What forms of politics do women get involved in? I will answer these questions based on my doctoral field research with a Syrian women organisation in Lebanon, which aims at supporting refugee women's participation. I conducted ethnographic research with a woman centre being the primary location for my research and Women Leadership Program the main space of my observations. After accompanying women in their learning process, I complemented my observations and everyday conversation with in-depth interviews with 34 emerging Syrian grassroots women leaders.

Reconceptualizing Feminist Activism: How Feminist Identity (Might) Translate Into Activism

Kristína Papcunová

Charles University in Prague, Czech Republic

Extensive research into the framing processes for feminist collective action has contributed significantly to the recognition that the sense of injustice and solidarity is an important motivation to overcome obstacles and to achieve a social change. Therefore, the presentation will explore various forms of feminist commitment to building the solidarities in the Czech Republic, which play central role in forming a collective identity within the feminist movement. The objective of the study is to elucidate the question of how women in the Czech Republic develop their feminist identification and to analyze in detail the cultural, political or social factors that influence their motivation for the activist engagement. Using data from biographical narrative interviews with feminists and feminist activists, in this presentation I will analyze the narratives of feminist identity and activism and their relevance in everyday life. The interviews reflect their experience with offline and online activism, the process of identifying with feminism or their previous experience with social justice activism. Furthermore, I will explore the question how feminists make sense of what it means to them to hold an identity of feminist and how this identity might translate into feminist activism.

Hacia La Huelga Feminista: Feminist Strikes In Spain And (Re)configurations Of Feminist Activisms Towards Change

Tayrine Dias

UOC, Spain

The 2018 and 2019 feminist strikes in Spain were multitudinous: at least hundreds of thousands took to the streets to protest on March 8 and around five millions workers went on partial or 24-hour labor strikes both years. Inspired by previous mobilizations in Latin America and Europe, feminist activists (re)claimed and (re)imagined a classic repertoire of contention: they called for labor, student, care and consumption strikes. The strikes were conceived, organized and performed by national and local-level networks of activists who joined efforts to debate, enact and connect through contentious practices.

The feminist strikes were groundbreaking for feminist movements at least in Spain if not in Europe, considering its transnational spillover with feminist strikes taking place in Germany, Portugal, Belgium and France, among others. The feminist strikes in Spain did not lead to the formation of 'a' new social movement in itself, but they cannot be reduced to a one-day public campaign. This is a case of women on the move: organizing strikes led to the very (unfinished) process of (re)shaping alliances, practices and political projects that put into question the taken-for-granted, the status-quo, the unsaid or the absent across intersecting dimensions of race, class, ethnicity and sexuality to (re)imagine the future in a context of crisis. Which (re)configurations of feminist activisms did the journey towards the feminist strikes propel? How did these groups (re)signified 'strike'? Which contradictions, dilemmas or conflicts emerge from these disputes for different ways to understand feminism activism and feminist contentious practices? To answer these questions, I conducted an extensive two-year fieldwork in Barcelona following meetings, events and protests, and analyzed material from semi-structured interviews, participant observation, documents and newspaper articles.

RN33_T03_03 | Gender Inequalities and Poverty

Intersecting Inequalities in Women's Life Paths and Their Strategies to Cope with Poverty

Elsa Guedes Teixeira, Helena C. Araújo

Universidade do Porto - FPCE, Portugal

In the last decades, perceptions about welfare have changed and recipients have been accused by mass media, politicians, and by public opinion, of dependency, laziness and fraud. This perception was also on the basis of active social policies, created to reinforce individual responsibility and 'autonomy'. This presentation aims to challenge some of the stereotypes specifically related to poor mothers, showing the idiosyncrasies of their paths and highlighting their strategies to cope with poverty within an inequality context.

The research draws on the work of Intersectionality authors, Equality Studies and Bernard Lahire's dispositionalist approach, to examine the ways in which inequalities intersect in the lives of poor mothers, and to explore how they resist the material and affective inequalities that pervade their lives. To explore the subject, sixty in-depth interviews were held with women from Portugal. Besides a clear intergenerational reproduction of poverty, characterised by the lack of economic resources, participants' social exclusion was deeply connected with affective inequalities, such as abuse and neglect in early childhood and domestic violence in adulthood, which have had emotional, health, economic and educational implications.

However, despite inequality, poor women had strategies to deal with their lives' constraints. Most interviewees had a defined strategy for upward social mobility, especially concerning their children's future and their agency was thus strongly related to children's care and the prioritization of their needs.

The research revealed that the income support allowance's value is clearly insufficient for the families' needs. In fact, it enables mere survival, keeping the interviewed women in a state of dependency towards welfare, making them vulnerable to abuse, thereby conflicting with the objectives of 'autonomy' for which they were designed.

Addressing the Gender-Poverty Nexus in the Post-Pandemic Era

Lindsay Blair Howe

ETH Zurich, Switzerland

The Covid-19 pandemic has sharply revealed the complex dynamics of gender, mobility, and poverty that shape space and everyday life. Post-pandemic policy has the potential to become transformative, if it can build on this to better identify and address the needs of these vulnerable social groups. This requires an intersectional understanding of the factors that drive their household decision-making processes and their movements. As part of a long-term comparative research project into the Gauteng City-Region (GCR) of South Africa, this paper presents two mixed-methods studies in the informal settlement of Denver, located just outside Johannesburg's city center. It discusses the results of focus groups, ethnographic and expert interviews, as well as mapping with an innovative smartphone tracking application, comparing everyday life for several households in this area in before the pandemic in 2019 and during the pandemic in 2020. Preliminary findings show that the female participants in Denver – already subject to significant burdens related to gendered roles of household management, childcare, and poverty – reported intensifications of gendered care and housework since the onset of the pandemic, and suspension of the crucial circuits of regional-scale familial migration that underpinned their livelihoods. The Covid-19 crisis is thus exacerbating several forms of inequality. The nexus between poverty and gendered spatial practices must be better embedded into both socio-spatial theory and policy conceptualization, if responses to the pandemic are to generate more equitable, resilient futures for the women of Denver, informal settlements of the GCR, and such vulnerable populations around the globe.

The Facts Survey – A Longitudinal Approach to Examine Gender Inequality in Electronic Music Festivals

Tanja Ehmann[1,2], Angelika Lepper[2], Corina MacDonald[2], Meg Wilhoite[2], Michelle Endo[2], Stephanie Roll[2], Susanne Kirchmayr[2]

[1]Catholic University of Applied Sciences Berlin, Germany; [2]female:pressure

Since 2012, members of female:pressure, an international network of women and LGBAT*I*QQ artists in electronic music, have conducted the FACTS survey, aiming to assess the gender distribution among artists performing at electronic music festivals. While there is no geographical restriction for inclusion in the survey, the focus is on Europe and North America. For each festival, FACTS volunteers collect gender data of the performing artists via festival websites, internet platforms for electronic music, or email enquiries with festival organisers. In addition, data on the type of funding, festival size (attendance), and gender of the artistic directors is assessed. If possible, data is verified by a second assessment. The latest 2020 survey includes 393 editions of 158 different festivals from 37 countries that took place in 2017 to 2019. A steady rise in female acts over the last eight years is observed: the proportion of female acts overall rose from 9.2 percent in 2012 to 24.6 percent in 2019 at festivals for electronic music. Larger festivals tend to have lower proportions of female acts, while publicly funded festivals and festivals with female artistic directors tend to have higher proportions of female acts.This disproportionate gender ratio can be interpreted as a structural discrimination in electronic music. In this regard, we would also like to discuss how to conceptualize and operationalize ethnicity of female artists within the framework of the FACTS survey and towards the field of electronic music festival culture in order to measure intersectional inequality due to gender and ethnicity.

Struggling Against Crisis: Italian Music Industry, Gender Inequality and the Solidarity As A Post-covid Effect

Alessandra Micalizzi

SAE Institute, Italy

Creative media can be seen as a socio-cultural context where models and practices are legitimated as well as an industry's sector that covers the 6,9% of the Italian GDP (Gross Domestic Product).
Music market is part of this specific area of our economy and, like other cultural and economic contexts, are dominated by a gender inequality (Unioncamere, 2019).
It is not only an Italian issue even if Italy represents the country with the highest gab between, for example, men (91,85%) and female (8,15%) productions (IMAE, 2019). However, beside such an unbalanced production, the economic value generated by female singers and performers is more than double (ivi).
Indeed the gender inequality is a wider socio-cultural issue that is a part of all the work market and it is a results of a generalized and pervasive masculine point of view that collocates women in a complementary position (among others Volpato, 2018, Connell, 2009, Carson, M, Lewis, T, & Shaw, SM 2004, Witheley, 2010).
This paper aims at presenting the main results of a qualitative study on the role of women in the Italian music industry. We carried out 40 narrative interviews with women that are at different stage of their careers in music industry. We added also 10 interviews with men priviledge observers.
We tried to highlight some dynamics triggered by the pandemic crisis: gender solidarity and the attempt to create communities of practices is one of the real great responses of the movement to women within the Italian music industry.

RN33_T04_01 | New Challenges in Gender Based Violence Research

Sociological Patterns of Femicide: a Focus on Female Geronticide

Shalva Weil

Hebrew University of Jerusalem, Israel

The study of femicide has now been established as a legitimate field. It is now time to diversify research interests and focus upon different sociological patterns of femicides characterizing different age groups, ethnic groups and classes. One of these fields is female geronticide, or the killing of elderly women because of their gender. Female geronticide constitutes approximately one tenth of all femicides globally, irrespective of culture. Within this field, different patterns of gendered geronticide can be ascertained, depending on the attitude to elderly persons, and the value of women in society. The paper surveys the limited research into the field globally, and focuses on a case-study of female geronticide in Arab and Jewish societies in Israel over a decade. The paper suggests that it is possible in many cases to predict female geronticide, and therefore it is possible theoretically to prevent it. This would reduce the number of femicides perpetrated annually.

Representations Of Femicide In The Public Arena: Political And Media Discourses

Simona Tirocchi, Marinella Belluati

University of Turin, Italy

In recent times, the representations of femicide have become relevant issues in the public debate, with regard to media coverage, journalistic visibility and academic attention. Despite this increase, visibility does not guarantee a good way of dealing with gender issues and, above all, of representing femicide and gender violence in general.

