Organisers

Executive Committee

Marta Soler-Gallart (Spain) | ESA President

Lígia Ferro (Portugal) | Kaja Gadowska (Poland) | Apostolos G. Papadopoulos (Greece) | Vice-Presidents

Lígia Ferro (Chair) | Maria Carmela Agodi (Italy) | Teresa Carvalho (Portugal) | Dilek Cindoglu (Turkey) | Teresa Consoli (Italy) | Kaja Gadowska (Poland) | Marta Soler | Romina Surugiu (Romania)
Conference Committee

Maria Carmela Agodi (Italy) | Milica Antic Gaber (Slovenia) | Paola Borgna (Italy) | Teresa Carvalho (Portugal) | Dilek Cindoglu (Turkey) | Teresa Consoli (Italy) | Lígia Ferro (Portugal) | Kaja Gadowska (Poland) | Sebastian Koos (Germany) | Tomáš Kostelecký (Czech Republic) | Gerben Moerman (The Netherlands) | Tiziana Nazio (Italy) | Apostolos G. Papadopoulos (Greece) | Ludger Pries (Germany) | Marta Soler-Gallart (Spain) | Romina Surugiu (Romania) | Irina Tartakovskaja (Russia)
Executive Committee Members

Sanna Aaltonen (Finland) | David Inglis (Finland) | Lynn Jamieson (UK) | Alan Warde (UK)
Executive Committee Members until 12.02.21

ESA Office

Esmeray Yogun | Executive Secretary
Elisabeth Torras-Gómez | Conference Assistant
Amina Lahyani | Intern
Anna Pascual | Intern
Ignacio de Pouplana | Intern
Dagmar Danko (until 08.05.2021)
Myriam Meliani (Jul-Dec 2020)

Local Organising Committee

Teresa Sordé Martí (Autonomous University of Barcelona & Catalan Sociological Association) | Chair
Adriana Aubert (University of Barcelona)
Pau Baizán (Pompeu Fabra University)
Antoni Biarnés (Professional Association of Political Sciences and Sociology of Catalonia)
Jordi Busquet (Blanquerna-Universitat Ramon Llull)
Natàlia Cantó (Open University of Catalonia)
Anna Escobedo (University of Barcelona)
Mar Joanpere (Rovira i Virgili University & Catalan Sociological Association)
Fidel Molina (University of Lleida)
Oscar Molina (Autonomous University of Barcelona)
David Murillo (ESADE Business School)
Luis Recuenco (Pompeu Fabra University & Catalan Sociological Association)
Albert Sabater (University of Girona)
Cristina Sánchez (University of Girona & Catalan Sociological Association)
Paquita Sanvicen (University of Lleida)
Olga Serradell (Autonomous University of Barcelona)
Natxo Sorolla (Rovira i Virgili University)

6

Research Networks Coordinators

RN01 | *Ageing in Europe*
Edward Tolhurst, Staffordshire University, UK;
Lucie Galčanová, Masaryk University, Czech Republic.
RN02 | *Sociology of the Arts*
Sari Karttunen, University of the Arts Helsinki & Centre for Cultural Policy Research, CUPORE, Finland;
Christopher Mathieu, University of Lund, Sweden,
RN03 | *Biographical Perspectives on European Societies*
Lyudmila Nurse, Oxford XXI, UK;
Katarzyna Waniek, University of Łodż, Poland.
RN04 | *Sociology of Children and Childhood*
Cath Larkins, University of Central Lancashire, UK;
Daniel Stoecklin, University of Geneva, Switzerland;
Lucia del Moral Espin, University of Cadiz, Spain.
RN05 | *Sociology of Consumption*
Stefan Wahlen, University of Giessen, Germany;
Arne Dulsrud, Oslo Metropolitan University, Norway;
Marlyne Sahakian, University of Geneva, Switzerland
RN06 | *Critical Political Economy*
David Bailey, University of Birmingham, UK;
Yuliya Yurchenko, University of Greenwich, UK

RN07 | *Sociology of Culture*
Anna-Mari Almila, London College of Fashion - University of the Arts London, UK;
Simon Stewart, University of Portsmouth, UK

RN08 | *Disaster, Conflict and Social Crisis*
Antti Silvast, Norwegian University of Science and Technology, Norway;
Eugenia Petropoulou, University of Crete, Greece.

RN09 | *Economic Sociology*
Andrea Maurer, University of Trier, Germany;
Sebastian Nessel, University of Graz, Austria;
Alberto Veira Ramos, University Carlos III de Madrid, Spain.

RN10 | *Sociology of Education*
Bernadette Brereton, Dundalk Institute of Technology, Ireland;
Adriana Aubert, University of Barcelona, Spain

RN11 | *Sociology of Emotions*
Yvonne Albrecht, Humboldt-University of Berlin,Germany;
Alberto Martin Perez, University of Barcelona, Spain;
Natàlia Cantó-Milà, University Oberta de Catalunya, Spain;
Nina Margies, Humboldt-University of Berlin, Germany

RN12 | *Environment & Society*
Audronė Telešienė, Kaunas University of Technology, Lithuania;
Çigdem Adem, Ankara Rivers Study Group, Turkey

RN13 | *Sociology of Families and Intimate Lives*
Jacques-Antoine Gauthier, University of Lausanne, Switzerland;
Vida Česnuitytė, Mykolas Romeris University, Lithuania.

RN14 | *Gender Relations in the Labour Market and the Welfare State*
Orly Benjamin, Bar-Ilan University, Israel;
Ana Lopes, Newcastle University, UK

RN15 | *Global, Transnational and Cosmopolitan Sociology*
Marco Caselli, Università Cattolica del Sacro Cuore, Milan, Italy;
Marjaana Rautalin, Tampere University, Finland

RN16 | *Sociology of Health and Illness*
Ellen Annandale, University of York, UK;
Ana Patricia Hilário, Universidade de Lisboa, Portugal

RN17 | *Work, Employment and Industrial Relations*
Valeria Pulignano, University of Leuven, Belgium;
Guglielmo Meardi, Scuola Normale Superiore, Italy

RN18 | *Sociology of Communications and Media Research*
Marisol Sandoval, City University London, UK;
Thomas Allmer, University of Innsbruck, Austria;
Paško Bilić, Institute for Development and International Relations, Croatia

RN19 | *Sociology of Professions*

Christiane Schnell, Goethe-University Frankfurt, Germany;
Helena Hirvonen, University of Eastern Finland, Finland

RN20 | *Qualitative Methods*
Florian Elliker, University of St. Gallen, Switzerland;
Ulrike T. Kissmann, University of Kassel, Germany

RN21 | *Quantitative Methods*
Jochen Mayerl, Chemnitz University of Technology, Germany;
Kathrin Komp-Leukkunen, University of Helsinki, Finland

RN22 | *Sociology of Risk and Uncertainty*
Patrick Brown, University of Amsterdam, The Netherlands;
Maria Grazia Galantino, Sapienza University of Rome, Italy

RN23 | *Sexuality*
Isabel Crowhurst, University of Essex, UK;
Sebastian Mohr, Karlstads University, Sweden

RN24 | *Science and Technology*
Ana Delicado, Institute of Social Sciences of the University of Lisbon, Portugal;
Bernhard Wieser, Graz University of Technology, Austria

RN25 | *Social Movements*
Katerina Vrablikova, University of Bath, UK;
Mattias Wahlström, University of Gothenburg, Sweden

RN26 | *Sociology of Social Policy and Social Welfare*
Hannu Turba, University of Kassel, Germany;
Volkan Yilmaz, Bogazici University, Turkey

RN27 | *Regional Network Southern European Societies*
Manuel Fernández-Esquinas, CSIC, Spain;
Teresa Consoli, University of Catania, Italy;
Julie Jarty, University of Toulouse, France;
Inês Vieira, Universidade Nova de Lisboa, Portugal

RN28 | *Society and Sports*
Alessandro Porrovecchio, University of the Littoral Opal Coast, France;
Nico Bortoletto, Università degli Studi di Teramo, Italy

RN29 | *Social Theory*
Hubert Knoblauch, Technical University of Berlin, Germany;
Mikael Carleheden, University of Copenhagen

RN30 | *Youth & Generation*
Carlo Genova, University of Torino, Italy;
Magda Nico, CIES-IUL, Portugal

RN31 | *Ethnic Relations, Racism and Antisemitism*
Karin Stögner, University of Passau, Germany;
David Seymour, City University London, UK

RN32 | *Political Sociology*
Pauline Cullen, Maynooth University, Ireland;
Alberta Giorgi, University of Bergamo, Italy

RN33 | *Women's and Gender Studies*
Lise Widding Isaksen, University of Bergen, Norway;
Elisabetta Ruspini, University of Milano-Bicocca, Italy

RN34 | *Sociology of Religion*
Siniša Zrinščak, University of Zagreb, Croatia;

Julia Martínez-Ariño, University of Groningen, the Netherlands

RN35 | *Sociology of Migration*

Kenneth Horvath, University of Lucerne, Switzerland;

Margit Fauser, University of Applied Sciences Darmstadt, Germany;

Fiammetta Fanizza, University of Foggia, Italy

RN36 | *Sociology of Transformations: East and West*

Coordinators:

Elena Danilova, Russian Academy of Science, FCTAS, Russia;

Agnieszka Kolasa-Nowak, Maria Curie-Skłodowska University, Poland;

Matej Makarovic, School of Advanced Social Studies and Faculty of Information Studies, Slovenia

RN37 | *Urban Sociology*

Marta Smagacz-Poziemska, Jagiellonian University, Poland;

M. Victoria Gómez, Universidad Carlos III de Madrid, Spain;

Patrícia Pereira, Universidade Nova de Lisboa, Portugal

Research Streams Coordinators

RS01 - After Weber: Making Alternative Ethical Rationalities 'Knowable' | Pedro Jorge Caetano, Maria Manuela Mendes, Stefania Toma

RS02 - A New Normality For a New Europe? - ¿Una nueva normalidad para una nueva Europa? | Carmen Elboj, Luis Baptista

RS03 - Current Sociologies of Architecture | Eveline Althaus, Marilena Prisco, Tino Schlinzig

RS04 - Institutional Ethnography | May-Linda Magnussen, Morena Tartari

RS05 - Maritime Sociology | Agnieszka Kołodziej-Durnaś, Frank Sowa, Marie C. Grasmeier

RS06 - Politics of Engagement | Eeva Luhtakallio, Veikko Eranti, Anders Blok

RS07 - Precariousness in a Post-Covid-19 World: Labour, Daily Life and Subjectivities | Mireia Bolibar, Renato Miguel do Carmo, Annalisa Murgia

RS08 - Researching Social Futures | Giuliana Mandich, Daniel Welch

RS09 - "Second-Generation" Youth: Acts and Lived Experiences of Citizenship | Veronica Riniolo, Mari Toivanen, Giulia Mezzetti

RS10 - Sociology of Celebration | Ismo Kantola, Ozana Cucu-Oancea, Sabina Hadzibulic

RS11 - Sociology of Knowledge: Ways of Knowing the Future in Action | Silke Steets, Honorata Jakubowska, René Tuma

RS12 - Sociology of Law: Law in Action in the Covid-19 Crisis | Eleni Nina-Pazarzi, Jacek Kurczewski, Mavis Maclean

RS13 - Sociology of Spatial Mobilities | Knut Petzold, Heiko Rüger, Gil Viry

RS14 - Sociology of the Commons: Refiguring Social Life Through Education | Yannis Pechtelidis, Carles Feixa

RS15 - Teaching, Learning and Training under Covid-19 Lockdown Conditions | Vasiliki Kantzara, Martina Loos, Birgit Behrensen

RS16 - Theorising Men and Masculinities: European Insights | Katarzyna Suwada, Katarzyna Wojnicka

RS17 - The Role of Co-Creation in Current Societies | Fidel Molina Luque, Mar Joanpere Foraster

RS18 - The State, Organisations, and Established-Outsider Relations | John Connolly, Paddy Dolan, Stephen Vertigans

RS19 - Transformative Rural-Urban Connections | Maria Jesus Rivera, Apostolos G. Papadopoulos

8

Sociological Knowledges For Alternative Futures

We live in a globalised world where emergencies and hybridities arise from several challenges posed by climate change, sustainable development, violent conflicts, forced mass migration, and now also new health threats. Social inequalities (gender, class, age, ethnic, racialised, religion, territorial, embodied, etc.) are constantly reshaped by those challenges. Sociological research is analysing them as well as the actions designed to overcome such inequalities. Younger generations especially mobilise and develop solidarities, engaging in social movements focused around topics such as climate change and human rights. Those social movements are being studied and reflected upon in sociological research, contributing to other ways of seeing and building society. In a context of pandemic due to the new Coronavirus, discussion about alternative futures is especially relevant. Across Europe we witness an array of actions, that range from utilitarian to humanistic approaches, which have made many people rethink solidarity, democracy and the search for more egalitarian, just and better environments which can sustain satisfactory and flourishing lives. Fighting social inequalities and protecting natural environments are seen not as contradictory but mutually reinforcing. Citizens want to decide which paths to take to achieve such goals, and sociological knowledge provides key analyses about which actions might contribute to practical accomplishments and which will not. In pandemic times of global crisis, closing borders, restricted mobilities, and growing unemployment, sociological knowledge can help to develop institutions able to cope with different risks and practical issues. We believe that the sociological imagination has a big role to play in rethinking alternatives for the future, starting from solid scientific knowledge and working outwards from it.

How can we build sociological knowledge to face so many challenges? This is a pertinent question at a time of "fake news" and "post-truth", when scientific expertise is frequently brought into question. The distinction between knowledge and opinion becomes blurred. Therefore now is the time to discuss how sociology offers better understanding and relevant knowledge to improve society. Populist and authoritarian politics gain even more power and attention, undermining democracy in multiple parts of the globe. The complex relations between centres and peripheries, understood in a global perspective, must be explored, and the social implications of the use of technological tools in a digital era must be identified and applied, so as to imagine and create *other* futures.

We know that gatekeepers do not always recognise the relevance of sociological knowledge for society, postponing dedicated funding programmes and not providing enough resources to generate bridges between the contexts of knowledge production and application. However, today citizens are demanding to see how research in all scientific fields is contributing to the improvement of their lives, and the social sciences are well positioned to account for those contributions.

In a moment of emergency, when we should join up all our various efforts, we invite colleagues to share and discuss recent research concerning all areas of society, with a view to building alternative futures together in the ESA 2021 conference in the vibrant city of Barcelona. We encourage sociologists, and social scientists more generally, from Europe and beyond, to feed the scientific discussion with fresh data, thoughts and ideas, and to contribute sociological knowledge which envisions and builds alternative futures. Approaches to these problems from different methodological frameworks (qualitative, quantitative, mixed methods, experimental, etc.) will be most welcome. Barcelona will be a place for joint work, dialogue and networking, focusing on multiple future possibilities.

The construction of new epistemic communities is a crucial step towards creating alternative futures. We count on you to think about and practice new ways of overcoming the complex social challenges of our time!

9

Types of Sessions

During the 15th ESA conference, different talks or debates will take place in which, depending on its characteristics, we have called it by other names in order to organize and simplify. While Research Network and Research Stream sessions cover the immense variety of sociological inquiry, Plenary, Semi-Plenary, Midday and Evening specials and Fringe Events offer the opportunity to engage in core debates. All session formats will include time for open discussion. Coming up next, we will make a brief explanation about the variety of sessions:

Plenaries (P) address the main conference theme. They take place in the evenings (Tuesday, Wednesday and Friday).

Semi-Plenaries (SPs) discuss the main conference theme from the viewpoint of different fields of research. They promote discussion between speakers, next to that with participants. SPs are based on proposals made by the ESA Research Networks and the Executive Committee. This time, two of them were open for abstract submission.

Midday / Evening (MD / EV) specials cover topics which are relevant for sociology as a discipline and/or for the day-to-day work of sociologists. They are offered at lunchtime (on Wednesday) and in the evening (on Thursday).

Research Network (RN) sessions feature research papers submitted in response to the Call for Papers. The majority of sessions are organised by ESA's 37 Research Networks. RNs are open to all ESA members. All RNs hold a business meeting at the conference (this time on Thursday, Sep 02, in the evening after the last regular session). New members are cordially invited to join one or several RNs of their choice. Note that many RNs organise **Joint Sessions** (JS), which are the union between two RN.

Research Stream (RS) sessions are made by sociologists from several European countries who come together to organise sessions on specific sociological topics. RSs are self-organised bodies with a loose structure which is determined by the researchers who join the stream. While some RSs regularly organise sessions at ESA conferences, others offer adhoc sessions around spur-of-the-moment topics.

Session codes:
Regular sessions are sorted by the number of Research Network (RN01 to RN37), Joint Session (JS_RN01_RN13 to JS_RN35_RN37) and Research Stream (RS01 to RS19).

Numbers after the underline character indicate in which timeslot the session took place:
_01 Wednesday 1 Sep 2021 10:45-12:15
_02 Wednesday 1 Sep 2021 12:30-14:00
_03 Wednesday 1 Sep 2021 15:30-17:00
_04 Wednesday 1 Sep 2021 17:15-18:45
_05 Thursday 2 Sep 2021 9:00-10:30
_06 Thursday 2 Sep 2021 10:45-12:15
_07 Thursday 2 Sep 2021 13:45-15:15
_08 Thursday 2 Sep 2021 17:15-18:45
_09 Friday 3 Sep 2021 10:45-12:15
_10 Friday 3 Sep 2021 12:30-14:00
_11 Friday 3 Sep 2021 16:00-17:30

10

Plenary 1

Chaired by Marta Soler-Gallart, ESA President

Science, Technology, and 21st Century Democracy

Nelson, Alondra

White House Office of Science and Technology Policy; Institute for Advanced Study in Princeton, USA

Biography

Dr. Alondra Nelson serves as the inaugural Deputy Director for Science and Society in the White House Office of Science and Technology Policy. In this role, she brings social science expertise, including attention to issues of social inequality, explicitly into the work of Federal science and technology strategy and policy.

Dr. Nelson is also Harold F. Linder Chair and Professor at the Institute for Advanced Study, an independent research center in Princeton, NJ. She was president of the Social Science Research Council, an international research nonprofit from 2017-2021. She was previously professor of sociology at Columbia University, where she also served as the inaugural Dean of Social Science.

Dr. Nelson's research contributions are situated at the intersection of political and social citizenship, on the one hand, and emerging science and technology, on the other. Dr. Nelson connects these dimensions in a range of widely acclaimed publications, including, most recently, *The Social Life of DNA*.

Dr. Nelson is a member of the American Academy of Arts and Sciences, the American Academy of Political and Social Science, the American Philosophical Society, and the National Academy of Medicine.

Inventing the Future

Mayor Zaragoza, Federico

President of the European Center for Peace and Development Council of the United Nations and former Director-General of UNESCO

Biography

Federico Mayor Zaragoza is President of the European Center for Peace and Development Council of the United Nations. He is the founder and President of the Foundation for a Culture of Peace and has served as Director-General of UNESCO for twelve years. Mayor Zaragoza is a renowned scientist, scholar, politician, diplomat, and poet. He has been a professor at different Spanish universities, rector of the University of Granada, Chair of the European Research Council Expert Group (ERCEG), and Co-founder of the Spanish High Council for Scientific Research. He also holds an extensive career as a diplomat and politician. He was Co- chair of the High-Level Group for the "Alliance of Civilizations" and served as Spanish Minister of Education and Science. He is an honorary member of several scientific societies and a member of different academies, among them the World Academy of Art and Science.

Plenary 2

Chaired by Chair of the Conference
Ferro, Lígia

Time And Liminality In Migratory Contexts

El Harras, Mokhtar

Mohammed V University, Morocco

In this paper, we approach time as a central variable in migrants' lives. We intend to show how migration provides the possibility to be involved in multiple time cultures, to experiment a diversity of temporal rhythms, and discordant temporalities which do have disruptive effects on migrants who increasingly face the challenge of transiting from one time to another, and experience the tension and difficulties of temporal coordination.

As marginalized beings from mainstream societies, they confront temporal disjuncture and disharmony between their expectations and reality. If we add to that the work instability, mobility uncertainty as to the duration of residence and next destination, we may then understand their feeling of not controlling their own time as well as their decreasing power in planning their future.

Mostly, migration implies a liminal period of waiting in border posts, at embassies and migratory offices in order to legally regulate the duration of stay, or to transit to another country. At this level, the concept of rite de passage seems suitable, because everyone involved is in liminal phase, between his actual situation and an objective to attain.

Moreover, the in-between state is characterized by indeterminacy, ambiguity and hybridity. In face of the Unknown and in a situation of weak 'time sovereignty', migrants try to establish new temporal routines, adopt strategies to mitigate risks, discover new opportunities and make new plans to adjust to unstable temporalities.

Biography

Mokhtar El Harras is a professor of Sociology at Mohammed V University in Rabat. He was a scientific committee member of the program "50 years of Human Development in Morocco". Currently he is a member of the *Hespéris Tamuda* review board. He is also a member of the Board of Trustees of the Arab Council for the Social Sciences. He also assumes the co-coordination of the Fatema Mernissi Chair. He was an active member in many national and international research projects and programs. He is the author of numerous articles and book chapters on rural development, rural women, youth, family, international and transnational migration, qualitative methods in social sciences, media Sociology, public space, and the image of the "other". Among the books published are: *Tribe and Power in Northern Morocco* (1989, Rabat, CNCPRST), *Fertility and Culture* (1996, Beirut, Dar Attalia, in collaboration with D. Bensaid), *Women in decision-taking positions* (2008, Tunis, KAWTAR), *Youth and Media in Morocco* (2011, Rabat, Éditions Maghrébines).

12

Unfolding Human Agency: The Case Of Grassroots Romani Women

Kostic Cisneros, Rosamaria Elisabeth

Coventry University, United Kingdom

The EU recognizes that Roma is the most marginalized cultural community in Europe. The Roma issues are also marginalized even in the scientific studies about cultural groups. Furthermore, Romani women are marginalized even in women and gender studies. The result are opaque lenses that prevent science and society from seeing the deep transformations that the Roma feminist movements are creating in their community and in society. The worst consequence is that science and society are full of racist and sexist stereotypes about us. Romani feminism is one of the most important forces of transformation that has taken place in Europe in the last three decades. After centuries of being double or triple silenced, Roma women have been raising their voice, their concerns and creating their own spaces and discourses challenging long standing prejudices and stereotypes. Grassroots associations like the Drom Kotar Mestipen (Barcelona, Spain) are just examples of how non-academic Romani women are getting organized, unfolding the full potential of human agency and transforming many oppressive structures, for instance, through deeply Roma women revolutionary international congresses. Amidst this context, new masculinities are also an emerging field of study and action led by many Roma men who are walking side by side with women to fight against any type of violence or subordination. Taking these analyses into consideration, I will argue how the advancement of sociological theory, and more particularly, sociology of gender could be much beneficial acknowledging these new and nearly not explored real utopias.

Biography

Rosamaria Cisneros is a Roma sociologist, curator, dance historian and critic, Romani scholar, and peace activist. She graduated from the University of Wisconsin-Madison and got a Master's degree in dance history and criticism. She also has a minor in Curriculum and Instruction from the University of New Mexico in Albuquerque. She earned her doctorate in Sociology from the University of Barcelona. The PhD entitled "Transferability of Successful Educational Actions of the Roma Women to the plural European Contexts" placed the Romani Women's Association Drom Kotar Mestipen at the centre of this academic investigation.

Cisneros was and is involved in various EU-funded projects from Framework Programmes of Research. Related to them, she spoke in the Headquarters of the European Parliament. She sits on several boards such as the Roma Coventry Project, GRT Police Association (UK), Drom Kotar Mestipen-Romani Association of Women (Spain). She is also a Research Fellow at Coventry University in the UK.

13

Plenary 2

Exit: The New Social Question

Faist, Thomas

Bielefeld University, Germany

The opening of The Communist Manifesto (1848) by Karl Marx and Friedrich Engels reads: *"A specter is haunting Europe—the specter of communism"* . Communism and the proletariat were held to be the gravediggers of the capitalist system. About 150 years later, Michael Hardt and Antonio Negri claimed in their monumental study, Empire (2000): "*A specter haunts the world and it is the specter of migration*". Have we moved from the social question, the conflict between capital and labour around unsustainable inequalities, to a cultural question, with migration and migrants as the utopian agents of our time? Has exit in the form of migration trumped the voice of class-based social movements? Has politics around the social question—the politicization of social inequalities—moved from exploitation to exclusion, from class to culture, from redistribution to recognition? This lecture addresses the implications of migration for political cleavages in emigration and immigration contexts. The argument is that exit complements voice in two ways. First, the social question changed its shape over the past 200 years with the advent of welfare states, sophisticated migration controls, the growing relevance of class intersecting other heterogeneities, such as ethnicity, race (racialization), religion, gender, or citizenship, and the growing pluralization of theories guiding political action. Second, the dynamics driving migration politics can be discerned in the politics around the economic and the cultural dimensions in both immigration contexts (welfare paradox and liberal paradox) and emigration contexts (development paradox and national paradox).

Biography

Thomas Faist (PhD, New School for Social Research) is Professor of Transnational, Migration and Development Sociology at Bielefeld University in Germany. He directs the Center on Migration, Citizenship and Development (COMCAD). Thomas Faist has contributed to ongoing debates about citizenship, transnationality, migration and social policy in Europe and beyond. He has authored and co-authored numerous books including *The Transnationalized Social Question: Migration and the Politics of Social Inequalities in the Twenty-First Century* (2019), *Disentangling Migration and Climate Change* (2016), *Transnational Migration* (2013), as well as *Citizenship: Discourse, Theory and Transnational Prospects* (2007), and *Dual Citizenship in Europe* (2007). Thomas Faist is a member of the North Rhine-Westphalian Academy of Sciences, Humanities and the Arts.

Plenary 2

Plenary 3: Sociological knowledges for sustainable futures

Chaired by Chair of the LOC
Sordé, Teresa

Connecting Practices: Large Topics In Society And Social Theory

Shove, Elizabeth

Lancaster University, United Kingdom

The text outlining the theme of the ESA 2021 conference 'Sociological Knowledges for Alternative Futures' promises to engage with pressing challenges including sustainable development, migration and threats to health. It also makes claims about the importance of Sociological knowledge for understanding and improving society.

In this talk I resist some of these assumptions. Rather than supposing that Sociology provides 'analyses' to inform the 'actions' that citizens and policy makers might take, and from which 'alternative futures' might spring, I restate the claim that social practices, and combinations of them, can and should be the focus of Sociological conceptualization and analysis.

This changes the agenda. If we view contemporary global problems as aspects and outcomes of relations and connections between social practices, new and different questions arise. How do practices extend across space and time? How do forms of connectivity develop and change and how do these dynamics produce uneven textures of advantage? In working through the implications of these ideas and in doing so with reference to a selection of empirical examples (trends in obesity, carbon emissions, plastic particles, the accumulation of wealth) I hope to provoke some debate about what Sociology has to offer and where its contribution lies.

Biography

Elizabeth Shove is Professor of Sociology at Lancaster University. She is best known for her work on social theories of practice, including The Dynamics of Social Practice with Matt Watson and Mika Pantzar (2012) and for bringing a distinctive approach to bear on questions of consumption and demand. Elizabeth led the DEMAND (Dynamics of Energy, Mobility and Demand) Research centre from 2013-2018. The core proposition that energy is used not for its own sake but in the course of accomplishing social practices at home, at work and in moving around underpinned the Centre's research, and helped generate new and sometimes challenging ways of thinking about these topics. Books arising from that work include The Nexus of Practices (2017); Infrastructures in Practice (2018); Energy Fables (2019) and Conceptualising Demand (2020).

Elizabeth is part of a group working on Practice Theory at Lancaster, thinking about how social practices connect and change together, and about the relevance of these ideas for debates about health and wellbeing, economic sociology and social inequality. Elizabeth has a visiting position at the University of Helsinki at the Centre for Consumer Society Research.

15

Forms Of Sustainability/ Sustainability Of Forms. Sociology, Critique And Form(s) Of Life

Pellizzoni, Luigi

University of Pisa, Italy

The ecological crisis, understood as a broad recognition of a systemic problem with the relationship between (western/industrial) society and its biophysical milieu, is about fifty years old. Three master narratives have marked this time span, implying different understandings of sustainability. The 'limits to growth' was the first. Sustainability meant stopping growth and turning to a stationary economy. The second emerged in the 1980s, as 'growth of limits', in the sense of receding into the horizon thanks to the ever-increasing eco-efficiency of the economy. Sustainability took then its official formulation. The third has arisen in the 2000s, as 'internalization of limits'. The blurring of distinctions like nature/technology, real/virtual, language/matter, control/resilience, makes sustainability to effectively coincide with the progress of techno-capitalism, as confirmed by the emergent response to (and the very origin of) the Covid-19 pandemic. In these circumstances, to exert a role as knowledge that matters, sociology should address a methodological and a substantive issue. First, against claims about the exhaustion of critique, it should clarify to which account of critique it subscribes. I'll make a case for a specific one, as suited to the challenge of the present. Second, it should focus on current enactments of such critique as a radical reframing of sustainability. To this purpose, I'll argue that a key analytical lens is offered by a likewise specific account of the concept of 'form(s) of life' – a notion recently witnessing a resurgence in interest. Such an account may help detect most promising expressions of social effervescence and directions for institutional change.

Biography

Luigi Pellizzoni is professor of Sociology of the environment at the University of Pisa, Italy. He has taught at the Universities of Trieste, IUAV Venice and the International School for Advanced Studies (ISAS). Recent visits include the Centre for the Study of Environmental Change (CSEC), Lancaster University, UK. Appointments comprise a two-term service in the ESA Executive Committee ESA (2011-2015). He has an extensive record of research at international level and authored about 140 publications. His theoretical and empirical interests are located at the intersection of environmental challenges, techno-science advancement and the transformation of governance. In the last years he has been developing a research program on the reciprocal affections of novel takes on materiality and the governmental rationality of late capitalism, results of which are accounted for in articles, book chapters and the book *Ontological Politics in a Disposable World: The New Mastery of Nature* (Routledge, 2016). He is presently working on new social mobilizations, post-work, anticipatory governance and alternative ways of relating with the world. He is the coordinator of the research group and community of discussion "Politics Ontologies Ecologies".

16

SP01 | Yes Means Yes Only With Freedom To Consent

Organised & Chaired by ESA President
Soler-Gallart, Marta

Sociology related to areas such as gender, language, and violence has provided scientific knowledge that contributes to reducing coercive relationships and to increasing freedom in sexual-affective relationships. Nowadays, and especially after the "me too" aftermath, society faces new challenges that require additional developments for alternative futures. In the area of consent, professionals from different fields, such as law, gender, communication are debating on human interaction that produces consent while defining which are the conditions that coerce.

So far, debates about consent have been focused on verbal language, for example, "no means no," or "anything less than yes is no". However, the "no means no" statement is quite erroneous because it is incomplete. "Only yes means yes" is also insufficient because "yes", is actually "no" when it is not said under conditions of freedom. We need to move towards removing coercive discourse from the "yes" so that it be said in full freedom. This semi-plenary contributes knowledge to advance towards enabling "yes" in full freedom. For that, three conditions are needed: 1) to approach speech acts, power interactions and coercive speech; 2) to address revictimization, which limits consent; 3) to analyse the need to legislate Second Order of Sexual Harassment (SOSH). There is no consent if there are no spaces free of any violence.

The speakers will present most recent results of a new line of research, which places the problem and the solution in communicative acts, rather than only speech acts. They will also tackle institutional power and interactive power, which determine coercive relationships in different spaces, such as companies, artistic career, or academia.

17

Legal Advances Towards Free Relationships: A View On The Pioneer Legislation Of The Second Order Violence (SOV)

Miller, Katharina

European Women Lawyers Association (EWLA), Belgium

Sexual assault is a problem affecting everyone in different contexts, across countries and cultures.
Research in a variety of areas connect sexual violence with the lack of properly addressing consent in intimate relatioplnships. Facing this reality, much consideration has been raised along with the debate on approaching sexual violence also from the legal world. In fact, there are situations that evidence this reality. Gang rapes occurred in different parts of the world and placed the issue of consent on an unprecedented media and social scale. The challenge consisting on articulating sexual abuse, aggression and rape on the basis of consent, requires the analysis of current legislations while increasing the effort to comprehend victim's willing on engaging in any sexual encounter.
Drawing on this, the first speaker of this semi-plenary contributes knowledge to advance towards enabling an affirmative consent in conditions of full freedom, from addressing the legal understanding of sexual consent while considering overcoming revictimization and second order violence, which restrict freedom and consent. In this line, Professor Miller will provide a comparative overview of how different EU member states handle second order violence. In fact, the Catalan Parliament recently approved the inclusion in current legislation of the Second Order Violence (SOV) as "the violence, backlash, humiliations and persecutions against the people who support the direct victims of gender violence". As there is not SOV legislation on EU level, she will emphasize from a legal perspective about the importance of legislating consent and SOV to prevent both sexual harassment and revictimization.

Biography

Katharina Miller is the President of the European Women Lawyers Association (EWLA) and a member of the Commission on European Union Law and International Law of the German Association of Women Jurists (DJB). She holds a degree in Economics and Law (University of Greifswald, 2004 and 2006) and a master's degree in European Union Law (Universities of Luxembourg and Strasbourg, 2007). She is a Non-Executive Member of various corporate boards with extensive legal experience and with expertise in Compliance & Ethics and Women Rights, being a qualified lawyer in Germany and Spain. She is known by the Boards of Directors of the IBEX35 for her impulse in the management of gender diversity in the boards of directors and the economic and social empowerment of women. She is Delegate for Spain and the EU to the W20 and Advisory Board Member for the Berkeley Center on Comparative Equality and Anti-Discrimination Law.