Why and in what way are these prevailing representations shaped by journalistic cultural and communication practices?

This contribution aims to reflect on the prevailing forms of representation of femicide, in the light of the final results of the Italian research unit of the PRIN project (Projects of relevant national interest - Ministry of Education, Italy) "Social representations of violence against women: the case of femicide in Italy", carried out from 2015 to 2017.

Starting from the content analysis of public debates and interviews to journalists and politicians, the research results conclude that the issue of femicide in the media constitutes a complex representation that configures a broader cultural and symbolic horizon and which provides a frame in which to embed the discourse. To promote proper representations of women and affirm a culture of respect between genders, it is necessary to adopt a critical perspective towards information mechanisms and give attention to the importance of media education, primarily aimed at citizens, and directed to public and media sector.

1078

Gender Equality, Sexual Tolerance and the Use of Social Media in the Formation of Attitudes About Justification of Violence Against Women

Pilar Rodriguez Martinez

Universidad de Almeria, Spain

Following the modernization theory (Inglehart and Norris), both attitudes about gender equality and sexual tolerance (defense of divorce, abortion and homosexuality) increased in the social modernization process and helped to explain the rejection of violence against women ("justification for a man to beat his wife") as some author pointed out (Rodriguez and Khalil, 2013). However, new information technologies (particularly the use of social media as a source of information) may be having a negative effect on the defense of equality and sexual tolerance, and consequently, in the justification of violence against women, if men use more social media than women. In this paper, we present the results of an analysis of World Values Survey (2017-2020) for two countries: Germany and the United States. The comparison (based on the construction of a structural equation model) allows us to conclude that Germany follow the prediction of the modernization theory, because sexual tolerance and gender equality contribute to the rejection of gender violence. In Germany the use of social media as source of information is associated with the justification of violence because men use social media as a source of information more than women do. But in USA, even if gender equality decreases the justification of violence, advocacy of sexual tolerance leads to an increase of justification of violence. The use of social media, in this case, do not have any effect on the justification of violence because women use more social media than men do.

RN33_T04_02 | Gendered Organizations

The Transformation of Patterns of Gendered Organizations in Response to the COVID-19 Pandemic: Evidence from the Russian Public Sector

Maria Davidenko, Anastasia Poretskova, Valeriya Utkina

Higher School of Economics, Russian Federation

In response to the first wave of the COVID-19 pandemic, the federal government in Russia introduced a series of measures that included remote work. Despite these measures, in the strongly-feminized public sector, employees frequently had to work extended hours in the office. We conceptualize the COVID-19 pandemic as an external shock that has influenced interactions at both structural and individual levels at the workplace. Drawing on interviews with female public servants working for the federal government, this paper aims to answer the following research question: how did basic patterns and characteristics of gendered organizations change during the COVID pandemic? To do so, we will compare female workers' expectations and actual practices related to anti-COVID policies. We operationalize our interviews on the basis of five processes that reproduce gender in organizations: the division of labor, cultural symbols, workplace interactions, individual identities, and organizational logic (Acker, 1990). The feminized public sector is an interesting case to examine since public service motivation has long been theorized as having gender dimensions—compassion, attraction to public policymaking, and commitment to public service—that might influence different organizational processes, including individual identities. We use an interpretative phenomenological analysis to grasp individual expectations and experiences of workplace policies. Our study aims to contribute to theory by teasing out how each of the five organizational processes operated under the influence of this unexpected external shock and the ad-hoc measures introduced.

Women and Men in the Portuguese Digital Games Industry: the Impact of Covid-19.

Luciana Lima[1,2,] Camila Pinto[3]

[1]Interactive Technologies Institute (ITI/LARSyS); [2]Faculty of Fine Arts, University of Lisbon; [3]Independent Researcher

The history of human civilization has shown us that in every crisis, being it environmental, religious, political, health or economic-financial, men and women are affected differently in various dimensions of their lives: family and work contexts, physical and mental health, etc. This means that the impacts of crises are never gender neutral, and the COVID-19 pandemic is no exception. This paper shows the preliminary results of a qualitative investigation which aims to identify what were the immediate effects of COVID-19 pandemic for women and men employed in the Portuguese digital games industry, namely the changes in their routines during and after the lockdown in Portugal. It also seeks to investigate how women and men reconciled their personal and professional time during the lockdown. Nine women and five men were interviewed. All of them had work experience in Portuguese digital games companies. The results showed differences in the self-management of work time, namely most of the women interviewed followed a fixed work schedule, while the men were guided by the projects they had to perform. Labor flexibility, remote working, and the use of information and communication technologies, inherent characteristics of this industry, contributed to the absence of significant changes in the routine of the interviewed workers. This paper is an empirical contribution on the impacts and constraints placed by gender social relationships on individual responses to pandemics and post-pandemics.

Forms Of Work In Spain Along Three Generations Of Women: A Qualitative Longitudinal Analysis

Constanza Tobío[1], María Teresa Martín-Palomo[2]

[1]Carlos III University of Madrid, Spain; [2]University of Almería

Focusing on the Spanish case, the paper examines the relationship between the transmission of employment patterns over generations and the involvement of women in the labour market. It looks at how a macro phenomenon, women in paid work as a new social norm, operates at the micro level, and the extent to which continuities exist between grandmothers, mothers and daughters that delay or advance the trend towards an adult worker model. The concept of path dependency is helpful to understand the transmission of work patterns from one generation to another. Qualitative longitudinal data are used, based on life histories of ten generational triads (30 interviewees) which represent different combinations of paid and unpaid work (traditional, transitional, modern and regressive.

1080

Structures of Technology Startups as a Context for the Production and Reproduction of Gender Patterns

Edyta Tobiasiewicz

Jagiellonian University, Poland

The purpose of my lecture is to present the preliminary results of larger research (project financed by the Polish National Science Centre, no. 2020/37/N/HS6/03913), focusing on the analysis gender patterns, produced and reproduced by social actors operating in technology startups in Poland. Important assumption adopted in the research is the belief that although the structures of technology startups are oriented towards implementing innovations and are organized in a non-traditional, non-hierarchical way (Christensen 1997, Kulej 2018), gender is an important category within them, that differentiates the division of labour and organizational power (and take on forms different from those typical of traditional, hierarchical, highly formalized organizations). Because

the heuristic framework of the research are referred to integrative concepts of gender (Connell 2006, Martin 2004, 2006), I understand gender patterns as recursive, complex relations among social practices and organizational structures. Based on the data collected during the research I will present: gendered strategies undertaken in relation to various situations occurring in the professional environment; positions occupied by units, expectations connected with them, scope of decision-making and duties; mechanisms of stratification; and a set of gender rules and norms in startups. The methodology of the project are derived from the multi-sited ethnography tradition. My analysis will be based on empirical material gathered from 15 semi-structured in-depth interviews with people representing the technology startups environment (investors, employees of various levels, business angels, mentors, managers) and existing materials (desk research), such as websites of institutions related to startups, regulations, documents or announcements related to (startup) events.

RN33_T04_03 | Work-Life Balances

Parental Leave and Home-Office: The Gendered Impact of the Covid-19 Pandemic. Empirical Evidence from Austria.

Gerlinde Mauerer

University of Vienna, Austria

In 2020, I submitted an abstract for the RN 33 midterm conference aiming at discussing "Parents' Experiences at Work and (Global) Future Perspectives". Meanwhile the pandemic has caused the gendered effects in the working sphere and he private. I explored this effect in a study on "Parental Leave and Women at Work in Vienna. Parents' dual Reconciliation of Work and Family (09/2020-02/2021). I would like to discuss these results referring also to my previous empirical outcome (Mauerer/Schmidt 2019; Mauerer 2018b, 2018a). Referring to parents' health, previous results showed an improvement of men's health during their parental leave, as most fathers got support from their partner and had time to do sports and meet friends. Furthermore, I

discovered a high level of gender inequalities at the workplace. The effects of the Covid19-pandemic tend to reinforce these inequalities, as welll as a traditional gendered division of labour, especially in employers' view.

Methodically, I have used the Grounded Theory (Strauss/Corbin 1990), as the studies aimed at generating theories of medium range regarding men on parental leave, based on data beyond single cases. The applied interview method was based on problem-centered interviews (Witzel 2000), suitable for surveying data on isolated issues or problems, without neglecting the relevant settings of the interviewees.

In my conference contribution I would like to discuss working parents' challenges before, during and after the pandemic, focusing on parents' dual reconciliation of work-family, family life and working time arrangements.

Gendered Realities During Covid-19 in Iceland: Work-life Balance from the Perspectives of Working Mothers

Valgerður Bjarnadóttir[1], Andrea Hjálmsdóttir[2]

[1]University of Iceland, Iceland; [2]University of Akureyri, Iceland

The paper explores the gendered realities of work-life balance in Iceland during the Covid-19 pandemic, in particular how these societal changes reflect and affect the gendered division of unpaid labour, such as childcare, household chores, and mental load. The study draws on written, open ended real-time diary entries, collected daily for two weeks during the peak of the first wave of the pandemic, in March and April 2020. The entries represent the voices of 37 mothers in heteronormative relationships.

The findings show how burdened the mothers were in their everyday life during the first wave of the pandemic, juggling time between work and childcare. Their words reflect a reality in which they shouldered more of the housework and childcare than their partners. They also described intense emotional labour, as they tried to keep everyone calm and safe. The division of tasks at home lay on their shoulders, causing them stress and frustration. The findings suggest that, even in a country that has been branded as a gender equality paradise, an unprecedented situation like Covid-19 can reveal and elicit strong gender norms and expectations towards mothers.

While the personal and rich reflections presented in the diary entries provided invaluable insights into everyday

life of working mothers in the first weeks of the pandemic, we also found it important to follow up on how the situation developed. Therefore, semi-structured follow up interviews are currently being conducted and our aim is to include them in the analysis for this paper.