18

'Only Yes Means Yes'. From Speech Acts To Communicative Acts In Consent

Puigvert, Lídia

Universidad de Barcelona, Spain

Despite strong efforts to address violence against women and the progress achieved so far, gender violence and sexual harassment are still huge challenges of our current society. Facing this reality, some aspects have to be deepen approached. At the basis of consent it raises the analysis of communicative acts (those including non-verbal communication in addition to the verbal speech acts) from the type of language used on people interactions. As language takes place through interactions and gender violence may happen in everyday contexts, specific communicative acts may permit or avoid such situations of violence. The theoretical background, based on women's studies and sociology, departs from Puigvert's conceptual framework on language and gender violence in order to analyse concrete factors which base consent on the intention of the act, while giving voices to survivors and contributing to prevent harassment and abuse.

In this line, Dr. Puigvert will provide insights from the sociological perspective by presenting the most recent results of a new line of research, which places the problem and the solution in communicative acts, rather than only speech acts. Under this framework, this conference also deepens on the analysis of communicative acts for ensuring consent, focusing on sexual freedom and the context under which consent can neither be asked for nor conceived. Lidia will also tackle institutional power and interactive power, which determine coercive relationships in different spaces, such as companies or academia, while emphasizing on the need to create awareness on the urgent need of achieving free consent without coercion.

Biography

Lídia Puigvert is professor of Sociology at the University of Barcelona, and Affiliated member of the Centre for Community, Gender and Social Justice at the Institute of Criminology, University of Cambridge. She is a feminist author internationally known for her theoretical contribution to dialogic feminism and to the prevention of gender based violence. She is co-author of the book "Women and social transformation" with Judith Butler and Elisabeth Beck-Gernsheim, besides many publications in top-ranked journals such as *Violence Against Women* or *Journal of Mixed Methods Research.* She has participated in research funded under the *European* Commission Framework Programme (FP5, FP6, and FP7) and most recently in the H2020 project PROTON on preventing organized crime and terrorist networks. She is currently leading a competitive study, funded by the Spanish Ministry of Science, about Sexual Consent in different space.

19

SP02 | Alternative Futures Beyond Neoliberalism: Inside and Outside of the European Union

Organised by RN06 - Critical Political Economy & RN32 - Political Sociology

Chaired by David J. Bailey, University of Birmingham; Pauline Cullen, Maynooth University

20

The global pandemic has revealed the inherent structural, material and embodied violence of neoliberal capitalism. We need alternative futures. The EU and its member states have responded with a form of crisis management that may have delivered reprieve for some, but has also exacerbated inequalities. This requires not only scholarly scrutiny but also alternative solutions able to attract political support from various constituencies. This semi-plenary focuses especially on the EU in order to consider how its role as an internal and external actor affords, or prevents, an alternative future.

1) Inside the EU

The political economy of the EU has systematically (re)produced a debt-driven model of neoliberal growth. The recent EU industrial policy, the Covid-19 rescue package, and the massive liquidity injections of the ECB into financial markets are each a case in point. These initiatives have reinforced class, gender, racial, and geographic inequalities across the EU. They are creating a potential for further contestation of the process and institutions of the EU, forcing progressives to think of alternatives to supranational integration without a retreat to nationalism.

2) Outside the EU

Through its colonial history, and contemporary external relations, the institutions and processes of European integration are implicated in global racialized and gendered hierarchies which underpin deep-rooted global inequalities. Analysing the EU's foreign, security and development policy in a period of crises raises questions about the EU's efforts to resolve its own credibility crisis and the ambiguities, tensions and contradictions that characterise its role as a global actor.

Re-Narrating Africa-EU Relations In A Time Of Crises

Haastrup, Toni

University of Stirling, United Kingdom

In the wake of multiple crises, including a global pandemic, and new social movements that call into question global power hierarchies, reflecting on the unequal relationship between African and the European Union merits considered attention now. It is still the case that so-called EU-Africa relations are steeped in the colonial patterns of interactions. Yet even the critiques of EU practices as found in the literature on "EU-Africa relations" have tended to reproduce this hierarchy for a variety of reasons. Consequently, so-called EU-Africa relations is also manifested in the insistence on certain 'patterns of knowledge production and meaning'.

Invariably then, both the study and practice of Africa's relations with the EU have had a detrimental impact on both the exercise of African agency and how we know Africa in the interregional relationship. The co-constitutive nature of the study and practice of Africa's relationship with the EU is one that this discussion aims to explore. I am motivated by the desire to re-narrate the so-called 'EU-Africa relations' through decolonial lenses in order to claim back African and as a way to challenge the dominant ways of knowing and doing EU External Relations. In doing so, I want to contribute to transforming the relationship between the EU and African actors, specifically, while offering a broader critique on the EU's external relations practices.

Biography

Toni Haastrup is a Senior Lecturer in International Politics at the University of Stirling, Scotland, UK. Her research interests are broadly in the area of Global Governance of Security, particularly the practices of the African and European Unions. Her research uses critical feminist lenses to understand the foreign policy practices of both institutions, and she has published widely in this area. Additionally, Haastrup teaches on themes of European security, contemporary global security challenges, crisis in Europe and feminist international politics. She is currently joint Editor in Chief of JCMS: Journal of Common Market Studies, and an occasional media commentator.

21

SP02 | Alternative Futures Beyond Neoliberalism: Inside and Outside of the European Union

Zombification Of The Economy In Pandemic Times

Wigger, Angela

Radboud University, The Netherlands

A World Awash With Cash And The

Political responses to the C-19 pandemic in the European Union (EU) but also beyond have consisted of various corporate rescue packages and massive state aid as part of a broader revival of industrial policy, as well as unseen levels of quantitative easing by central banks. The talk will embed these measures into the context of the 'Wall of Money' searching for yield and the continued debt-led accumulation patterns that have prevailed during more than thirty years of neoliberal capitalism.

The crisis responses at EU-level have so far not led to investments in the production sphere. Instead, corporations are building up debt to finance share buy backs, make dividend payments to shareholders, or conduct mergers and acquisitions. In many industrial sectors, such activities exceed greenfield investments or investments in R&D. We seem to find ourselves in a phase of capitalism that Karl Marx described almost 170 years ago as a phase where everybody is seized with a sort of craze for making profit without producing. What will be identified as 'the zombification of the economy' is reinforcing class, gender, racial, and geographic divisions not only in Europe but also beyond. In this context, the invocation of the 2017 'White Paper on the Future of Europe' that the hard-earned human dignity, freedom and democracy in Europe can never be relinquished, appears as a mere platitude. The talk will not only discredit, de-legitimize and politicize the crisis management from a critical political economy perspective, but also sketch the contours of a progressive alternative.

Biography

Angela Wigger is Associate Professor Global Political Economy at Radboud University, the Netherlands. Her research is theoretically anchored in historical materialism and anarchism, and focuses on debt-led accumulation in capitalist crises, shadow banking, crises responses in the field of competition and industrial policy, and prefigurative forms of resistance. She has co-authored The Politics of European Competition Regulation: A Critical Political Economy Perspective (Routledge, 2011), and published widely in New Political Economy, New Political Science, Review of International Political Economy, Journal of Common Market Studies, Economy and Society, Globalizations, and Capital & Class, Journal of International Relations and Development, or Geoforum. She has been a board member of the Critical Political Economy Research Network (RN06), where she acted as chair from 2017-2019. She forms part of the supervisory board of the Research Centre on Multinational Corporations (SOMO), the EuromemoGroup, and the journals Capital & Class and Structural Change and Economic Dynamics.

SP02 | Alternative Futures Beyond Neoliberalism: Inside and Outside of the European Union

SP03 | Social Research and Social Justice in the Study of Migration Towards Southern Europe

Organised by RN27 - Regional Network Southern European Societies & RN35 - Sociology of Migration

Chaired by M. Teresa Consoli, University of Catania; Fiammetta Fanizza, University of Foggia

The semi-plenary aims to offer a critical update on recent trends and research developments related to migration towards southern Europe. The focus on this strategic geographical and socioeconomic region of Europe remains important due to the fact that it enables researchers and policymakers understand and reflect upon the needs and claims of the newly arriving populations, while also exemplify and discuss research findings and governance issues that articulate social justice and moral obligations towards these populations.

Against the domination of the human security approach that points towards the alleged threats and risks attached to migration that seems to be preferred by most of politicians, social scientists are obliged to deconstruct the suggested narratives and misconceptions and bring to the fore evidence that supports a sober scientific approach to migration along with the condemnation of an emerging "sociology of racism". Moreover, this semi-plenary seeks to unveil and denounce the links between the narratives of migratory events and media languages and national legislations used in the attempt to govern integration processes in the name of sustaining different market economies.

The basic intention of the organizers is to re-introduce the scientific and policy discussions aiming at prioritizing migrant integration, in response to new public discourses connected to securitizing migration, by reconnecting migration and social justice in European countries. It seems that the major challenge implied by this topic is to allow for different identities and cultural backgrounds be represented in the performance of the European social construction.

23

Intra-EU Mobility and Welfare: The European North-South Divide Revisited (again)

Finotelli, Claudia

Universidad Complutense de Madrid, Spain

The rhetoric on a North-South divide has been present in a good deal of the European recent migration history. The idea that many asylum seekers in Northern European countries proceed from less attractive (and generous) Southern European countries or that regularisations in Southern Europe trigger new flows of unwanted migrants towards Northern Europe came up every so often in the political debate. Since the 1990s, Southern European countries have certainly improved their regulation frameworks and migration control capacity over time whereas only few would deny that irregular migration is a reality in both Southern and Northern European countries.

This notwithstanding, the recent 'migration crisis' has shown that Southern European countries still have troubles in shaking off their reputation as 'transit countries' with porous borders and unattractive asylum systems. Moreover, the post-recession intra-EU mobility from Southern Europe to Northern European countries has revived the idea of a welfare-migration nexus between Southern and Northern Europe where Southern European workers started to be perceived as a welfare burden in some EU countries. But what about the non-labour-motivated mobility from Northern European countries in Southern Europe? To what extent can it represent a welfare burden for Southern European countries? I will answer these questions by discussing to what extent the idea of a North-South divide still seems to bias the public perception of Southern European migration countries and how it can be further reviewed by reversing the traditional North-South perspective on the welfare impact of intra-EU mobility.

Biography

Claudia Finotelli holds a Ph.D. in Political Science from the University of Münster (Germany) and is currently Associate Professor at the Department of Applied Sociology of the Universidad Complutense de Madrid. Her research interests cover the areas of migration control and citizenship with a special focus on Southern Europe. With MariaCaterina La Barbera, she is PI of the Research Project "The subjective dimension of citizenship: conceptions, juridical practice and individual strategies in Italy and in Spain" (CIVITES) funded by the Spanish Ministry of Science and Innovation (2020-2023). She is currently editing together with Irene Ponzo a book for Springer on migration control logics and strategies in Europe.

24

A Paradigm Of Siege. External And Internal Bordering In The Manufacture Of Cultural And "Racial" Difference

Maneri, Marcello

University of Milano Bicocca, Italy

The many policies and activities for the contrast of "illegal immigration" seem inspired by a "paradigm of siege". This metaphor – sustained by powerful iconic representations – conveys the idea of an ongoing external threat to the stability of the European economic and social system. The daily management of the European Southern border based on the securitisation of territorial sovereignty is a social ordering practice based on associations and dis-associations. This boundary-making process involves the formation of identities and the definition of in-groups and out-groups. So, European security policies at the external borders, and their regime of visibility, create the lenses we use to think and talk about differences.

What kind of difference is being produced and reproduced by these bordering practices? The discourse that makes sense of the post-national, pan-European belonging, made possible by the Schengen bordering, often puts at the centre the concepts of integration and cultural compatibility as conditions to preserve European civilisation and identity. However, this discourse on culture, customs, and values is what we can see on the surface. Still, other less confessable boundaries—inherited from the colonial past and revolving around an implicit idea of whiteness—are being renovated as well. An analysis of images accompanying news about the "refugee crisis" shows Europe's unconfessed racial views.

Biography

Marcello Maneri is Associate Professor of Sociology at the University of Milano Bicocca where he teaches Media and Cultural sociology. His research focuses on the media and power, especially on news about migration, on racism, public discourse on crime and security, and moral panics. With Ann Morning, he is currently publishing a book for Russell-Sage on the notions of cultural and biological difference of descent-based groups in Italy and the United States.

25

SP04 | The Future of Gender Equality in Post-Pandemic Societies

Organised by RN33 - Women's and Gender Studies

Chaired by Maria Carmela Agodi, University of Naples Federico II

Covid-19 is a new disease and still too poorly understood to allow us to assess its ultimate impact on gendered structures and practices. The pandemic is revealing and widening gaps between rich and poor, black and white, men and women. Gendered perspectives, theories and empirical analysis are in high demand in order to develop a comprehensive understanding of the impact the pandemic has on individuals and its complex consequences on social reproduction, labour markets, new private/public dynamics and quality of life in general. This semi-plenary will encourage debates about consequences and risks the epidemic has on women's lives: gendered divisions of care and housework, how 'lockdowns' intensify private domestic and care responsibilities, risks for frontline healthcare workers in the Covid-19 response. Will contemporary patterns that have worked in favour of improving gender equality be reversed? What kind of sociology, feminist research and gender studies will be valuable in crafting a response to new risks related to the progress towards gender equality, especially in health, education, and gender-based violence?

Fighting the virus requires cooperation, sociological imagination and a forward-looking perspective. We must look beyond the current crisis and re-image our future in the post-Covid-19 world. Gender-specific knowledge can help develop institutions able to cope with different risks, implement a gender-sensitive approach in the responses to the pandemic and in the recovery phase, and increase society's resilience.

26

Centered On Care. Dispatches From Domestic Workers During The Pandemic

Rosińska, Anna Maria

University of Venice Ca' Foscari

The pandemic has exacerbated and exposed many of the problems that have troubled societies before – from gender to class inequalities to racism. This paper offers a lesson from the perspective of a predominantly female labor sector that has been at the heart of COVID-19 response: care and domestic work. Domestic workers, most of whom are women and working-class, oftentimes of color and/or migrants, found themselves again at the intersection of multiple exclusions from both the everyday and emergency safety nets. Moreover, domestic workers experience the paradox of essential work: being frontline and fundamental yet unprotected and, in the end, 'disposable' (Chang 2000).

Domestic and care work during the pandemic offers an important lesson in the ethics of care — interdependencies become even more visible; however, they very often lack the principle of care necessary to build the caring democracy: 'justice, equality, and freedom for all' (Tronto 2011), and, above all, reciprocity.

Yet, given the prominence that care has recently gained (Fine, Tronto 2020), in a way, the pandemic offers a chance to reinterpret the established order. In the United States, social movements have incessantly navigated the paradoxes of 'essential work' in order to gain recognition, acquire necessary protections, access the vaccines, while avoiding the pitfalls of 'disposable workers' framing (Rosińska, Pellerito 2021). This paper shares the findings from the research study of domestic workers and their movements in the US and Europe to reimagine a more just and equitable society centered on care.

Biography

Anna Rosinska is a sociologist of care and domestic work. She is a Marie Skłodowska-Curie Fellow at the Ca' Foscari University of Venice. She has studied paid domestic and care work in Italy, Poland, and the United States, working at the University of Warsaw and as a visiting scholar at the University of Massachusetts Lowell (2018-2020). Author of the book '(U)sługi domowe' about domestic work in post-war Poland (2016, Wydawnictwo UMK, under Anna Kordasiewicz). With A.Radziwinowiczówna and W.Kloc-Nowak she co-authored the book „Ethnomorality of care. Migrants and their aging parents" (2018, Routledge). Her current project is 'Intersections of class and ethnicity in paid domestic and care work in Italy and in the USA' (2018-2022). She runs a Facebook page about domestic work. She is interested in social relationships, reproducing, perpetuating and constructing inequalities, the intersectional perspective and workers' activism of marginalized groups on the job market.

27

"I am Lucky, Because my Husband Helps me a Lot": Gender (In)equality in Home Office

Nagy, Beáta[1]; Geambașu, Réka[2]; Gergely, Orsolya[3]; Somogyi, Nikolett[4]

[1]Corvinus University of Budapest, Hungary; [2]Babeș-Bolyai University, Romania, Centre for Economic and Regional Studies - Eötvös Loránd Research Network, Budapest, Hungary; [3]Sapientia Hungarian University of Transylvania, Romania; [4]University of Antwerp

The quarantine, confined upon us by the COVID-19 outbreak, created a unique, three-month-long, laboratory-like situation in which we could investigate gender roles. Full-time working parents who switched to home office, were in a unique position to renegotiate the division of housework, childcare, or the supervision of school-related tasks. This paper intends to explore what happened to the gendered division of unpaid work, when all kinds of productive and reproductive tasks were moved inside the home. To answer this question, we interviewed 52 mothers in two countries, Hungary and Romania, who lived in dual-earner families with children under the age 14, and worked full-time. Results show that despite the unusual situation, most parents followed the usual pattern. Even though they were unhappy with the workload, most women did not mind the division itself. During the quarantine, they suffered from permanent tiredness, as well as felt limited to carry out their paid work satisfactorily. Despite the significant similarities among mothers, some country-specific differences have also been detected. Research findings deliver evidence for the deeply rooted gender beliefs regarding the division of unpaid work, particularly if these duties are connected to childcare and education. Results contain implications for the post-pandemic gender relations and also for the preconditions of the fair gender division of labour.

Biography

Beáta Nagy, PhD is professor at the Institute of Communication and Sociology at Corvinus University of Budapest. Her main research field is gender and work. She is the co-director of the Gender and Cultural Centre at her university, and board member of the *European Consortium for Sociological Research* (ECSR).

She has published articles in both Hungarian and English journals, such as *Gender in Management: An International Journal; Gender, Work and Organization*. Beáta published a book on the lack of female students in IT and technology in 2015. She has recently co-edited a special issue on 'Work-life balance/imbalance: individual, organizational and social experiences' for the journal *Intersections. East European Journal of Society and Politics,* and a special issue on *'Leveraging cooperation for gender equality in management'* for the journal *European Management Review.*

Her latest research dealt with the work-life balance, and also with the time teenagers and their parents spend together with special attention to digital technology. The present qualitative research investigated the situation of mothers during the COVID-19 quarantine In Hungary and in Romania in cooperation with Réka Geambasu, Orsolya Gergely and Nikolett Somogyi.

28

SP05 | Covid-19, European Solidarity and the Future of Europe

Organized by Kaja Gadowska, Sebastian Koos & Irina Tartakovskaja

Chaired by Sebastian Koos, University of Konstanz

The COVID-19 pandemic presents enormous challenges to the European Union (EU). The combination of a health crisis and a dramatic economic crisis exacerbates existing inequalities within the EU. The centrifugal forces released by this trend jeopardize the future of the European community. Contrary to initial expectations that the COVID-19 would be a symmetrical crisis subjecting all countries and citizens to the same risk, the asymmetrical effects of the crisis become increasingly evident—both in the medical and in the economic domain. In some countries, hit by high numbers of infections and hospitalizations, the virus brought national health systems to the brink of collapse, while other countries severely suffered from the economic impacts of the pandemic and ensuing lockdown measures. After an initial paralysis and uncoordinated closing of borders throughout Europe, the EU member states have intensified their joint actions to fight the pandemic and its devastating economic repercussions. To relieve overburdened health systems, for instance, in early summer 2020 French COVID-19 patients were transported to and treated by neighboring EU countries. In July 2020, the heads of state and government agreed on a 750 billion Euro recovery fund (NextGenerationEU). The coordinated vaccination-purchasing program of the EU has further shown that there is hope for European solidarity. In this semi-plenary we will discuss what we have learned from past crisis and the still ingoing Covid-19 pandemic about European Solidarity.

Conditioned Solidarity: EU Citizens' Attitudes Towards Economic And Social Austerities For Crisis Countries Receiving Financial Aid

Lengfeld, Holger & Kley, Florian

Institute of Sociology at Leipzig University, Germany

During the European debt crisis, there has been a massive political debate between the EU institutions and the governments of crisis countries on the kind of austerity measures these countries have to accept in order to receive financial assistance from rescue funds established by EU and IMF. Based on a Weberian approach regarding solidarity as an act of mutual help, we interpret austerity measures as particular conditions of solidarity Alter has to agree to in order to receive assistance from Ego. In this paper, we ask to what extent citizens of EU countries agree on the notion of conditioned solidarity, and to which extent they are divided by socio-structural or cultural conflict lines, or by country particularities. Using unique data from the 2016 13 country 'Transnational European Solidarity Survey', findings show that the majority of respondents reject the idea of conditionality. Logistic regressions reveal rather weak attitudinal differences between respondents at the individual level, while at the country level respondents from countries with growing unemployment, higher unemployment rates, government debt, and poverty rates are in tendency more likely to reject the measures. We conclude that paying attention to the idea of conditionality is an important aspect of assistance measures in the future, if political actors look to avoid a lack of legitimacy among European citizens.

Biography

Holger Lengfeld is Professor of Sociology at the Institute of Sociology at Leipzig University, Germany, and Research Fellow at the German Institute of Economic Research Berlin. His research focuses on social stratification, inequality, and European social integration. Among his publications are 'Modernization Losers' Revenge? Income Mobility and Support for Right- and Left-Wing Populist Parties in Germany' (European Sociological Review, 2021, with J. Hartmann and K. Kurz); 'Contemplating the Eurozone crisis: are European citizens willing to pay for a European solidarity tax? Evidence from Germany and Portugal' (European Societies, 2020, with F. K. Kley and J. Häuberer); 'European Solidarity in Times of Crisis. Insights from a Thirteen-Country Survey' (Routledge, 2019, with J. Gerhards, Z. S. Ignácz, F. K. Kley, and M. Priem).

Florian K. Kley is a researcher at the Institute of Sociology at Leipzig University, Germany, and currently working as a researcher in the DFG-Project Changing middle class: A comparison of Germany and the US. Previously, he was a researcher in the HORIZON 2020-Project, Solidarity in European Societies: Empowerment, Social Justice and Citizenship (SOLIDUS). His main research fields are European social integration, social stratification research, and quantitative data analysis. Among his publications are 'Contemplating the Eurozone crisis: are European citizens willing to pay for a European solidarity tax? Evidence from Germany and Portugal' (European Societies, 2020, with H. Lengfeld and J. Häuberer); 'European Solidarity in Times of Crisis. Insights from a Thirteen-Country Survey' (Routledge, 2019, with J. Gerhards, H. Lengfeld, Z. S. Ignácz, and M. Priem).

Viral Solidarity? Support for European Fiscal Integration in the COVID-19 Crisis

Kuhn, Theresa

University of Amsterdam, The Netherlands

Although fiscal integration is seen as necessary to ensure the stability of the European monetary union, concerns about a Euroskeptic backlash constrained national governments' ability to pursue further fiscal integration in the euro crisis. During the COVID-19 pandemic, however, European governments agreed on an ambitious recovery fund, which established an unprecedented fiscal stabilization capacity. This development challenges the assumption that public opinion constrains EU governments and begs the question of whether, and under which conditions, citizens are supportive of European solidarity measures in the COVID-19 crisis. Theresa Kuhn presents the results of an original survey experiment on public support for a European pandemic recovery fund in five European countries (France, Germany, Italy, the Netherlands, and Spain) in July 2020. She shows that there is remarkably high support for a joint European fiscal instrument, and that the design of such an instrument influences support. While cross-country differences reflect perceptions of collective self-interest, there is considerable support for the pandemic recovery fund across all countries. Citizens' left-right orientations, their pro-anti EU positions, and to a lesser extent, their perceived economic risk from COVID-19 structure differences within countries. The findings suggest that public support for fiscal integration is higher than commonly assumed. The research has been conducted jointly with Björn Bremer, Maurits Meijers and Francesco Nicoli.

Theresa Kuhn is Associate Professor in Political Science at the University of Amsterdam where she is also co-director of the faculty research priority area Amsterdam Center for European Studies and leader of the programme group Challenges to democratic representation. After obtaining her PhD from the European University institute in Florence, she was a Postdoc Fellow at Nuffield College, University of Oxford and at the chair of macro sociology, Freie Universität Berlin. She works on questions of European integration and solidarity, using comparative survey and experimental methods. Her research has been published in numerous renowned international journals. In 2015 she published an award winning monograph on "Experiencing European Integration. Transnational Lives and European Identity" at Oxford University Press. Together with other colleagues, she just received a large research grant by the Volkswagen foundation to study the effect of COVID19 on Euroscepticism, solidarity and vote choice.

Biography

SP05 | Covid-19, European Solidarity and the Future of Europe

SP06 | Sociology Transforming Science and Society

Organised by the LOC members Teresa Sordé & Luis Recuenco

Chaired by Teresa Sordé Martí, Universitat Autònoma de Barcelona

During the Covid-19 pandemic, citizens know to what extent their lives fully depend on scientific advancements. Amidst democratic revolutions, people's will to self-govern themselves lead to the Social Sciences (SS) foundation with the main purpose of making all human lives more flourishing. Sociology played a key role to address the core problems affecting citizens. However, throughout the years, Sociology has been to some extent deeply affected by a bureaucratization process, deviating its original purpose to respond to citizens' claims to provide scientific evidence to better support societies' self-management. Frequently the word Sociology has been used as a resource to reinforce ideological or political standpoints, instead for contributing with the sociological developments to the objectives of the humanity. Consequently, Sociology does not play a central role in the key issues affecting humanity, even when it could have done so. Taking the recent pandemic example, most of the prevention measures or key debates are located within the core issues of Sociology, however, sociologists' voices or contributions are not perceived as being crucial. There is an urgent need to decolonize the Sociology domain from being a battlefield between political forces, and to restore its independence and universal nature, providing the needed expert knowledge to satisfy citizens' claims. This way, it will be possible for Sociology to recover the initial purpose and regain our central role in society, without depending on who is in power to be fully considered and heard.

32

Sociological Responses to The Pandemic And Their Takeaways For A Post-COVID19 Society

Aiello, Emilia

Harvard Kennedy School, United States of America

Societal challenges across Europe such as access to social protection, adequate working conditions or food security for those at risk have worsened by the crises unleashed by COVID-19, evidencing the cracks of our system but also offering a unique opportunity to act. In record-time, the presence of science in lay people's daily life gained unprecedented importance. Health sciences have been at the forefront of the crisis, contributing to a way out of the health emergency. However, a mid-term and long-term way out of the economic, societal and political crises will require a broader approach and collaboration between all societal and political actors, namely policy-makers, scientists, and civil society. Amid this context, sociologists in Europe can play a key role, offering theoretical and methodological tools to capture, analyse and work with the public to offer transformative alternatives. Although part of the expert knowledge from sociological research is still trapped at the Ivory Tower, others have proven to have great social impact, and serve as the basis to inform policy and actions welcomed by both policy-makers and end-users. In this sense, knowledge co-creation is not solely a criterion posed by research programmes such as Horizon Europe to democratise knowledge, but also claimed by end-users. Examples of successful collaborations between sociologists and those working at the grassroots can be identified. I will discuss how European Sociology is already serving as a forum where accurate societal analyses are developed and ambitious ideas co-created and implemented, thus helping those in positions of leadership and decision-making.

Biography

Emilia Aiello, PhD, is EU Marie Sklodowska-Curie Post-doctoral fellow at the Ash Center for Democratic Governance and Innovation, at the Harvard Kennedy School, and at the Department of Sociology at Universitat Autònoma de Barcelona (UAB). She is also research affiliate of the UAB Group of Ethnic Studies and Migration (GEDIME), and member of the Community of Researchers on Excellence for All (CREA). Emilia's research interests are focused on how the most vulnerable social groups organize at the grassroots level to overcome inequalities and gain social and political power. Her scientific and personal concern also focuses on uncovering the ways to maximize the social impact of all types of scientific research, better connecting scientific interests and outputs to societal needs. She collaborates with the Spanish organization "Ciencia en el Parlamento", and with the Drom Kotar Mestipen Roma Association of Women.

Sociology as a Vocation. Weber Against Weber

Hanafi, Sari

AUB, Lebanon (Lebanese Republic)

Max Weber has two famous lectures about the academic field in its relationship to the other field: one on science as a vocation in 1917 and the other ''Politics as a Vocation'' in January 1919. Even with a span of two years one cannot understand the former without connecting it to the second. I will show that Max Weber contradicts his own sociology and his descriptive science guided by Wertfreiheit contains within it "smuggled in" prescriptions about how institutional matters ought to be arranged and about how one ought to confront the realities described. Also I will use Bruno Latour to show that Science and politics have the same vocation. In this talk I have proceed as following:
- What are the major messages of Weber "Science as a vocation"?
- What are Institutional, political and cultural circumstances that bore upon Weber to write his piece?
- If his position is justified at that time, is it still valid for 21st c.?
- If his lecture is about sociology of vocation, what about sociology as a vocation?

Biography

Sari Hanafi is currently a Professor of Sociology, Director of Center for Arab and Middle Eastern Studies and Chair of the Islamic Studies program at the American University of Beirut. He is the President of the International Sociological Association. Recently he created the "Portal for Social Impact of Scientific Research in/on the Arab World" (Athar). He was the Vice President of the board of the Arab Council of Social Science. He is as well editor of Idafat: the Arab Journal of Sociology (Arabic) Among his recent books are: The Oxford Handbook of the Sociology of the Middle East, Knowledge Production in the Arab World: The Impossible Promise. (with R. Arvanitis). He is the winner of 2014 Abdelhamid Shouman Award and 2015 Kuwait Award for social science. In 2019, he was awarded an Honorary Doctorate (Doctor Honoris Causa) of the National University of San Marcos (the first and the leading university in Lima- Peru – established in 1551). (His website: https://sites.aub.edu.lb/sarihanafi/).

The Failure Of Academic Social Science On Both Sides Of The North Atlantic In Explaining And Helping To Change The World

Navarro, Vicenç

Public Policy, Johns Hopkins University, United States of America

The Academic Social Science has a major crisis of credibility on both sides of the North Atlantic that parallels and accompanies the crisis of legitimacy of representative democratic institutions in both continents (also in multinational European Institutions such as the European Union, whose popularity has been in decline considerably). Academic Social Science has been unable to explain, predict, and contribute to resolve those political crises. At most, they have been able to analyse some specific protest and liberation movements (based on different forms of exploitation), but without relating them to the overall crisis of legitimacy of political regimes dominant in both sides of the Atlantic since the 80s.

This explains the lack of proposals for alternative political regimes that could enable different movements of liberation to construct political spaces with a common strategy to change those regimes. A country could have many social movements in defence of minorities, women, better environment, among many others, and still have very few political, social, and labour rights for each group, as it happens in the United States, where each social group competes with others for political and media attention. A major deficit of dominant social science is the limited attention paid to the elements of transversality that can relate to different forms of exploitation helping to establish joint strategy that could facilitate the change of those regimes. The big atomisation among the different protest movements explains the weakness of each one. Diversity is not the problem. The absence of transversality is the problem.

Biography

Dr Vicente Navarro is professor of Public Policy at Johns Hopkins University, Baltimore and is also Emeritus Professor of Political and Social Sciences at the Pompeu Fabra University in Barcelona, he is also the Founding Director of the JHU-UPF Public Policy Center. He has published more than 40 books, translated into different languages, as well as having published more than 400 articles in peer reviewed scientific journals. He is one of the most frequently cited scholars in the Scientific International Literature. He has been an advisor to many international agencies such as the UN, ILO and many governments in developed and developing countries. His area of work is on political economy and social science, focusing very much on the economic, political, and social determinants of quality of life on both sides of the North Atlantic.

SP07 | Public Spaces after Covid-19: Building Alternative Knowledges for the Future

Organised & Chaired by ESA Vice-President & Chair of the Conference Committee Ferro, Lígia

Evaluation On Spatial, Socio-cultural And Economic Concerns Across Europe

Bravo, Luisa

City Space Architecture, Italy

The COVID-19 pandemic has made clear the fundamental role of public space in our cities, not just for social life but also in regards of the functioning of the economic urban system. The imposed lockdown, to prevent the widespread of the contagion at the global level, combined with physical distancing and health restrictions, significantly impacted on public urban life while reinforcing existing inequalities, at many different levels, accelerating the process of social exclusion of minorities and disadvantaged and marginalized groups. Youth, older persons and persons with disabilities experienced isolation, frustration and loneliness, with a significant raise of helplessness and fear. Women were hit harder than men and many lost their jobs. From being a health emergency, the pandemic soon became an economic crisis.

We are now aware that in the 'next normal' the shared civic space will no longer be as we know it: the pandemic has put at the forefront some urban models, such as the car-free city or the 15-minute city, aimed at re-organizing priorities around the human scale, and it has established the 1,5 meter society as a new form of safe physical co-existence, while moving many social interactions on the cyberspace and on multiple virtual platforms. This health and economic crisis will permanently change the way humans will interact in the public domain in the post-COVID 19 city.

Biography

Luisa Bravo is Adjunct Professor in Urban Design at the University of Florence in Italy and Guest Researcher at KTH Royal Institute of Technology, Centre for the Future of Places in Sweden. She has more than 15-years experience in the professional field as urban planner and designer with a specific focus on public space. Her expertise is grounded in extensive academic postdoctoral research and teaching in Italy and Europe, the United States, Middle East, Asia and Australia.

With her non-profit organization City Space Architecture, that she founded in 2013 she has organized and curated international conferences, seminars, workshops and exhibitions aimed at promoting public space culture, through an interdisciplinary approach, involving art and architecture. Luisa is the Founder and Editor in Chief of 'The Journal of Public Space', the first, international, interdisciplinary, academic, open access journal entirely dedicated to public space, that she established through City Space Architecture in 2015, in partnership with UN-Habitat.

In 2020 Luisa launched the online initiative '2020: A Year without Public Space under the COVID-19 Pandemic', in cooperation with the School of Architecture at The Chinese University of Hong Kong, and organized 20 webinars across five months, engaging more than 100 speakers globally, and a final two-day symposium in November.

Social Interactions On The Streets During The Covid-19 Pandemic: Counterpoints Between European And Brazilian Cities

Frúgoli Jr., Heitor

University of São Paulo, Brazil

I intend to address urban dynamics characterized by the interchange between social isolation and lockdown ending, resulting from the Covid-19 pandemic. This analysis will be based on counterpoints between certain European Mediterranean metropolises and the Brazilian ones, mainly São Paulo – the latter located in a national context marked by a longstanding confluence of health, political and economic crises. The most comprehensive ethnographic focus of the analysis, due to the impacts on the possibilities of face-to-face interaction, has as its starting point the mapping and reading of diaries written from the pandemic decree by the World Health Organization (March 2020), especially regarding the narrative of experiences of interaction in public spaces.

It is important to review meanings of the notion of urban utopia. This is especially relevant in a period marked by a series of criticisms to agglomerations in public spaces, due to the transmission of the virus, or new criticisms of the idea of urban growth, due to the harmful effects on the environment. At the same time, it is necessary to understand, as in the case of the Brazilian urban context, that social isolation has not been a choice for a large contingent of city dwellers, on account of housing precariousness and employment options, with their sociability forms to be better understood in these dramatic times.

Biography

Heitor Frúgoli Jr. is Associate Professor of the Department of Anthropology of the University of São Paulo, (USP) (currently Head of Department) and coordinator of Anthropology of the City Study Group (GEAC-USP). He was visiting professor at University of Leiden (2010) and directeur d'études at École des Hautes Études en Sciences Sociales (Paris, 2013). He is CNPq (National Council for Scientific and Technological Development) researcher since 2005. Educational background: Visiting Scholar, University Institute of Lisbon (ISCTE-IUL) (2011); Ph. D., University of São Paulo, USP (Sociology) (1998); Visiting Scholar, University of California, San Diego (1995-1996); M. A., University of São Paulo, USP (Anthropology) (1990). He is the author, among other books, of Sociabilidade urbana (Zahar, 2007), Centralidade em São Paulo (Edusp, 2000) and São Paulo: espaços públicos e interação social (Marco Zero, 1995).

37

Invisible Voices In The Public Space: From Unknown Realities To Evidence Of Transformations

Redondo-Sama, Gisela

University of Deusto, Spain

The pandemic has raised major concerns about how the public space is conceptualized and used by citizens, including the most vulnerable. In this vein, sociology has analyzed the ways society re-builds the understanding of public spaces in very diverse contexts, in urban and rural areas. However, less is known about how to include the voices of citizens into public space research in effective ways during pandemics, in particular the voices of the most vulnerable that tend to be invisible in the public discourses. The advancements in sociological research about the creation, development and sustainability of alternatives in the COVID-19 context, implies bottom-up approaches that place the voices of the most vulnerable at the core of the transformations. Furthermore, research with social impact shows the evidence that citizens use to improve their cities, villages and territories. In this vein, Dr. Redondo-Sama will approach the most recent contributions in sociology that, in collaboration with other disciplines, are presenting evidence of transformations in the public space that include the voices of the most vulnerable, among others. Gisela will also include some of the insights developed at the international level on social impact of research that can inspire further investigations in the field of public space.

Biography

Gisela Redondo-Sama is Ramón y Cajal Fellow and has been Marie Curie Fellow at the University of Cambridge. She has research experience acquired at CREA, Community of Research on Excellence for All. Among others, she has participated in the INCLUD-ED project, the only project in socioeconomic sciences and humanities in the list of the 10 success stories of European Research published by the EC. Her research interests are focused on dialogic leadership, community participation, social impact, homeless and gender. Her academic works have been published in ranked journals such as PLoS ONE, International Sociology, Qualitative Inquiry or Sustainability. She is the editor of the eSymposium publication of the ISA and topic editor of the Special Issue "Information on Pandemic for Socially Vulnerable Groups" in the International Journal of Environmental Research and Public Health.

38

SP08 | Covid-19 in the City: Building Positive Futures

Organised by RN16 - Sociology of Health and Illness & RN37 - Urban Sociology

Chaired by Ellen Carol Annandale, University of York; Maria Victoria Gómez, University Carlos III

The Covid-19 pandemic is unprecedented in the last century and has been acutely felt in many cities all over the world. Covid-19 is showing us in a dramatic way our vulnerability as human beings and the importance of our urban contexts, in particular its schisms for mental and physical health, challenging our sense of responsibility towards matters that transcend the private sphere, towards our neighbours and other people and the affairs and values of city, community and society.

Whenever a trend and explanation for the spread of the infection emerges, Covid-19 challenges it: shifting our knowledge of the most affected ages, genders, ethnic groups, countries and territories. However, it seems clear that the virus is not "democratic" at all: the inequalities of our cities are exacerbated by the pandemic, and many people disadvantaged by lack of resources and skills are unable to defend themselves.

The pandemic has brought an increase in social and political awareness of the need for change in European cities where people's care and their health can be – but presently often are not – at the centre of its design. Thinking about health and care means placing the sustainability of life, urban mobility, spatial segregation, public space and people's daily experiences at the centre of political decisions.

While the pandemic has reinforced urban and health inequalities, it also provides a window of opportunity for us as sociologists to rethink issues concerning this matter. RN16 and RN37 would like to invite colleagues to discuss these topics, with a view to building alternative futures.

From Sociographical Disruption To Medicalized Futures: Integrating Covid-19 Into Everyday Life In The City.

Maturo, Antonio

Bologna University, Italy

"Biographical disruption" is a key concept in medical sociology. This expression refers to the rupture in the fabric of everyday life and the upheaval in cognitive categories after the diagnosis of a chronic disease. It is not reductive to state that what we have experienced due to Covid-19 has been, and still is, a biographical disruption at a large scale: a "sociographical disruption". During the major lockdown in the early months of the pandemic, our homes were a refuge but also a prison, a place of rest but also of work. Outside the home, a surreal silence reigned, broken only by ambulance sirens. We thus had to reinvent a domestic life marked by hybridization, ambiguity, and the uncanny (Unheimlichkeit). We also experienced a peculiar form of medicalization of everyday life characterized by new objects; new hygienic practices; and new forms of interaction in the city.
Will all these new normalities fade away thanks to the vaccine? Will we then go back to our old, pre-Covid normalcy? Probably not. The virus has proven our vulnerability. The events of 9/11 gave rise to huge changes in the security systems of airports and other crowded places; Covid-19 will give rise, on a much larger scale, to changes in every part of our lives. Life in the cities will be characterized by molecular surveillance (Endopticon) and several risk-reduction practices. Some of these practices will be presented and discussed.

Biography

Antonio Maturo is a medical sociologist and Professor at Bologna University. His latest books are Digital Health and the Gamification of Life, Emerald, 2018 (with Veronica Moretti) and Good Pharma, Palgrave, 2015 (with Donald Light) and among his publications on Covid: Unhome Sweet Home: The Construction of New Normalities in Italy during COVID-19, in Lupton D., Willis K. (eds) The Coronavirus Crisis: Social Perspectives, Routledge (with Veronica Moretti). He has edited two volumes of the journal Salute e Società: The Medicalisation of Life, 2009 (with Peter Conrad) and Medicine of Emotions and Cognitions, 2012 (with Kristin Barker). At Bologna University, Antonio is the Chair of the PhD Programme in Sociology and responsible for the Unit for the Horizon2020 "Oncorelief" Project. Moreover, he has taught Medical Sociology for five years at Brown University, USA. Antonio is proud to have been one of first Erasmus students, at the Katholieke University of Leuven, in the distant 1989/1990.

Cities and Covid-19: Utopias and Dystopias

Rolnik, Raquel

Faculty of Architecture and Urbanism of the University of São Paulo (FAUUSP), Brazil

The current pandemic has intensified and made the preexisting crisis clear cut and explicit: the biopolitics grounded on growingly extractivist logics and in the destruction and promotion of death have taken hold of all existing relationships between bodies and territories. With it, also preceding forms of control and surveillance, such as the confinement imposed in many cities and countries and other shapes of the restructuring of the surplus extraction process through cyber capitalism, which had also been redesigning our cities, have also been intensified: private, controlled and securitized systems of territorial governance; as well as a mainly cybernetic economy based on automation and bigdata, and on the collection and extraction of people's personal data and on the tracking of all their movements. This scenario represents the dystopia that is presented to us as our future. However, in an opposite vein, the pandemic has also catalyzed the rise of a myriad of forms of self-organization and mobilization geared towards securing people's survival in contexts where a scarcity of resources emerges. These forms take a variety of means – legal, illegal, supra-legal – and operate in and through community and collective takeover, solidarity networks, and spaces of invention and improvisation. The post-pandemic situation is thus one of struggle between the previous dystopia and this utopia of the political imagination to invent another model for our cities, one not based on a centralized model attached to the extractivist, exploitative and consumer logic, but rather on an alternative model envisioning change grounded on the primacy of defending life.

Biography

Raquel Rolnik is a professor of Urban Planning at the University of São Paulo. She was planning director at the São Paulo Municipal Planning Secretariat (1989-92) and National Secretary of Urban Programmes of the Brazilian Ministry of Cities (2003–2007). From 2008 to 2014, she held the mandate of UN Special Rapporteur on adequate housing. She was an urbanism columnist for Rádio CBN-SP, Band News FM and Rádio Nacional, and for the newspaper Folha de S. Paulo, and she currently keeps a column on Radio USP, UOL and on her personal webpage. She has recently authored Urban Warfare: Housing under the Empire of Finance (Verso, 2019).

41

SP09 | Civic Action: Creating and Living Alternative Futures

Organised RN20 - Qualitative Methods, RN25 - Social Movements, RN29 - Social Theory & RN32 - Political Sociology

Chaired by Florian Elliker, University of St. Gallen; Mattias Wahlström, University of Gothenburg

Alternative futures do not only emerge through mass media and mass publics, but through commitment in (physical) copresence that is often established in groups and movements. Civic action within such communities aims, on the one hand, to bring about institutional changes. As such, they constitute both practical and epistemic communities in which knowledge for alternative futures is (re)produced, seeking to make this knowledge more widely relevant than just within this community. In these "tiny publics" (Fine & Harrington 2004), on the other hand, resistance is not only enacted by striving for structural change. Rather, they are crucial in constituting spaces in which their members practice and experience alternative ways of living. Within such groups, individual and collective meanings of resistance often coalesce and become underpinned with lived experience. Identities, practices, and experiences fashioned and gained within the plausibility structures of such groups may reverberate throughout the lives of former group members, creating not only rational evidence, but also emotional-appreciative evidence (Max Weber) that alternative futures are feasible.

This semi-plenary's aim is to address questions of how creating and living alternative futures in groups and movements in structured. What are the key structural properties of such movements? What are the various "group styles" (Eliasoph & Lichterman 2003) that shape the culture of deliberation, discussion and interaction in such groups? How is attachment to the group and commitment to its purposes created, particularly (yet not only) through the interplay of various forms of physical and digital copresence? What are the symbolic, political, cultural, social or material motivations of individuals to participate and engage in such groups? How do the political commitments of such groups reverberate beyond the boundaries of the respective communities?

42

Can Alternative Futures Be Common Futures?

Lichterman, Paul

University of Southern California, United States of America

Civic groups seem like a promising source of knowledge for an alternative, more just and sustainable future. Yet, this knowledge poses a dilemma for civic activists and the public who listen to them: The critical or transformative knowledge of civic groups would often project a future in which only a relatively few, socially and culturally distinct people can fully participate. That is because the knowledge that group participants can generate depends on how participants imagine their connections to each other and the wider world – their style. Groups can communicate critical or transformative knowledge when they locate and coordinate themselves as actors marginal to dominant institutions, but this self-marginalizing style will make participants' knowledge claims sound culturally and socially marginal or exclusive, too. Examples from local environmental and housing advocacy in the US over the past thirty years illustrate this dilemma of self-marginalizing, radical knowledge. Concluding comments propose a response to the dilemma that includes a practical role for scholars.

Biography

Paul Lichterman currently is Professor of Sociology and Religion at the University of Southern California. A cultural sociologist and ethnographer of public life, he has studied participation in a variety of social movement efforts, religious volunteer groups, and professional NGOs. He has been honored with disciplinary awards for his articles in premier journals and his two monograph books, The Search for Political Community: American Activists Reinventing Commitment and Elusive Togetherness: Church Groups Trying to Bridge America's Divisions. His forthcoming book, How Civic Action Works: Fighting for Housing in Los Angeles (Princeton University Press, 2021) offers a new, pragmatist-inspired framework that illuminates how social advocates construct the claims, relationships and strategies that drive collective action.

43

Refracted Horizons: Re-imagining Futures Via Civic Scenarios in Crisis Times

Mische, Ann

University of Notre Dame, United States of America

In times of crisis and uncertainty, how do we pry the future open, while stabilizing it enough to make it responsive to our interventions? I examine the experiences of transnational "public interest" or "civic" scenario projects that use foresight methods (and "futures thinking" more generally) to address urgent public problems in the area of democracy, development, peacebuilding and climate change. Such futures are "ensemble" productions involving varying combinations of "experts," "stakeholders" and "ordinary people." They link actors in the Global North and South, with differing degrees of proximity to institutional powerholders, and different strategies by which to include (and/or contain) divergent and oppositional voices. I argue that futures as told through scenario exercises are "fractal" in that they are multiple -- the unity of the imagined future is blown open and "fractured," so as to recover multiple lines of possibility, from "business as usual" to "action under constraint" to radical narratives of transformation or collapse. This fractal quality in turn expresses fundamental ambivalences about capitalism and democracy. Scenario work often dances uneasily between creativity and containment, consensus-building and critique. This can reflect exclusionary, exploitative and autocratic tendencies, as well as attempts to challenge the forces that generate inequality and exclusion. These patterns reappear in many different contexts and at different analytical levels -- reflecting the multiple and fractured character of contemporary futures. Reconceiving futures in this way provides insight into the challenging potential of imagined futures, as well as into how difficult it is to move from imagination to action.

Biography

Ann Mische is an Associate Professor of Sociology and Peace Studies at the University of Notre Dame. Currently, she is working on a book on the role of futures thinking and foresight methodologies in social and political change efforts focused on democracy, development, peacebuilding and climate change. She is also working on a separate project on the political trajectories of anti-partisan protest cycles in the global protest wave since 2008. Her first book, Partisan Publics: Communication and Contention Across Brazilian Youth Activist Networks, examined civic and political networks of Brazilian youth activism during the re-democratization period. She has also written theoretical articles on agency, culture, networks, temporality, and social interaction.

44

SP10 | Radical Sexual Politics - Envisioning Alternative Futures in Political Action, Activism and People's Lives

Organised by RN23 – Sexuality

Between Citizenship and Governance: Reimagining Sexual Democracy from the South

Seely, Stephen D

Newcastle University, United Kingdom

Over the past decade, social scientists have developed the concept of 'sexual democracy' as a framework for critically analyzing the increasing conflation of 'democracy' with a specific set of Euro-American sexuality and gender rights. Focusing on Euro-American contexts, this literature has theorized 'sexual democracy' as a mode of late liberal governance deployed both domestically in the management of migrant populations and internationally in controlling 'unruly' African and Middle Eastern states through their construction as inherently 'anti-democratic' due to their resistance to these sexuality and gender norms. This literature joins queer and postcolonial critiques of rights claims as depoliticizing, as a way of rooting citizenship in essentialist forms of sexual 'identity,' and as forcibly universalizing a particular form of Euro-American sexual personhood in the name of protecting sexual minorities.

Drawing on the framework of 'theory from the South,' this paper examines the case of South Africa (in many ways the world's first 'sexual democracy,' as the first state with constitutional protections for sexuality). Looking at the activist work of LGBTQ+ iSangoma (Zulu 'traditional' healers), and their negotiation of constitutional, international, and customary legal cultures, I challenge many of the assumptions in the Eurocentric theorization of sexual democracy. I contend that learning from the ways African LGBTQ+ people actually negotiate these different registers of legal personhood into forms of insurgent citizenship capable of challenging the (neo)liberal parameters of the state offers an alternative vision of sexual democracy as a praxis of 'participatory difference' that could be developed within the European context as a challenge to the rhetorical use of 'sexual democracy' as an alibi for nationalist, xenophobic, and neo-colonial projects.

Biography

Stephen D Seely PhD is an Academic Track Fellow in the School of Geography, Politics, and Sociology at Newcastle University (UK), where he is currently working on a monograph on the role of sexuality in the democratic imaginary of South Africa. Specializing in feminist, decolonial, and social theory, his work has appeared in Theory, Culture & Society, Sexualities, Social Text, philoSOPHIA: A Journal of Continental Feminism, Feminist Formations, and the Australian Feminist Law Journal and has been recognized by visiting fellowships from the Institute of Advanced Study (University of Warwick) and Zentrum Gender Studies (Universitat Basel) and awards from the Luce Irigaray Circle, philoSOPHIA: A Continental Feminist Society, and the Society for Phenomenology and Existential Philosophy. His first book, The Spirit of Revolution: Beyond the Dead Ends of Man, co-authored with Drucilla Cornell, was published by Polity Press in 2016.

45

Looking for a Different kind of Abolitionism: Sex Work, Migration and the Politics of Care

Vuolajarvi, Niina

The New School of Social Research, United States of America

The heightened concerns about trafficking and the globalization of commercial sex have led to a new trend in prostitution policies. In 1999, Sweden was the first country to aim at abolishing the sex trade through criminalizing buying (rather than selling) of sex relying on feminist arguments of protection. Sweden has become a supermodel for prostitution and trafficking policies and its policy approach has spread globally. Through multi-sited fieldwork in the Nordic region among sex workers, including 210 interviews, this paper complicates the simplified image of Sweden's policies and asks what does it mean that sex work is increasingly governed through feminist arguments of protection and care? What kind of political futures and conception of justice does this policy approach promote?

These questions become especially crucial in the context of feminized migration where migrants have become also a majority in the sex trades. These new configurations of labor, intimacy and mobility call us to pay attention to what Angela Davis has named the intersectionality of struggles. The findings demonstrate how the Swedish policy approach legitimates state violence and racialized policing towards migrant and sex working women by creating an ideological landscape that defines sex work as a form of men's violence against women to be combatted. In the paper, I use Ruth Wilson Gilmore's understanding of violence as exposure to "premature death" and argue that the Swedish approach by exacerbating the already precarious lives of sex workers serves as a form of "violence against women" in a Gilmorean sense. I conclude the paper with a call for a different kind of abolitionist feminism and futures.

Biography

Niina Vuolajärvi PhD is a Postdoctoral Fellow at the Zolberg Institute of Migration and Mobility at the New School of Social Research. Her interdisciplinary work is situated at the intersection of migration, feminist and socio-legal studies. Currently, she is working on her first book Ending the Demand? Migration, Sex Work and the Feminist Politics of Care that is based on a vast three-country ethnography among migrant sex workers in the Nordic region. In 2021, Rutgers School of Graduate Studies acknowledged her groundbreaking scholarship through the Outstanding Doctoral Student Award. Her work has been published in journals such as the Journal of Ethnic and Migration Studies and Sexuality Research and Social Policy and recognized by the Law and Society Association, American Sociological Association, the American Council of Learned Societies, and the Fulbright Foundation.

46

SP11 | The Rise of Authoritarianism in Central Eastern Europe

Organised & Chaired by ESA Vice-President Gadowska, Kaja, Jagiellonian University

Over 30 years ago, the Iron Curtain was torn asunder and even the USSR was undone. Initially, nearly all the societies of Central Eastern Europe at least nominally accepted a model of liberal democracy; indeed, at the beginning of the 1990s, there were few systemic alternatives.

Yet today authoritarian trends have gained a political presence in countries around the world, including those of CEE. The stronger that presence, the weaker the institutions of liberal democracy have become. Real power shifts into the hands of ruling party leaders. Constitutional provisions are bent to their will and expectations. Legal (or semi-legal) acts are introduced to steadily weaken the judiciary, public and private media, civil service, electoral institutions, and NGOs. Within a nominally democratic framework, "soft" or "hard" authoritarianism is anchored in a beholden nomenclature reigning over areas of economic, social, and cultural life.

What factors are guiding the authoritarian turn and where is it leading the societies of Central Eastern Europe? Indeed, what about this phenomenon is specific to this region and what is analogous to despotic drifts elsewhere? What insight can sociologists contribute regarding these phenomena? Can sociological knowledge resonate with societies drawn into autocracy?

Nevertheless, we are actually witnessing not only the reversal of democracy in several Central Eastern European states, but also – starting from Belarus – the public communication, in word and deed, of a civic desire for democracy, a robust movement towards it. Could this act as an impetus deterring authoritarian trends or will such tendencies prevail in the region?

47

Not Suicide But Murder: Why East Central European Democracies Fail

Scheppele, Kim Lane

Princeton University, United States of America

By now, the narrative about why democracies are failing in East-Central Europe is well-known. Populism has overrun Hungary and Poland (and other states in the region). What else could we expect (or so the story goes)? After all, these countries had problematic histories, wrestling first with fascism and then with communism. They were in a bad neighborhood, sandwiched between Germany and Russia. They never had proper democracies before and so, being new at the whole thing in 1989 and after, they failed because their populations got impatient and voted democracy away.

By contrast, I want to argue for a very different case: East-Central European democracies did not die by suicide as the result of a self-inflicted wound brought about by populism. Instead, I will argue, these democracies were murdered by elected leaders, eager for power, who lied their way into office; distracted the population with historical fantasy, resentment and promises of cash; and systematically dismantled checks on executive power while their populations were distracted, creating an autocratic government in the shadows. Neither Poles nor Hungarians ever voted to abandon democratic government or democratic values, and to this day they do not approve. But by the time they realize that they may have voted for an unrealistic national fantasy but got autocracy instead, it's too late. If we think of creeping autocracy in East-Central Europe as having resulted from the premeditated murder by national leaders rather than suicide by populism, our understanding of democratic failure, as well as prescriptions for how to restore democracy in the region, will change.

Biography

Professor Kim Lane Scheppele is the Laurance S. Rockefeller Professor of Sociology and International Affairs at Princeton University. Scheppele's work focuses on the intersection of constitutional and international law, particularly in constitutional systems under stress. After 1989, Scheppele studied the emergence of constitutional law in post-communist Europe, living in Hungary and Russia for extended periods. After 9/11, she researched the effects of the international "war on terror" on constitutional protections around the world. Since 2010, she has been documenting the rise of autocratic legalism first in Hungary and then in Poland within the European Union, as well as its spread around the world. Her many publications in law reviews, in social science journals and in many languages cover these topics and others. She is a commentator in the popular press, discussing comparative constitutional law, the state of Europe, the rule of law and the rise of populism. Scheppele is an elected member of the American Academy of Arts and Sciences and the International Academy of Comparative Law. In 2014, she received the Law and Society Association's Kalven Prize for influential scholarship and was elected President of the Law and Society Association for the 2017-2019 term. Scheppele began her career in the political science department at the University of Michigan, became full professor in the law school at the University of Pennsylvania, was the founding director of the gender program at Central European University Budapest, became Director of the Program in Law and Public Affairs at Princeton and has held visiting faculty positions in the law schools at Michigan, Yale, Harvard, Erasmus/Rotterdam, and Humboldt/Berlin.

48

Catching up with Society: Authoritarianism from Below and the Failure of Liberal Democracy in Central Europe

Ekiert, Grzegorz

Harvard University, United States of America

Research on populism increasingly pays attention to the supply side of politics. And, indeed, the failure of liberal democracies in the region is not the result of economic victimization of large parts of the population inflicted by the transition to capitalism. It is the result of deliberate actions of local political elites victimized by their failure to join the European elite convergence process. Since they had no skills and ability to join the club, they decided to turn their backs on the European integration process. Yet, their grievances, complaints and lies, their rabid nationalism, their homophobia, racism and religious fundamentalism could travel only so far, if it was not shared by the significant part of citizens in their countries who brought them to power. In this presentation I will discuss the complementarity between traditional political cultures in the region and populist/nationalist/fundamentalist ideas peddled by right-wing politicians in power.

Biography

Grzegorz Ekiert is Laurence A. Tisch Professor of Government at Harvard University, Director of the Minda de Gunzburg Center for European Studies, and Senior Scholar at the Harvard Academy for International and Area Studies. His research and teaching interests focus on comparative politics, regime change and democratization, civil society and social movements and East European politics and societies. His books include: Ruling by Other Means: State-Mobilized Movements, (co-editors Elizabeth J. Perry and Yan Xiaojun), Cambridge University Press, 2020; Capitalism and Democracy in Central and Eastern Europe: Assessing the Legacy of Communist Rule, (co-editor Stephen Hanson), Cambridge University Press 2003; Rebellious Civil Society. Popular Protest and Democratic Consolidation in Poland, (co-author Jan Kubik, Rutgers University) University of Michigan Press 1999; The State Against Society: Political Crises and Their Aftermath in East Central Europe, Princeton University Press 1996. His papers appeared in numerous social science journals in the US, Europe and Asia and in many edited volumes.

49

SP12 | Discussing the Effects of the Lockdown: The Expansion of Remote Work and Inequalities in Home Learning

Organised by RN09 - Economic Sociology & RN17 - Work, Employment and Industrial Relations

Chaired by Alberto Vieira-Ramos, Universidad Carlos III de Madrid; Valeria Pulignano, Ku Leuven

50

According to Eurostat, 5.3% of the employed population in the EU worked remotely on a regular basis in 2019. However, the level of implementation of remote work varies greatly between countries, ranging from 14% in the Netherlands and Finland, to 5.2% in Germany. This suggests that there are still important barriers (and reluctance) to implement remote work that, given the new reality imposed by the Covid-19 pandemic, could be relaxed. For this reason, we consider 2021 to be an ideal year to organize a semi-plenary session to present the most recent empirical research on remote work, its past and potential future development, and its impact on productivity, work-life balance, social inequalities and future education and training.

A lower presence of workers in the workplace can pose greater difficulties for supervisory tasks, but it can also favour a more efficient use of spaces and the innovation of new forms of coordination and evaluation of task execution. Moreover, greater autonomy and flexibility in the organization of working time can lead to a redistribution of time spent on domestic tasks, or leisure, enabling employees to improve their work-life balance. At the same time, remote work could entail an erosion of workers' positional power with respect to employers and/or penalize certain individuals such as single parents, particularly women.

Further expansion of remote work will necessarily affect the types of skills that future workers will require. This will provoke the reassessment of education and training programmes and how education is provided.

Homeworking during Lockdown: Growth, Productivity and its Long-term Future in the UK

Reuschke, Darja

Cardiff University, United Kingdom

The Covid-19 pandemic has changed the world in many ways. One of the biggest changes is where people work. During the presentation new and up-to-date evidence on the scale of the shift of paid work into the home in the UK during lockdown, its impact on the mental well-being and productivity of homeworkers, and the likely prevalence of homeworking after social distancing restrictions are fully lifted will be discussed. The findings are based on a high quality panel study of workers who were interviewed at the end of April, May, June, July, September and November 2020. From this, representative conclusions can be drawn for the United Kingdom. Before the pandemic, homeworking in the UK was on a gradual, but slow, upward trajectory. However, it rose dramatically and suddenly in lockdown and has remained high ever since. A similar pattern can be observed in other countries as policy makers have urged those who can to work at home in order to arrest the spread of Covid-19. The results of our analysis suggest that many workers have got used to – and may even have experienced the benefits of – working at home. In addition, productivity has not been adversely affected by the shift towards homeworking. Furthermore, if those who want to continue working at home in the future are allowed to do so, productivity may be boosted by a sustained increase in the prevalence of homeworking as those who report that their productivity has increased are also those who are keenest to continue to work at home.

Biography

Darja Reuschke is Associate Professor at the School of Geography and Environmental Science at the University of Southampton. Her research is concerned with the future of work and organisational transformations with a particular focus on cities.
With her ERC Starting Grant project WORKANDHOME she has investigated new locations and forms of working and businesses such as home-based businesses and coworking that are emerging through new technologies, economic restructuring and social change across Europe

51

Inequalities In Home Learning During The Pandemic

Pensiero, Nicola

University of Southampton, United Kingdom

The spring of 2020 saw a widespread and prolonged closure of schools across the UK due to the Covid-19 pandemic. The transition to distance schooling is likely to exacerbate inequalities by socio-economic groups due to both the socio-economic gap in the volume of schoolwork completed and to the relative ability of parents to support children's learning. Using data from Understanding Society, the UK Household Longitudinal Study, we found that children in the most advantaged families, where both parents work regularly from home, the main parent is in a 'service class' and the children have their own computer spent on average 2.8 hours per day on school work for primary and 3.8 per day for secondary pupils. More disadvantaged children in families where the main parent is not in a service class occupation, where the child has to share a computer with other family members and either parent does not work regularly from home, the hours spent per day on schoolwork are 2.3 for primary and 2.6 for secondary education. We estimate the educational loss to be more pronounced for children from disadvantaged socio-economic backgrounds than for other children.

Biography

Nicola Pensiero is a lecturer in quantitative education and social science at Southampton University School of Education. Previously he worked at UCL Institute of Education, where he joined in 2013 after completing his PhD at the European University Institute. He is an interdisciplinary researcher with a good record of leading externally funded education research projects. His expertise lies in the use of analytical and choice-based approaches in studying social phenomena such as education programme effectiveness, comparative analysis of the effectiveness of education system characteristics, inequality in educational attainment, school segregation and income inequality. His current research includes studies on the role of individual decision-making mechanisms in shaping educational inequality by social origins and school segregation. He is also conducting a cross-national study on the effect of upper secondary education system characteristics on skills levels and inequality.

52

SP13 | The Public Role of National Sociological Associations Towards Alternative Futures

Organised & Chaired by ESA Executive Committee member & NA

Council Chair Agodi, Maria Carmela

The reshaping that European societies are going to face is a great challenge and opportunity for sociological knowledge and its societal impact. What will the role of National Associations be in facing this challenge?

The debate about "public sociology" used to be centered on individual researchers' engagement. Maybe today the issue is not that of competing kinds of involvement with the discipline and its possible publics. If sociological knowledge has to gain greater impact in the public sphere, at stake may be the move of responsibility for engagement from the individual to the institutional level, with the scientific community of sociologists and their associations assuming it collectively. Are Sociological Associations motivated to engage in a project of repositioning in the public domain and of responsibility towards alternative designs of future, for their countries and for Europe? Are they ready at deploying new organizational practices that give all their possible interlocutors access to their knowledge, to sociological imagination, to its potential applications, to the assessment of possible, alternative policies and the futures they prepare? Is the knowledge that their scientific communities are producing accountable also to those in the shadow of invisibility and silence? Are they able to contextualize - and situate in the spectrum of always conflicting values – pieces of knowledge and research results, even those coming from other scientific disciplines? Do they produce segregated sociological communities at the national level or are they fostering mutual knowledge of national peculiarities and contexts, so that they will find integration within a diverse and reflexive scientific community of European sociologists?

53

The Public Role of NSAs Towards Alternative Futures

Hanafi, Sari

AUB, Lebanon (Lebanese Republic)

Biography

Sari Hanafi is currently a Professor of Sociology, Director of Center for Arab and Middle Eastern Studies and Chair of the Islamic Studies program at the American University of Beirut. He is the President of the International Sociological Association. Recently he created the "Portal for Social Impact of Scientific Research in/on the Arab World" (Athar). He was the Vice President of the board of the Arab Council of Social Science. He is as well editor of Idafat: the Arab Journal of Sociology (Arabic) Among his recent books are: The Oxford Handbook of the Sociology of the Middle East, Knowledge Production in the Arab World: The Impossible Promise. (with R. Arvanitis). He is the winner of 2014 Abdelhamid Shouman Award and 2015 Kuwait Award for social science. In 2019, he was awarded an Honorary Doctorate (Doctor Honoris Causa) of the National University of San Marcos (the first and the leading university in Lima- Peru – established in 1551). (His website: https://sites.aub.edu.lb/sarihanafi/).

54

Assessing the Multiple Roles Of Sociology Associations In Contemporary Systems of Knowledge Production

Fernandez-Esquinas, Manuel

CSIC, Spain

In this paper I make a brief assessment of the conditions of national sociology associations (NSA) to fulfil different roles in complex regimes of knowledge production. My main assumption is that NSA can be analysed with the categories used for studying collective actors in science. In particular, at institutional level it is necessary to pay attention to the situation of NSA in their systems of knowledge production, including collaboration, competition and conflict with other disciplines and actors that claim for scientific legitimacy. At organizational level, it is useful to consider the core values, capacities and practices of NSA, and the packs of activities they are able to develop.