Diversifying Corporate Policies for Working Parents in the Digital and (Post)Pandemic Age

Olga Savinskaya

HSE University, Russian Federation

The study explores the practices of combining professional and family life of parents in business organizations as one of the dimensions of gender equality in the workplace. The SARS-2019 pandemic had intensified these issues. What are the established ways of solving the issue, and what are the new mechanisms and tools for solving the work-life balance based on the digital society facilities? How are the different types of families to which workers belong are considered in the corporative support measures? Do HR personnel recognize the need to diversify corporate policies to support workers with different family responsibilities or different gender roles in the families? These rather practical questions will answer sociological research questions. Do corporate policies to support employees with family responsibilities reproduce traditional gender roles, thereby perpetuating gender inequality in society? Do the policies to support employees with family responsibilities help to shape the diversity of the family life of employees, or do they target the main forms of families with children (nuclear, complete, with a traditional distribution of gender roles in the family) and discriminate against atypical families (large, single-parent (mothers and fathers), with disabled children who have special hobbies (including involvement in different subcultures), etc.)? How do new formats of work in a digital society (and especially in the pandemic) change working conditions and create new opportunities and new barriers for combining professional and parenting responsibilities?

Gender and Equality-Promoting Communicative Practice in State Welfare Representatives' Interactions with New Parents about Parental Leave

Marie Flinkfeldt, Frida Höglund

Uppsala University, Sweden

This paper investigates the Swedish welfare state's adoption of gender-neutral language in relation to parental leave. Despite gender-equal regulations, Swedish women use most of the parental leave, which impacts negatively on their incomes, pensions, and health. In addition to reforms and campaigns, the state's equality-promoting work includes developing more inclusive language practices. For example, official terminology is non-gendered (parental, not maternity/paternity leave) and information is designed to suit various family constellations ('the pregnant parent' rather than 'the mother'). While this shift has been observed in official documents, little is known about the use of non/gendered terminology in informal welfare encounters with parents. What happens in such 'street-level' interactions is important since state policy is here realized in conjunction with personalized service provision. We use conversation analysis to examine 559 recorded phone calls and 378 emails between clients and welfare representatives, focusing on references to a non-present parent (e.g. your husband, your partner). We show how welfare representatives avoid heteronormative presumptions by non-gendered references (e.g. 'the other parent') when gender is unknown, thus aligning with equality-promoting objectives. However, when clients make gendered references (e.g. 'my wife'), welfare representatives nevertheless tend to respond in gendered-neutral terms. Opting for less specific terms than clients themselves use diverges from how reference in conversation typically works. We thus argue that gender-neutral language may come at the cost of formality, standardization, and de-personalization, and discuss how welfare organizations can implement an inclusive language that avoids such pitfalls. This analysis brings new knowledge on how welfare organizations can work to promote gender equality.

RN33_T05_01 | Domestic Violence and the Covid-19 Pandemic

Addressing Violence Against Women Under the Covid-19 Pandemic Through Communication. A Comparative Analysis of European Countries' Public Communication Campaigns.

Gabriella Polizzi

Università degli Studi di Enna "Kore", Enna, Italy

The public debate on violence against women under the COVID-19 pandemic which has recently developed within and outside Europe has highlighted that the risk for women to be victims of domestic violence have been made more severe by the conditions of home isolation with violent partners which national governments have imposed to reduce the spread of the virus.

In order to provide additional support to current as well as prospective victims of domestic violence under the pandemic, the national governments of an increasing number of European countries have set specific anti-violence measures and launched public communication campaigns to spread information about them.

From these premises, this paper aims to explore the contribution of European countries' public communication campaigns for addressing the issue of male violence against women under the COVID-19 pandemic as a "double emergency".

To achieve this goal, the paper presents the objectives, method and results of a comparative analysis of the public campaigns launched by the national governments of some of the most affected countries in Europe, such as Italy, France, Spain and the United Kingdom.

The ultimate purpose of the comparative analysis is to identify what frames of representation of the violence against women emergency as connected to the COVID-19 emergency can be traced in the campaigns' media texts. Research results show how the campaigns portray victims, perpetrators as well as witnesses of violence under the COVID-19 pandemic, what types of recipients and ultimate beneficiaries the campaigns are targeted to, what beliefs, values and behaviour the campaigns are intended to deconstruct or, conversely, foster, and lastly, what specific types of anti-violence services the campaigns promote to address the double emergency.

Cyberactivism: Domestic Violence In The Pandemic

Maria Antonia Moráz Fiorini

Universidade do Porto, Portugal

The coronavirus pandemic emphasized women's vulnerability to restrictive measures enacted by governments. Confinement forced women to live daily with their partners in order to enhance domestic violence. The present study aims to understand the cyberactivism developed around the increase of domestic violence in times of confinement in four social networks of feminist movements in Portugal, taking into account the contents and the way in which cyberactivism is being used in the pages of the Facebook of feminist movements in Portugal on domestic violence during the pandemic. Content dealing with the subject was selected on the Facebook pages of Feministas em Movimento, Feminismos sobre Rodas, Rede 8 de Março and Frequência Feminista between April 18 to May 18 and January 15 to February 15, 2021. The clipping The research team will understand the content published on the pages during the two periods, in a comparative perspective. The main themes addressed are the history of feminist movements (Freire, 2010), the appropriation of social networks by movements (Câmara, 2016) cyberspace and cyberactivism (Fonseca, 2018). The research will use a methodological approach based on content analysis (Bardin, 1977) to guide the analysis of posts. After the analysis, it will be possible to identify the approach given to the occurrences of domestic violence during the pandemic through the pages of Portuguese feminist movements, the main forms of cyberactivism and the formats of the initiatives taken in this context of domestic violence during the pandemic.

Breathing Between Threat and Security: A Posthuman Perspective on Domestic Violence in Times of the Covid-19 Pandemic

Grit Höppner

Catholic University of Applied Sciences, Germany

In times of the Covid-19 pandemic violence in partnerships increases and also the ambivalence of threat and security that persons affected by violence have to deal with. This ambivalence becomes virulent through the analysis of breathing. In a posthuman reading (Barad 2007) breathing is a process in which humans are just as involved as forms of nonhuman materiality (Górska 2016), such as visible breathing masks and the non-visible virus.

In applying this idea to women affected by domestic violence the analysis of interviews and observations shows several breathing constellations, in which the ambivalence of threat and security is expressed in different ways. The carefree breathing in the own living space can transform into a threatened breathing when the partner is more often present through home office, short-time work or unemployment or if the virus is instrumentalized as a means of promoting violence. If women move to a shelter, visible protections must be taken to ensure safe breathing, however, the women can become a threat to other people through breathing. Unsafe breathing in public occurs when women feel constricted by the mask due to their experiences, and fears are reactivated or they cannot recognize their counterpart because of his breathing mask.

A posthuman perspective on domestic violence through breathing points up vulnerabilities that affect women more than men in their everyday experiences. The paper shows that breathing is not a gender-neutral bodily process, but a way of stabilizing ideas of femininity and masculinity and gendered power relations.

RN33_T05_02 | Women, Gender and Migration

Gender (equality) ideals among young migrants in Berlin

Katarzyna Wojnicka

University of Gothenburg, Sweden

The debates at the nexus of migration and gender often focus the supposedly diverging values Muslims and Christians have in regard to gender equality, including norms of femininity and masculinity. Highly politicized discussions center Muslim women with burqas or young refugee men performances of 'dangerous masculinity'. Such migrant feminities and masculinities are considered to be at odds with liberal, western values and undermine the efforts for more gender equality in western societies. Only few studies have so far addressed such issues and our paper intends to close this gap. We adopt an intersectional lens to investigate how young (16-29 years old) male and female migrants with roots in different world regions imagine their own and others' ideal of masculinity and femininity, and which role they assign to gender equality. We use data collected in 2019 in Berlin, Germany. While all research participants – alike the non-migrant youth – wishes their life partnerships and friendships to be based on equality, we see that their ideals of feminities and masculinities are underpinned by racialized social relations. Analyzing different kinds of data, including narratives generated in in-depth individual interviews, focus group discussions and thematic visuals produced during the research by our participants, we go beyond the explicit accounts of feminities and masculinities. In conclusion to our paper, we discuss how imaginaries of feminities and masculinities shape gender (in)equality, and how concealed racism undermines the efforts for more gender equality in Germany.

The Polish Female Migrants During COVID-19 Pandemic in Norway

Elżbieta Anna Czapka, Monika Mazurek

University of Gdańsk, Poland

The COVID-19 pandemic has become one of the most important public health crisis in Europe. It affected the societies not only on health, and at the socioeconomic level, magnifying already existing social inequalities. Migrants often belong to population groups with lower socioeconomic status including poor living and working conditions.

In the paper, we will present the results of quantitative online survey of Polish migrant women in Norway. The Polish migrant women are in a particularly difficult situation as many of them have family obligations in both Poland and Norway. The paper will discuss the impacts and implications of the pandemic on the Polish female migrants in Norway. We will look at their situation on the labour market, health and access to healthcare services, transnational activities and gender dynamics in the families.

The paper will also discuss how Polish female migrants experience the existing borders, both real and symbolic. Until now, the borders in Europe were rather invisible, symbolic. The pandemic has made them visible, sometimes impassable and very real. For the first time in a very long time, national borders have been closed and for some people it was impossible to return home.

Searching Gendered Unpaid Labor in Turkey's Migration Narratives: The Representations of Guest Hosting Women in the Process of Urbanization

Elif Sabahat Uyar Mura

Canakkale Onsekiz Mart University, Turkey

This study traces the way women's guest hosting is represented in Turkey's migration narratives. Within the context of gradual process of rural-urban migration, short-term and long-term guest-hosting have functioned as an access mechanism for the extended family networks to urban-based facilities of education, work, and health. Young migrant women have mostly shouldered labor-intensive tasks of hosting as gendered unpaid work. Neither guest hosting nor women's hosting work have attracted much attention in the migration studies despite the widespread acknowledgement of utility of solidarity practices among migrants to alleviate the conditions of poverty. On the contrary, the prominent works of the literature and cinema have not overlooked migrants' guest hosting and often captured the tension between overnight guests and hosts as one of the significant parts of social life. For example, Oğuz Atay's famous novel Tehlikeli Oyunlar (1973) starts with the stream of consciousness of the protagonist Hikmet, a young man who recently migrated to Istanbul staying in an acquaintance's home as a guest. Likewise, two migration movies, Köyden İndim Şehire (1974) and Züğürt Ağa (1985) portrays the tension between urban hosts and guests although exclusively from men's and guests' perspectives. The protagonists stayed with a relative or acquaintance in the city and presumed that they are entitled to the women's labor in that household. This research provides a thorough analysis of such popular narratives in the peak years of migration with a specific focus on gendered unpaid labor of hosting women.

1085

The Intersections Of Gender, Migration And Illiteracy In European Social Policy

Margarida Barroso

Universidad Autonoma de Madrid, Spain

Despite decreasing levels of absolute illiteracy over the last decades, women still represent two thirds of the world's adult population unable to read or write (UNESCO, 2016). Women also constitute 48% of the worldwide migration and 52,4% of Europe's international migration (IOM, 2018). Therefore, the intersections of gender, migration and illiteracy are shaping the lives of many women in contemporary societies, raising the need to debate how social policy is responding to the specific needs of these individuals.

In this presentation, we aim to discuss the intersections of gender, migration and absolute illiteracy in European social policy, based in the content analysis of reference EU policy documents in the fields of gender, migration and education.

Using Matsuda's method "ask the other question" (Matsuda, 1990), results show good developments in the integration of a gender perspective in migration and adult learning policies, and at the same time, the consideration of the low skilled and of the migrant population in gender equality policy. However, the confluence of gender, migration and illiteracy, have not yet been comprehensively addressed at the EU level.

We argue that the illiteracy of migrant women configures concrete challenges for social integration and remains as an invisible phenomenon in European social policy, despite the existence of EU funded literacy programs in place in several Member-States.

Following Beluda's (2017) and Manuel's (2006) analysis, debate is still needed on how public policy can succeed in addressing the needs of the populations with different social locations.

Covid-19 Outbreak Experiences of Women Over 65 Living in Istanbul: Deepening Inequalities and Sources of Resilience

Esra Kaya Erdoğan

Postdoctoral Independent Researcher, Turkey

The COVID-19 outbreak has affected every social segment worldwide, and especially those people over the age of 65, at various levels of impact. Research conducted during this period makes the argument that the pandemic has deepened gender-based inequalities and has also revealed a social care crisis. The research we conducted between July-December 2020 revealed that women and men experience the pandemic in different ways . This research* includes both qualitative and quantitative methods, and was undertaken for the purpose of understanding and explaining the social sources of resilience of the population aged over 65 and living in İstanbul. After a survey conducted with 502 individuals and interviews held with 50 individuals, our analysis indicates that the pandemic introduced additional daily burdens and responsabilities for women. Apart from the visible and direct consequences of increased domestic work, women are subject to pre-existing structural and historical inequalities, such as low personal income. In addition, differences such as age, income, education, and profession among women, impacted the effects of the epidemic within the context of economic and socio-cultural capital. There were differences between men and women, as well as among the women themselves, with respect to the sources of resilience and coping mechanisms developed against the pandemic's adverse effects. The proposed text conveys women's experiences of the pandemic within the contexts of gender inequality and the sources of their resilience.

"I am Not That": Reflections About the Intersections Between Gender, Ageing and ICT

Andrea García-Santesmases[1], Daniel López[2], Roser Beneito-Montagut[3]

[1]Universidad Nacional de Educación a Distancia (UNED); [2]Universitat Oberta de Catalunya (UOC); [3]Cardiff University

This presentation analyzes the intersection between gender and age in mediated practices of social connectedness to uncover their models of femininity and masculinity. It draws on an ethnographic study of the media ecologies of older people (BCONNECT: The Digital Lives of Older People). The study involved 22 people (13 women and 9 men), average age of 79 years, living in three different housing arrangements: own house, sheltered housing for older people and care homes. It pays attention to the role of ICTs, not focusing on specific digital technologies but any old or new technology older people have incorporated into their daily lives to stay connected. In this presentation, we discuss two significant aspects of their mediated practices of social connectedness that are different for men and women: firstly, the participants allude to their past (live histories, body and relationships) to re-position themselves as successful subjects; and secondly, they also relate to each other, using the marks of gender and age, to approach and differentiate themselves, perpetuating sexist and ageist stereotypes around (in)competence and (un)desirability. This analysis allows to see how ageism and heterosexism are systems of social differentiation which are also embodied and present in technologically mediated relations.

"Coping with COVID-19 at Home" for Youth in Turkey – a Gendered Perspective

Nilay Çabuk Kaya, Mukaddes Uzbay Ülgen, Cansu Okan

Ankara University, Turkey

This study examines the findings of a research project about the pandemic experiences of youth during the COVID-19 in Turkey and the dynamics affecting these experiences, through a gendered perspective. In this mixed-method research, 955 surveys are conducted with young adults, aged between 18 to 30 and 40 in-depth interviews were carried out with 20 women and 20 men selected with nested sampling.

Due to a global emphasis on "social" distancing as a major precaution against the spreading of the virus, "staying at home" gained importance. Moreover, the data in this study shows that the majority of the participants live with their families during the pandemic. Thus, this study focuses on the domestic dynamics and their impacts on youth's way of coping with the COVID-19. The main argument of this study is that instead of developing a new form of the domestic division of labor in Turkey, gender stereotypes are reproduced under the conditions of the pandemic. While "staying at home" means more responsibilities for the young women, it means more involvement in productive activities for young men. Additionally, the findings of this study suggest that compared to men, women adopt positive coping strategies more commonly, as well as making use of emotional and behavioral coping strategies more often. These gendered differences of youth's experience during the pandemic are discussed comprehensively in relation to their familial relations, educational experiences, social relations, economic situations, and daily experiences.

Keywords: Gender and COVID-19; youth, gender and pandemic experiences; gender stereotypes

Health Crisis, Social Crisis, Gender Crisis. Focus on Gender Inequalities in the Aftermath of the Covid-19 Pandemic

Susanna Pagiotti, Gaia Matilde Ripamonti

Università di Perugia, Italy

The Covid-19 health crisis soon turned into a social crisis that strongly impacted the most vulnerables. The pandemic has contributed to stress inequalities already widely spread in the society, as gender ones. According to ISTAT, in Italy less than a year after the beginning of the pandemic, a dangerous reversal is already being recorded in the living conditions of Italian women. However, it is still necessary to investigate the characteristics of the phenomenon to fully understand it. This proposal goes in this direction. An online questionnaire was submitted to the citizens of Umbria (region in the centre of Italy) during August 2020, between the first and the second wave of the pandemic. The survey was organized in different thematic sections on demographic and socioeconomic characteristics of respondents, and on the impact of the pandemic in terms of personal well-being. Thanks to the sample of 1,092 respondents, it was possible to outline the features of the new scenario.

The survey has allowed to add important considerations on psychological and socioeconomic conditions of the female population during the pandemic, also in relation to the male condition. Preliminary results show that the 2,3% of female respondents were fired during the first wave of the crisis, for 16,5% of them job activity was suspended, and this is even more true in the case of low-skilled jobs; overall, 61,7% of women reported a high level of stress, especially the younger ones who result the most affected by the crisis.

Black Female Nurses Working Through the COVID-19 Pandemic in the British National Health Service an Intersectionality Perspective

Beverley Brathwaite

Middlesex University, United Kingdom

Nurses occupy front line position putting them more at risk of exposure to the corona virus. Nursing continues to be a female dominated profession and amongst females, death rates are 3.3 times higher in the Black ethnic group, and 2.3 times higher in the Asian ethnic group than the White ethnic group. A Public Health England (PHE) review acknowledges the disparities in the risk and outcomes of COVID-19 across ethnicities. 'The report identifies that a 'total of 10,841 COVID-19 cases were identified in nurses, midwives and nursing associates registered with the Nursing and Midwifery Council'.

Black women are important, and intersectionality puts the Black women at the center of its analysis, addressing the multiple ways in which Black women experience employment due to their race and gender. Black women are omitted and marginalised within society and deserve to be a crucial site of analysis.

COVID-19 has presented a social context that has highlighted the precarious position of being Black, female and a nurse in the NHS. Using data, evidence and nurses accounts I will discuss how the pandemic has shown how intersectionality and the structures of the NHS and society has placed Black female nurses at more risk of death due to COVID-19 than white nurses.

Reproductive Work and Care Work in Global Capitalism: Exploitation, Inequalities and Intersectionality in the Spanish Context

Rosa Maria Ortiz Monera, Anna Morero Beltrán

Universitat de Barcelona, Spain

In the context of neoliberal globalization, there is a commodification of care and reproductive capacities that are characterized by gender, origin, ethnicity and social class inequalities. Surrogacy and global care chains can be analysed from the perspective of the stratification related to this commodification.

Surrogacy is often considered a form of transnational motherhood, where the reproductive capacity of women, mainly from the Global South, is commodified. With global care chains, transnational motherhood also occurs because of the migration of women from countries of the Global South to develop care work in the Global North. This paper aims to show the underlying inequalities, which are common to both phenomena, from an intersectional perspective. Besides, empirical results from the survey designed within the framework of the R&D project "Surrogacy: family transformations in 21st century Spain" will be shared. Data from the Active Population Survey (National Statistics Institute, Spain) and the Social Security System will be used too to show the multiple inequalities that are necessary in order to guarantee the processes of reproduction and care in the Spanish context. This is especially relevant because Spain is a paradigmatic case for both phenomena, due to its strong participation in reproductive markets and the presence of a very high number of domestic workers from countries of the Global South.

Processes And Mechanisms Explaining Success Of Inclusive Policies for LGBTI People in Southern European Countries. A Case Study Of Malta Excellent Performance On The Rainbow Index

Carmela Ferrara, Maria Carmela Agodi

University of Napoli Federico II, Italy

In last decades, some Western governments have begun to plan policies aimed at ensuring the inclusion of the LGBTI population in the public sphere.

According to the Rainbow Index developed by ILGA Europe - an independent, international non-governmental umbrella organization bringing together over 600 LGBTI organizations - the most inclusive country in Europe for LGBTI people is Malta. In fact, in 2020, for the fifth year in a row, Malta continues to occupy the number one spot in the Rainbow Europe ranking.