For making such assessment I use some tools accumulated by the sociology of science. Firstly, the paper is framed in the approach that understands the social arrangements in science systems through its outcomes, and takes into account the combination of symbolic and social structural elements that contribute to such outcomes. Secondly, it reviews briefly the 'internal' roles of NSA, namely: 1) Promotion of knowledge production, 2) Reproduction of a scientific field, 3) Allocation of scientific capital, and 4) Community building. Thirdly, it focuses on the 'external' roles: 1) Interest representation and lobby, 2) Policy advise, 3) Social support for the discipline, and 4) Public communication of science. Finally, the paper considers the interrelationship of both. In particular, how the making of the discipline shapes the capacities to promote knowledge utilization, interact with interest groups and strengthening the public image of sociology. I will use the experience of the Spanish Sociological Federation to highlight the main challenges and key issues of combining both 'functions'.

Biography

Manuel Fernández Esquinas is President of the Spanish Sociological Federation (FES) and Coordinator of the Research Network "Southern European Societies" of the European Sociological Association.

He is a Research Scientist at the Institute for Advanced Social Studies (IESA), an official centre of the Spanish National Research Council (CSIC), and has been a visiting fellow at Southbank University (UK), the University of Wollongong, Western Sydney University (Australia), Indiana University and the University of New Mexico (USA). He has worked on values and behaviors related to innovation, mainly using survey methodology; on science and innovation policies, several forms of knowledge transfer between science and industry, research training, and collaboration dynamics of universities and research centers with other domains. He has been working on the "institutional quality" of innovation systems and on knowledge transfer and knowledge utilization, with a special focus on the social sciences. He has also worked as evaluator and consultant for the Spanish Ministry for Science and Innovation, several regional governments and international organizations such as OECD and the EU. He is the director of Revista Española de Sociología/Spanish Journal of Sociology, and the editor of the new book series "Southern European Societies" (Edward Elgar).

55

Translating Complexity: Public Sociology Between Populism And Critical Reflexivity

Villa, Paula Irene

LMU Munich, Germany

Globally, but with regional specificities, 'public science' has increasingly become an issue over the last years. A wide range of actors - governmental, from civic society, funding agencies, academic communities, private sector, educational systems, and more - demand some, or more, public engagement from the science, often implying a problematic status quo in which privileged researchers do self-centered things in their ivory towers, shying away from the critical light of the public political sphere and hard-working tax-payers. In populist contexts, be they government or fringy mobilizations, such rhetoric is often paired by anti-intellectualism and 'skepticism' towards science. Sociology itself has had - and still has - its very own and specific debate regarding "public sociology" (Burawoy 2005), which actually goes back to the founding classics, especially Weber.

My paper reflects on the ambiguities of public sociology", focussing on the role of National Associations. It draws upon experiences as publicly engaged Gender Studies scholar, and as president of the German Sociological Association, and will argue that public sociology must find ways to defend the proper logic and space of research - resisting populist demands of all sorts - while translating sociological knowledge into other contexts in order to generate critical reflexivity. There is much sociological research to help us navigate this difficult trajectory.

Biography

Paula Irene Villa is President of the German Sociological Association, she is full professor and chair for Sociology and Gender Studies at LMU München. She also served as elected board member of the German Association for Gender Studies from 2010 - 2014.

Her research focuses on the analysis of biopolitics, i.e. the ambivalent entanglements of society and soma, on Cultural Studies (Pop and Politics, Embodiment within Subcultures such as Tango), on Care & Gender, and on Science/Academia and Gender.

She has published widely on gender/social theory (post-structuralism, Butler, Bourdieu, symbolic violence), the sociology of embodiment, beautification and normalization, on feminist body politics, and on German and European "anti-genderism" as part of new nationalist populism. She has directed funded empirical research (e.g. DFG, VW, Humboldt foundations) on Cosmetic Surgery, Food/Fitness, comparative analysis of Gender Equality Programs in academic capitalism, and on popular culture.

56

Sustaining Sociology In An Illiberal Democracy In The 21st Century

Wessely, Anna

ELTE, Hungary

The talk uses the example of the recent history and present state of Hungarian sociology due to the shortness of the allotted time and the speaker's deficient knowledge of the situation in other illiberal democracies. The focus will be on the attempt to explain the dwindling of public interest in sociological knowledge, the interpretation of the present state of affairs will inevitably keep referring back to the political and social structural changes of the past four decades as well as to the impact of a more recent narrowly conceived national science policy.

Biography

Anna Weseley President of the Hungarian Sociological Association, she is editor-in-chief of BUKSZ (The Budapest Review of Books), and teaches at the Sociology Institute of Eötvös Loránd University, Budapest and the Hungarian Fine Arts University, Budapest.
She was previously Rudolf Arnheim Professor in Art History at the Humboldt University, Berlin, 2006; Research Fellow at the Getty Research Institute, Los Angeles, 1999–2000; Research Fellow at the Wissenschaftskolleg, Berlin, 2000; member and later President of the international advisory board of the International Research Centre for Cultural Studies, Vienna, 1998–2005; Research Associate at the University of California, Berkeley, 1992–1993; and Research Associate at Boston University, Boston, 1987–1988. Alongside art history, her research extends to intellectual history and the sociology of art and culture. She has also been working on the relationship between sociology and philosophy of knowledge, on authors as Mannheim, Simmel, Weber, Bourdieu, Latour; contributing to research about consumption patterns and the development of consumerism in Eastern Europe. Her publications include studies on visual augmentation in the eighteenth century as well as criticism of contemporary art.

SP14 | Artmaking and Economy in Time of Crises

Organised by RN02 - Sociology of the Arts & RN09 - Economic Sociology

Chaired by Dafne Muntanyola Saura, Universitat Autònoma de Barcelona; Andrea Maurer, Universitat Trier

The Covid-19 pandemic has impacted all aspects of arts and cultural life as well as the economic sphere, just like other sectors of society. During the last few months, we have witnessed coping reactions and calls for help from all categories of actors involved in the arts and culture sphere. At the same time, the arts and culture as all kind of economic actors have proven ever more significant in a time of existential crisis and be able to develop new forms of economic activities, markets, and associations. These new and alternative developments are worth to be studied in inter- and transdisciplinary perspectives. The session seeks to bring together experts specialised in cultural policies and others in economics and market issues, to discuss what changes are happening in the arts and culture on macro, meso, and micro levels and the ways this is related to economy.

58

Arts Fundraisers At The Forefront Of The Covid-19 Crisis: Coping Strategies, Innovation And Resilience

Herrero, Marta

University of York, United Kingdom

The Covid-19 pandemic has had a devastating effect on non-profit organisations in the arts and culture sectors; from having to close down all their activities, the sectors have also experienced high levels of redundancies and furlough. In the midst of all the uncertainty, fundraisers play a key strategic role often unacknowledged and mostly misunderstood. In this presentation, I draw on survey and interview data collected from fundraisers in the art and culture sectors in the UK between August and October 2020. I will explore some of the key obstacles fundraisers face and the set of strategies they have developed in order to cope with the economic, social, cultural and often personal effects of Covid-19.

This research was carried out in collaboration with the Cultural Sector Network of the Chartered Institute of Fundraising in the UK, (the national professional membership body for fundraising).

Biography

Dr Marta Herrero is Lecturer in Creative Industries Management at the University of Sheffield, Management School where she teaches on Fundraising Management in the culture sector. She is the author of Irish Intellectuals and Aesthetics. The Making of a Modern Art Collection (Irish Press, 2008) and co-editor of Art and Aesthetics (Routledge, 2013). She is also the author of numerous articles on the sociology of art, art museums, art markets and fundraising.

59

SP14 | Artmaking and Economy in Time of Crises

Cultural Values And Economic Value In The Battlefield oO Cultural Policy: Visions From The Past And Prospects For The Future

Rodríguez Morató, Arturo

University of Barcelona, Spain

One of the explicit goals of cultural policy, when it was institutionalized in Europe in the 1960s, was the preservation of artistic autonomy in the face of the growing power of the cultural industry. After an initial stage focused on the promotion of cultural excellence, the development of cultural policy in following decades brought out a plurality of other cultural values and contributed to their legitimation. Very soon, however, in the context of the progressive culturalization of the economy, an orientation emerged in this area that specifically claimed the economic value of culture. Within the framework of the subsequent neoliberal development of western societies, culture tended to be seen in political circles under the exclusive lens of the economy and its contribution to it. In recent times, however, once it has become clear that advances in the culturalization of the economy result in advances of the commodification of culture, this predominance of the economic perspective has been increasingly contested. In the present circumstances cultural policy has become a battlefield for the valuation of culture and the main battle in this respect is about the representation of cultural value and its measurement. It is a battle pitting the unidimensional view of the economic value of culture referred to purely monetary measures against a plural value perspective based on more diverse and qualitative indicators. The presentation will develop various arguments around the current controversy over cultural values and regarding their prospects in a post COVID-19 future.

Biography

Arturo Rodriguez Morató is Professor of Sociology and Director of the Center for the Study of Culture, Politics and Society at the University of Barcelona. Former Vice President for Research of the International Sociological Association (2006-2010) when he established the ISA Forum of Sociology, and Former President of its Research Committee on Sociology of the Arts (1998-2002). Currently, he is Visiting Scholar at the Weatherhead Center for International Affairs, Harvard University. In the past he has had similar appointments at the EHESS, the New School for Social Research and the University of Cambridge.

From 2015 to 2017 he has been Coordinator of the Social Platform CulturalBase and now is coordinating UNCHARTED: Understanding, Capturing and Fostering the Societal Value of Culture (2020 - 24), both projects funded by the H2020 Programme. He has published extensively on cultural policy, artistic professions and urban culture. In 2018 he co-edited a special issue of the International Journal of Cultural Policy on Cultural Policy in Ibero-America, and now is also co-editing a book on Sociology of the Arts in Action – New Perspectives on Creation, Production, and Reception (Palgrave, forthcoming).

60

The Fabrication Of ›Closeness‹ In The Realm Of The Digital

Zahner, Nina Tessa

Kunstakademie Duesseldorf, Germany

The corona pandemic has driven art into the realm of the digital. Some commentators see this as a long overdue step, since the virtual dominates reality anyway. In their vision art is constantly constructing a "fiction of closeness" just to attract as many visitors as possible to museums, theatres or concert halls. Other voices view particularly the unmediated experience of artistic works as the key contribution of the arts to individual growth and society's development. They see this contribution massively endangered by the displacement of the arts into the virtual sphere. The lecture draws on some case studies to examine various attempts to create "closeness" and "immediacy" within the digital experience of the arts or how this is deliberately avoided. It further investigates the transformations possibly resulting from these strategies for experiencing art and the social function of art and the demand for cultural events and products.

Biography

Nina Tessa Zahner is Professor for Sociology at the Düsseldorf Art Academy. She studied sociology, anthropology and history in Erlangen, Bamberg and London. From 2010 to 2017 she was Junior Professor for Cultural Management and Sociology of the Cultural Field at the University of Leipzig. Her work focuses on the sociology of art, the sociology of perception and the senses, and art market research.
Her latest publications include: Das Publikum als Ort der Auseinandersetzung um legitime Formen des Kunst- und Weltwahrnehmens. In: Schürkmann, Christiane; Zahner, Nina Tessa: Wahrnehmen als soziale Praxis. Springer VS, 2021. Kunstwahrnehmen im Ausstellungskontext. Das Go-Along Interview als Instrument zur Rekonstruktion des perceptual space in Kunstausstellungen. In: Escher, Cornelia, Zahner, Nina: Begegnung mit dem Materiellen. Erfahrung mit Materialität in Architektur, Kunst und Digitalem. Transcript 2021.

61

SP15 | Quantitative Surveys Against the Climate and Health Crises of Today

Organised by RN12 - Environment & Society & RN21 - Quantitative

Chaired by Audrone Telesiene, Kaunas University of Technology; Jochen Mayerl, Chemnitz University of Technology

New global reality bewhelmed humanity with multiple unfolding crises and complex long-term implications. Covid-19 pandemic and the accompanying economic lockdowns have paralyzed the established lifestyles and climate crisis further threatens to jeopardize the balance of eco-social systems. Do we really understand the full mosaic of social experiences in this carousel? How can sociological knowledges assist in addressing the challenges and inequalities? Are the classical instruments still valid? These broad questions are the genuine drivers for this semi-plenary. Specifically, we'd like to discuss the role of quantitative surveys in generating the needed sociological knowledge. Surveys have become the traditional tool for generating understanding. The International Social Survey Programme (ISSP), the European Values Study and multiple other scholarly endeavors have long tried to capture the opinions, values, behaviors and experiences of people. Are such surveys still able to capture the attitudes, needs and perceptions of people in such an ongoing situation of a permanently changing pandemic context and high degree of uncertainty?

The semi-plenary discussion would help navigating the terrain of quantitative sociology and could possibly inspire further scholarly debate on climate and other crises.

62

Biases In Health Data – Usual Suspects And New Pitfalls During The Crises

Gross, Christiane

University of Würzburg, Germany

The talk will first present an overview of systematic biases in the process of generating health data depending on data type (register versus survey data) and the operationalization of health outcomes referring to the disease filter (Gross et al. 2015) as a heuristic tool provided before the crises. Afterwards, I will discuss implications of these systematic biases for intra- and international comparisons with Covid-19 incidence data with a focus on systematic underestimation. Finally, I will discuss the potentials and pitfalls of newer developments in data collection/generation processes known under the buzzwords big data, artificial intelligence and citizen science (e.g. data donations, Corona applications). On the one hand, scientists might be able to reach large case numbers and high statistical power with relatively low monetary costs and effort. On the other hand, scientists may lose control over core issues of quantitative empirical research such as sampling strategies and operationalization; finally, yet importantly, the research question itself might be driven by the data provided by other sources.

Biography

Christiane Gross is Professor of Quantitative Methods in the Social Sciences at the University of Würzburg. After studying sociology in Augsburg and Munich (LMU), she worked at the universities in Munich (LMU), Kiel, Erlangen-Nuremberg, and Hanover, as well as being interims professor at the University of Konstanz. She has also worked on several projects funded by the German Research Association (DFG) and the Federal Ministry of Education and Research (BMBF). Her dissertation thesis at the CAU Kiel was awarded the Faculty Prize. She is elected representative of the empirical social, behavioral, and economic sciences in the German Data Forum (RatSWD) in its seventh appointment period. Her research and teaching interests include quantitative methods and social stratification in education, work, and health.

Surveying Climate And Health Relevant Topics During The Covid-19 Crisis

Hadler, Markus

University of Graz, Austria

This talk consists of three parts. The first part summarizes the development of the ISSP Environment and Health modules, which are supposed to be fielded between 2020 and 2022. The new ISSP environment module consists of 60 questions on environmental attitudes and behaviors, including a new set of questions related to climate relevant behaviors. The health module initially included questions on the personal health status and preferences regarding the health system, but was extended at the very last minute by several questions on the Covid-19 crisis. The second part provides an overview of findings from various international surveys on attitudes related to the environment and Covid-19, also including data from social media. It shows that differences are not just arising from the method of data collection, but also from the contextual influence of the Covid-19 crisis, which altered individual attitudes and behaviors. The third part draws several conclusions on how the Covid-19 crisis has affected surveys and what we can learn from it.

Biography

Markus Hadler is Professor of Social Research at the Department of Sociology, University of Graz, Austria. Before that he held positions at Marshall University (USA) and Macquarie University (Australia). He is an Austrian representative to the International Social Survey Programme (ISSP) and was the convener of the 2020 ISSP survey on environmental attitudes and behaviors. His research focuses on topics of environmental sociology and social inequality with an emphasis on research methods. Currently, he is leading three research projects: measuring CO_2 relevant behavior using survey research; connecting social survey and social media data on climate related views; and a S-LCA of a carbon-emission reducing production process in a steel factory. His teaching interests include quantitative methods, environmental sociology, and social stratification.

64

SP16 | Knowledge, Religions and Environmental Change

Organised by RN12 - Environment & Society & RN34 - Sociology of Religion

Chaired by Cigdem Adem, Ankara Rivers Study Group; Julia Martínez-Ariño, University of Groningen

As with any other major social challenge, perceptions and discourses about environmental change vary across global regions and countries, as well as across social strata. At stake is not just a matter of acknowledging what is taking place, but more about which types of changes we perceive as most influential and most pressing and which types of futures various social groups propose. Questions emerge, such as: How exactly do we picture changes and solutions, and do they match with each other or not? Who presents those changes/solutions and how do they do that? What do people know about sustainable development at macro, meso and micro social levels? And what do religious groups have to do with all these issues? As a powerful source of social discourses, by both describing and determining social reality, religions shape the social world and influence social actions. Thus, the ways religions talk about social life in general and about environmental changes in particular present an important angle to build our understanding of a future social world.

This semi-plenary will discuss how people understand climate change, which values and ideas inform their knowledge about major social changes and how that knowledge shapes their behavior. It will focus on the supposed "greening" of religions and different potentials and barriers of religions to facilitate transition toward more sustainable, low-carbon societies. While drawing on empirical studies, the panel will show the lack of research about the intersection of religious knowledges and climate change and suggest future directions for research and policymaking.

Knowledge and Environmental Change

Jones, Nikoleta

University of Cambridge, United Kingdom

In a rapidly changing natural environment, citizens in Europe and beyond nowadays receive an increasing amount of information on how to become more environmentally friendly by, for example, offsetting their travel by plane and switching to renewable energy providers. However, finding successful pathways in using information to reinforce environmental responsible behaviour remains a challenge for scientists and practitioners. Environmental sociologists have tried for decades to understand how knowledge can lead to behavioural change. From the research of Dunlap et al. (2000) on New Ecological Paradigm to the work of Gross (2010; 2015) on knowledge and uncertainty, several scholars have explored the process of acquiring and handling knowledge during times of environmental change and most important how this knowledge can be used to change behaviours, perceptions and attitudes. This talk examines the role of knowledge in times of environmental change, within the context of extreme uncertainty; the Covid-19 pandemic. Initially, the evolution of key theories in environmental sociology will be discussed focusing on the important connections between knowledge and environmental behaviour. Empirical qualitative and quantitative case studies will then be presented from three National Parks in Europe (Black Forest-Germany, Matsalu-Estonia, Eastern Macedonia & Thrace-Greece) exploring how different paths of information can transform knowledge and most importantly how this knowledge changes through time. A key argument during the talk is that knowledge can be constructed through the on-going interactions between different systems, including social, political and ecological, all existing within a specific governance framework.

Biography

Nikoleta Jones is an Associate Professor at the University of Warwick (starting July 2021). She is an environmental social scientist, and her work focuses mainly on social impacts of environmental policies and improving the levels of public acceptance for policy initiatives. In recent years, she has become increasingly interested in assessing social impacts of biodiversity conservation policies. She is currently leading the project FIDELIO funded by a European Research Council Starting Grant (2019-2024, €1.5m) exploring social impacts of European Protected Areas focusing on their temporal and spatial dimensions.

66

Climate Change and Religion

Köehrsen, Jens

University of Basel, Switzerland

Religions can effectively promote (or block) climate change mitigation and adaptation. They can disseminate environmental values and worldviews to their members, engage in lobbying for corresponding political decisions, and implement mitigation or adaptation projects. Scholarship has suggested a "greening" of religions, leading faith traditions to increasingly draw on the aforementioned potentials and address environmental challenges. Especially in the Global South, faith communities can become crucial agents in climate change mitigation and adaptation. In many regions of the Global South, religions assume a central role in peoples' worldviews and everyday lifestyles as well as in the public sphere where faith leaders often enjoy high credibility. However, broad empirical research underpinning these potentials is missing. While there is evidence for some "greening" and an increasing grasp of climate change among faith leaders in the Global South, existing insights indicate problems in the diffusion of environmental awareness at the grassroots level of religious communities. At the same time, highly successful innovations in the religious landscapes of the Global South, such as prosperity theology, have dubious environmental implications (e.g. focus on ostensive consumption). Based on these observations, this presentation proposes two additional development pathways of religions vis-à-vis environmental challenges such as climate change: "non-greening" and "un-greening".

Biography

Jens Köhrsen is professor of religion and economics at University of Basel's Centre for Religion, Economy and Politics. His research interests include the sociological study of climate change and sustainability transitions, the relationship between social inequality and religion, as well as religion and sustainable development. He is the principal investigator of the Swiss National Science Foundation project "Urban Green Religions" that explores the role of religion in urban sustainability transitions.

67

SP16 | Knowledge, Religions and Environmental Change

MD01 |How and Where to Get Your Paper Published?

Organized & Chaired by Pries, Ludger

Digitalization, new commercial publishing strategies as well as shifting reading and writing habits of scientists and the broader audience lead to turbulence in publication strategies of all actor groups involved. Where and how should young scholars aim to publish? How will Open Access strategies develop in the field of social sciences? Will we go to a bright future of accessible and inclusive scientific publishing for all? Or will existing social inequalities in the science system increase according to countries' policies of paying article processing costs (APCs) and/or institutional strategies of administering digitalized complex platforms? The session will deal with these topics focussing especially on ESA's two associational journals European Societies (ES) and European Journal of Cultural and Political Sociology (EJCPS). Based on some input papers, editors of both journals will share their experiences and make recommendations for scientists' publication strategies.

Blokker, Paul is associate professor in political sociology at the Department of Sociology and Business Law, University of Bologna, Italy. He is also research coordinator at the Institute of Sociological Studies, Charles University Prague, Czechia. His research focuses on populism, a sociology of constitutions, constitutional politics, and democratic participation.

Lianos, Michalis is Professor at the University of Rouen-Haute Normandie and Editor-in-Chief of the ESA journal European Societies. He was previously Lecturer at the University of London (Goldsmiths College) and Director of the "Centre for Empirically Informed Social Theory" (CEIST) at the University of Portsmouth. His latest book is "Conflict and the Social Bond", Routledge, 2019.

Präg, Patrick works as an assistant professor of sociology at CREST/ENSAE in Paris and is a faculty member of the department of economics at Institut Polytechnique de Paris. He's interested in social stratification and social demography. Next to Alexi Gugushvili (Oslo) and Evelyn Ersanilli (Amsterdam), he's the incoming editor of European Societies.

Pries, Ludger holds a Chair for Sociology at Ruhr Universität Bochum. He taught and did research in Brazil, Mexico, Spain and the USA. Main fields of research are Sociology of migration, transnationalization, organisations, work and labour regulation. He is Chair of the Publications Committee of the Executive Committee of ESA (2019-2021).

68

MD02 | ESA Best Paper Award and ESA Young Scholar Award Special Session

Organized by Antic Gaber, Milica; Pries, Ludger & Ferro, Lígia
Chaired by Antić Gaber, Milica

For the first time, ESA has opened a call for two awards. The Young Scholar Award recognizes the quality of an original publication by an early-career researcher. The content of this paper is derived from the researcher's PhD, and it covers a relevant contribution in Sociology. ESA's Best Article Award recognizes the best paper published in each of ESA's journal's (European Societies and European Journal of Cultural and Political Sociology) over 2019-2020. This session holds the presentation and discussion of these three contributions. It is expected a strong participation from the online audience.

Gonzalez Santos, Felipe | Rocking the Boat of Eviction: Personal availability and Empowerment in Social Movement Organizations | Winner of the ESA Young Scholar Award 2021

Andersen, Ditte | Stuck! Welfare state dependency as lived experience | Winner of the ESA Best Article Award 2021 – European Societies (ES) |

Mannevuo, Mona | Anxious politicians: Productivity imperatives in the Finnish Parliament | Winner of the ESA Best Article Award 2021 – European Journal of Cultural & Political Sociology (EJCPS)

Antić Gaber, Milica is Professor of Sociology at Faculty of Arts, University of Ljubljana where she coordinates the doctoral program Gender Studies. She is currently member of ESA's Executive Committee and served as director of PhD Summer School 2020. She served two mandates as Head of Slovene Sociological Association. She was member of the Expert Forum of European Institute for Gender Equality and a member of the Equality Council at Slovenia's Ministry of Labour, Family, Social Affairs and Equal Opportunities. Her research interest covers issues of gender, politics, violence, and migrations. As an author, co-author and editor, she has published several monographs and she contributed numerous chapters in the books and articles in journals on gender equality in Slovenia and abroad.

69

MD03 | Urban Perspectives on the Past and Possible Futures for Barcelona

Organized by Ferro, Lígia & Sordé, Teresa
Chaired by Ferro, Lígia

Barcelona was the place where we all of us would like to be at this Conference. Unfortunately, due to pandemic restrictions, we were not able to meet in presence in the city, but we can share knowledge and perspectives on this vibrant city at this midday special. Some of the most important social movements and tendencies in Europe started in Barcelona, like the workers' mobilization that led to a pioneering law limiting the working day to eight hours. Urbanism and architecture were one of the most developed areas in this innovative context, from the Cerdà plan that represented a new vision for Modern cities to the unique creativity of the bourgeois funded Modernism of Gaudí. Decades later, the city that host the 1992 Olympic Games which transformed the city space and its social configuration. Since then, an intense process of touristification and gentrification affected the city. Other mobilizations took place such as the struggles around the independentism of Catalunya, including the ones for and against it. Recently, the city was particularly fustigated by the pandemic which left its marks. Sociologists and other social scientists were always active to improve knowledge on the urban changes and give insights to improve people's lives in Barcelona. Looking at the past and present of the city, how can we social scientists envision futures for Barcelona?

McDonogh, Gary is an urban anthropologist. He has chaired the interdisciplinary dialogues in architecture and social sciences that constitute Bryn Mawr's Growth and Structure of Cities Department since 1992. He has examined various aspects of Barcelona society and culture since the 1970s--elites, marginal districts, planning and most recently, Chinatowns. In addition, he has published widely on urban society and culture in Hong Kong, the American South, and Latin America, engaging topics ranging from the formation of global downtowns to sustainability. His current research examines global Chinatowns and their urban implications. Representative publications: Good Families of Barcelona (1986); Black and Catholic in Savannah (1992); Global Hong Kong (2005); Global Downtowns (2012).

Ferro, Lígia is Professor of Sociology at the University of Porto (UP), and Member of the Executive Committee of the Institute of Sociology (UP) where she co-coordinates the international network ETNO.Urb (connecting European and South American Universities). Interested in social inequalities and working now on the H2020 project Uncharted –Fostering the Societal Value of Culture. Author of publications in English, Portuguese, Spanish, Catalan, French and German. Currently, ESA Vice- President and Chair of the ESA2021 Conference Committee.

70

MD04 | Why researchers from all sciences look for sociologists?

Organised & Chaired by ESA President
Soler-Gallart, Marta

The European Commission has assumed a democratic change clarifying that the research funded by the EU should have an orientation towards achieving the goals decided by the citizens and the representatives they elect. For that, there is a clear move towards addressing global challenges, represented by the Sustainable Development Goals, as well as enabling the pathways for the monitoring and achievement of social impact across these diverse challenges. This is very clear in the orientations of the current Framework Programme of Research Horizon Europe. That is why today, more than ever, scholars from all sciences look for collaborations with social scientists. In this session we will discuss with two researchers in the fields of health and climate change in order to see what kind of partnerships they have already had, and would like to have with sociologists, and to dialogue in open conversation with sociology delegates.

Llasat Botija, Carmen is a Full Professor at the Department of Applied Physics of the University of Barcelona. Her research focuses on the study of natural risks of meteorological origin and the impact of climate change on them, as well as the improvement of citizen awareness and resilience in the face of extreme events. She directs the Group of Analysis of Adverse Weather Situations, GAMA. She is member of the steering committees of the HYMEX and MedECC programs and the scientific committees of the OPCC and the Adour-Garonne Agency, among others. She was president of the Natural Hazards Section of the European Geophysical Society, editor-in-chief of Natural Hazards and Earth System Science journal, and international coordinator of the Heavy Rains working group of the AMHY / FRIEND UNESCO program.

Ovseiko, Pavel is a Senior Research Fellow in Health Policy and Management at the Radcliffe Department of Medicine of the University of Oxford. He is leading a multi-disciplinary programme of research and policy advocacy on gender equity and diversity across medical and social sciences. He is currently working on "Partnerships for Health, Wealth and Innovation" for the NIHR Oxford Biomedical Centre. His past work informed the creation of an Academic Health Science Centre in Oxford, the Health Innovation and Education Cluster in Thames Valley, and an Academic Health Science Network in South Central England. He is also involved in the Paradigm Project, funded by the Robert Wood Johnson Foundation, to increase the relevance, timeliness, quality and impact of health services research.

Soler-Gallart, Marta, Harvard PhD, is Full Professor and Chair of the Department of Sociology of the University of Barcelona, and Director of the research community CREA. She is President of the European Sociological Association and has served at the Governing Board of the European Alliance for the Social Sciences and Humanities, as well as at the Board of Directors of ORCID. She was the main researcher of the H2020 European funded project SOLIDUS and is currently involved in the H2020 research ALLINTERACT. Among her recent publications highlight the book "Achieving social impact. Sociology in the public sphere" in Springer, as well as articles in journals such as Current Sociology, Qualitative Inquiry and Palgrave Communications, among other. She is also the Editor of the ISA journal "International Sociology".

71

MD05 | Relational Ageing in a Future Shaped by Pandemic

Organized by RN01 - Ageing in Europe
Chaired by Galčanová Batista, Lucie

This session addresses how a social world affected by Covid-19 shapes, and will continue to shape, the nature of ageing in European societies. Covid-19 has had disproportionate impacts within populations, with mortality rates higher for older people. This has prompted different national responses on how to protect populations, including the most vulnerable members of society. Fundamental tensions inhere within endeavours to mitigate the interrelated health impacts and economic consequences of a pandemic. These endeavours seek to reconcile limits to the contagion, which curtails social activity, with the maintenance of economic stability, which requires the stimulation of social activity. In simplistic terms, it has been argued that limiting the contagion prioritises older people, while the stimulation of economic activity prioritises the needs of working age people and children. Nevertheless, this simplification could reinforce a sense there is a zero-sum association between the needs of older people and those of younger people. Such conceptualisations could reinforce social divisions at a time when positive solutions to substantial socioeconomic challenges are required. The Covid-19 situation thus raises profound ongoing questions for sociology and ageing research, related to older people, intergenerational relations, and conceptualisations of age and ageing. Sociology is well placed to evaluate micro and macro dimensions of the impacts of Covid-19, including how relationships at an interpersonal level are influenced by changing economic and cultural contexts. Crucially, how will the relational basis of ageing be affected by the pandemic and how should sociology inform positive responses to its impacts?

Ramsay-Jones, Esther (Open University, United Kingdom) is a practising palliative and organisational psychotherapist, working psychodynamically with people living with life-limiting conditions, their families and within a counselling service for older adults. She lectures on Death, Dying and Bereavement at the Open University. Her book, Holding Time: Human Need and Relationships in Dementia Care (2019) is an ethnographic exploration of the care home context drawing from her PhD research. More recently she has written The Silly Thing: Shaping the Story of Life and Death (2020).

Weicht, Bernhard (Department of Sociology, University of Innsbruck, Austria) has studied Economics in Vienna and Social Policy in Nottingham. He holds a PhD from the University of Nottingham where he researched the social and moral construction of care for older people. After postdoc work at Utrecht University and Leiden University College he received his Habilitation at the University of Innsbruck in 2018 with his work entitled "A Caring Sociology for Ageing Societies". Bernhard has published on the construction of care, ideas of dependency, migrant care workers, the intersection of migration and care regimes and the construction of ageing. He is the author of The Meaning of Care (2015).

72

MD06 | The rise of hate speeches: building alternative futures against racism, antisemitism, sexism and homophobia

Organized by Ferro, Lígia
Chaired by Moerman, Gerben

Intersections of Antisemitism and Antifeminism – the Authoritarian Personality re-visited - K. Stögner
The persistence and current rise of antisemitism, sexism, and homophobia calls for a sociological analysis that does not view ideologies as isolated phenomena but recognizes them as interrelated. Such an intersectional ideology critique can be formulated by referring to methodological and theoretical tools provided 70 years ago in the Authoritarian Personality. In these groundbreaking studies, the often-overlooked co-author Else Frenkel-Brunswik emphasized the importance of sexuality and of gender relations for the formation of the authoritarian ideological syndrome. She found a significant connection between an insistence on strict gender binary and ethnocentric, nationalistic, and antisemitic attitudes. Based on this early form of intersectionality I have developed an intersectional ideology critique that focuses on how antisemitism is permeated by antigenderism, sexism and homophobia.
Academic research on race, racism and online hate speech has seen a remarkable development. Nevertheless, a significant part of this theoretical production remains chained to the "prejudice paradigm", suggesting that the authors of these discourses are extremists. However, I argue that racism should not be viewed as a marginal phenomenon of Western societies, but should instead be problematized from a broader ideological framework. Based on a critical analysis of the discourse on the social media platforms Facebook and Youtube, as well as comments found in two Portuguese online newspapers, the aim of this talk is to characterize and categorize racial hate speeches in the Portuguese digital sphere.

Stögner, Karin is a Professor of Sociology at the University of Passau, Germany and held Visiting Professorships at Goethe University Frankfurt (2018) and at the Hebrew University of Jerusalem (2017). She received both her PhD and her Habilitation from the Department of Sociology at the University of Vienna. Her research focuses on a feminist reading and further development of the Critical Theory of the Frankfurt School and on the study and critique of antisemitism, sexism, homophobia, racism and nationalism as intersecting ideologies. Her numerous publications include the edited volume "Kritische Theorie und Feminismus" (Suhrkamp 2022), the monograph "Antisemitismus und Sexismus. Historisch-gesellschaftliche Konstellationen" (Nomos 2014), and the recent articles "Antisemitism and Intersectional Feminism: Strange Alliances" (2021), „New Challenges in Feminism. Intersectionality, Critical Theory, and Antizionism" (2019) and "Walter Benjamin, subjectivity, and gender" (2020).