Starting from these assumptions, this study investigates social mechanisms, cultural dynamics and the role played by institutions in leading Malta to this result.

The paper presents the results of two months of ethnographic research and 20 in depth interviews with privileged witnesses among policy makers, opinion leaders and queer activists.

Empirical materials were analysed with the process tracing tool (Collier 2011), with the support of the Atlas.ti software.

1089

Impacts of Covid-19 on Gender Inequality in Academia

Filipa Godinho[1], Thais França[1], Beatriz Padilla2, Mara Vicente[1], Lígia Amâncio[1], Ana Alexandre Fernandes[3]

[1]ISCTE-IUL, Portugal; [2]USF, USA; [3]ISCSP-UL, Portugal

The Covid-19 outbreak brought unprecedented challenges to societies at the same time that old inequalities dynamics saw a significant setback.

In the academia due to the shifts of activities from the universities and research center's facilities to virtual platforms, the boundaries of time and space between the private and professional spheres became more blurred, resulting in a more unbalanced division of home labor including childcare and house duties between the sexes. As a result, their productivity, assessed using conventional neoliberal indicators of performance, such as number of scientific publications, grant applications and research projects submission, dropped significantly. At the same time, the trend to delegate to women most of the academic service and the emotional work to take care of students' well-being was exacerbated.

Drawing on new empirical evidence gathered in Portugal from mixed-methods research, based on an on-line survey, in-depth interviews with women working on academia and a focus group with both women and men, we look at the gendered impact of the pandemic in academia.

Grounded on the literature on gender inequalities within neoliberal academia, we argue that the combination of academia 'gender blindness', unequal household division and the increasing corporatization and liberalization of the academia, women's career is unequally penalized. Furthermore, we advocate that neoliberal performance measurement indicators might not be suitable to evaluate academic performance during the pandemic.

The Effect Of Intersectional Discrimination Experiences On The Scientists' Life

Antonia Velicu, Julia Jerke, Heiko Rauhut

Institute of Sociology, University of Zurich, Switzerland

Even though discrimination in science has been in the focus of research for some time, it is still widely unknown how intersectional discrimination experiences affect scientific work and collaborations. Originally conceptualised by Crenshaw (1898), intersectionality was intended to capture the multitude of discrimination. Building on previous inequality research, we implement an extended version of the diversity wheel in a large-scale survey with 15'778 scientists across all disciplines from Germany, Austria and Switzerland. Almost half of the respondents state that they have experienced disadvantages at least once in their career, with scientists that identify with the third gender experiencing the most discrimination (71%), followed by women (57%), and men experiencing the least (37%). 57% of all respondents with such experiences have been discriminated based on more than one diversity dimension, again with women and the third sex being more affected.

Preliminary results further show that, regardless of the gender, experiencing discrimination has a strong impact on the everyday life as a scientist. Respondents who faced disadvantages report more frequent and more stressful conflicts with co-authors as well as a tougher competition and a less collegial atmosphere, on the one hand, and fewer training and career opportunities on the other hand. Strikingly, these effects are substantially amplified when we consider respondents that have made discrimination experiences based on more than one trait, underlining the importance of research on intersectional discrimination. Our findings, therefore, provide valuable insights on how (intersectional) discrimination affects science in general along with working conditions and collaborations in particular.

1090

The Impact Of The COVID-19 Pandemic On The Functioning Of An Organisation Working For LGBTQ+ People. A Case Study

Aleksandra Sobańska

University of Łódź, Poland

The paper is an example of "hot sociology" - an ongoing record of important social events. It aims to draw attention to the social situation of LGBTQ+ people in Poland, which worsened during the first lockdown, as well as to the paralysis of organisations fighting on behalf of LGBTQ+ people caused by the pandemic. This presentation is the result of an analysis of the functioning of a selected non-governmental organisation supporting LGBTQ+ people and the direction of its activities during the COVID-19 pandemic. The subject of the research is the Equality Factory Association - one of the largest organisations for LGBTQ+ people in Poland. The first part of this article presents an outline of the problem of marginalisation of LGBTQIA+ people, as well as a general description of the organisation under research. It also refers to the negative image of the LGBTQIA+ community created by conservative environments. The second part of the paper describes the main activities undertaken by the organisation during the first lockdown (March-May 2020). The research made use of the technique of targeted free interviews with activists of the indicated organisation. The time of the first social isolation period proved to be difficult for the organisation, freezing its activities for some time. The organisation had to learn to work in an online form, even if its main field of action was street demonstrations and face-to-face meetings.
Keywords: LGBTQIA+, marginalisation, NGOs, Equality Factory Association, COVID-19 pandemic

Experiences of Living with Stigmatized Fat Bodies in Poland. An Exploratory Analysis Based on Biographical Interviews

Katarzyna Mańkowska, Anna Wojtewicz, Beata Bielska

University of Nicolaus Copernicus in Toruń, Poland

Research studies relating to fat body experience are dominated by a medicalized discourse that equates fatness with being unhealthy. The basis of this study was to adopt a non-medicalizing, non-pathologizing and intersectional perspective. The main aim was to understand the life-long experience of living with the fat body, including their wellbeing, with the use of Goffman's stigma theory. We conducted biographical interviews, complemented by individual in-depth interviews and the projection technique. We interviewed cisgender and transgender women and men, living in the countryside, in the medium and the large city, who were or had been 'obese' (BMI over 30). For this speech purpose, we decided to analyze three components of their narratives: (1) fat-stigma visibility, (2) fat-stigma management and (3) the unexpected positive aspects of fatness in the transgender people's experience. The study also gave us the possibility to check whether the Goffman's theory is still applicable, and despite criticism, if it allows to better understand the experience of fatness stigma.

1091

Gender-sensitive Drug Interventions in Europe. Overview of Available Interventions and Gaps

Linda Lombi[1], Cristiana Vale Pires[2], Liesbeth Vandam3, Jane Mounteney[3], Linda Montanari3

[1]Università Cattolica di Milano, Italy; [2]Universidade Católica Portuguesa; [3]European Monitoring Centre for Drugs and Drug Addiction

Evidence indicates that there are significant gender differences in the epidemiology of substance use disorders, including illicit drug use, social factors and characteristics, biological responses, patterns of use, progressions to dependence, health consequences, co-occurring psychiatric disorders, and factors related to treatment entry, retention, and completion (Ettorre 2010; Kandall 1996; European Monitoring Centre for Drugs and Drug Addiction, 2017). Furthermore, research has shown that male and female substance users show different addictive "career trajectories" that are influenced by the gender (so by social construction) and not only by the sex (that is a biological dimension) (Knight 2015).

Despite this evidence, research, policy and interventions have not been considering a gender perspective in the drug problem in a systematic way. Researchers, policy makers and professionals in the drug field have tended to consider the drug issue as a neutral problem, as most illicit drug users are men, despite recent indicators point to a narrowing gender gap. Nevertheless, it is the gender specific nature of the drug problem is largely recognized. Our presentation will focus on international analysis of gender and drugs in Europe providing an overview of available gender-sensitive interventions in the European countries reporting to the European Monitoring Centre for Drugs and Drug Addiction (EMCDDA). Gender specific needs and gaps in research and interventions in Europe will be identified and will support planning and organization of effective gender sensitive interventions in the drug field.

RN33_T08_01 | Movements, Networks and Policies on Gender based Violence

Winning or Losing the Abortion War in Croatia: Movement and Countermovement Strategies

Antonia Petričušić[1], Maja Gregorić[2], Branka Galić[3]

[1]Faculty of Law, University of Zagreb, Croatia; [2]Faculty of Political Sciences, University of Zagreb, Croatia; [3]Faculty of Humanities and Social Sciences, University of Zagreb, Croatia

The wave of resistance against women's sexual and reproductive health and rights has taken on a new form of the anti-gender movement which has developed with the goal to ban abortion. This countermovement is comprised of diverse networks, including religious actors, far-right parties and organizations as well as professional and parent associations. The roots of the countermovement's institutional activities go back to 1991 when the constitutionality of the abortion law has been challenged with the Constitutional Court, while the noninstitutional activities began with the 2014 '40 days for life' and in 2015 with the 'Walk for Life' protest actions. At the same time the feminist movement has continued to advocate for further liberalisation of the abortion law and developed new strategies in the form of grassroots and disruptive protests and coalition building. This paper will give a unique insight into both the supply and demand side of the movement and countermovement. The supply side will be examined through protest event analysis (PEA) of the feminist and anti-gender movement in Croatia. At the same time, the demand side will be analysed through a cross-sectional study which was conducted among a quota sample of Croatian residents (N=600) at the end of 2020 where special focus will be given to the relationship between the stance on abortion and prior experience in activism.

By analysing the supply and demand side of both movements, the paper will provide insight into the movement-countermovement dynamics as well as give a deeper understanding of activities surrounding the issue of sexual and reproductive rights.

1092

A Tale of Two Sisters: How do Social Movement Actors Adopt and Transform Global Repertoires Regarding the Framing of 'Violence Against Women' at a National Level?

Brogan Gallagher

Maynooth University, Ireland

One in three women globally will experience violence in their lifetime: violence against women is a multi-layered human rights issue. Both the Argentinean social movement Ni Una Menos (not one (woman) less) and the Irish social movement, ROSA (for Reproductive Rights, against Oppression, Sexism and Austerity), are currently engaged in mobilisations seeking radical social transformation, with a strong focus on eliminating violence against women and attaining reproductive rights. These transnational feminist movements signal a type of feminist mobilisation that is 'beyond' the classic opposition between Western liberal feminism and Third World feminism.

This study will identify the process through which each movement adopts master frames relating to violence against women at a global level and transforms them at a national level into culturally resonant frames. The conceptualisation of women's oppression will be interrogated in the public sphere; both online and offline. This will be achieved through a comparative analysis of hashtag usage on social media during pivotal moments of the struggle; in-depth semi-structured interviews with members of the movements active during these moments; and content analysis of the framing of gender violence through national policy documentation. By combining methods, this research aims to illuminate the nuanced framing strategies present in these contemporary mobilisations, which will give insight into the potential and challenges of a global feminist movement. It will also provide practical applications for civil society and social movement actors, which are needed in campaigns related to eradicating violence against women.