Sousa Almeida, Pedro is a researcher at The Centre for Research in Anthropology (CRIA) where he conducts research on racial issues. He currently coordinates the project "Racism and Xenophobia in Portugal: normalization of hate speech online", funded by the Portuguese National Funding Agency for Science, Research and Technology (FCT). Pedro holds a P.h.D in "Democracy in the Twenty-first Century", in the field of critical theory, by the University of Coimbra (2019), institution where he also took his degree in Anthropology (2001). He completed a Master's degree in "Family and Social Systems" at the Miguel Torga Institute of Higher Education (2004), where he worked as a teacher between 2002 and 2010. From the idea that sport is a uniquely favourable field for studying social reality, his main research interests have centred on the relations between football, race, racism, postcolonialism and national identity.

Moerman, Gerben is Director of the BSc and MSc programmes in Sociology at the University of Amsterdam. His research focuses on qualitative methods – including interview dynamics (PhD in 2010) and analytical practices such as participatory interpretation. Gerben has long been active in RN20 "Qualitative Methods", as vice-chair and chair (2013–2017) and board member (2017-2021). Since February 2021, he has been a member of the ESA Executive board, contributing to the organisation of the Summer School and recent discussions on enhancing democracy and accountability. Gerben has a passion for teaching sociology (University Lecturer of the Year 2011). He believes the ESA can extend its role towards teaching, since the classroom is our primary stage for public sociology. He wants to help sociologists (re-)developing courses by setting up a platform for peer learning and exchange of teaching materials and ideas.

73

EV01 | ERC: Find the Research Grants

Organised & Chaired by Mark Nielsen, Anne

The European Research Council supports excellent, investigator-driven frontier research across all fields of science through a competitive peer review process based on scientific excellence as the only selection criterion. Without predetermined thematic priorities, the ERC encourages proposals that cross disciplinary boundaries, address new and emerging fields, and introduce unconventional, innovative approaches.

Researchers of any career stage are offered flexible, long-term funding for up to five years (six years in the Synergy grant call). ERC calls for proposals are open to researchers from around the world who plan to carry out their research project at a host institution in an EU Member State or in a country associated to the current EU Framework Programme for Research and Innovation. For the Synergy grants, one of the Principal Investigators can be based outside the EU/associated countries permanently.

In the first part of the session, Anne Nielsen, Scientific Officer at the ERC Executive Agency, will present the ERC funding schemes. In the second part of the session, ERC grantee Dr. Nikoleta Jones, will talk about her ERC project, FIDELIO: Forecasting social Impacts of bioDiversity consErvation poLicies In EurOpe, and her experience in preparing and leading her ERC project. Participants will have the opportunity to ask questions about ERC funding schemes and the evaluation process.

Mark Nielsen, Anne is Scientific Officer in the European Research Council's Executive Agency (ERCEA), where she has worked since 2017. She holds a PhD in the Social Sciences from the European University Institute in Florence, Italy, which was followed by a 2-year postdoctoral fellowship at Yale University. Before ERCEA, she worked as a Policy Officer in the European Commission's General-Directorate for Research and Innovation. She has also worked in a migration think-tank in Washington D.C. and an international NGO in Brussels working on women's rights.

Jones, Nikoleta is an Associate Professor at the University of Warwick (starting July 2021). She is an environmental social scientist, and her work focuses mainly on social impacts of environmental policies and improving the levels of public acceptance for policy initiatives. In recent years, she has become increasingly interested in assessing social impacts of biodiversity conservation policies. She is currently leading the project FIDELIO funded by a European Research Council Starting Grant (2019-2024, €1.5m) exploring social impacts of European Protected Areas focusing on their temporal and spatial dimensions.

EV02 | The Transformative Potential of New Environmentalism and Its Narratives: Hope, Catastrophe and Visions of the Future

EV02 | The Transformative Potential of New Environmentalism and Its Narratives: Hope, Catastrophe and Visions of the Future

Organized by RN12 - Environment & Society & RN25 - Social Movements
Chaired by Adem, Çigdem & Wahlström, Mattias

The last decade has witnessed novel trends in environmental activism, which will be approached from two different perspectives in this special session. The first part will focus on everyday small-scale struggles for social and environmental change in an urban setting, its eco-social transformative potential and how to theorize such initiatives. How can we develop better sociological ways to comprehend the important political difference that small-scale collective actions initiate? Which research methods would suit best to study environmental movements and what is the position of the researcher? What is the potential of everyday environmentalism or diverse examples of alternative political practice in extending ideas of environmental justice and in reclaiming its political importance? The second part of the special session deals with imaginaries and narratives by environmental mobilizations focused on the experience or acceptance of loss. In certain currents of climate justice activism, the transition movement and so-called collapsology networks, a "postapocalyptic" environmentalism that views catastrophe as ongoing or unavoidable has partially displaced previous apocalyptic narratives that portray it as a future threat. How is a post-apocalyptic politics possible and what role does hope play in it? A variety of strategies employed by activists are charted, including invoking new forms of hope through a rejection of "false" hope, the reliance on emotions generated by the interaction with things as well as human others, and the emergence of philosophical outlooks that stress mourning and loyalty to what is lost.

Dr MacGregor, Sherilyn is a Reader in Environmental Politics at the University of Manchester. She specialises in the relationships between environmental (un)sustainability and social inequality, applying insights from ecofeminist and other critical political theories. Current research projects include: the impacts of climate change on unpaid care work (funded by Oxfam USA); a feminist Green New Deal for the UK (funded by the Women's Budget Group); and 'everyday sustainabilities' in marginalised immigrant households (funded by the Leverhulme Trust). She is an Editor of Environmental Politics.

Cassegård, Carl is professor of sociology at the University of Gothenburg, Sweden. His current research interests include the environmental movement, critical theory and eco-Marxism, contemporary "post-apocalyptic" environmentalism, and anti-nuclear activism in Japan. He is the author of Toward a Critical Theory of Nature: Capital, Ecology, and Dialectics (2020), Youth Movements, Trauma and Alternative Space in Contemporary Japan (2014) and Shock and Naturalization in Contemporary Japanese Literature (2007). He has also co-edited Climate Action in a Globalizing World: Comparative Perspectives on Environmental Movements in the Global North (2017).

75

Adem, Çigdem is a Research Fellow at Ankara Rivers Study Group. Her research interests include environmental movements, environmental governance and citizenship. As part of her interest in science-policy-society interface, she is member of the IPBES Capacity-Building Task Force. She is a long-time member, board member and recently co-coordinator of RN12 Environment and Society.

Wahlström, Mattias is Associate Professor of sociology at the University of Gothenburg, Sweden, and co-coordinator of ESA RN25 Social Movements. His research mainly focuses on various aspects of political protest and the governance of dissent. He is currently researching climate activism and the political visions of the climate movement.

EV03 | Ricca Edmondson: a Celebration of Her Contribution to Sociology and Ageing Research

Organised by RN01 - Ageing in Europe
Chaired by Spännäri, Jenni

Ricca Edmondson, former Coordinator of RN01 Ageing in Europe and ESA Executive Committee member, sadly passed away in June this year. Ricca was a kind, generous and wonderful colleague who will be greatly missed. Everyone is welcome to attend this session to acknowledge and celebrate Ricca's work and contribution to ageing research.

Tolhurst, Edward is a Senior Lecturer in Health Research at Staffordshire University, UK. He is a qualitative researcher in the field of ageing, dementia and care. Edward's first involvement with ESA and Ageing in Europe (RN01) was as a participant at a PhD workshop in Porto in July 2012. He then joined the Board in early 2014. Edward is the current Coordinator of ESA RN01.

Spännäri, Jenni is a postdoctoral researcher in the University of Eastern Finland and Åbo Akademi, and head of research at CoHumans. Her research interests include wisdom, aging, compassion and religion & spirituality. She is a long-time board member of ESA RN01 Ageing in Europe

76

EV04 | Solidarity in Poland and Anti-Authoritarianism in Belarus: What can a 21st Century Social Movement for Democratization Learn from a 20th Century one?

Organised by Gadowska, Kaja; Koos, Sebastian & Tartakovskaja, Irina
Chaired by Gadowska, Kaja

Over 40 years ago a Polish social movement shook a Europe divided by the Iron Curtain. In an instant, the notion of Solidarność (Solidarity) inscribed itself in history as a symbol of collective action by people striving for freedom, equality, and social justice. Today the concept of solidarity also defines social movements. In Belarus, grassroots organizations loudly declare that "Our solidarity is stronger than the repressions".

With the long trajectory (1956-89) leading up to the final victory of Solidarity as a point of reference, the anti-authoritarian protests in Belarus will be analyzed through four stages in the development of social movements: emergence, coalescence, bureaucratization, and decline. Indeed, 21st century communication technologies have greatly accelerated mobilization and the ongoing dissent in Belarus has quickly reached its third stage, yet its transformation into a regime-toppling force has been stymied by the brutal repressions unleashed by Lukashenka's regime. This has been made possible by the emergence of 21st century authoritarianism, considerably different from that of the waning Cold War.

However, the spectacular changes in people's conceptions of national identity – built around symbols distinct from those promoted by the officialdom – could sustain the emotional mobilization and social solidarity needed to persevere long enough to engineer the final push when an opportunity arises. Will the nascent Belarusian (and global) solidarity culminate in the emergence of durable organizations capable of effecting political change or remain a phenomenon solely expressed more fleetingly on the streets?

Kubik, Jan is Professor in the Department of Political Science at Rutgers University and Professor of Slavonic and East European Studies at University College London (UCL). He works on the rise of right-wing populism, culture and politics, and protest politics. Among his books are: The Power of Symbols against the Symbols of Power and Twenty Years After Communism: The Politics of Memory and Commemoration, with Michael Bernhard. The 2020 President of Association for East European and Eurasian Studies and the recipient of the 2018 Distinguished Achievement Award from the Polish Institute of Arts and Sciences in America (PIASA). Co-director (with Richard Mole) of two international projects, Delayed Transformational Fatigue in Central and Eastern Europe and Populist Rebellion Against Modernity in 21st-century Eastern Europe (https://populism-europe.com/poprebel/). He received M.A. (sociology and philosophy) from the Jagiellonian University in Kraków, Poland and Ph.D. (anthropology, with distinction) from Columbia University.

Dr. Kulakevich, Tatsiana is a researcher on Eastern Europe born and raised in Belarus. She is a permanent instructor at the University of South Florida School of Interdisciplinary Global Studies, research fellow and affiliated faculty at the USF Institute on Russia. Her research focuses on international political economy, migration, and ethnic politics. Dr. Kulakevich's analyses appeared in media and academic journals, including The Washington Post, The Conversation, The Globe Post, The New Eastern Europe, International Migration, SAIS Review, Journal of Belarusian Studies, and East European Politics and Societies: and Cultures.

77

EV05 | Doing Human Service Ethnography - Generating Valid Knowledge about Service Work

Organised by Jacobsson, Katarina; Gubrium, Jaber & Elliker, Florian
Chaired by Elliker, Florian

Human service work is performed in many places – hospitals, shelters, households, prisons, schools, clinics – and is characterized by a complex mixture of organizing principles, relations and rules. With ethnographic methods, researchers can investigate these site-specific complexities, providing multi-dimensional and compelling analyses.

The goal of human service ethnography is to make visible forms of service-related personal experience and social organization that are either unrecognized, misunderstood, or otherwise hidden from view. This relates in particular to areas of service provider and recipient experiences and complexities otherwise taken-for-granted or trivialized in the simplifying practices of accountability. This is especially pertinent in the current public policy environment where trends for evaluating human service work are decidedly non-ethnographic, favoring rampant quantification. There is a need for more humanistic and context-sensitive approach to generate valid knowledge about today's service work, which is argued for in the recently published book Doing Human Service Ethnography in which twelve contributors exemplify ethnographic analytical creativeness in the field of health and social care.

F. Gubrium, Jaber is professor emeritus and former chair of Sociology at the University of Missouri-Columbia, USA. He is an ethnographer and conducts research on the narrative organization of service and care in human service institutions. His interest in discursive practice, organizational embeddedness, and intertextuality has been applied to the everyday contours of professional work in nursing homes, physical rehabilitation, mental health, dementia, and residential treatment for emotionally disturbed children. Gubrium is co-editor of Turning Troubles into Problems (Routledge 2014) and Reimagining the Human Service Relationship (Columbia University Press 2016).

Jacobsson, Katarina is a sociologist and Professor of Social Work at Lund University, Sweden. With a general interest in qualitative methodology and sociology of knowledge, her current projects deal with documenting practices among human service workers, particularly within social work. Her writings on methodology deal with the analyses of documents from an ethnographic approach and interviewing. Jacobsson's latest book is the ethnography Hidden attractions of administration, (Routledge, 2021; with Åkerström, Andersson-Cederholm and Wästerfors).

Wästerfors, David is Professor in Sociology at the Department of Sociology, Lund University, Sweden. His research is often focused on interactions, institutions, emotions and social control. He has completed three research projects with ethnographic data from Swedish detention homes (on conflicts, schooling and violence). A related interest is qualitative methodology, shown in the book Analyze! Crafting Your Data in Qualitative Research (with Jens Rennstam, 2018). At the moment he is working in two projects, one on accessibility for people with disabilities in urban and digital settings, and another one on people's digital discussions and crowdsourcing activities around criminal events.

Elliker, Florian is Senior Lecturer in Sociology at the Institute of Sociology, University of St.Gallen, Switzerland. He specializes in working with interviews, participant observation, discourse analysis, and a sociology of knowledge approach to discourse ethnography. He currently conducts an ethnographic research project on the transformation of South African student residences, focusing on minorities, cultural precariousness, and the dynamics of reinventive institutions. His upcoming project concerns the study of consciousness-altering substances in the context of transforming drug regulations. He is the coordinator of the ESA research network 20 Qualitative Methods.

78

EV06 | Bridging Disciplinary Boundaries in Horizon Europe

Organised & Chaired by Papadopoulos, Apostolos

This session aims at exploring the ways that social science disciplines respond to challenges both within and outside the academic settings. It may be considered as common knowledge that the academic environment offers certain protection to social scientists who reproduce traditional academic practices and knowledges. In this connection, two significant conditions need to be mentioned here: first, the wider socioeconomic and institutional developments bring about changes to disciplines by shaping their relevance, contribution(s), and impact, and second outside academia disciplinary practices, knowledge and impact are valued to the extent that they contribute to addressing real life problems, challenges and pressing issues.

The main challenge within the academic settings involves the reproduction of academic practices and the stretching of disciplinary boundaries in view of the developments and exchanges across the disciplines. In this way, there is a continued expansion of sub-disciplines based on interactions/cross-fertilization between disciplines, while also intersectionality emerges for enabling disciplines to be more responsive to scientific questions.

The challenge coming from outside the academic setting is how best the social science and humanities disciplines can represent their communities for addressing agendas set by external international actors. Therefore, the relevant questions are: How possible is it for scientific associations to cross their disciplinary boundaries and provide knowledge, support and expertise which is relevant and important for funding agencies and major policy actors? How is it possible to expand the interactions between the disciplinary/ scientific actors and the funding/ policy actors?

Lombardo, Gabi (LSE, PhD) is the Director of the European Alliance for Social Sciences and Humanities (www.eassh.eu), the largest advocacy and science policy organization for social sciences and humanities in Europe. She worked with the London School of Economics (LSE) the European Research Council (ERC) and Science Europe (SE). As Director of EASSH, Gabi advocates advocates also for the need of a strong evidence-based approach to policymaking, and the inclusion of researchers in science policy development

for strategic and broad-based research funding. She is an expert evaluator for SSH disciplines and research ethics for the EU Commission, World Bank, WISE and COST. In November 2018, Gabi received the Young Academy of Europe Annual Prize.

Ivancheva, Mariya holds a PhD in Sociology and Social Anthropology from the Central European University. She has done research and published broadly on the casualization, commercialisation and automation of higher education and labour in the digital era, as well as on alternative/socialist models of social organisation and social change. She has done fieldwork on these topics in diverse settings across Europe, Latin America and Southern Africa. Mariya has been active in feminist, anti-racist, labour- and financial justice struggles, and is a founding member of international platforms such as LeftEast, Essential Autonomous Struggles Trabsnational (EAST) and pressure group PrecAnthro. As a representative of the latter, she was elected a member of the executive committee (2019-2021), and now serves as President (2021-2023) of the European Association of Social Anthropologists (EASA). Mariya has just taken up the position of Senior Lecturer at the School of Education, University of Strathclyde, Glasgow, Scotland

RN01 | Ageing in Europe

RN01_T01_01 | Loneliness in Old Age

Meanings of Loneliness for LGBTQ-elderly: A Qualitative Interview Study

Gillingsjö, Jenny

Linköping University, Sweden

The research dealing with LGBTQ elderly and loneliness has as a rule used quantitative methods, focusing on how different variables correlate with loneliness. This presentation is based on a qualitative study focusing on identifying the meanings of loneliness attributed by older LGBTQ adults. The empirical material consists of semi-structured interviews with LGBTQ elderly (65+) living in Sweden. The study focuses both on the worries expressed about the possibility of being lonely and on approaches to avoid loneliness. Even if the focus in the presentation is on loneliness, it is inevitable to address the correlate issue of social relationships. In the presentation, differences will be distinguished in regard to being both an older adult as well as an LGBTQ-individual to understand how these two categories affects the meaning of loneliness. The results indicate that LGBTQ elderly express views on loneliness that sometimes only refers mainly to one of these two categories. However, there are also examples when the two categories intersect and can be understood to reinforce each other and the feeling of loneliness. The presentation will contribute to the debate on the importance of nuancing the different meanings that can be attributed to loneliness. This can be of importance for understanding both the social context of older LGBTQ adults as well as older adults belonging to other minority groups.

Strategies Facing Loneliness: A Qualitative Study of Older Adult's Experiences

Rivera, Paula; García-González, Juan Manuel; Morales, Fatima

Universidad Pablo de Olavide, Spain

Background: Loneliness is a subjective phenomenon that affects a considerable part of the adult-elderly population. Loneliness is significantly related to health and wellbeing, and a protective factor for physical and mental health, and social life. It is relevant to know the personal and collective strategies and resources of those who feel lonely, since they allow them to accept, cope, and control the loneliness.
Objectives: To know the concept of loneliness that of older adults who feel lonely, to explore the strategies and resources they use to cope with loneliness, and to analyze the management of that feeling in daily life.
Data and methods: Qualitative design. Twelve community-dwelling older people identified as lonely (standardized measure and self-reported) participated in in-depth interviews in 2020 and 2021. Sample profiles were established by gender, age, civil status, and type of household. Given the context of the pandemic, a specific section about covid-19 and the lockdown was included.
Results: Participants drew a broad range of individual and collective strategies and resources to ease and cope with loneliness both indoor and outdoor. There were differences by social context, age, and gender. Those strategies were indoor: acceptance, positive attitude, use of TV and radio, reading, hobbies, and cognitive strategies of adaptation; and outdoor: physical exercise, visits to vicinity shops, attendance to daycare centers, church attendance, and daily life with neighbors. The meaning of loneliness differed mainly by the causes that lead that feeling and its duration.
Conclusions: This study includes the strategies and experiences of those living in loneliness. These personal views can offer valuable information to the administrations that develop the policies and practice responses to prevent and manage loneliness.

'This is Going to Sound Like I'm Really Lonely…': The Everyday Coping Practices of Older Men Living Alone and Experiencing Loneliness in England.

Willis, Paul; Vickery, Alex

School for Policy Studies, University of Bristol, United Kingdom

While much attention has been given to loneliness as a public health and societal problem less attention has been given to men's experiences and the ways in which masculinities, sexual identity, and older age intersect and shape men's accounts of loneliness. UK policy and government responses to loneliness frequently identify older people as a population of concern due to the multiple risk factors associated with loneliness in older age. However, there is a limited evidence-base on what works with supporting older men to counteract the impact of loneliness on their mental and social wellbeing. In this paper, we focus on the experiences of men (65-95 years) living alone gathered through qualitative, semi-structured interviews. Our inquiry centred on the everyday coping practices older men apply when seeking to alleviate loneliness and increase social engagement. Between 2017-18 72 men residing in England (65-95 years of age) took part, including heterosexual (51) and gay-identifying men (21). We present thematic findings on the difficulties men experienced in discussing loneliness with significant others, the solitary and interpersonal coping practices men applied within and external to their home, and the importance of homosocial friendships. Our findings show a tension between the ways in which micro coping practices exercised within the home contribute to biographical continuity while also compounding loneliness experiences. We discuss barriers to social engagement outside of the home, overlapping with discourses of shame attached to loneliness, and identify ways in which sexual identity shapes the differing value and significance placed on older men's friendships.

Active Ageing Agenda of Social Services for Elderly in Russia: between "Paternalistic" and "Optimistic" Discourses

Prisiazhniuk, Daria[1]; Holavin, Artur [2]

[1]HSE University, Russian Federation; [2]TSI, Latvia

Like other states around the globe, Russia faces ageing of the population, and active ageing policy becomes one of the viable solutions for the Russian regime. The research deals with active ageing adoption at the social policy decision-making, organizational discourses and representations of the social services by elderly people. The research reconstructs the main approaches to active ageing in the context of transfer of social policy implementation functions to non-state actors. Based on a series of semi-structured interviews (N=19) with participants of programs promoting active ageing in two Russian cities, the research provides evidences of how rhetoric and policy implementation collides with the requests, expectations, and meanings that elderly people themselves. Using intersectional theory we explain how class differences influence elderly lifestyles, and opportunities to exercise active ageing. Research participants understand that "paternalistic" view of old age as an age of trouble, is now largely viewed as obsolete, yet the new "optimistic" of old age as a time of freedom and opportunities does not necessarily reflect their everyday life experiences. We conclude that this mismatch in discourses and practices reflects the non-homogeneity of the group of elderly themselves as well as the process of participatory empowerment rhetoric of the active ageing becoming a justification to modest state social service provision. It is an example of the empowerment paradox (Fook 2016; Solimeo et al. 2015) – the case for activism and empowerment being possible only for those resourceful, well-educated, relatively wealthy, and relatively healthy individuals already.

Active ageing during fourth age by Finnish Older Adults

Valpuri Kiuru, Hilla; Valokivi, Heli

University of Jyväskylä, Finland

Active ageing during fourth age by Finnish Older Adults
Hilla Kiuru, Heli Valokivi

Keywords: active ageing, fourth age, Active Ageing Index, content analysis

Population is ageing and solutions for its challenges are sought. One is active ageing discourse that is promoted in European Union. Active ageing has brought diversity to the roles of the older adults. However, it has also been criticized as being potentially exclusive.

In our research, we study active ageing during fourth age. Our research questions are: How are older adults active? In what ways the indicators of the Active Ageing Index (AAI) can be seen in older adults´ lives.

The data was collected in the Well-functioning Home Care in Lapland (2016–2018) project, funded by Finland's Ministry of Social Affairs and Health. It consists of 16 interviews with older adults who live at their own homes in Finnish Lapland. The method is content analysis, guided by AAI.

AAI doesn´t cover all the fourth agers´ activities, like hobbies. Some indicators, like employment rate and care to children and grandchildren weren´t part of these people´s activity anymore. In our data activity can be seen as supported activity, in which some things are done independently but in others help is needed. Living at one´s own home was important.

Our research brings more perspective to the discussion of active ageing by focusing on the fourth age. It´s also important to evaluate, how indicators like AAI fit to the lives of different older adults.

Active Ageing In Italy: Evidence-Based Recommendations For Policy Making

Lucantoni, Davide[1]; Barbabella, Francesco[2]; Principi, Andrea[3]

[1]Centre for Socio-Economic Research on Ageing - National Institute of Health and Science on Ageing (IRCCS INRCA), Ancona, Italy; [2]Centre for Socio-Economic Research on Ageing - National Institute of Health and Science on Ageing (IRCCS INRCA), Ancona, Italy; [3]Centre for Socio-Economic Research on Ageing - National Institute of Health and Science on Ageing (IRCCS INRCA), Ancona, Italy

Active ageing (AA) has been recognized as a fruitful concept at the European policy level, to make policies address social and economic consequences of population ageing. However, in Italy a national Plan-of-Action (PoA) (2019-2022) on AA was launched only recently (Barbabella et al., 2020). The PoA is coherent with Social Innovation principles and aims to analyze, deliver recommendations and consult with policy makers and stakeholders about the field of AA.

Through a multilevel stakeholder involvement, systematic review and analysis were conducted about the state-of-the-art in national and regional AA policies by the scientific team led by IRCCS INRCA, funded by the Department for Family Policies at the Presidency of the Council of Ministers. On that basis, we identified policy gaps and developed policy recommendations, in compliance with the international framework provided by the Madrid International Plan of Action on Ageing (MIPAA) and the Sustainable Development Goals (Agenda 2030).

A set of 25 recommendations for the adoption of policies on active ageing was developed in 13 policy areas. A stakeholders network has been involved, with consultative and co-decisional roles, to enhance scientific, technical, political and organizational competences in all phases of the policy cycle and towards a better coordination of AA policies in Italy.

National and regional governmental bodies were included in the process and their involvement can encourage the consideration and adoption of policy recommendations, in order to improve the internalization of the AA paradigm in a more systematic way across all policies and at all levels.

Well-being

Subjective Well-being And Mental Health In European Older Adults During The Pandemic Outbreak: A Role Of Institutional Trust

Lee, Sunwoo [1][2]

[1]Palacky University Olomouc, Czech Republic; [2]Charles University, Czech Republic

This current study examined the relationship between perceived material adversities due to pandemic crisis, institutional trust, and subjective wellbeing and mental health among European older adults. The study employed secondary data analysis using cross-sectional COVID-19 survey data collected from 27 European countries in April 2020; initial survey was designed and implemented by The European Foundation for the Improvement of Living and Working Conditions (Eurofound). A total of 10,885 older adults aged 65+ were analyzed (Mean = 69.71, SD = 5.15; female 70%; retired 86%). Analysis focused on the financial impact and material security in relation to pandemic lockdown, institutional trust (news media, police, national government, European Union, and healthcare system), and subjective well-being and mental health. Nearly one-third of respondents reported their financial situations worsened compared to three months ago; of the respondents, 38.4% reported some difficulty in making ends meet, and 6.3 % reported great difficulty. Regression analysis indicated that perceived insecurity in material living conditions during pandemic crisis (e.g., worsening finances, difficulty paying for basic necessities) were significantly related to respondents' life satisfaction, happiness, self-rated health, mental health index, and psychological distress when controlled for socio-demographic variables. Institutional trust appeared to partially mediate the relationship between perceived adversities and subjective well-being and mental health. Additionally, the role of each institution varied. Findings suggest that institutional trust may play an important role in explaining older adults' resilience, attitudes toward organizational measures, and coping strategies during the pandemic crisis. Recommendations for policy and public service during a prolonged epidemic and beyond are provided.

What contributes to ageing well? Perspectives of older adults in Austria, Canada and Sweden

Kadi, Selma[1]; Augustsson, Erika[2]; Jull, Janet[3]; Rodrigues, Ricardo [1]

[1]European Centre for Social Welfare Policy & Research, Vienna, Austria; [2]Aging Research Center, Karolinska Institutet & Stockholm University, Stockholm, Sweden; [3]School of Rehabilitation Therapy, Queen's University, Kingston, Canada

Despite the bulk of research exploring concepts of ageing well such as active or successful ageing, studies on subjective definitions of ageing well remain relatively rare. Older people's perspectives can contribute to a better understanding of the diversity of experiences of ageing and constitute an important input for initiatives to support ageing well. We present findings from a project in which quantitative research on intersections of gender, age, health and care was used as a starting point for the examination of older people's perspectives on the same themes, focusing on ageing well.

Those studies which examine older people's subjective definitions using qualitative methods tend to focus on single locations which often makes comparisons difficult. In contrast, we explore subjective definitions and perspectives using the same approach in three different countries. The paper is based on the analysis of 60 semi-structured interviews with women and men who are 60 years or older in Austria, Canada and Sweden. Findings demonstrate the diversity of definitions of ageing well and the impact of gender and socio-economic status as it is perceived by older women and men in these three countries.

83

Loneliness as Mediator Between Exclusion from Social Relations and Mental Well-being for Older Adults

Marian Vasile, Octavian[1,4]; Aarsten, Marja[2], Precupețu, Iuliana[3,4;] Tufă, Laura[3,4]; Pop. Cosmina[3,4]; Dumitrescu, Diana[3]; Radogna, Maria Rosa [3]

[1]University of Bucharest, Faculty of Sociology and Social Work, Department of Sociology; [2]Oslo Metropolitan University / NOVA; [3]University of Bucharest, Research Institute of the University of Bucharest; [4]Romanian Academy, Research Institute for Quality of Life

Scholars say that people with frequent contacts with family, friends or neighbors have high social integration. Loneliness, a negative subjective feeling about social relationships, is an effect of exclusion from social relations and correlates with mental well-being (Burholt et al. 2020). Data shows low levels of mental well-being for more than half of Romanian and at least a quarter of EU adults 50 years or older. World Health Organization considers mental well-being essential to well-being and as important as physical health. Using data for the year 2016 from European Quality of Life Survey, and multilevel structural equation models, we test the direct and indirect effects of exclusion from social relations and loneliness for mental well-being. We found evidence for both types of relationships while controlling for gender, employment status, material deprivation, and residence. The positive effect of having contacts by phone or internet is interesting if we think at the COVID-19 pandemic which imposes physical distancing as a prevention measurement. We discuss which is the proper measurement model for exclusion from social relations, reflective or formative, and measurement equivalence of the WHO-5 scale for mental well-being.

Untangling The Concept Of Well-being In Very Old Age – An Integrative Review Using Rodgers' Evolutionary Concept Analysis

Näsman, Marina; Nyqvist, Fredrica & Nygård, Mikael

Åbo Akademi University, Finland

In order to promote well-being in very old age, there is a need for a more cohesive understanding of the meaning of the concept in this particular context. Hence, the aim of this study was to review scientific literature in order to examine the conceptualization of well-being in very old age. Rodgers' evolutionary concept analysis was used as a guiding framework. The search in scientific databases generated a sample of 568 unique articles published in the years 2009-2019, of which 49 were included in the final analysis. Four main attributes of well-being in very old age were identified: Multifaceted; Intertwined with health and quality of life; Ability to adapt, and Part of successful aging. Further, the antecedents and consequences of well-being in very old age, as well as related concepts were summarized and discussed. The results revealed that there was a movement between general aspects of well-being, and specific aspects of very old age. A majority of the articles included definitions of well-being that were not related to a specific age group or context, indicating that well-being is assumed to have some universal characteristics. Simultaneously, there were also some attributes that were highlighted in very old age, in particular related to adaptation and successful aging. The results could be used to inform policy and social and health care development as well as future research.

RN01_T02_01 | Ageism: technology and media

Centenarians in Swedish Mass Media: Is it Reverse Ageism?

Nyman, Rosita; Joy Torgé, Cristina

Institute of Gerontology, Jönköping University, Sweden

Studies on ageism often deal with negative stereotypes due to increasing age. Seldom studied is the increase in status that seems to occur at the turning point of 100 years. This study explores how centenarians are portrayed in Swedish media texts and relates this to mechanisms of ageism and age coding.

We used Retriever database, which is the biggest Nordic database containing print media, to search for Swedish articles concerning 100- to 105-year-olds from national and local press. Our search resulted in 1468 articles, consisting of news and feature articles. Excluding articles that did not deal with persons, articles with a paywall and redundant articles resulted in 235 articles. We coded these articles in NVivo and analyzed (1) the contexts in which centenarians appeared (2) the relevance of the persons' age to the event and (3) feelings and values evoked in the articles.

On the one hand, news reports evoke how centenarians ought to be shielded from harm and emphasize the indignity of even small wrongdoings. On the other hand, feature articles often use superhuman adjectives to describe centenarians, and emphasize their "youthfulness". In birthday features, there was an expectation for centenarians to publicize their celebrations and a recurrent trope was that centenarians held well-kept secrets about ageing well.

Portrayals of centenarians show that they are an esteemed group. However, these portrayals can hide other forms of ageism, particularly compassionate ageism, and a stereotyping of centenarians that play down ill health and emphasize youthfulness at the extremes of old age.

Artificial Intelligence, Ageing and Ageism – What do we Know, What Should we Know?

Stypinska, Justyna

Free University Berlin, Germany

Artificial intelligence (AI), despite its unequivocal power to change the world for better, has also proved to have a shadow side to it, where malicious use of AI systems produce outcomes which are harmful for individuals, social groups or whole communities. The scholarly research into the issues of algorithmic fairness and AI biases gained significant momentum after several seminal works depicting racism and sexism in AI had been brough to public attention. Yet, the existing academic scrutiny of AI biases and discrimination has failed to include the category of age as one of the most pivotal socio-demographic characteristics contributing to social and economic inequalities. This paper aims to cast some light onto the way age bias and age discrimination operate within the AI systems by providing empirical examples of these practices. Secondly, the paper delivers a conceptual framework of ageism in AI arguing that it represents a new manifestation of ageism, which is distinct in its forms and implications from its more traditional forms. This paper aims to stimulate a broader sociological debate and scholarly inquiry into the role of AI systems for the construction of ageing and age inequalities.