The Role of the Solidarity Networks in the Process of Recovering from Gender Violence

Roger Campdepadrós-Cullell, Cristina Sánchez Miret, Albert Sabater-Coll

University of Girona, Spain

This paper provides a review of the role of solidarity networks in the process of recovering from gender violence. The research is based on the RTD project Sol.Net. Solidarity Networks with an Impact on the Gender Violence Victims' Recovery Process, which analyses solidarity networks between victims of gender violence and their communities, including how and to what extent such networks have a long-term impact towards effective recovery. There is literature on solidarity but scarce literature on its impact on the long-term victims' recovery. This paper aims to provide those elements from the literature review and previous research showing common elements of solidarity among women who have suffered gender violence.

The results suggest that people who form close support networks are especially significant for women who suffer gender violence, not least because they usually are the first to reveal their situation. By analysing individuals' reactions within such networks is especially relevant for victims of gender violence to carry out actions such as requesting professional help, help take control and, of course, to avoid being in a violent relationship. From a policy perspective, we believe that it is essential to focus on solidarity networks at various community levels to facilitate the recovery process to find a new balance and meaning in life after the violence has ended.

Overcoming Second Order of Sexual Harassment

Mar Joanpere Foraster1, Sara Gómez Cuevas2, Bea Villarejo2, Cristina Pulido3

[1]University Rovira i Virgili; [2]University of Barcelona; [3]Autonomous University of Barcelona

The feminists, men, and women who have stood alongside the victims of gender violence, have been attacked and slandered. These attacks, on the part of the lobby of harassers, are being carried out to isolate the victims and thus leave them helpless. With the isolation of victims, silence is achieved, and cases are not brought forward, for fear of retaliation, re-victimization, pressure, etc. Sociological contributions by feminists have shown that only by protecting those who protect, violence and victimization can be ended. The concept of second-order violence has been theorized from its causes to its consequences, thanks to the contributions made, the Catalan Parliament has been the first parliament in Europe and in the world to incorporate second-order violence as a form of violence in legislation, which will enable the support of victims and people who show solidarity with them to be strengthened, in all areas.

The Representations of Woman in Digital Games: The Case of League of Legends

Ioanna Kourou

National and Kapodistrian University of Athens, Greece

The current study focuses on the social representations of women in digital games and it is a case study about the Multiplayer Online Battle Arena game, which is called League of Legends. It aims to collect, describe and analyze the image of the female presence within this game. The image of woman in the game is multidimensional and it is being surveyed if there is strong female representation in League of Legends, if the appearance of female characters reproduces the same stereotypes about female beauty and, as far as their role and powers in the game are concerned, if they are equally strong with male characters. As these games transmit messages and values to those who play them, they also influence their perceptions of the role of women. In this case study has been used digital ethnographic research and an interpretive approach in order to be seen if stereotypes about women are reproduced in digital games.

Movies as Advocates of Socio-Cultural Change: What awaits for Feminism and Gender Equality in 21st century Kerala?

Titty Varghese

KAUNAS UNIVERSITY OF TECHNOLOGY, Lithuania

The advantage of the 21st century is the opportunity to interact using numerous social media platforms rapidly. Cinema is an important medium for developing society's perception on various matters. It can influence the development (or under development) by exposing different socio-cultural contexts and norms. Kerala's South Indian state is also witnessing such visualization on feminist expression and obstacles for women's development, including deeply rooted patriarchy for centuries. However, the state's progressive status is still apparent, as violence against women and domestic exploitation is still growing in Kerala. A recent change in portraying women as a central and empowered figure in films shows women as raising voice against the various oppressions, especially in marital life. Therefore, this paper aims to identify whether films effectively foster socio-cultural change on women's rights and affect men's perspective on women's equality and freedom from domestic space. The methodology used for this study is based on qualitative content analysis of over 10000 comments on YouTube videos of 4 films which are based on equality and women's oppression, released between 2015-2021, using MAXQDA. The study reveals that there are progressive discussions on gender equality by visualizing films, but feminism is still misinterpreted in Kerala society.

Keywords: gender equality, feminism, domestic violence, patriarchy, media, Kerala

Changing or Preserving Gender Order and Gender Structure? On gender arrangements on the COVID 19 and post-COVID 19 world

Malina Voicu

Romanian Academy, Romania

COVID 19 pandemic has changed individual and social lives in different ways than other economic crises or natural disasters did. The interplay between economic crisis, health emergency and the global dimension of these challenges is reshaping social relations having impact on family life, labor market and care provision. As the pandemic brought more to do at home and increased the vulnerability on the labor market for most of non-essential workers, sociological research should focus on studying to what extent the new context lead or may lead in future to the change of gender arrangements. This paper analyses the circumstances that call into question the renegotiation of gender arrangements in the pandemic and post-pandemic context. On one hand, the changes on the labor market and the additional house and care work requires the revision of family's practices regarding the division of paid - unpaid work between partners, leading to changes in gender structure. On the other hand, economic scarcity and the biological threat may trigger the values change, challenging the gender order. The interplay between gender arrangements, gender order and gender structure depends on the pre-existing arrangements, as well as on the unfolding of the pandemic. The analysis compares Germany, Italy, Sweden and Romania, as representing different gender regimes and countries with different unfolding of the pandemic, focusing on how gender balance in work and family life changed under the impact of the pandemic. Long- and short-term scenarios regarding the transformation of gender arrangements are considered.

"The Political is Personal". The Emotional Condition of Women Supporting the Civil Resistance to the Tightening up of the Abortion Law in Poland

Monika Frąckowiak-Sochańska

Adam Mickiewicz University Poznań, Poland

This paper aims to analyze the mechanisms of the interpenetration of the public and private spheres on the example of the experiences of women participating in civil protests against tightening up the abortion regulations in Poland.

On 22 October 2020, the Constitutional Tribunal ruled that abortion due to "a high probability of severe and irreversible impairment of the fetus or an incurable life-threatening disease" is inconsistent with the Constitution. This ruling led to mass street protests in the following months. Hundreds of thousands of people demonstrated despite the COVID-19 pandemic and related restrictions. The Tribunal's decision affects all citizens by interfering with the most intimate sphere of human life, the approach to human rights, and prenatal medicine. Additionally, the pandemic and related perinatal care worsening increase the atmosphere of fear. Simultaneously strong emotions push people to action.

This paper's empirical foundation is the qualitative research (IDIs) on a sample of several dozen women supporting the aforementioned civil protests, representing three generations and performing various family roles of daughters, mothers, and grandmothers. This research aims at understanding women's emotional condition (mainly the lack of emotional wellbeing) in the context of reproductive health hazards evoked by the political decision. In particular, the research questions boil down to the following ones:

What emotions do the Constitutional Tribunal's rule evoke in women, and how do these emotions transform in the context of mass protests?

Do the Tribunal's judgment evoke memories of women's experiences such as pregnancy complications, miscarriage, ectopic pregnancy, childbirth, and maternity. We are particularly interested in the mechanisms of women's secondary traumatization.

How does the political situation influence women's plans for the future and life decisions?

RN33_T09_01 | Intersectionality and Inequality in studies on Gender Based Violence

Victimisation Against Older Women; Their Voices

Emma Finnegan

Northumbria university, United Kingdom

There is growing recognition that 'older' women can be victims and the term 'elder abuse' now defines the abuse of 'older' people. However, there is still a poverty of research examining victimisation against older groups. Despite calls that the experiences of women, later in their life course, should be heard, the voices of 'older' women is still somewhat marginalised. The dearth of criminological and victimological interest is surprising given the ageing nature of populations and the dramatic and long-lasting impact of such abuse.

This project addresses the current lacuna by listening to the lived experiences of women aged 60 and over, who have been abused. An intersectional feminist framework work, that is informed by social constructionism was adopted to examine respondent's experiences. In doing so, the connection between age and gender, and other sites of inequality was explored. Moreover, it provides a means to break down the oppressive domains of knowledge construction and facilities change.

Reflecting on some findings from this study, this presentation sets out to highlight how older women experience violence and/or abuse. It will focus on three key areas: the types of victimisation participants identified, how they perceived age in connection with their experiences, and how they demonstrated resilience and/or empowerment. The focus in these areas also seeks to demonstrate how their voices can be used as a tool to challenge some of the dominant notions surrounding age and victimisation.

Intimate Partner Violence Against Women: Gender, Power and Systems of Inequality

Joana Aguiar Patrício

Instituto Universitário de Lisboa (ISCTE-IUL), Centro de Investigação e Estudos de Sociologia, Lisboa, Portugal

Gender-based violence against women, girls and young women is a violation of human rights, a social problem with growing political and social visibility. Since the 1990s, along with the globalization process, an increasing problematization of violence against women, domestic violence and gender-based violence has been observed, regardless the context of occurrence.

At the theoretical level, with different perspectives, social scientists have discussed the concepts of power and gender, terms commonly conjugated (Radtke and Stam, 1994). Gender structures do not operate in isolation from other systems of inequality (e.g. class, ethnicity, sexuality) (Scarborough and Risman, 2017).

Based on in-depth interviews with women who have experienced violence from an intimate partner, conducted as part of doctoral research, this presentation analyses the impact of violence on the lives of women and their children, particularly in terms of education, work and employment, exposing obstacles to the development of full citizenship and their ability to enjoy rights and freedoms on an equal basis.

Researching Domestic Violence At The Intersection Of Academia, Activism And Corporate Social Responsibility: Tensions, Effects

Blanka Nyklova

Institute of Sociology CAS, Czech Republic

The Central European region has struggled with adopting legislation against domestic violence with the Czech Republic being no exception. Legislation was adapted in the 2000s and amended later, with efforts at explicitly addressing the gender based nature of violence have been in vain – the latest blow coming in the form of rejecting the ratification of the Istanbul Convention across the region. This makes domestic violence a rich field for (applied) social scientific research, which however remains under-researched within traditional academic research. Most research is done by feminist NGOs on the one hand, and conservative criminology on the other. A window of opportunity opened with the onset of the COVID-19 pandemic. Two researchers (Blanka Nyklová and Dana Moree) interested in oppression and gender based violence came together with activists and social workers from NGOs working predominantly with women survivors of domestic abuse to conduct research into how the pandemic and corresponding measures affect the system of assistance for survivors. The research was done with no project funding. As such it was dependent on informal networks and possibilities and reflected on the epistemological and practical effects of project-based funding. At the same time, it drew attention to the possibilities and issues in collaboration with politically motivated NGOs and PR-oriented corporations, which approached the researchers in mid-2020 offering to pay for parts of the research. In the paper, I present the issues stemming from doing feminist research at the interface of academia, activism and corporate social responsibility in the Central European region where gender-related issues are largely contested.