Gendered Ageism in Corporate Media: A Critical Discourse Analysis of Working Life on Recruitment Agencies

Wenqian Xu1 , Federica Previtali2

1 Linping University; 2 Tampere University

Recruitment agencies have increasingly appropriated and used social media tools to advertise positions and choose suitable candidates with the purpose of supporting human resource development for client enterprises. Research has dedicated little attention to investigate how this type of agencies use social media to construct an image of employees or jobseekers to serve the corporate purpose. This study sheds light on the recruitment agencies LinkedIn discourses in Italy. Italy stands out as an interesting case due to its history of relatively low employment rate for women, the young, and older

85

workers among EU countries. Drawing on a critical discourse analysis of LinkedIn posts depicting working life, this study investigated how the media practices of the institutions in question serve to construct ageing and gender experience from a corporate perspective. It also draws on the intersectionality perspective of ageing and gender to understand the unique experience of gendered ageism in recruitment that hinders the employability of women and adds complexity to the challenges faced by ageing workers in the labour market. The study found that age and gender relations were expressed in visual discourses as to the employment-oriented online service. The findings show that men were persuasively assigned with authoritative positions, a wider range of activities and a diversity of work patterns, as well as integrating the good employee ideal at different life stages. Whilst women were mostly positioned in group settings, relinquishing power positions and presence as they age. This study can hopefully improve the understanding on the role of recruitment agencies in maintaining gendered ageism, as well as inform company policies about how to prevent (gendered) ageism in corporate media and communications.

Gendered Ageism in Corporate Media: A Critical Discourse Analysis of Working Life on Recruitment Agencies' LinkedIn

Xu, Wenqian [1], Previtali, Federica [2]

[1]Linköping University; [2]Tampere University

Recruitment agencies have increasingly appropriated and used social media tools to advertise positions and choose suitable candidates with the purpose of supporting human resource development for client enterprises. Research has dedicated little attention to investigate how this type of agencies use social media to construct an image of employees or jobseekers to serve the corporate purpose. This study sheds light on the recruitment agencies' LinkedIn discourses in Italy. Understanding the Practice of 'Going Out' Through Movement

Gambier-Ross, Katie [1], Clarke, Charlotte [2], Wilkinson, Heather [1], Woolnough, Penny [3]

[1]University of Edinburgh, United Kingdom; [2]Durham University, United Kingdom; [3]Abertay University, United Kingdom

Going outdoors is an important part of living well with dementia. However, concerns regarding risk and harm often lead to preventative measures such as restricting outdoor movements, which can negatively affect a person's quality of life. Little is known about how people with dementia engage in the everyday practice of 'going out', how they relocate themselves if lost and how they interact with and navigate their environment. This PhD study examined the experience of 'going out' for people with dementia and their families. Repeat walking interviews were conducted with 7 participants living with dementia over a seven-month period. This paper will share the narrative findings from these walking interviews as well as a reflection on the experience of conducting walking interviews. Walking alongside participants offered an opportunity to communicate their experiences via the embodied act of moving in the environment. A focus on the body allowed for insights into how participants interacted with their locality and how they used strategies and landmarks to locate themselves. These findings can inform policy and practice that supports people with dementia to live safely and independently in their communities.

Home Alone – On The Dark Side Of Ageing in Place

Vasara, Paula Helena

University of Jyväskylä, Finland

Policy of ageing in place is strongly supported in Finnish society. Continuing independent living in long-term homes is portrayed as ideal for ageing well. Adequate public services, provided for all in need, in accordance with the idea of universalism, are mentioned as means to ensure good quality of life and independent living, even with physical impairments. These premises rely on the idea that the relationship between individuals and places stays the same, and that necessary services can be acquired. In practice, the relationship between home and its inhabitant alters in time, and necessary care and support may be difficult to acquire. Thus, homes may become unsuitable and unable to fulfil the requirements necessary for well-being.

The purpose of this study is to challenge the assumptions underlying this idea of ageing in place, and particularly the emphasis on regular homes as the ideal and preferred places to age. Narrative analysis is employed in order to explore the relationships between ageing individuals and place. The data comprises 12 semi-structured interviews of older adults, all customers of an outreach programme intended to enable encounters with those in the margins. Preliminary results demonstrate the complex nature of the relationship between places and individuals. They indicate the intricate ways physical surroundings, care services and social networks and support interplay in the patchwork contributing to experiences of ageing well. These findings suggest that the places and various ways of good ageing, and the one-sided policy emphasis, should be reconsidered in the future.

Ageing on the Street: Trajectories of Older Homeless People in Relation to Social and Health Care Institutions

Menšíková, Tereza

Masaryk University, Czech Republic

The increasing number of older homeless people in developed countries worldwide is a prevalent issue linked to demographic and socio-political changes. In this paper, I introduce the findings of a case study describing and analysing trajectories of interactions among older homeless people and social and health care institutions in the city of Brno in the Czech Republic. Through institutional ethnography and semi-structured interviews conducted in 2019–2020 with social and health care workers, the study shows stigmatisation and marginalisation of older homeless people in institutional discourse and practices based on the age, gender, and living environment. The study examines the network of services for homeless people, possible gaps and barriers of service-client relations, impacting factors, and formal and informal strategies of overcoming these barriers in practice. I present several institutional issues concerning service-client relations and their impact on older homeless people's living conditions in the Czech Republic. Firstly, I argue that problematic categorisation of clients in institutions according to their socio-cultural environment or age leads to further marginalisation in access to care and housing. Furthermore, the categorisation methods in institutions form and propagate the stereotypical image of "classical homeless person" as an overall representation of the older homeless population. This paper points out how these conditions, along with insufficient social and health care services, pull older homeless people's trajectories into loops of exclusion, letting them circle from one social housing service to another.

87

If The Mountain Won't Come to Muhammad then Muhammad Must go to the Mountain. "Hooking" the Elderly To Support Their Ageing In Place

Costa, Giuliana

Politecnico di Milano, Italy

"Ageing in place" has become a paradigm of action in dealing with older people needs. This approach inspired many and different social care policies, programs, and projects around Europe. Homes became the place where to provide services to fragile elderly people, instead of moving them to other care settings to tackle their needs. Literature shows that this shift is keen with peoples' desires and aspirations as most of us want to stay at home till the end of our lives. Most innovation in this field is related to the reorganization or the integration of existing home-based services. Less has been done to reach people that don't ask for help even if they are fragile, living in solitude or lacking informal network, people which needs remain latent and are not transformed into demands. There is evidence that these "invisible" groups are growing, especially in contexts that rely extensively on the presence of family members to signal needs and to enact the delivery of help and supports. For this reason, it is of paramount importance that local welfare systems engage in "sewing the territory" and "hooking" their potential users, intercepting their needs to support better ageing in place processes. The paper discusses some key issues related to the hooking welfare approach for older people and discusses how it has been implemented in different projects, programs, and policies mainly in Italy in the last five years through the analysis of case studies.

RN01_T02_03 |Work and employment

Combing Employment with Informal Care for the Aged: Raising Awareness in an Aging Society

Geisen, Thomas[1], Krajic, Karl [2], Mairhuber, Ingrid [3], Nideröst, Sibylle [1]

[1]University of Applied Sciences and Arts Northwestern Switzerland, Switzerland; [2]University of Vienna, Austria; [3]Working Life Research Centre, Vienna, Austria

Demographic developments increasing demand for informal care on the one hand, women's increasing participation in the labour market and pressures to postpone retirement age in general, mean that knowledge about combining employment and informal care for the aged is growing in importance. Research shows that this involves more than financial considerations. The main challenges seem to lie in the interplay between company, individual and family practices, conditioned by a complex nexus of workplaces as organizations, welfare state and household elements. In a Swiss-Austrian research project, we examine which formal and informal practices develop on the company level to handle the interplay between employment and caring for the aged. As a first module a systematic literature review (SLR) is carried out corresponding to the MOOSE guidelines (Petticrew/Robert). Research indicates that combining employment and informal caregiving often involves extreme burdens and self-restrictions and its feasibility depends on supportive private or professional care networks. Mental and physical health significantly worsens for double-duty caregivers. But remaining in employment is also described as enrichment, offering compensations for the demands of informal caregiving - if supported by organizational structures and cultures at the workplace, welfare state provisions and informal support networks. There has been scarcely any research examining the interplay between employment and caring for the aged on the company level. The findings of the SLR will present the state of the art on this topic.

88

Researching the Multidimensionality of the Age Construct Within Work Organisations Through the Quality of Ageing at Work Model

Marcaletti, Francesco[1], Iñiguez Berrozpe, Tatiana [1], Garavaglia, Emma [2], Elboj Saso, Carmen [1]

[1]Universidad de Zaragoza, Spain; [2]Università Cattolica del Sacro Cuore, Italy

The number of studies on ageing within work organisations has rapidly increased (Boehm, Schröder, & Kunze, 2013). Nonetheless, recent insights on theory and methodological improvements have highlighted the need to conceptualise age and the ageing process as more complex constructs than it appears in the majority of studies carried out in the past and recently (Baars, 2010; Nilsson, 2016). According to literature, eight methodological recommendations for achieving improvements in research on work and ageing have been proposed (Bohlmann, Rudolph, & Zacher, 2018). Following these authors, the aim of the study is to confirm the relevance of these conceptualisations and methodological recommendations, using the approach proposed by the Quality of Aging at Work (QAW) model as a case study. The approach has been developed as an action research methodology that consist of different quantitative and qualitative tools aiming at supporting work organisations in designing and developing their own age management policies and strategies. Within its framework, the QAW model assumes the multidimensionality of the age construct in association with the passing of time effect, and after being applied in action research projects within more than 30 organisations, demonstrated to positively incorporate at least seven out of eight methodological recommendations, that is: incorporate in the analysis age-related individual and contextual characteristics as mediators; examine differences between younger and older workers; develop longitudinal research; sample workers belonging to every age group; operationalize age as a continuous variable; examine curvilinear effects with age as continuous variable; control for time-related constructs, such as job tenure.

The Challenge Of Remote Working For Older Workers: Reflections From An Italian Local Experience

Barabaschi, Barbara; Cantoni, Franca; Virtuani, Roberta

Università Cattolica del Sacro Cuore, Italy

The multidisciplinary research (both sociological and organizational perspectives are adopted) investigates the ways in which remote working has been adopted and experienced by workers of different ages in companies, focusing attention on the over 50s. The objective is to verify whether this method can offer an opportunity to overcome some critical issues that are traditionally attributed to the seniors compared to the younger relating, for example, to less flexibility, limited availability to geographic mobility and to training, finally to use of technologies. This issue, still not very present in both sociological and organizational literature, is studied in the context of small and medium-sized enterprises in the Piacenza area, one of the hardest hit by the Covid-19, since the pandemic has accelerated the adoption of remote working. The data come from two surveys conducted one at the end of the first phase of the pandemic and one at the end of the second (still ongoing), which made use of qualitative-quantitative methodologies, based on the administration of a questionnaire and in-depth interviews addressed both to employees and to managers of companies in different economic sectors. A total of about 350 subjects is estimated to be involved.

The final remarks attempt to identify the most relevant elements in the creation of smart and sustainable work contexts for senior workers, useful for minimizing the negative aspects of remote working already classified in the literature (isolation, stress, less coordination and motivation) and to emphasize the positive ones (work-life balance, higher productivity and perceived quality of work).

89

Understanding Bridge Employment Practices Across Different Industries. Evidence from a Danish Company Survey.

Yogachandiran Qvist, Jeevitha & Jensen, Per H

Aalborg University, Denmark

Bridge employment comprises different practices aiming at transitioning the period from long-term employment to full retirement and is considered one of the most common senior policies to cope with ageing populations. Bridge employment appears in different ways such as time bridging, task bridging, career development, or health optimizing practices. However, bridge employment is likely to be unevenly distributed across the economy and different industries, because the opportunity to construct bridge employment is preconditioned by a range of factors, including differences in the workforce and company features as well as differences in labour market conditions. However, these factors conditioning the opportunity to construct bridge employment has received little attention in the previous literature. Thus, this paper aims to examine the differences in bridge employment practices across different industries, i.e. the production sector, the service sector, and the knowledge-based sector, and to explain these industry differences in bridge employment practices. The study utilizes data from a survey conducted among Danish companies in 2018, which is linked to administrative register data to conduct KHB-corrected logistic regression models. The results suggest that health optimizing practices and career development practices are most prevalent in the knowledge-based sector, whereas task bridging practices are most prevalent in the production sector and time bridging practices most prevalent in the service sector. These industry differences in bridge employment practices are in most cases explained by differences in workforce characteristics and to some extent also explained by differences in company characteristics and economic and labor market conditions.

RN01_T03_01 | Interaction and relationships

Sustaining Relational Subjectivity: The Experience of Dementia for Women with the Condition

Tolhurst, Edward

Staffordshire University, United Kingdom

This paper provides insights into the experience of dementia from the perspective of women with the condition, addressing the negotiation of spousal relationships in particular. Literature has highlighted the requirement to address how gender shapes health-related experience. Despite this recognition, research usually addresses dementia in gender-neutral terms. This could be particularly counterproductive for women with the condition, who face a 'triple jeopardy' of stigma in relation to gender, age and neurodegeneration. Qualitative research included semi-structured interviews with 10 mixed-sex spousal couples, where the woman with dementia and male partner were interviewed together. From these dyadic interviews, this paper focuses on the accounts provided by the women with dementia. A process of thematic analysis was undertaken to establish key content of the women's accounts, recognising key commonalities (and divergence) across the interviews. Data are conveyed via three principal themes: psychological and political resistance to the condition; working together/working alone; and maintaining connections to social settings. These themes examine the challenges women face in sustaining relational subjectivity via the spousal relationship and wider social associations, while negotiating the direct impacts of dementia. It is vital that the influence of gender upon women dementia is granted ongoing scrutiny. Social scientists must devise a more nuanced model of relationality that accounts for how gender shapes personal responses to the condition and the negotiation of relationships. Policy-makers must also recognise how (socially-oriented) services should be configured to account for the gendered experience of women.

An Interactional Perspective on Needs Assessment Meetings with Older Couples in Times of Covid-19

Nilsson, Elin; Olaison, Anna

Centre for social work (CESAR), Department of Sociology, Uppsala University, Sweden

Covid-19 has affected elder care and the services provided for older people to a great extent. In the needs assessment process, care managers are facing an indefinite closure or limitation of support and services to offer older people. Also, as older people in Sweden are encouraged to isolate themselves, assessment meetings are held via telephone. The purpose of this project is to explore communicative approaches for conducting care assessment meetings with older couples during Covid-19. Twenty audio-recorded care assessment meetings between care managers and older couples, collected in Sweden during the Covid-19 pandemic were analyzed at micro-level by means of conversation analysis. Talk which regard "corona" or "Covid-19" were chosen for analysis. Three different approaches surfaced during initial analysis; (1)"business on hold", (2)"exploring new options" and (3)"joint speculation". In the first approach, the meetings unfold as if all regular services were still possible to offer, only to be utilized once Covid-19 has passed. In the second and third approach, care managers use their discretion embedded in their professional role to find solutions outside the regular system. In the third approach, care managers also take a more symmetric position in relation to the couples, when jointly speculating on potential support and services. The findings add new knowledge as they suggest allowing and encouraging care managers to use their relational competence more in meetings with older people, as well as initiates technical education. At practice level, the findings suggest further support of innovative approaches for making remote assessments. As such, the presentation will contribute to the debate on managing the challenges embedded in this new digital landscape surrounding elder care in times of Covid-19.

Later Life Partnerships and Quality of Life: The Role of Non-Marital and Nonresident Relationships in Sweden

Sacco, Lawrence B.[1], Königm Stefanie[2]; Högnäsm, Robin[1]; Martin, Hydem[3], Westerlund, Hugo [1], Platts, Loretta G.[1]

[1]Stockholm University; [2]University of Gothenburg; [3]Swansea University

Older adults are shaping new forms of intimacy in which the primacy of marriage is giving way to other relationship forms such as nonresident partnerships. Integrating theoretical insights from the marital resource model and the continuum of commitment, we examined how partnership status relates to quality of life with the objectives of assessing: 1) whether relationship forms other than marriage mitigate the risk of lower quality of life among older adults who are neither married nor cohabiting (i.e., never married, divorced and widowed) and 2) how quality of life gains from living-apart-together (LAT) compare to gains from cohabiting relationships. Gender stratified analyses were performed using the annual HEalth, Ageing and Retirement Transitions in Sweden (HEARTS, 2015–2019) study, a prospective web/postal survey drawn from national registers of Swedish residents aged 60–66 years in 2015. Each year participants provided information about partnership, cohabitation and relationship status as well as CASP-12 quality of life. Unmarried versus married/cohabiting participants reported lower quality of life, an association that was mitigated for unmarried participants who were in romantic relationships or had nonresident arrangements. Quality of life for unmarried men in a romantic relationship resembled that of married/cohabiting men; while quality of life for unmarried women in a relationship was midway between being married/cohabiting and being single. To conclude, having any relationship mattered for men's quality of life; while relationships formalized by marriage or cohabitation with a partner, mattered more than weaker intimate attachments for women's quality of life.

91

A Scale for Measuring Embeddedness in Social Relationships in Late Adulthood

Gaižauskaitė, Inga; Mikulionienė, Sarmitė

Lithuanian Centre for Social Sciences, Lithuania

One of the acknowledged areas of general social exclusion is exclusion from social relations. Although the concept of social exclusion is well known in current academic and social policy discourses, development of its domains varies. Among conceptually and empirically underdeveloped domains is the exclusion from social relations (Cordier et al. 2017; UNECE 2016). Following the analysis of a myriad of related concepts of exclusion from social relations and their operationalization through empirical indicators, we propose a three-dimensional scale to measure older adults' level of embeddedness in social relations. Our scale includes the dimensions of social participation, sense of belonging, and civic participation. Each dimension entails a set of indicators that grasp both objective (e.g., participation in cultural activities) and subjective (e.g., assessing the quality of social relationships) manifestations of an older adult's daily involvement in social life and interactions with others. The paper presents the conceptual rationale supporting the scale and an example of its empirical application. We applied the scale via the representative survey (funded by LMTLT, agreement No 09.3.3-LMT-K-712-01-0063) of Lithuania, Latvia and Estonia residents aged 50 years and older (conducted in the three countries between October-December 2019; total sample size 2015 respondents; survey mode - face-to-face interviews). We demonstrate how the combination of three dimensions allowed us to place our respondents along the continuum of their social-embeddedness-level. Besides, we show the added value the scale brings into social exclusion in later adulthood analysis.

Patterns and Correlates of Social Exclusion in the Balkan States

Aartsen, Marja[1]; Vasile, Marian [2,4,5,6]; Tufa, Laura [3,4,5,6]; Pop, Cosmina [3,4,5,6]; Dumitrescu, Diana [2,4,5]; Radogna, Rosa Maria [4]; Precupetu, Iuliana [3,4,5,6]

[1]Oslo Metropolitan University, Norway; [2]Faculty of sociology and social work; [3]Research institute for Quality of Life; [4]University of Bucharest; [5]Research Institute of the University of Bucharest; [6]Romanian Academy

Social exclusion (SE) is traditionally defined as exclusion from work and material resources, but scholars increasingly agree that SE is a multidimensional concept including also separation from other people and mainstream society. Although exclusion from one dimension raises the odds of exclusion from another, people are not necessarily excluded from all dimensions. Identifying groups that are at risk of social exclusion is relevant for research and practice. The aim of our study is to examine factors that are associated with types of SE. By means of a Latent Class Analysis (LCA) and a subsequent multinomial regression, we categorize older people with the same type of SE into homogeneous groups and examine factors associated with each SE-type. Data are from the year 2016 of the European Quality of Life Survey. We select the Balkan states for its high proportion of socially excluded people (i.e. Bulgaria, Romania, Albania, Montenegro, Macedonia, and Serbia: N=3030). We found evidence for five types of SE; (I) Fully integrated; (II) Locally integrated, poor (III) Locally integrated not poor; (IV) Excluded on all dimensions; and (V) Socially excluded, not poor (prevalence is 57%, 12%, 19%, 3% and 9% respectively). People excluded from all dimensions are more often older, have low education, and low self-rated health. Gender is associated with type III, and trust in other people and the government is associated with type II, III and IV. Implications for theory and practice will be discussed.

92

Aging Tendencies Among Hungarian Roma Community

Cserti Csapó, Tibor

University of Pécs, Hungary

The various fields of social sciences have interesting the issue of questions and problems of aging. At the same time, in aging European societies, there are groups with very different demographic characteristics, such as Roma population. The population trends of this group, the youthful age structure, the more traditional demographic behavior appear among the emphasized topics of Hungarian sociological interest in recent decades. They are often seen in Hungarian governmental and social policy thinking as the potential human resource of the future, despite the fact that their present social status largely questionnig this. There are rich empirical materialt o examine the topic, but the representative sociological data surveys, but also the official statistics must face the difficulties and obstacles of interpretation of the sociological methodology of minorities. Nevertheless, the data show similar slow aging trends. To what extent is this related to the tendencies of the middle class forming started among the Gypsies in Hungary and described by several studies, the increase of their level of education, the dissolution of traditional communities, especially the dynamic transformation of women's roles? In addition to statistics, social science theories on population trends can help a lot in interpretation.

The theoretical models used in the comparison are the demographic transition theory, the models outlined by economics, and the sociological theory of fertility. Each model can interpret and explain the processes that have shown the slow transformation of the traditional multi-child family model within Gypsies towards a more modern, long-established demographic model in Western societies.

An Intersectional Life Course Approach to Transnational Ageing: Experiences of Turkey-born Women in Sweden

Tuncer, Merve

Örebro University, Sweden

Previous research has highlighted the risk of research reproducing stigmatised stereotypes of older migrant women. A more nuanced theoretical and analytical framework is needed to study transnational ageing and the complex ageing experiences of women in a transnational context. The aim of this paper is therefore to propose a theoretical framework to discuss the intersection of age, gender and ethnicity while avoiding stigmatised stereotypes that are based on essentialist understandings of ethnicity, sex and old age. The theoretical starting point for this discussion is inspired by Torres' (2015) call to expand our gerontological imagination.

The paper is structured around three research questions: a) How are older migrant women's multiple social positions interconnected and how do they interplay to form their experiences of transnational ageing? b) How could these interconnections and interplays between older migrant women's multiple social positions theoretically be explored? c) How could the challenges and structural barriers for older migrant women be addressed in research, while at the same time not reproducing the existing social stigma around ageing migrant women as social problems?

The paper empirically draws on semi-structured in-depth interviews with Turkey-born migrant women, between 60 to 80 years old, who have migrated to Sweden in their early to mid-adulthood. Preliminary findings suggest that there are significant nuances among participants based on the resources that are available to them which were negotiated, challenged and/or reproduced over the life course. The paper adds to an ongoing discussion on expanding our gerontological imagination in order to address heterogeneity in later life while avoiding the persistent problematisation of old age and migrancy.

93

How Generous Are Societies toward their Elderly? A European Comparative Study of Households' Replacement Rates, Well-Being and Economic Adequacy

Tur-Sinai, Aviad [1], Spivak, Avia [2]

[1]The Max Stern Yezreel Valley College, Israel; [2]Ben-Gurion University of the Negev, Israel

Replacement rates have become accepted as a useful metric for assessing the conditions of retirees and households at point of retirement. We use data from the SHARE longitudinal database to investigate income dynamics within a comparative European context. Our analysis, centering on households as opposed to the individuals on whom international data commonly focus, reduces replacement rates to their components — pension, labor income, etc — and looks at the dynamics among household members in relation to work and pension income.

Total replacement rates vary widely among the fourteen countries sampled: overall replacement rates of around the Bismarckian 70% across the entire sample, 80% in countries that have Social Democratic and Continental social-policy regimes, and 60% in countries that have East European and Middle Eastern regimes. Looking the pension and wage components, however, the latter accounts for about 30% of household income—an important fact for decision-makers to consider. Couples tend to retire together, especially if close in age, and labor income compensates amply for lower pension income. The Gini coefficients of our sample are compared before/after retirement to determine whether the social programs that underlie pensions mitigate income inequality after retirement. Post-retirement ability to move on the income ladder is another measure of equality.

Finally, we examine the well-being and quality of life of retirees and their households. We find a positive correlation between replacement rate and indicators of retirees' and their households' quality of life, e.g., satisfaction with life, ability to consume healthcare services, and ability to cover unforeseen expenses.

RN01_T03_03 | Family networks

Critical Issues in Supporting Frail Older People and Their Family Carers: Indications Emerging from a Pre-post Pandemic Survey Conducted in the Marche Region (Italy)

Gagliardi, Cristina [1], Fisher, Oliver [1,2], Piccinini, Flavia [1], Fabbietti, Paolo [1], Lamura, Giovanni [1]

[1]Centre for Socio-Economic Research on Ageing, IRCCS INRCA—National Institute of Health and Science on Ageing, Italy; [2]Department of Economics and Social Sciences, Università Politecnica delle Marche, Italy

The Marche region is one of the areas with the oldest population in Italy. This study analyses long-term care provision to community dwellings frail over 75 years old people, by comparing the situation before the outburst of the first wave of the Covid-19 pandemic and soon afterwards. In light of the far-reaching impact of the epidemic, it is crucial to understand which measures should be adopted to better support this segment of the population, which is among those most heavily affected by the crisis.

Each dyad (over 75 years old and his/her primary carer) was contacted twice, in November 2019-March 2020 and in July-August 2020. Questionnaires were administered face-to-face at baseline and by a telephone interview at follow-up.

The sample consists of 269 dyads. A worsening in physical, psychological and cognitive status of most elderly was reported. A general decrease of external help provided both by public services and migrant care workers resulted from the pandemic. However, technology was useful to keep in touch with relatives and friends and get information.

This study represents one of the few longitudinal examples of surveys carried out in the Italian context, highlighting consequences due to suspension of most hospital and home care services. The information collected is highly policy-relevant, especially with regard to the impact of the crisis on the support provided by home-based migrant care workers – an often neglected issue – and on the use of ICT-based solutions to stay in touch with relevant contact persons.

94

How Contacts with Personal Relationships are Associated with Relationships with Siblings: Findings from The Survey of Health, Ageing and Retirement in Europe (SHARE)

Wang, Jing-Yi

University of Edinburgh, United Kingdom

While previous research found that whether people have contact and support exchange with a sibling is linked to the homophily in a sibling dyad and to their relationships with their parents, little did we know the extent to which people integrate their siblings into their core discussion network. This study uses ego-centric network data, which allows us to study sibling relationships in the network context that is not bound by household and kinship. We examine two questions using the SHARE data which contains information of people who aged 50 or over: First, do people contact siblings more often when family members and friends are absent in the network? Second, does having higher contact frequencies with family members and friends crowd in or crowd out sibling relationships?

Using ordered logistic regression, our study shows two mechanisms on the network level. After controlling for individual and dyadic characteristics, compared to people whose contact frequencies with parents, children or friends are low, people who do not have these types of network members are more likely to contact their siblings more often. But people are also more likely to contact their siblings more often when contact frequencies with parents, children or friends are high. These results underscore the sibling's importance as a source of support and the crowding-in effect of highly contacted network members on sibling relationships in the middle and old age. This study helps researchers to understand the conditions under which networks increase people's contact with their siblings in the middle and old age.

Overcoming Loneliness in Old Age: What Role do Family Networks Play?

Girardin, Myriam; Ciobanu, Oana; Widmer, Eric

University of Geneva, Switzerland

We know that family matters in reducing loneliness. We learned that family matters also for increasing loneliness. What we know little, if anything, about is the ambivalence of ties within the family, the differences in family structures, and which ones are more beneficial to overcome and reduce loneliness feelings in old age. The aim of this study is to investigate the emotional and instrumental support exchanged among family network members, and conflict in family networks of older adults, and see how they are related to loneliness feelings in old age. The paper draws on the Vivre/Leben/Vivere survey which studied family life and health conditions of persons aged 65+ residing in Switzerland. Analyses focused on 994 participants who were surveyed in the first wave in 2011-12, and responded also in the second wave in 2017-18. The information was gathered by means of face-to-face interviews. Data on family networks was collected in both waves, and feelings of loneliness were measured only in the second wave using the loneliness scale developed by de Jong Gierveld. Results showed that conflict density in the family networks, measured at Wave 1, were significantly associated with loneliness measured at Wave 2. Findings revealed that more than the lack of family support (emotional or practical), conflict in family networks has a lasting and detrimental effect on loneliness in old age. This study stresses that it is important to assess positive and negative relationships within family networks of older adults for a better understanding of loneliness in old age.

RN01_T04_01 | Ageism and discrimination

Ageism as Social Order

Alftberg, Åsa

Malmö University, Sweden

The concept of ageism has long been discussed, defined as a systematic process of prejudice and discrimination based on age. Older people are considered deviant and different from younger people and to some extent less human than other age groups. This paper aims to theoretically explore ageism as social order by drawing upon Mary Douglas' classic work Purity and Danger (1966). Douglas' thesis is that every society have a cultural intolerance against anomaly and invent strategies to handle that which lies outside the normative ordering system. Anomalies are matter out of place and by-products of a systematic ordering and classification, since ordering involves rejecting inappropriate elements. The ageing body as well as the disabled body are treated as matter out of place, to use the vocabulary of Douglas, which also reveals the close connection between ageism and ableism. This paper will discuss the ordering strategies of ageism and its impact on individuals and societies. Further knowledge and new perspectives make it possible to undermine the oppressive structure of ageism and mould a more positive future.

Is Age Discrimination A Risk Factor For Frailty Among Older Adults? A Longitudinal Analysis Of The English Longitudinal Study Of Ageing.

Quadri Aminu, Abodunrin; Torrance, Nicola; Grant, Aileen & Kydd, Angela

Robert Gordon University, United Kingdom

Frailty has been linked to adverse health outcomes such as mortality, fall and hospitalisation in the older population. With the increasing global burden of frailty on healthcare resources, it is important to understand the modifiable risk factors of frailty. In this study, we have examined age discrimination as a potential risk factor for frailty among individuals aged 65 years and over.

This longitudinal cohort study was conducted using data from Waves 5 to 9 of the English Longitudinal Study of Ageing (ELSA). ELSA is a nationally representative sample of men and women aged 50 years and over. This study includes frailty outcome at baseline, eight-years follow-up (future-frailty), and for the non-frail sample at baseline (incident-frailty). Frailty scores (0 to 1) were calculated using the multidimensional Frailty Index and individuals with ≥ 0.2 were considered frail. The binomial generalised linear models (GLM) were fitted in R studio using age discrimination as the main predictor and age, gender, chronic illness, cognition, socioeconomic status (SES) as covariates.

2,385 responses were analysed and 55% (n=1312) of the respondents were female. Approximately 38% of the respondents reported age discrimination. Age discrimination significantly predicted baseline-frailty (OR 1.43[1.28-1.59]), future-frailty (OR 1.33[1.20-1.46]), and incident-frailty (OR 1.14[1.00-1.30]) at 95% CI and $P < 0.05$. All the covariate were significant predictors of the frailty outcomes with risk of frailty higher among women, those with chronic illness, those with poor cognition and those with low SES.

Future studies should examine if interventions to reduce age discrimination can impact frailty outcome among older adults in England.

Pandemic Effects on People Ageing with Functional Diversity: Narratives of a Double Discrimination

E-Hall, Karen A.; Deusdad, Blanca; D'Hers Del Pozo, Manuel; Martinez, Angel

Rovira i Virgili University, Spain

Research question: What were the major consequences people with functional diversity endure from the Pandemic?

Theoretical Framework: Focused on the intersectionality of disability and ageing and the common experiences associated with them within the health and welfare sectors. Some examples were human rights contraventions, and obvious discriminations. In the context of COVID-19, these have intensified leading to practices that could be interpreted as the endurance of double-inequity.

Objective: The aim of this paper is to highlight the consequences of the pandemic through a qualitative analysis of comments by disabled people in response to the by VICE.com video-clip.

96

Methodology: A net-ethnographic study of narratives from persons with disabilities as they experienced isolation from the quarantine policies and the resultant effects on their lives. A sample of approximately 100 comments were analysed.

Preliminary findings: The results showed that the effect on the lives of these persons were often detrimental due to the worsening of mobility and communication structures created by the implementation of quarantine policies. Thus, increasing their experiences of discrimination and situations of neglect. Interestingly, this has occurred in countries with active social policies protecting the rights of people with disabilities.

Contribution to Knowledge: Legal regulations regarding Covid-19 and people with disabilities have not been sufficiently ratified in most countries. The pandemic has exposed the inadequacies in the existing care systems within Western countries with advanced social protection policies. That the voices of the disabled are still unheard, and many with functional diversity told their stories on social media, and finally, that human and disability rights movement lost their momentum in the visage of pandemic policies restrictions.

Older Intersex People: Hidden from (Sociological) Gaze

Whittney Berry, Adeline & Monro, Surya

University of Huddersfield, United Kingdom

People with variations of sex characteristics number approximately 1% of the population, yet their issues remain largely hidden and there is a dearth of legal and policy provision to support them. This issue is particularly stark with regards to older intersex people. This paper utilises a critical intersex theoretical approach to interrogate ways older intersex people are hidden and their needs overlooked. Critical intersex theory provides insight into the elision of sex variance, via surgery and social erasure, using poststructuralist, queer and feminist theory.