Forced, Arranged And Love Marriages In Western Societies: Addressing The "Grey Zones" Through The Intersectional Lens

Romina Tavernelli[1], Sonia Parella[1], Alisa Petroff[1,2], Berta Güell[1,3], Paola Contreras[1]

[1]Universitat Autonoma de Barcelona, Spain; [2]Universitat Oberta de Catalunya; [3]CIDOB

1097

Forced and arranged marriages are prototypical cases illustrating the tensions that pervade multicultural societies. While forced marriages are to be rejected and fought against due to its coercive and gender based manifestations, liberal societies cannot neglect other forms of marriages. These include arranged marriages, product of migratory processes, and the classical love marriages, predominant in modern societies. To address these tensions, new balances and more inclusive meanings of sentimental relationships are required. In this communication we discuss the limitations of tackling this phenomenon exclusively as a human rights issue, as gender-based violence or as a topic linked to gender and multiculturalism. Alternatively, we propose a holistic approach based on the idea of continuum (Gill and Anitha 2009) and intersectionality (Crenshaw 1989). This proposal is operationalized with the conceptual triad of forced-arranged-love marriages, crosscut by 'grey zones' entailing different degrees of pressures, coercions and violence. At the same time, we problematise the concept of love marriages as a hegemonic and ethnocentric form of sentimental relationship in Western societies, and discuss the grey areas connecting this type of marriage with the arranged and forced ones. We argue the need to: 1) reinforce the "red lines" to limit forced marriages; 2) critically question love marriage as the only type of commitment valid in our societies; 3) preserve and respect the arranged marriages of specific communities; while 4) identifying and addressing the theoretical and political challenges when grasping the grey zones between these types of marriages.

RN33_T09_02 | Sociologies of Care

Breaking Social Contract: Solo Mothers In The Czech Republic Negotiating Money, Work And Care In The Times Of Pandemic

Radka Dudova

Institute of Sociology, CAS, Czech Republic

he Covid-19 pandemic breached and invalidated the current "care contract". Parents of young children were losing access to care institutions and the public education. The individualisation of risk and the responsibilisation of individuals had a particularly severe impact on persons in vulnerable position, such as solo mothers living alone with their children. The Czech Republic is among the countries hit the most severely by the Covid-19 pandemics, with the school closure being so far the longest in Europe. I use the intersectionnal approach in order to answer the following questions: How did the solo mothers deal with the increased care obligations during the school closures and how they negotiated work and care? How does this group experience the crisis, and what do we learn about the crisis from their perspective? Which characteristics make them more vulnerable or, in the contrary, help them to compensate for the risks? I present a longitudinal qualitative study of the life situation of solo mothers in the Czech Republic during the covid-19 health crisis, based on repeated interviews with women from three Czech regions. The preliminary findings indicate that the work position of the interviewed women before the pandemic hit was crucial for their coping with the increased care obligations. For all of them, irrespective of their work situation, the pandemics deepened their feelings of vulnerability and stress and had negative impacts on their mental health, and all of them experienced some kind of economic hardship. The lack of any systemic support and the ignoring of interests of (solo) parents (and children) was accompanied by their individual responsibilisation. In consequence, old inequalities deepened and new arose.

Experiencing Motherhood in Greece During the Pandemic: Care, Work and Vulnerability

Aliki Kosyfologou

Indepedent Researcher, Greece

The Covid-19 global health crisis had a devastating social impact, widening social, gender, racial, and disability–related inequalities. When the coronavirus outbreak arrived in Greece, parents transferred their work at home and strived to balance their professional routine and domestic duties. In this context, the growing demand for more unpaid care work to maintain the pandemic's daily routine increased the existing unequal division of care labour. Mothers were overwhelmed with care work, often at the expense of their professional performance or leisure time.

Furthermore, the crisis of the welfare services as a long-term consequence of the austerity policies, the lack of policies for the reconciliation of professional and family life, and women's more vulnerable status in the labor market in Greece – women's unemployment rate is considerably higher than the one of men, approx. 20 - 13% respectively) had a significant negative impact on their work and life prospects. In addition to that, while formal and informal resources of childcare provision declined – e.g. help provided by grandparents consisted no longer an alternative due to the increased vulnerability of the elderly to the disease- the ability of many mothers to work was constrained, mainly when their jobs couldn't be carried out remotely.

The research seeks to illustrate motherhood experiences in various social, economic, and racial backgrounds during the pandemic in Greece and to investigate the underlying struggles, the visible and the unspoken resistances, and the solidarity practices. The latter will contribute to a comprehensive understanding of Greece's current pandemic's multilayered gendered aspects in its social, economic, and political context.

The Impact of the Covid-19 on Social Innovation: 0-3 Pre-school Care and the Gender Divide.

Raquel Gallego-Calderón[1], Lara Ivana Maestripieri[2]

[1]Universitat Autònoma de Barcelona, Spain; [2]Politecnico di Milano, Italy

In the Southern European welfare model family care plays a peculiar role, especially for dependent members as children 0-3. Research have provided evidence for the functional overload of families, in which unpaid work is mainly provided by women (even when they work full-time), in a context in which public and private provision of childcare is insufficient to meet families' demand. Since few years in Barcelona, demand for childcare 0-3 has been partially covered by the emergence of grass-root initiatives that alleviate mothers by creating communities of care of parents and educators. However, participants in social innovations such as tagesmutters, free-education nurseries and communitarian groups of care have been impacted strongly by the Covid19. Educators in these projects have struggled to maintain the economical balance, while mothers have to juggle the re-domestication of care.

This abstract presents the effects of Covid-19 pandemic on mothers and professionals involved in projects of social innovation in Barcelona. The paper uses qualitative and quantitative empirical material gathered between May 2019 and October 2020: interviews with educators and mothers and a survey with families having 0-3 children (before and after the arrival of Covid19). The results of our investigation show that the communities behind the projects were used as a fundamental resource of help, as soon as movement restrictions started to be released. Parents and professionals helped each other, sharing care and financial resources to keep the projects going on and to find new balances of work-family reconciliation even when projects were still officially closed.

Polish Woman, Or A Full-time Housewife: How the Pandemic Has Exposed the Gender Inequality

Justyna Tomczyk

Pedagogical University of Cracow, Poland

The article deals with the importance and role of gender equality (GE) in household and family life in Poland, in the context of COVID-19 pandemic. The main thesis of the text speaks of the necessity to implement the GE assumptions in a division of household duties and tasks. The pandemic has exposed blatant gender inequalities in the private sphere. Polish women, who stayed at home because of lockdown, became full-time housewives (in the scope of running a household, caring, raising children, organizing family life), and at the same time they carried out their career from home. Based on in-depth interviews, I show their experiences, opinions and emotions.

Unpaid Work And Well-being: What Makes Unpaid Work More Enjoyable?

Ekaterina Hertog[1], Penghui Shi[1], Pierre Walthery[2]

[1]University of Oxford, United Kingdom; [2]University College London

Domestic work takes up a significant proportion of men's and women's waking hours and is highly gendered. A better understanding of mechanisms associated with the enjoyment – or lack thereof – of unpaid work is important for our general understanding of domestic life and related patterns of wellbeing.

Most existing studies focus on enjoyment of unpaid work within couples, especially couples with children, and find that interactive childcare is the most and routine housework the least enjoyable type of domestic work. Partnered men and women broadly enjoy domestic work to similar extents, but women feel particularly positive

when they carry out domestic work with their partner around and when they can break the monotony of some housework tasks with multi-tasking.

Our paper is the first to look at both single and married people's experience of domestic work across life course stages. Using the UK Time Use Survey, we look for systematic differences in how married and single men and women enjoy domestic work to assess whether enjoyment of unpaid work is associated with "doing gender" in marriages. We compare enjoyment during co-presence and co-production of domestic work to understand whether it is sharing the load or rather bonding with another adult while carrying out household tasks that matters for individual well-being. Finally, we will investigate a detailed list of activities to see whether intrinsic activity characteristics, length of time spend on a domestic task, and overall busyness and stress are associated with enjoyment of domestic work.

COVID-19 As A Gendered Pandemic: Intensifying Women's Workloads at Home

Maha Sabbah Karkabi

Ben Gurion University, Israel

COVID-19 has been characterized by a substantial increase in unpaid care and domestic work, given lockdowns, quarantine, school closures, elder vulnerability and work-from-home arrangements. Although both men and women have seen an increase in unpaid domestic work, recent research indicates that women continue to carry most of the burden. This paper draws on the concept of the double burden in theorizing the gender roles in the context of a disaster.

Gender analysis frameworks are frequently used to explore the division of labor in economically developed countries in which gender equality has been a central issue in the public agenda, while in developing societies little scholarly attention has been paid to changing gender roles and the household division of labor during a pandemic. Through the conduct of 25 interviews with married, Palestinian women in Israel, from dual-earner families I explored the following questions: To what extent did the COVID-19 pandemic affect the gendered inequality within the Palestinian family, and to what extent did working from home for both spouses or being unemployed challenge the rigid gender roles? The main results show that even during a time where the spouse is unemployed or where the woman is an essential worker and continues to work, women continue to do the bulk of the work needed to keep their households running.

Although signs of change were noticed in the realm of childcare, the interviewees indicated that instead of focusing their energy on advancement in the workplace, they were forced to redirect it to the home.