The paper asks the following research questions: How and why are older intersex people socially erased? What are the key issues they experience? How could a sociology of aging and intersex be developed? It approaches these questions via a comprehensive review of existing research and policy documents, undertaken as part of the large European Commission funded project INIA. The UN special rapporteur has acknowledged non-consensual medical interventions as a form of torture. Literature indicates that many older intersex people have experienced negative outcomes from medical treatment. Research shows that health needs for older intersex

people go unmet due to a lack of specialised treatment and avoidance due to fear of discrimination. The paper concludes there is a need for sociologists to research intersex, and challenge negative medical practices and the erasure of older intersex people.

Keywords: Aging, intersex, medical abuse

RN01_T04_02 | Leisure

Leisure Adjustments During the Early Stages of the Pandemic: Qualitative Inquiry on the Writings of Finnish Older Adults Over 70 Years of Age

Koskinen, Veera Katariina

University of Helsinki, Finland

The prevalent discourse of active aging emphasizes the importance of active leisure participation in older adulthood. This relates to the view that leisure activities enable older adults to stay physically, mentally, and socially active, and thereby contribute to maintaining wellbeing as people grow older. In 2020, leisure activity engagement was significantly hampered by the outbreak of the global COVID-19 pandemic. In Finland, a recommendation was implemented for persons over 70 years of age to avoid meeting others in person, which had a wide range of impacts on the daily lives and leisure participation of many older adults. Against this backdrop, the present study explores the leisure patterns and leisure-related adaptation strategies among Finnish older adults during the early stages of the global pandemic. The data comprises the written accounts (N= 77) of older adults that were collected via an open invitation in April to June of 2020. Preliminary analysis of the collected data indicates that the recommendation for self-isolation challenged some respondents' perception of themselves as "active agers", resulting in variety of compensating behaviors that kept the person mentally and physically busy. These included, for example, increased attention to self-care and the adoption of new or previously less significant leisure activities. Drawing on activity theory and collected empirical data, the study discusses the changes in older adults' leisure activities and contributes to the timeless debate on how individuals adapt to and seek meaning in the midst of sudden change and uncertainty.

97

Senior Leisure Tourism: Does it Empower or Exclude Older People?

Stončikaitė, Ieva

University of Lleida, Spain

An increasing growth of older people has caused significant socioeconomic transformations for almost all sectors of society, including the tourism industry. In the last decades, seniors have become an important target group for the leisure tourism market on a global scale. It is estimated that older individuals will be responsible for a relatively large share of all holiday spending, and that senior-oriented tourism will become the fastest and biggest potential driving force in the hospitality markets. Yet, the senior leisure tourism is still a marginal branch in aging and tourism studies. This paper aims to fill this gap by highlighting the complex relationship between recreational later-life mobility and successful aging. It questions whether the senior tourism market liberates and empowers older adults, or, in its stead, further perpetuates age-related inequalities and reinforces consumerist pressures and the ideas of happy old age. These aspects will become even more significant because of the Covid-19 pandemic and its devastating affects on the tourism industry and social relationships. The senior leisure tourism will have to adapt to new policy measures and the key requirements to offer safer and better options to satisfy the increasing demand for novel and hedonistic experiences in later life.

Older Adults' Experiences of Being on a Senior Summer Camp

Wallroth, Veronika[1]; Larsson, Kjerstin[2], Schröder, Agneta [2]

[1]Linköping University, Sweden; [2]University Health Care Research Center, Örebro University, Sweden

Action is being taken across Europe to address social isolation and loneliness among older adults. More and more municipalities in Sweden are now arranging, senior summer camps to create a place where older adults can meet and break their social isolation. Building on a larger project evaluating a senior summer camp for older adults in the summer of 2017 this presentation focusses on how the older adults experienced their stay at a senior summer camp. A qualitative method with a phenomenographic approach was chosen to explore the qualitative variations in the older adult's experience of staying at a senior summer camp. Three descriptive categories evolved relating to how the participant experienced the senior summer camp. The descriptive categories were "A pleasant environment to be in", "Something to do for all" and "Brake once loneliness". Findings from this study implies that just getting away, not having to cook, seeing, and experiencing something else and having company when eating food or doing activities meant a lot to the participants who experience loneliness in different ways. Knowing that other nice persons where lonely made the participants at the senior summer camp realize that loneliness was not due to themselves.

Practicing Intimacy in Grey Dancing: Ageing, Age Norms and Couple Dance in Sweden

Heikkinen, Satu & Henriksson, Andreas

Karlstad University, Sweden

Couple dancing is an activity involving intimacy. However, there is little research in social science about how intimacy is practiced on the dance floor and especially how different kinds of intimate relationships are formed among older dancing persons. This article investigates how intimacy is enacted among older Swedish people couple dancing. Drawing on observations from 14 different sites for dancing and 44 interviews with older individuals, we discuss the phenomenon of "dance friends" and bonds that only exist on the dance floor, as well as the boundaries between intimacy and sexuality. The article also analyses how relationships are formed outside of and in relation to the dance floor, a boundary which need to be negotiated among the dancing persons. Various forms of intimacy are formed, pointing to a richness of intimate relationships in old age. The article contributes to recent research about how intimacy in older age has changed in late modernity, challenging notions of old age as presumably involving the loss of intimate relationships and as a period of loneliness.

98

RN01_T04_03 | Caring and care practices

Person-centred Care With Older People In The Era Of COVID-19

Lombard, Daniel

University of Bristol, United Kingdom

The aim of this PhD study is to explore interpretations of person-centredness, and the relationship between policy and practice in long-term care for older people. It takes account of the highly contextualised and pluralist nature of person-centredness and its application to practice, the organisational factors which support its delivery, and the plethora of models surrounding the concept.

At the heart of person-centred care lies a truism steeped in common sense: that most people requiring assistance with activities of daily living would wish to be supported in a way that is tailored to individual needs and preferences. This reductive description belies areas of complexity and contention surrounding theories of person-centredness. Complex because it requires a number of prerequisites, including interpersonal skills and self-knowledge among care professionals, and a supportive work environment (McCormack and McCance 2006). Contentious because of a lack of consensus about the meaning and parameters of the concept itself (Edvardsson et al 2008).

Given the central role played by care workers and managers in delivering person-centred care, the study offers findings of qualitative interviews with these actors working in residential and domiciliary care in England. The findings will explore the realities of delivering person-centred care with older people in the context of COVID-19, alongside narratives of extraordinary dedication and utilisation of problem-solving nous to protect and enable clients in the participants' care. This adds to a growing body of governance research and the way person-centred values are interpreted and put into practice with people requiring support under challenging circumstances.

The Expert Caregiver Program Targeting Former Caregivers In Finland: An Exploratory Mixed Method Feasibility Study

Åkerman, Sarah [1], Nyqvist, Fredrica [1], Coll-Planas, Laura [2], Wentjärvi, Annika [3]

[1]Åbo Akademi University, Finland; [2]Universitat Autònoma de Barcelona, Spain; [3]Novia University of Applied Sciences, Finland

A lot of informal care to frail older adults is provided by older adults themselves, especially by spouses. While the situation of caregivers is increasingly highlighted in policies and research, former caregivers have received less attention. The regional "Expert Caregiver program" in Ostrobothnia, Finland was developed to engage former caregivers by co-designing a training and volunteering program for them based on local current caregivers' needs.

The aim of this study was to report the co-designing and implementation phase of the Expert Caregiver-program and to assess the effects on the participants' well-being. This was an exploratory mixed methods study. To assess the effects on the participants' well-being, their Sense of coherence and Subjective Well-being were assessed at three occasions by using questionnaires. Qualitative data from focus group interviews was also collected.

The co-designing phase resulted in a 30-hour training program, where 25 former caregivers participated, mostly bereaved older spouses. Almost all Expert Caregivers engaged in voluntary activities after the program, especially by offering virtual peer support during the Covid-19 pandemic. The quantitative analysis showed a minor but non-significant positive change in the participants' well-being. The qualitative data revealed several positive effects of the program such as feeling competent and supported, and a sense of belonging with the other participants.

The findings suggest that former caregivers should be increasingly acknowledged, as they may not only act as a resource for current caregivers, but also benefit from such activities themselves.

99

Health Care Practices for the Elderly at «Risk Group» in the Context of the Covid-19 Pandemic in Russia

Orekh, Ekaterina & Bogomiagkova, Elena

St. Petersburg University, Russian Federation

According to the concept of active aging, the integration of the elderly into the labor and consumption markets serves as a means of overcoming their social exclusion. Today is voiced the point of view that the Covid-19 pandemic showed problems with this concept, isolating people 65+ as a "risk group". However, the negative consequences of the severe restrictions on movement and work introduced in Russia in March 2020 for the "65+ risk group", which contributed to its social isolation, are unexpectedly offset by another consequence of the pandemic. This is about the forced introduction and use of information and communication technologies by older people. It is because of the pandemic that working retirees were forced to master online communication methods, use digital technologies and form new habits, in particular, in the field of health care.

Our report is devoted to the study of people in the "65+ risk group" living in St. Petersburg, Russia. We were interested in whether representatives of this age group can be considered as a resource base for the dissemination of modern medical information and computer technologies, and also whether their health care practices have changed under the influence of the Covid-19 pandemic. At the first stage of the study (11.2020 - 02.2021), a series of semi-structured interviews were conducted on the topic of health perceptions and health care practices used among citizens of different age groups (90 interviews). The analysis of the interviews showed that the pandemic did influence the intensity of learning new practices among some members of the 65+ group. Digital technologies are used to monitor the characteristics of well-being, obtain expert advice and self-education.

RN01_T05_01 | Technology

Smart and Social Home Care: A Sustainable Solution at the Crossroads of Technology and Public Health and Social Sciences

Anciaux, Amélie & Lits, Grégoire

UCLouvain, Belgium

The intensification of ageing of the Belgian population will be a major challenge in the coming years. The current system, where elderly people live in elderly care homes will not be sustainable in this growing context because of the lack of infrastructure and personnel, but also because it is too expensive to maintain it at such large scale. For this reason, the nature of the aid provided to elderly people needs a radically change, with a major shift towards home care (assisted living) as compared to care homes. This trend also responds to the wishes of a majority of people in Belgium which want to grow old at home, connected with their community. This paper presents the first results of an interdisciplinary (sociology/engineering) research project aiming at developing an integrated and secure home care technological solution centred around the elderly and her/his social care network. The solution combines smart home (IoT) solutions together with communication technologies, enabling the cooperation and communication between the care network (family, professional, neighbours…) and the elderly. We will present the analysis of the first qualitative phase of the project aiming at understanding the discrepancies between elderlies' perceptions of intelligent and social homecare solutions, and perceptions of other members of their care network. This analysis will contribute to the field of critical data studies and ageing sociology by interrogating the perception of digitalisation of care, and its risk of dehumanisation (Lits et al. 2017; Bourguignon et al. 2016), through an original methodology based on crossed interviews from social care network.

Old-age Diversity Is Underrepresented in Research on Digital Health Technologies

Poli, Arianna[1], Kelfve, Susanne[2], Motel-Klingebiel, Andreas[1]

[1]Division Ageing and Social Change (ASC), Linköping University, Sweden; [2]Division Social Work, Linköping University, Sweden & Aging Research Center, Karolinska Institutet and Stockholm University, Sweden

Much research is conducted for evaluating digital-based solutions for healthcare. However, little is known about the extent to which such evaluations succeed in representing old-age diversity. We present an analysis of participation in two evaluations of digital-based interventions: (a) an exergaming programme for improving physical activity among individuals with heart failure, (b) a mobile-based system for monitoring individuals' progress after day surgery. Participation is conceptualised as resulting from three processes of selection of individuals: pre-screening (i.e. individuals are or are not screened for participation), recruitment (i.e. individuals are in- or excluded due to study criteria), self-selection (i.e. individuals decide to participate or not). Based on field information and survey data, we modelled (1) the (non-)participation and (2) the individual decision to participate (or not) in the two evaluations. Main findings indicate that increasing age enhances the likelihood of not being screened, not recruited or to decline the invitation to participate. Those not recruited were most often ineligible because of technology-related barriers, time constraints, health limitations. Decliners and those who decided to participate differ by age, gender, job, health status, digital skills. Results suggest that very specific groups of older people are more likely to be involved in evaluations of digital-based interventions. Old-age diversity is not properly reflected in digital health research. This has implications for the inclusiveness of new digital health technologies and their ability to address the needs of various groups of older people, as well as for increased risks of old-age exclusion and exacerbation of inequality

The Impact Of Digital Divide On The Elderly During The Period Of Coronavirus Restrictions In Russia

Chulkov, Sergei

The Herzen State Pedagogical University of Russia, Russian Federation

The coronavirus restrictions have fundamentally changed the world, turning it at least for a while into a digital one. In Russia, almost half of the people over the age of 55 have no Internet access, and they are more at risk of getting seriously sick.

The study was carried out on the basis of analyzing 62 in-depth interviews conducted from May to June 2020 among people over 55 throughout Russia. We asked how the Internet affected their lives during the period of restrictions.

The digital divide radically influenced the way older people were impacted by the restrictions. The more a person was involved in the Internet, the easier it was to endure the restrictions. Those who adapted to technology well saw the advantages of the Internet and began communicating online even more. For older people who had not used the Internet before the restrictions, this life threatening situation did not become a reason to go online, which shows the strength of the barriers preventing people from joining ICT.

An important factor influencing the perception of restrictions is the digitalization of the space around. If the penetration of ICT is not so deep, and people continue communicating more offline, usually the restrictions are not so strict and, as a result, transition to the digital space is not noticeable. Consequently, there is not such a strong rejection among the elderly. The higher the level of digitalization, the greater the discomfort experienced by the elderly who are not included in the digital space.

Self-tracking Technologies, Health, Older Adults: An Ethnographic Study In Rural Italy

Carlo, Simone & Bonifacio, Francesco

Università Cattolica del Sacro Cuore, Italy

As part of a wider research on the use of eHealth technologies, in this contribution we discuss how everyday practices of older people living in a remote area are remediated (Lanzara 2010) by the adoption of self-tracking digital services. Results draw on a one-month ethnographic study in a mountain village in the centre of Italy, based on twenty biographical interviews with over-65 people. Two macro-types of digital apps and services were distinguished. On the one hand, self-tracking technologies related to wellbeing and fitness; on the other hand, self-tracking clinical tools, which are strictly related to medical parameters. Consistently with the existing literature on the use of health-related digital services (Maturo e Setiffi 2016), our observations remark the blurred boundary between health and playful concerns, fostered by data-driven gamified affordances (such disclosing calories consumption, heartbeats, etc). Self-tracking services of the first type were enthusiastically adopted into practices such mountain walking, which are considered by older people from the start as playful in nature, despite being consciously charged with health-related concerns or not. Conversely, when it comes to the monitoring of chronic diseases (such blood pressure measuring and glycemia), self-tracking digital devices do not only appear less playful themselves but somehow useless, interplaying with older adults' embodied knowledge and experience of their own diseases. These results warn against generalized optimistic conclusions about the efficacy of gamified apps (Martinho et al. 2020), rather suggesting a situated understanding based on their context of adoption.

Housin Costs Of Older Households: How Do Transitions Into Retirement Affect The Housing Cost Burden?

Lozano Alcántara, Alberto; Romeu Gordo, Laura; Engstler, Heribert & Vogel, Claudia

German Centre of Gerontology, Germany

The housing cost burden, that is, the percentage of income spent on housing, may change over the life course. This depends on the evolution of both income and housing costs. The transition into retirement is a biographical event that usually leads to a decrease in household income and may thus increase the housing cost burden if the housing costs cannot be reduced, as it is mostly the case. We therefore examine how the housing cost burden evolves over the second half of life; how the transition into retirement impacts on the housing cost burden, and how this differs for different groups.

For answering our research questions, we use household data from the German Socio-Economic Panel (SOEP) from the years 1993 to 2018. In the analysis, we focus on private households with a reference person aged 55 years and above. First, we estimate fixed-effects and random-effects growth curves of the housing cost burden from the age 55 to 75. Second, we investigate the impact of the transition into retirement of the reference person into the housing cost burden. Third, we repeat both analyses for different social groups such as homeowners and tenants.

Our preliminary results show that the housing cost burden increases over the second half of life among the tenants while it stays stable among the homeowners. Similarly, the transition into retirement only increases the tenants' housing cost burden. Our results imply that the inequality in living standards between the homeowners and the tenants in Germany increases over age.

When do we plan to retire? First Results from Share

Hess, Moritz [1], Naegele, Laura [2], Mäcken, Jana[3], Becker, Lena [4], De Tavernier, Wouter "Wouti"[5]

[1]University of Applied Sciences, Germany; [2]University of Vechta, Germany; [3]University of Cologne, Germany; [4]University of Bremen, Germany; [5]OECD, Paris

Population ageing with its increasing number of older people has resulted in concerns that the financial future of many European welfare states and especially pension systems is in jeopardy since the late 1980s. In particular, public pay-as-you-go pensions are seen as vulnerable to population ageing. In reaction, policy makers in many European countries have implemented reforms aimed at delaying retirement and extending working lives. They have increased state pension ages, closed early retirement options and invested in the employability of older workers and as a result older workers' employment rates are increasing.

Yet, many of these reforms have a time-lagged effect, thus, todays pensioners have often not felt the full impact of the reforms. Nevertheless, previous studies have shown that older workers not only adapt to the new credo of extended working lives, but are also quite precise when estimating their retirement timing. Older workers' planned retirement age might therefore help evaluate the reforms impact and could be used as a proxy for older worker's future actual retirement behaviour.

So far however, no studies exist that investigates the planned retirement age and its potential changes in a European perspective. Based on data from Survey of Health, Ageing and Retirement in Europe (SHARE) the paper at hand aims to fill this gab in the literature and explore the planned retirement age in a cohort and a country comparison. Preliminary results show an increase of the planned retirement age. Further analyses consider country, socio-economic status, and gender differences.

Retirement and the Social Support Networks Over Time: an exploration using a Mixed Methods approach

Ortiz, Francisca

The University of Manchester, United Kingdom

In the studies of ageing, some efforts have been made to understand the different approaches adopted by older people in their life course to confront those inequalities. Notably, there have been few studies about how they used their different type of support networks to address their struggles, which are their networks in different moments of their life, and the changes across time according to meaningful personal events.

Chile is a developing country with a growing ageing population with a unique neoliberal system of pensions, which makes it an interesting case of study about retired people. In this context, this research aims to advance on those knowledge gaps. Therefore, this study is mainly looking to understand the different paths that older people in Chile had taken in their personal lives to survive over time. For this purpose, it has been considered a theoretical framework composed of the cumulative advantages/disadvantage's theory, life-course approach, age stratification and relational sociology. It is proposed in this research that they can be united for future research.

To address this research, we use a longitudinal and mixed methods network approach. The data used include the history of the life of retired people, interviews to experts, press, photographs, data surveys and the construction of at least three support ego-networks in retrospectives of each person interviewed. Those networks were drawn in what retire people announce as their most important event over time. We collect the information from October 2019 to January 2020 in Santiago of Chile. In this presentation, we will present the first results of the social network analysis that was applied.

103

The Impact of the Retirement Process on Changes in Life Orientations

Grunwald, Olga [1,2], Damman, Marleen [2,3], Henkens, Kène [1,2,4]

[1]NIDI, The Netherlands; [2]University Medical Center Groningen, The Netherlands; [3]Radboud University Nijmegen, The Netherlands; [4]University of Amsterdam

The transition from work into retirement is a major life event, which might prompt individuals to re-consider what they value in life (i.e., their life orientations). However, quantitative empirical knowledge about this process is limited. This study aims to fill this gap by examining to what extent and how the transition from a career job into retirement changes life orientations, and how these processes may differ between socio-demographic groups. We analyze data that were collected in 2015 and 2018 among 5,189 Dutch individuals aged 60–65 and employed at baseline. Around half had fully retired at follow-up and ten percent worked after their retirement. We used principal components factor analysis to guide the construction of life orientations and arrived at five dimensions: self-development, social status, benevolence, generativity, and social connectedness. Conditional change models reveal that full retirement is associated with a lower perceived importance of all life orientations except for social connectedness, which was unrelated to retirement. Engagement in post-retirement work is related to a lower importance of self-development and social status. Our findings generally suggest that there seems to be discontinuity in life orientations during the retirement process.

RN01_T05_03 | Gender

Caring Masculinities – is There a New Man in Town?

Agren, Axel; Nilsson, Magnus & Wallroth, Veronika

Linköping University, Sweden

More couples live and grow old together due to increased life expectancy among men in many countries. Hence more men become caregivers for their partners. As a response, the concept "caring masculinities" have over the past years gained increased attention. However, there are few critical discussions about the concept. A critical discussion about the assumptions behind the concept of "caring masculinity", for example that it presupposes that men have not been involved in caregiving before, is needed. Furthermore, the conceptualization of "caring masculinities" gives the impression that men who provides care are a certain kind of man, even a new type of man, and that caring masculinities comes with younger generations of men. Moreover, the concept of caring masculinity gives the impression that men can choose to provide care, while women cannot. There is therefore no corresponding concept for women, i. e. "caring femininity", as women are assumed to be natural caregivers. As such, there is a notion that men's lesser involvement in care is because of their privileged position in society and women's involvement in care is seen as a burden for them. The aim of this study is to problematize explicit and implicit assumptions of "caring masculinities" and how older men who provide care are positioned in scientific literature.

Do We All Love The Same Old Age Pension Schemes? Gender And Class In Attitudes To Distribution Principles

Hege Kitterød, Ragni & Skevik Grødem, Anne

Institute for Social Research, Norway

When researchers ask populations in Europe to indicate what social programs they think governments should be responsible for, programs targeting the elderly always achieve a high score. Old age pensions are popular, but is there also consensus as to what sort of benefits retired workers should receive? Is it important that minimum levels are above the poverty line, and do most people prefer distribution principles of equity or equality? In this paper, we analyse results from a survey conducted in Norway in 2019 on pension attitudes. We look at patterns of support for two outcome variables (anti-poverty and equity vs. equality), paying particular attention to a potential gender gap in attitudes, which has been widely discussed among welfare researchers in recent years. We start from two dominant hypotheses regarding why general levels of support for the elderly are so high, namely the deservingness (CARIN) criteria and the life course vs. labour market related-risk perspective, and discuss the implications the two approaches may have for support for various designs, overall and in terms of gender. Our findings suggest that partners and children influence attitudes among women, while labour market factors are stronger drivers of attitudes among men. Incomes however strongly predict attitudes for both men and women for both outcome variables, suggesting that self-interest plays an important role in opinion formation about pension system design.

Partner Care Arrangements and Older Europeans' Well-being: Variations by Gender and Welfare Context

Ginevra Floridi, Ginevra [1], Quashie, Nekehia [2], Glaser, Karen [1], Brandt. Martina [2]

[1]King's College London; [2]Technische Universität Dortmund

Within ageing couples, partners often fulfil each other's care needs. Yet, partners do not always assume (full) care responsibilities, and a variety of care arrangements can be observed across Europe. Previous research has documented the negative association between caregiving and well-being, with variations by gender and care arrangement. However, no study to date has examined the interrelations between partners' care arrangements, (potential) caregivers' gender, and the social welfare context in which care is embedded. We use 2015 data from the Survey of Health, Ageing and Retirement in Europe covering 17 European countries, with information on 3,465 couples aged 50+ where at least one partner receives care. We examine how life satisfaction and depressive symptoms of (potential) caregivers vary across five care arrangements: solo-care; shared formal; shared informal; outsourced formal; and outsourced informal. We explore heterogeneity in this association by gender and across four welfare regime models (corresponding to Northern, Western, Southern and Eastern Europe). Three results emerge: first, sharing partners' care with formal providers is associated with lower well-being among women, potentially reflecting stresses arising from inefficiencies in the coordination of care networks. Second, outsourcing partners' care to formal or informal providers is linked with higher well-being among Northern and Western European women, but with lower well-being among women in Southern Europe, where traditional female caregiving roles are more normative. Third, among men, outsourcing partners' care to informal providers is associated with higher life satisfaction in all welfare contexts, possibly due to expanded social networks and relief from caregiving roles.

105

Exclusion From Social Relations and Association With Quality of Life Among Older Europeans: gender differences and the moderation effect of network satisfaction.

Pavlidis, George [1], Motel-Klingebiel, Andreas [1], Aartsen, Marja [2], Hansen, Thomas [2]

[1]Linköping University, Sweden; [2]Oslo Metropolitan University

Exclusion from social relations (ESR) in older age is characterized by shortcomings in social relations and is likely to have broad and important negative consequences for quality of life (QoL). Many studies have emphasized the importance of the social network's structure (e.g., social network size) and function for QoL in older age, yet their conjoint association with network satisfaction has been underexamined. Recent evidence suggests that older persons' wellbeing may be affected by how satisfied they are with their social network, whereas dissatisfaction when facing ESR may be stratified by gender. This cross-sectional study set out to examine the modifying role of network satisfaction in the associations of ESR and QoL among 72,433 respondents in the Survey of Health, Ageing, and Retirement in Europe (SHARE). The results indicate that, for older persons, having a social network, suboptimal network satisfaction and smaller network sizes are related to QoL. Those without social relations who are satisfied with a lack of relations are not in a disadvantaged position in terms of QoL compared to those who have a social network. Older "network-less" persons with suboptimal satisfaction levels due to a lack of relations are in the most disadvantaged position in terms of QoL. Men seem to be overrepresented among the "network-less" and at greater risk of having a low QoL. It was concluded that for both older men and older women, low QoL is more prevalent among those who have smaller or no social networks and suboptimal satisfaction levels, but not among those who are content with being "network-less".

RN01_T06_01 | Reciprocity and exclusion

Exclusion from Social Relations in Later Life in the Context of Covid-19 Pandemic.

Urbaniak, Anna

University of Vienna, Austria

While there is a lot of focus in the ageing research on social relations, there is still a potential to further advance our understanding of exclusion from social relations. This form of exclusion can encompass a range of outcomes: deficient social networks, limited social opportunities, and a lack of intimate relationships. There is also ambiguity around how age and gender combine to construct exclusion from social relations in the life course. With an ageing population, more older people living alone, and a reported increase in the levels of loneliness, it is more important than ever to better understand this form of exclusion. Especially in terms of Covid-19. Unpacking how the pandemic impacts different facets of social relations help to draw some insights into this. Therefore the aim of this contribution is to explore the lived experience of exclusion from social relations in later life in the context of the Covid-19 pandemic. Data come from the Austrian component of the GENPATH study. The sample consisted of 30 in-depth interviews with men and women aged 65 and over. Results show that Covid-19 brings attention to a diverse set of mechanisms that can impact people's relationships. It exposes existing weaknesses and inequalities.

Social Network Size, Loneliness, Physical Functioning and Depressive Symptoms Among Older Adults: Examining Reciprocal Associations in Four Waves of the Longitudinal Aging Study Amsterdam (LASA)

Domènech-Abella, Joan [1], Mundó, Jordi [2]

[1]Parc Sanitari Sant Joan de Déu, Spain; [2]Department of sociology, Universitat de Barcelona

Previous research indicates that social isolation, loneliness, physical dysfunction and depressive symptoms are interrelated factors, little is known about the potential pathways among them. The aim of the study is to analyse simultaneously reciprocal relationships that could exist between the four factors to clarify potential mediation effects.

Within a large representative sample of older people in the Longitudinal Aging Study Amsterdam (LASA), participants aged 75 and over were followed up over a period of 11 years (four waves). We tested cross-lagged and autoregressive longitudinal associations of social network size, loneliness, physical functioning and depressive symptoms using structural equation modelling (SEM).

Several statistically significant cross-lagged associations were found: decreasing physical functioning (Coef.=-0.03; p<0.05), as well as social network size (Coef.=-0.02; p<0.05), predicted higher levels of loneliness, which predicted an increase in depressive symptoms (Coef.=0.17; p<0.05) and further reduction of social network (Coef.=-0.20; p<0.05). Decreasing physical functioning also predicted an increase in depressive symptoms (Coef.=-0.08; p<0.05). All autoregressive associations were statistically significant.

Interventions focused on promoting social activities among older adults after negative life events, such as loss of social contacts or declining physical functionality, can alleviate feelings of loneliness and act as mental health protector.

Risk Factors for Loneliness Among Older People in a Nordic Regional Context – a Longitudinal Study

Nyqvist, Fredrica [1], Näsman, Marina [1], Hemberg, Jessica [2], Nygård, Mikael [1]

[1]Åbo Akademi University, Faculty of Education and Welfare Studies, Social Policy Unit, Finland; [2]Åbo Akademi University, Faculty of Education and Welfare Studies, Department of Caring Sciences and Health Sciences, Finland

Although previous research suggests that loneliness levels are lower in the Nordic countries as compared to other European countries, knowledge regarding changes in loneliness across time in this region is limited. The aim of this study was, therefore, to study prevalence of loneliness and to identify risk factors for loneliness in a Nordic regional context over a six-year period. Longitudinal data on 4269 older adults living in northern parts of Sweden and western parts of Finland aged 65, 70, 75 and 80 at baseline in 2010 from the GERDA study were analysed. Logistic regressions were used to analyse sociodemographic, social and health-related risk factors at baseline and changes in these for loneliness at follow-up. The results showed that most older adults (85%) did not suffer from loneliness in our study region. However, three percent in the sample reported loneliness in both study years indicating enduring and chronic loneliness. The analyses revealed that being widowed and becoming a widow/er as well as poor self-rated health at baseline and the onset of depression were risk factors for loneliness. Finally, the risk for loneliness was higher among older people living in Sweden. The findings may be important for policy makers and practitioners in identifying groups at risk for loneliness. Further work is needed to explore changes and stability in loneliness as well as to increase the understanding of between-country differences in loneliness.

The De-clientification of an Older Person. How Care Managers Talk About a Complex Case in Case Conferences

Olaison, Anna [1], Taghizadeh Larsson, Annika [2], Österholm, Johannes [3]

[1]Centre for Social Work (CESAR), Uppsala University, Sweden.; [2]Division of Social work , Linkoping University, Sweden; [3]Division of Occupational Therapy, Linkoping University, Sweden

There are few studies within elder care that cast light on how case conferences function as assessments. How older persons are categorized in case conferences are mainly determined by how their rights to services are processed in institutions (Gubrium et al 2016). This presentation focuses on an older person with dementia who has significant care needs whose case is discussed and assessed by participants from two teams of care managers handling cases under two different legislations (regarding services in elder care and disability services). The data consist of recordings of two case conference in one Swedish social work agency. The case conferences were analyzed using discourse analysis. Case conferences officially have an advisory stated function. The study however demonstrates that the talk in the conferences is rich in arguments about priorities and how to dismiss solutions about how to meet the older person´s needs. Further, the arguments differ depending on which legislation the care managers rely on. Assessments regarding elder care services, based on the Social Service Act, which is a framework legislation rather open for interpretations, relies more on cultural arguments. The case conference regarding disability services, which are granted under the 'Act Concerning Support and Services to Persons with Certain Functional Impairments', which is a civil rights legislations which gives clearer directives, encompasses more legal and organizational arguments. In making case conferences visible as everyday assessment practices, the findings also highlights a de-clientificating process which is directed by categorization of the older person where cultural, organizational as well as legislative arguments are at play.

Fading In, Fading Out: Profiles and Predictors of Labor Market Participation among Older Adults in Germany

Mergenthaler, Andreas & Cihlar, Volker

Federal Institute for Population Research, Germany

Changes in pension legislation and a higher propensity to work have led to prolonged labor market participation in later adulthood in Germany. Against this background, the paper examines which transitional profiles from labor market participation to retirement can be identified. In particular, the paper focuses on profiles that are characterized by a temporary return to the labor market after retirement. A longitudinal sample from three waves and two intermediate short questionnaires of the study "Transitions and Old Age Potential" (TOP) was used for the analysis (N=745) resulting in five measurement points. The results of theory-guided coding reveal five profiles of labor market transition: "Permanently full-time" (25.8%), "Permanently part-time" (13.7%), "Fading out to zero from full-time" (23.5%), "Fading out to zero from part-time" (17.2%) and "Volatile labor market participation (19.9%). To observe individual, socioeconomic and occupational differences between the profiles of labor market transitions within a push- and pull-framework, a multinomial logistic regression was conducted. The findings show that push factors (e. g. low education, health-related functional limitations, mental or physical strain at work) have a greater explanatory power than pull-factors (e. g. financial situation, employment status of the partner, financial support of children or grandchildren). The results reveal that women, older people and employees with a lower socio-economic status are more likely to be in the volatile group compared to those who are permanently working full-time. Therefore, the volatile group not only reflects new forms of employment in later adulthood, but is also relevant in terms of social policy.

Violence Against Older People in Nursing Homes: Subject's Narratives and Representations

Lemos, Rute [1], Dias, Isabel [1], Lopes, Alexandra [2], Henriques, Ana [3], Fraga, Sílvia [3]

[1]Institut of Sociology - University of Porto, Portugal;
[2]Department of Sociology - University of Porto, Portugal;
[3]Institut of Public Health of University of Porto

This paper discusses the preliminary results of the ongoing Ph.D. work entitled "The subjective construction of abuse of elder abuse: narratives and discourses in the first person" financed by FCT. The research analyzes the social representations that people aged 60+, both victims and non-victims of abuse, have about the phenomenon of abuse of older people. This qualitative study used data from in-depth semi-structured interviews, with 45 community-dwelling persons aged 60+.