We at Least Say we Are Equal: Gender Equality and Class in Healthcare Professionals Discursive Framing of Migrant Mothers

Sunna Símonardóttir, Annadís Rúdólfsdóttir, Helga Gottfreðsdóttir

University of Iceland, Iceland

In the last few decades, the demography of Iceland has become increasingly diverse with an immigrant population similar to that of the other Nordic countries. Women comprise almost half of all international migrants and many of those female migrants require maternity care in their host countries. While some literature describes how migrant women experience the healthcare provisions of their host countries, less is known about the experience of providing the service, from the perspective of the healthcare practitioners. In this study we adopt a social constructionist perspective to explore the discourses of knowledge healthcare professionals in Iceland draw on, in their discussion of prenatal and postpartum healthcare in Iceland. Interviews were conducted with 16 healthcare professionals with extensive experience of providing maternity care to migrant women to understand how they construct and make sense of the needs and behaviour of migrant women seeking maternity care. Our findings suggest that some healthcare professionals' subject migrant women to normative professional discourses of parenting, without considering how those ideals are tailored to white, middle class women. Migrant mothers and pregnant women are thus excluded from the middle-class mothering norms that are ascribed to Icelandic women. Our findings also highlight how national identity, such as being part of a gender equal society and the image of Iceland as a classless society, influences how healthcare professionals view migrant women. This underscores the importance of cultural reflexivity, and policies and scholarship where an intersectional understanding of gender, class and migrant worker status is at the forefront.

RN34 | Sociology of Religion

RN34_T01_01 | Studying the Dynamics of Islam in Europe

"Islamic Youth Associations in Italy: Religion and Civic Participation of Young Muslims"

Martina Crescenti, Isabella Crespi

Università di Macerata, Italy

In the Italian context, the second generation of young Muslims constitutes a bridge generation in the transition between the family culture, still centered on Islamic values and the Italian culture.The conflicts and contrasts that arise from these two cultural worlds' coexistence represent the motivations of young people to act and transform the society in which they want to be included.Islamic associations founded by young Muslims are spaces for socialization, where they share the experience of belonging to different cultures: on one side, the Islamic and ethnic one coming from the family, on the other, the Italian culture in which they were mostly born, raised and educated. Belonging to the second generation means seeking a negotiation between these cultural worlds. Young Muslims carry out actions that can make them recognized by Italian society participating in associations and organizing sporting and recreational events, protest actions, meetings for local citizens, conferences and training courses on Islam. To understand how young Muslims deal with their multiple belonging, we first interviewed some representatives of Islamic youth associations and organizations in Italy (10 between June-October 2020). Then, administering an online questionnaire to young people participating in associations (January-April 2021), we shed light on how faith-based second-generation associations provide youth activism spaces and different citizenship practices. We aim to investigate how second-generation Muslim youth's identity constructs and produces practices of citizenship, religious and cultural belonging by analysing interviews and questionnaire results.

"I´m Tired of it": Experiences of Racism and Islamophobia of Young Muslims in Spain

Maria Jiménez-Delgado[1], Diana Jareño-Ruiz[1], Pablo de Gracia-Soriano[2], Javier Jiménez-Loaisa[1]

[1]Universidad de Alicante, Spain; [2]Universidad Complutense de Madrid, Spain

This article analyses the narratives of young Muslim university students on their perceptions of their passage through the Spanish education system. For this purpose in-depth interviews and focus groups were conducted. The study population was the total group of Muslim university students at the University of Alicante. In participants' narratives it emerged that their passage through the educational institutions had been successful and had broadened their life opportunities. In contrast to the abundant academic literature that mostly highlights biases in the school system, these young people stressed the opportunities for personal emancipation and social integration offered them by their education, while at the same time indicating gaps in the curriculum and deficits in the intercultural and democratic skills and qualifications of teaching staff which negatively affected their schooling and citizenship participation, contributing to the perpetuation of the "Islamic other" and the normalization of day-to-day forms of racism and Islamophobia.

Civil Society Activity and Islam in France and the North Caucasus in Prevention of Radicalization and Deradicalization

Saida Sirazhudinova[1], Mohammed Farouk Toualbia[2]

[1]Dagestan state university of the national economy, Russian Federation; [2]The School for Advanced Studies in the Social Sciences

Islam has always been focused on regulating people's lives. In recent years, the influence of religion on the lives and actions of people has increased. In recent decades, the problem of religious radicalism has emerged and spread widely in Europe and Russia.

The main institution in countering radicalism and deradicalization is civil society and religious organizations. We will consider what is radicalism in religion, as well as the structure, role and activity of non-governmental and religious organizations in the process of preventing religious radicalization.

Both Russia and France have faced challenges related to religious radicalism. We will present the results of our qualitative research based on interviews with imams, Muslims and adherents of radical ideology who have been convicted of participating in terrorist organizations. We studied the peculiarities of the approaches of religious structures in relation to the issue of religious radicalism and conducted a comparative analysis.

The Arrival of Legal Salafism – Reflection and Adaptation Processes in Germany between 2002 - 2020

Arndt Emmerich

University of Heidelberg, Germany

1102

Salafism is a diverse and global revivalist movement that promotes a return to the practice of the Qurʾan from the time of Prophet Muhammad. This article investigates a new trend, namely the emergence of "legal Salafism" in Germany being characterized by a shift from an informal, inward-looking and exclusive approach, seeking to protect the Salafi boundaries, toward a more inclusive debate centered on minority empowerment through the spread of constitutional literacy and legal pragmatism. Past research focused on the "Salafi growth phase" (2005-2015) that has been associated with the appeal of exclusive group boundaries, flat hierarchies, and informal networks. Currently, segments within the Salafi mainstream are responding to the current decline of the movement and changing opportunities. This was recently witnessed during the Covid-19 pandemic, when the Salafi organization, Federal Islamic Union, won a high-profile court case in April 2020, which allowed the re-opening of mosques, synagogues, churches and temples. The same group launched a campaign to support mosque communities in financially precarious situations, regardless of their theological positions and ethnic heritage, which previously prevented Salafis from cooperating with other denominations. It is this - post-expansion - phase, which indicates a re-orientation, adaptation process, and critical reflection of past strategies and new ways of civic engagement, which may generate novel avenues for future state-society relations. Using a participatory methodology within a prominent Salafi mosque in Northern Germany, the article contributes to the academic debate around the growing involvement of Muslim organizations in democratic processes and whether liberal democracies can nurture trust in its institutions that enables minorities to defend their cultural and religious traditions, while guiding young Muslims to be confident members of their respective societies.

RN34_T01_02 | Religion, Minorities, and Alternative Practicies

I Am Niqabi: Cyber fundamentalism Against Anomie?

Alexandra Ainz-Galende, Rubén Rodríguez-Puertas, Juan Sebastián Fernández-Prados

Universidad de Almería, Spain

This presentation delves into the meaning that the niqab has for the Niqabi women belonging to the Telegram channel "Orgullo niqabi" (Spanish for "Niqabi Pride"). More specifically, our goal is to know the exact reasons that motivated said women to become Niqabi. The ground hypothesis is that these women opt for the niqab because they have found in fundamentalist Islam –whose main representation in the public sphere and everyday life are niqab wearing women– the "meaning of life" which they yearned for. With the aim of proving our hypothesis, we interviewed 27 women belonging to the aforementioned channel who declare themselves to be Niqabi or "on the way to becoming Niqabi" and carried out an ideological analysis of their discourses. One of the main conclusions is that "being Niqabi" is the result of a grounded, rational decision which puts an end to their constant search for meaning. This search concludes –at least temporarily– with the incorporation of cyber fundamentalism to the way they see the world, which guides their behavior both in their personal sphere and in their social environment.

Keywords: anomie, cyber fundamentalism, existential emptiness, niqab, niqabi

'Tell the Truth and Act as if the Truth is Real': Emotional Honesty and Catastrophic Futures in Christian and Buddhist Climate Activism.

Matthew James Stemp

Goldsmiths, University of London, United Kingdom

The expectation of climate breakdown and societal collapse is both a motivating and demotivating force in climate activism. Movements such as Extinction Rebellion (XR) have successfully appealed to predictions of catastrophic futures in their interpretations of climate science to mobilise people into civil disobedience, justifying this approach through their interpretations of climate science and by appealing to 'emotional honesty.' However, this comes at a psychological cost, with eco-anxiety and burnout becoming common features of climate activist experience. Religious beliefs – such as eschatological beliefs in Christianity, and beliefs about impermanence in Buddhism – complicate this dynamic further, requiring activists to navigate complex terrains of despair and hope, certainty and uncertainty.

In this paper, I draw on participant observation and in-depth interviews with Christians and Buddhists in XR UK to explore how religious 'rebels' address tensions around climate futures. I show how XR's slogan to 'tell the truth' is interpreted as a call to integrate belief and action, identifying emotional honesty about the future as a spiritual practice that both enlivens their faith and grounds their activism. This practice generates feelings of authenticity, solidarity and virtue, which legitimate sacrificial and disruptive forms of protest. However, the practice also leads to misrepresentations of climate science, resulting in a reticence to entertain the possibility of rapid and just sociopolitical transformations. Climate activism therefore offers a fruitful site for further research on how religion contributes to the construction of alternative futures.

1103

Public Religious Ritual and Civic Performativity: The Performative Logics of Shia Lamentation Processions in Barcelona

Avi Astor, Rosa Martínez, Victor Albert

Universitat Autònoma de Barcelona, Spain

Recent work on diasporic religiosity has emphasized how public rituals serve as a stage for religious minorities to become visible, assert their rights, and gain recognition. Although this focus has yielded important insights, it has led scholars to overlook alternative forms of civic performativity that, while less conspicuous, are nonetheless crucial for understanding how religious minorities demonstrate deservingness of inclusion in the polity. We challenge this assertive bias in the study of public religiosity, and "performative citizenship" more generally, by drawing attention to more "conciliatory" forms of civic performativity, or performative practices that demonstrate qualities associated with civility (e.g., respect for local norms and openness to compromise). Our empirical analysis centers on the civic dimensions of Shia public lamentation processions in Barcelona. We highlight various features of local Shia leaders that dispose them toward conciliatory rather than assertive forms of civic performativity, most notably their migration trajectory and socio-structural location.

RN34_T02_01 | Digital Media and Religion

Interweaving Everyday Life with Religion. Digital Media in Roman Catholic Women's Lived Religious Practices

Anna Szwed

Jagiellonian University, Poland