The main findings point to the notion that nursing homes for older people are places of risk to exposure to multiple forms of abuse. The institutional settings and their professionals are seen as potential aggressors, within a narrative that sees the abuse as a betrayal of trust of those who have the responsibility to guarantee the well-being of older people. At the same time, the decision of adult children to institutionalize their parents is perceived as a form of family abandonment. Finally, in the narratives about violence in nursing homes, the abstract agent of The State and The Policies emerges as a category of aggressors. This is related primarily to a representation of abuse as neglect, lack of recognition of the social value of older people, and violations of rights. The institutionalization of older people is thus represented as a form of violence, involving different types of aggressors.

The preliminary findings point to a negative image of institutional settings and reinforce the need for policies tackling issues of quality of care for older people.

Justice for Family Carers of Older People – Can the concept of wellbeing help?

Cheshire-Allen, Maria

Swansea University, United Kingdom

The inequalities laid bare by the Covid-19 pandemic have had particular implications for the wellbeing of family carers of older people. This article considers these impacts from a social justice perspective, drawing on elements of the ethics of care and the capabilities approach and findings from interviews with 30 family carers in Wales, UK during the initial months of 'lockdown' in 2020. In the interviews, key themes emerge around the sense of loss, poorer outcomes, 'caring solidarity' and its absence, and concerns about the dominant discourse on care. Though rooted in the specifics of the pandemic experience, all have wider implications for how we understand wellbeing itself and particular in its application to questions of social justice. We argue for the value of an extended conception of wellbeing – one that avoids the individualistic tendencies of some accounts and incorporates the importance of relationality and extrinsic material factors.

"We Should Be at the Back of the Line": A Frame Analysis of Old Age within the Distribution Order of the COVID Vaccine

Diane Allen, Laura [1], Zofia Odziemczyk, Idalina[2], Perek-Białas, Jolanta [3], Ayalon, Liat [1]

[1]Louis and Gabi Weisfeld School of Social Work, Bar-Ilan University, Ramat Gan, Israel; [2]Doctoral School in the Social Sciences, Jagiellonian University, Cracow, Poland; [3]Institute of Sociology and Center of Evaluation and Public Policy Analysis, Jagiellonian University, Cracow, Poland

The goal of this paper is to explore the perceptions of older people in the context of establishing the order for the coronavirus vaccination. This study involves a frame analysis of the online comments on a December 10th New York Times article about the U.S. recommendations for distributing the coronavirus vaccine. "Frame" in this paper is understood as a constructed definition of a situation (cf. Goffman 1974) created by selecting some aspects of a perceived reality and making them more salient in a communicating text (cf. Entman 1993, p. 52). We explore what frames are used in the comments discussion to situate older people within the context of a limited vaccine and what social criteria commenters use to determine the right, morally justified position of this group for vaccination. We are interested in the commenters' critical reflections of the frames presented in the newspaper article, as well as the justified vaccination order they propose.

Based on the analysis of 228 comment threads, two frames for a priority order emerged: vulnerability and social contribution. In the first frame, we find that commenters consistently equate old age to vulnerability without hesitation. Within the second frame, older commenters apply an ageist perspective to themselves and present their role as no longer contributors to the common good. Therefore, they offer their place in the order to groups considered more essential or at greater risk. Implications of these [self-]ageist stereotypes during the coronavirus pandemic will be discussed.

Portraying The Elderly As Scapegoats for Covid 19 In Romanian Public Discourses

Oancea, Veronica

University of Bucharest, Romania

It has been one year since Covid-19 polarized the public discourse on many aspects, the elders' situation being one of the points of contention.

In societies where the economic crisis has emerged because of lockdowns and pandemic restrictions, justified especially through risks that are differentiated by generation, ageist discourses have re-surfaced and intensified.

In this study I analyze discourses on the elderly from the Romanian mass-media in the last year, highlighting an evolving typology of ageist stereotypes and public responses of generational solidarity.

We live in a society based on a meritocracy and that promotes very much the young population that produces palpable economic income, income sustaining all population, including elders who are perceived as consumers only.

These recent realities created friction in what concerns the older segment of the population, which are very much on the verge of creating them the social scapegoat for the current situation. The elder is artificially portraited as unworthy to consume the resources he does not currently contribute to making.

Recent pandemic-fueled discourses in Romania highlight imputed guilt of the elders for being so many and for being so fragile in front of the virus, realities that cost the society money. Such scapegoating arguments externalize and individualize responsibility, while alternative discourses discuss structural factors: economic vulnerabilities due to political choices, corruption, and short-sighted societal vision that led to the blocking of the health system and to the economic crisis.

My analysis documents how the present has many versions, socially constructed by general beliefs or by the public discourse, with unexpected and, sometimes, unfair consequences on different population segments, shaping the future development of society.

110

Covid-19 and Older People's SM Use in Everyday Life. Results from a Qualitative Study Carried out in the First Lockdown Area in Europe

Melis, Giulia [1], Sala, Emanuela [1], Zaccaria, Daniele [2]

[1]University of Milano Bicocca, Italy; [2]University of Applied Sciences and Arts of Southern Switzerland, Switzerland

The containment measures that many Governments adopted to contrast the Covid-19 outbreak are based on the physical distancing principles, e.g., the lockdown. These measures are likely to have a significant impact on older people, having suddenly disrupted everyday lives and daily routines, i.e. the main milieu that fosters "ontological security'' (Giddens 1991). Indeed, everyday life reinforces a sense of identity and biographical continuity generated by the repetition of social relationships and events. In this work, we describe the changes that Covid-19 brought about in older people's everyday lives and the strategies that were enacted to recreate a new everyday life. We focus on the role played by older people's SM use in contrasting the social consequences of the lockdown. We analyze data from a unique qualitative case study conducted between May and July 2020 on a purposive sample of 40 men and women aged 65 and over, living in the 10 municipalities located in the province of Lodi (southern part of Milan) and belonging to Europe's first Covid-19 'Red Zone'. We collected data through semi-structured interviews carried out using video-calls (e.g., WhatsApp, Google Meet, Skype). To analyze the data, we performed a thematic-descriptive analysis, using Nvivo 12. Patterns are identified by contrasting and comparing each theme with the others and, in turn, with the theoretical framework. This constant comparison method is followed until intersubjective agreement amongst the research team is reached. Results show several patterns of SM use amongst older people, highlighting the key role it played in adjusting to the social consequences of the lockdown. Moreover, SM use also represented a useful means to challenge social isolation.

Meaningfulness in among Frail Older Adults receiving home-based care

Hemberg, Jessica [1], Näsman, Marina [2], Nyqvist, Fredrica [3]

[1]Åbo Akademi University, Finland; [2]Åbo Akademi University, Finland; [3]Åbo Akademi University, Finland

Background: Meaningfulness is a fundamental aspect in the promotion of frail older adults' health and well-being. From a salutogenic point of view, meaningfulness is a vital component of a Sense of coherence (SOC), since having a strong SOC aids toward assembling the resources needed to cope with stressors and manage tensions with success. In order to respond to the challenges of population aging and the need to enable frail older adults to live at home for as long as possible, it is important to explore their meaningfulness in the context of home-based care.
Aim: A salutogenic framework was used to study meaningfulness. The aim was to explore what promotes meaningfulness among frail older adults.
Method: The study uses a hermeneutical approach and has a qualitative design. In total, 17 frail older adults were interviewed. The data was analyzed by content analysis.
Results: The results uncovered four themes that the respondents considered important in enhancing meaningfulness in daily life: home care personnel, outdoor activities and green spaces, cultural activities and spirituality. Important aspects that promotes meaningfulness among frail older adults are depicted and discussed.
Conclusion: Our study revealed the important role of home care personnel as a resource in promoting meaningfulness in the context of home-based care. Hence, this group should be given sufficient resources, knowledge and competence for enabling meaningfulness and thus a SOC amongst frail older adults.

A Home, an Institution and a Community – Frames of Social Relationships and Interaction in Assisted Living

Tuominen, Katariina [1,3,4], Pietilä, Ilkka[2,4], Jylhä, Marja [1,3,4], Pirhonen, Jari [2,4]

[1]Tampere University, Finland; [2]University of Helsinki, Finland; [3]Gerontology Research Center (GEREC); [4]Centre of Excellence in Research on Ageing and Care (CoE AgeCare)

Assisted living facilities are presented as the older person's home, but at the same time they are defined by institutional and communal characteristics. This multifaceted social environment calls for a perspective that considers different interpretations of social situations. Thus, in this study we look at social relationships and interaction in assisted living using Goffman's concept of frame (1974) as an analytical lens. The aim is to find out how home, institution and community frames define social relationships of older people in assisted living facilities.

The data consists of observations, one group discussion and ten individual interviews with residents in an assisted living facility. Data analysis was based on a theory driven approach where the reading and grouping of the data were guided by the concept of frame.

The three frames define social relationships and interaction differently. The home frame was characterized by the meaningfulness, spontaneousness and informality of social relationships and interaction. In contrast, social relationships and interaction appeared formal and distant in the institution frame. The community frame was characterized by the ambiguity of the rules of interaction and of opportunities for spontaneous interaction and relationships.

The findings suggest that the idea of frames could be used to create a deeper understanding of how different interpretations of social environment can affect the realization of successful social life in assisted living. Understanding of frames could be used to avoid misunderstandings and conflicts, to enhance home-likeness and thus to improve well-being in assisted living.

Between Themselves And Others: Home Care Work In Old Age

Rabain, Thibault

Université de Nantes, France

This conference offers an ecological approach to home care work in a working-class world driven by the combination of a dispositionist sociology and an interactionist sociology. It will mobilize repeated interviews and observations collected during an ethnographic survey carried out between 2017 and 2020 among people aged 68 to 98 living in a working-class district of Nantes (France).

The desire shared by many elders to live in ordinary housing - despite sometimes serious difficulties - invited me to question the methods of production and delegation of all the tasks that allow an elderly person to live in his dwelling. What is called home support work cross several work settings since old people can do these tasks themselves or have them done by relatives such as professionals.

After having outlined the terms of the research, I underline the primacy of domestic self-sufficiency in working-class environments thanks to attention to the trade-offs made by old people between the forms of delegation of home support work. This focus makes it possible to observe the modes in which they are perceived and used the dependencies by this population. Finally the conference will focus on how to maintain self-sufficiency, both by spreading aid and accepting living conditions perceived by oneself as difficult. The people we meet struggle to maintain domestic self-sufficiency because this is the way with they gain the legitimacy to decide for themselves about their own way of life.

Transnationalism vs. Translocalism: Comparing International and Internal Migrants

Oana Ciobanu, Ruxandra; Ludwig-Dehm, Sarah; Dones, Luna

University of Geneva, Switzerland

Transnationalism and translocalism are studied solely among international migrants. This, in spite of the fact that internal migrants maintain contact to home communities similar to international migrants. Yet, such transnational or translocal practices are rarely compared among international and internal migrants. In this paper, we draw on an original survey conducted in Switzerland and Italy among 1600 respondents. The two study populations we compare in this paper are: international migrants from southern Italy to Switzerland and internal migrants from southern to northern Italy. The sample is stratified by age (65 to 74 and 75+) and gender. The two groups of migrants are highly comparable as both migration flows occurred at almost the same time – following the Second World War – motivated by the search for labour opportunities, and both international and internal migrants experienced discrimination.

This innovative survey allows us to compare trans-national and trans-local practices. The questions we set out to answer are:

i.   Which common trans-national/ -local practices can be identified among international and internal migrants?
ii.   Which factors shape trans-national/ -local practices?
iii. Is the 'trans-nationalism' of international migrants focused on the region of origin or on the country of origin?

Spotting Good Ageing: Using Welfare Theory of Health to Frame the Agency of Older Adults with Immigrant Backgrounds to Attain Good Ageing

Johansson, Carl [1], Asztalos Morell, Ildikó [1,2], Lindberg, Daniel [1]; Gustafsson, Lena-Karin [1]

[1]Mälardalen University, Sweden; [2]Swedish University of Agriculture, Sweden

Spotting good ageing- using the welfare theory of health to frame the agency of older adults with immigrant background to reach the good ageing
Care providers for older adult with immigrant background in Sweden find themselves in a paradox. Individuals and associations call for culturally sensitive elderly care. But implementing such care comes with a risk of over-culturizing needs and behaviors. Such over-cauterizations carry's great risk of missing information or misinterpret care recipients and enhances the negative picture of the problematic immigrant. To find balance in this paradox, we applied the welfare theory of health (WTH) to grasp a new understanding of the phenomena and draw a holistic picture of a person's needs and resources available to achieve a good ageing, reaching beyond the cultural paradox.
We used semi-structured interviews with older adults with immigrant background in Sweden framing their needs with the Welfare theory of health. The interview material was analyzed with thematic analysis. Combining the welfare theory of health and immaterial capital theories gave a holistic theoretical approach to the good ageing. This took departure from the agency of older adults, mitigating the gap between their vital life goals and the available resources to reach these goals. Although the informants wanted caring interventions from close family (as a cultural preference), we could identify distinct responses to mitigate the diminished trust older adults had in the capability of welfare institutions to provide adequate elderly care.

113

Social Services Demands From International Retirement Migrants (IRM) Settled In Spain When They Are Facing The Lack Of Personal Autonomy

Martínez-Cassinello, Rafael

Universidad Complutense de Madrid, Spain

This paper presents the first results of the research project: "The retirement of Europe: The impact of retirement migration on the Social Services".

Results are based on qualitative phone interviews to Social Services Managers in municipalities where more than one third of elderly residents (65+), hold a European nationality (other than the Spanish). For instance, 122 municipalities matched with these characteristics.

In this paper we describe different responses offered by European retirees living in Spain when they get older, loose capacities and require some assistance. The distinctive feature is they don´t have family support nearby and have to rely on other actors such as social network, markets or the public Social Services. Especial focus will be paid on the Covid impact in the mentioned areas for IRMs.

In that sense home care provided by public institutions, but sometimes it is not enough. In some other cases they request caregivers in private based in the area. In cases where the elderly have high incomes, they afford hiring home assistance, to be cared for. Likewise, high solidarity networks are formed among the elders community, offering assistance each other informally. However, this aid becomes insufficient to the extent that the dependence level is increasing. Residences is also another option. Thereby cohousing, is still marginal. Professional care givers recommend preferentially support provided at home.

In the face of increasing constraints on autonomy, and the extreme dependence, they return to their countries of origin, instigated by their descendants, who can easily provide their assistance.

Contacts with Children and Subjective Wellbeing: Do the Relationships Differ For Older Migrants and Natives in Europe?

Valeria Bordone, Valeria [1], Arpino, Bruno [2], De Valk, Helga [3]

[1]University of Vienna, Austria; [2]University of Florence, Italy; [3]NIDI & University of Groningen, The Netherlands

Previous studies have demonstrated, on the one hand, an association between intergenerational relationships and life satisfaction and, on the other hand, differences in life satisfaction between migrants and natives. We examine similarities and differences in life satisfaction of older Europeans by migration background (whether born in the country of residence) across four European regions and intergenerational solidarity. In this respect, we consider associational solidarity (contacts) between older parents and adult children. Life satisfaction is used as an indicator of subjective well-being (SWB) in later life. We carry out models including interaction effects between immigrant status and the categories of contact and distance, using data from the Survey of Health, Ageing and Retirement in Europe (waves 2, 4, 5, 6). Our results show that the lower the frequency of contacts with the children, the lower the life satisfaction of the parents both among immigrants and natives. For both women and men, parents with no contact to their children show the lowest levels of life satisfaction, significantly below the life satisfaction of childless individuals. Such a negative effect is stronger for immigrants, especially among women. Further steps will consider geographical proximity, number of children and grandparental childcare as additional explanatory variables that might show differential effects on life satisfaction between immigrants and natives in later life.

Civic Participation as a Promoter of Active Aging: Comparative Analysis among European Countries

Vega-Tinoco, Andrea; Gil-Lacruz, Ana Isabel; Gil-Lacruz, Marta

University of Zaragoza, Spain

This work arises as a result of our previous research, which determined the causal effect of civic participation on the well-being of European elders. As an extension of the aforementioned study, the objective of the present research is to identify and analyze the differences between European welfare systems regarding both civic participation and well-being.

For this purpose, we used the cross-sectional data from the 9 waves of the European Social Survey (ESS 2002-2018). We have considered people born before 1965 in 14 countries: Belgium, Finland, France, Germany, Hungary, Ireland, Netherlands, Norway, Poland, Portugal, Spain, Sweden, Switzerland and the United Kingdom. As an empirical strategy, the logistic multilevel regression and ANOVA techniques were performed.

Significant differences in well-being were observed, with Anglo-Saxon elders being the healthiest, and the Nordic the happiest and most satisfied with their lives. In contrast, Eastern European seniors scored the lowest levels of well-being. Also, Nordic countries are the most civically engaged, followed by Continental and Anglo-Saxon, while Eastern and Mediterranean countries engage the least. However, the impact of civic participation on health is strongest for the Eastern and Anglo-Saxon countries, while its impact on satisfaction and happiness is highest for the Nordic countries.

Also, in general, all forms of civic participation show a positive influence on the well-being of the elderly in all welfare systems, especially when involving in political parties. However, these effects differ across nations and should therefore be considered by policy makers.

New Challenges in the Process of Growing Old: Active Aging and the Use of ICT by Older People in Brazil and Portugal

Azevedo, Celiana

Universidade Nova de Lisboa, Portugal

The aging of the population and diffusion of information and communication technologies have created alterations in social relations by placing new challenges at the individual, family and social life. Brazil and Portugal have higher percentages of elderly (IBGE, 2020; INE, 2020), but whose ownership and use of ICT are still low (CGI.br, 2019; Obercom, 2019). In this sense, this paper discusses the relationship between elderly and ICT in Brazil and Portugal having the objective of answering the following question: in what ways the uses and the ownership of ICT influence on active aging of people with 60 years or more? We consider the concept of active aging, the social context in which the elderly is inserted, theories and theoretical models related to the aging process and the use of ICT - life course theory; the concept of generation; the selective optimization with compensation model; the theory of innovation of successful aging; and activity theory.

We used a qualitative methodological approach through the non-participant observation, focus groups and semi-structured interviews. The sample was composed of 36 persons, Brazilian and Portuguese between 60 and 84 years old, who attended computer classes in senior universities.

The results showed that the social context and the life course influence how they deal with ICT building up the social interactions and increasing the frequency of communication inside and outside the family and between generations; the uses of ICT influence on the process of active aging with positive effects, but not totally free of negative consequences.

Senior Volunteering: The Role Of Trust And Economic Inequality

Sánchez-García, Julia; Gil-Lacruz, Ana Isabel; Gil-Lacruz, Marta

University of Zaragoza, Spain

One of the major aims in public health today is to reduce the negative effects of increasing age. Voluntary activity is an example of active ageing, fostering social relations and economic growth. However, much of the research so far has focused on the beneficial effects of civic participation (Taghian, Polonsky and D'Souza, 2019), without considering the determinants that may lead an older person to volunteer. Therefore, this study focuses on analysing the influence of trust (generalised, interpersonal and institutional) and economic inequality in a country on senior volunteering in its different categories.

The main contributions of the study are: (1) to examine how generalised and interpersonal trust influences the decision to volunteer among seniors, (2) to analyse how institutional trust influences volunteer participation, (3) to explore whether a country's economic inequality influences volunteering in its different categories (Social Awareness, Professional and Political, Education and Leisure, and Religion). Data are drawn from the World Values Survey (2005-2009, 2010-2014, 2017-2020) and the World Bank (2020) for the year in which the data were collected. Consequently, econometric estimation techniques and multilevel logit models (STATA: xtmelogit) are performed to assess the influence of trust and economic inequality on senior volunteering.

"Prevention is More Fun than Dementia" – The Challenges of Framing Dementia by the Discourse of Active Ageing

Hasmanova Marhankova, Jaroslava

Charles University, Czech Republic

The discourse on active ageing represents a key framework of policies whose aim is to formulate visions for ageing societies and (re)define meanings associated with life in older age. A set of critical voices were raised pointing out the problematic impact of such discourses on stigmatization of fourth age subjectivities. This paper builds on those critical responses and analyses how the discourse of active ageing impact on the representations of dementia. Dementia in many ways represents an antithesis to the popular images of active ageing. In this paper I argue that although representations of dementia are marginalized in (and by) the discourse on active ageing, they are simultaneously integrated into such discourse. Following my previous research, the paper highlights three significant frameworks of the concept of active ageing: individualization of responsibility for one's own ageing, active ageing as life-course project and the idea of activity as a way to happy ageing. Using the example of social policy documents and media representations of dementia in Czech Republic, this paper shows how those frameworks impact on the representation of dementia. Dementia is through those frameworks integrated into the project of active ageing. I will argue that such representations do not contribute to the destigmatization of dementia or to a more inclusive approach to active ageing but contrary lead to the strengthening of the notion of dementia as a failure in the "project" of active ageing leaving the very idea of active ageing unchallenged.

RN01_T09_01 | Agency, culture and meaning

"We've Never Discussed That" – Discussion and Non-discussion About Religion and Meaning in Life of Older Finns

Spännäri, Jenni; Tervo-Niemelä, Kati; Kallatsa, Laura

University of Eastern Finland, Finland

For many older adults, in certain cohorts and cultural contexts such as Finns belonging to baby boomer and preceding generations, the search for meaning in life has taken place in a religious framework (e.g., Niemelä 2011). At the same time, silence and quietude are sometimes described as a 'natural way of being' for a Finnish person. (Carbaugh et al. 2006) But if one does not discuss values, worldview, religion and meaning in life, how can those be created – and transmitted to others?

This paper explores the early findings of the Finnish sub-project of the five-country research project "The transmission of religion across generations." The paper draws from three-generation interviews and family portrayals done in 12 Finnish families. The focus is on questions related to discussing and non-discussing religious and meaning-related issues.

A key result is, that in many families the oldest generation was very unfamiliar with speaking about their personal religiosity, convictions and meaning of life, be it with family members or with friends. In contrast, the younger generations were increasingly accustomed to discussing these issues. This paper discusses the cultural change related to that, but also explores the life course factors at play. The paper provides new insight for the study of meaning in different cultural contexts, and lays a foundation to practical applications for meaning-related discussion activities for older persons.

Aging Couples, Individualization and the End of Agency

Klingel, Markus

TU Dortmund, Germany, Bremen International Graduate School of Social Science

With increasing life expectancy, late life has become a longer, crucial part of the individualized life course. New opportunities, tasks and decisions emerged. This has also changed normative frames of aging, with an emphasis on agency and individual autonomy. What does aging mean for individualized actors? How do norms of successful aging reflect on aging couples?

Autonomy ideals and successful aging norms can be activating. Yet, they can become dysfunctional when actors are not able to live up to them any longer. Aging, functional losses and approaching death can threaten couples' well-being, homeostasis and functionality. In the worst case, successful aging norms could weaken intra-dyadic solidarity when it is needed the most: in late life.

This mixed-methods longitudinal study stretches along three observations across five years and focuses on findings at time point 3. The final sample consists of 8 German couples (78-86 years old, 50-65 years married, high relationship satisfaction, white, urban). How do aging couples negotiate, decide and act on aging, autonomy and death?

Results show that couples have internalized autonomy ideals and benefit by influencing their health positively. However, this becomes ambivalent as the future is perceived increasingly as beyond individual control. Acceptance of losses is thus difficult, autonomy ideals burdensome and death salient. Overall, the dyad is still a functional stronghold in late life and against aging. Yet, this can threaten the functional, sometimes even the emotional unity of aging couples. Four patterns of self-dyad dynamics emerged and will be discussed as examples of individualized aging.

117

Multiple Layers of Uncertainty: Palliative Psychotherapy at a Time of Coronavirus

Ramsay-Jones, Esther

Open University, United Kingdom

This presentation will be an exploration of the way in which the social context, both the emotional and political impact of the coronavirus pandemic, enters into the psychotherapeutic work with older dying patients and their family members, often both paralleling and distracting from the immediacy of the life-limiting condition.

The paper will draw from anonymised vignettes, along with the psychoanalytic theory of Melanie Klein (1952) in which some of the social defenses -such as splitting - that have been employed by populations around the globe in the face of far-reaching anxiety stirred up by the pandemic have also powerfully found their ways into therapeutic support groups, with divisions of them and us surfacing in weekly meets. In line with society at large, this paper will also consider the way in which a move to online therapeutic practice - a necessary measure of protection at certain points of lockdown - has also meant that often the most in need, dependent and unwell older people have been the least able to benefit from the emotional and psychological care vital at the end of life, exacerbating and mirroring a pre-existing social inequality.

Older People's Attitude Towards Death and Death Preparation.

Kalniņa, Diāna; Rungule, Ritma; Seņkāne, Silva

Riga Stradins University, Latvia

Death and dying affect people of all ages, but as they age, attitudes towards it become more acceptable, practical and more business-like.

Based on a representative survey of the Latvian population (N=1003) on death and dying (September-October 2020), we compared the attitudes of people of different ages towards death, their views on desirable conditions of death and preparation for death.

The Death Attitude Profile-Revised (DAP-R) was used to study attitudes towards dying and death. Translation and validation of this instrument (multidimensional measurement) was performed. Analysis of the survey data showed that older respondents were less afraid and more accepting of death as a reality and as an escape than younger participants. Approach Acceptance (dimension implies a belief in a happy afterlife) and Escape Acceptance (dimension captures positive attitudes towards death in light of suffering) are more common in the elderly.

Regarding the desired conditions of death, most respondents want to die without pain and suffering, compared to other age groups, older people are more likely to die at home, in the presence of relatives, as well as sudden death.

As age increases, the proportion of respondents who believe that they should prepare for death increases, aged 64-75 this is acknowledged by 51.5% of respondents (39% in total). Respondents of different ages have different perceptions of what needs to be done in preparation for death. The need to prepare a will is acknowledged by people of all ages, but the need to save money for a funeral is more acknowledged by respondents over 45, while the need to take care of a place in a cemetery and suitable clothing is more acknowledged by respondents over 65.

Long-term care

Shaping Long-term Care for Older Adults in Italy: The Role of General Practitioners and Geriatricians

Degiuli, Francesca

Fairleigh Dickinson University, United States of America

Research on the relationship between long-term care and immigrant labor has traditionally focused on the triangle involving state, market, and families to understand how the organization of long-term care comes into place. Little to no attention, however, has been paid to the role of doctors in generating and sustaining these labor relationships. This paper begins to fill this gap by exploring how Italian general practitioners and geriatricians, both directly and/or indirectly, influence the decisions of aging adults and their families in designing individual long-term care projects which often involve hiring immigrant homecare assistants. The paper is based on qualitative interviews and participant observation at regional and national scientific conferences. A preliminary analysis of the data provides insights on the importance of these actors in naturalizing these relationships of labor, downplaying, in the process, larger economic and political decisions concerning older adults long-term care and its provision.

Innovating Long-term Care Systems in a Comparative Perspective in Covid 19 Pandemic Time: a Comparison of Recent Developments in Italy and Germany

Casanova, Georgia [1,2], Lamura, Giovanni [2], Gori, Cristiano [3], Teti, Andrea [4]

[1]Polibienstar - Research Institute on Social Welfare Policy -University of Valencia; [2]IRCSS INRCA National Institute of Health & Science on Ageing, Centre for Socio-Economic Research on Ageing; [3]Sociology and Social Research Department – University of Trento; [4]Institute of Gerontology – University of Vechta

Italy and Germany represent two different care regimes (Schulmann et al., 2014), with specific peculiarities in terms of demographic trends, families' characteristics, care needs and system response to these needs. The Italian family-based care system is characterized by a high demand for care, a high provision of informal and low formal care. In Germany, a medium/high demand for care is met by a medium/low level of informal are and a medium level of formal care. This studywants to compare both countries' long-term care (LTC) systems to identify the main innovations promoted by them, including social innovations (as defined by the European Commission, 2013). An additional aim is to understand how innovations may better support responsiveness at the system level, by contrasting emerging care needs due to the Covid-19 health and social emergency in the two countries. A rapid review of the literature, supported by secondary data from national and international official sources, allowed us to identify the two LTC systems' main characteristics, capacity to meet care needs, and main innovations. These findings were validated by means of expert interviews, which identified their implications in terms of possible future applications to LTC systems in a European perspective, underlining what makes these measures a good example of "social innovation" also in pandemic times like the current ones.

119

Ageing, Long Term Care, Poverty and Socio-economic Deprivation of Families: Results from a Scoping Review

Martarelli, Rossella [1], Casanova, Georgia [2,1], Belletti, Francesco [3], Lamura, Giovanni [1]

[1]IRCCS INRCA National Institute of Health & Science on Ageing, Centre for Socio-Economic Research on Ageing; [2]Polibienstar - Research Institute on Social Welfare Policy - University of Valencia; [3]CISF International Center for Family Studies

Poverty and population ageing are two important topics in the current international debate on social policies. This scoping review aims at widening this debate to the issue of socio-economic deprivation of families with older people to take care of, by focussing primarily on non-European low-income countries (on account of the large variety of mixed studies). The last economic crisis — strengthened by the indirect effects of the current Covid-19 pandemic — is pushing for an increased attention to the combined effect of these social issues. Our study is part of a cross-national research effort promoted by the International Family Monitor, a research project finalised at analysing the real living conditions of families worldwide (https://www.familymonitor.net). Aligned with Munn et al. (2018), this review aims to: identify the type of available evidence; clarify the main key-concepts used, with particular regard to older care and the difficulties experienced by family caregivers; identify the methods applied by the existing studies; select the factors linked to the relationships between ageing and socio-economic deprivation of families; track any possible conceptual gap in order to inspire further researches. This study considers the seven phases proposed by Lockwood et al. (2018) for implementing a scoping review. Our expected findings will emphasise the multidimensionality of poverty, on the assumption that material deprivation is strongly connected with relational, educational and/or job deficiency. This review will also provide evidence on the relationship between the costs for older people with ADL limitations and the poverty of their families.

RN01_T10_01 | Media and communication

Depictions of Aging and Old-age Vulnerability in Slovene daily newspapers

Gerdina, Otto

University of Ljubljana, Slovenia

From a social constructionist approach, media representations can give us important insights into how vulnerability and old age are constructed. The media are important sources of information when the majority of the population does not have frequent contact with the social group in question as is the case with older people. Although Slovenian research has brought attention on how age and ageing are portrayed in the daily media, no attention has been paid to how newspaper reporting on old age has changed over time, nor to whether certain dimensions, dynamics and relations of old-age related risks have received media attention at the expense of others. A detailed account of how much attention daily newspapers pay to the context when reporting on the intersection of vulnerability and old age can help to assess the implications media coverage on the quality of life of older people. The aim of the study on which this presentation is based, is to shed light on the contexts in which the representations of old age changed in daily newspapers in Slovenia in the period 2004 - 2018. This presentation will highlight the results of a quantitative and qualitative content analysis on the longitudinal changes in media representations at the intersection of vulnerability and old age. The results will be interrogated against the backdrop that scholarship on media representations of old age provide.

120

New Communication Technologies in the Elderly Communication Practices

Bukowski, Andrzej

Jagiellonian University, Poland

Social isolation of the elderly has been indicated among the major problems contemporary societes cope with over the last years. During pandemic it is even more severe. Spatial isolation of old persons is required to protect them against COVID-19 infection, but apparently it is painful to digitally excluded ones. Explaining factors decisive for readiness of seniors to use new technologies is crucial in combating digital exclusion and in consequence social exclusion.

To solve this problem a performative-praxiological approach is proposed. It has been elaborated on the basis of the theory of social practices (TSP) and particularly on the notion of sociomateriality. According to this perspective acceptance of new communication technologies and their assimilation will be affected by mechanisms of new technologies "embedding" in the elderly communication practices, understood as comprehensive complexes of bodily movements, of forms of interpreting, knowing how and wanting and of the usage of things", that together form the day-to-day ways of contacting with other persons. There are four basic aspects of the proccess: (1) interactions between technology demands and bodily-mental limits of users; (2) day-to-day operation (with its history of successes and failures); (3) introducing new elements of communication into well-established rutines and habits; (4) dynamic connections with other practices.

During the presentation preliminary results of pilot research conducted in several Senior' Activity Centers in Krakow (Poland) will be presented. Due to pandemic all the centers had to change the form of classes for on-line only. The research were run among seniors who decided / were able to take part in on-line form of the classes and with those who were not / resigned from and lost contact with the Centers.

Rights, Responsibilities and Claims making: A Case Study Of The Representation Of Elder Care In The Media

Nilsson, Magnus

Linköping University, Sweden

Public opinion regarding the organization of welfare and elder care, as well as how the right to care is articulated, are issues that have mainly been studied as expressions of individual attitudes or conflicting ideologies. By contrast, and departing from an understanding of the importance of context and societal rhetoric, this study is designed as a case study of the rhetorical landscape of elder care in public discourse in Sweden. The study circles around a TV documentary about problems in elder care that was aired in early 2020, just before the pandemic. The analysis focuses on how the issues were framed in the documentary but also on how different actors in news media and on the TV-channels Facebook page reacted to the claims in the documentary and how different actors used the documentary for their own aims.

The study departs from a discourse analytical perspective and the analytical focus is on how the rights to elder care and the rights of users of elder care are articulated in relation to what the problems of the organization of elder are represented to be.

RN01_T10_02 | Work and employment (iii)

Labour Market Participation And Cognitive Decline At Older Ages: Evidence From Germany

Trahms, Annette [1], Romeu Gordo, Laura [2]

[1]IAB, Institute for Employment Research, Germany; [2]DZA, German Centre of Gerontology, Germany

Ageing of the population is one of the main societal challenges in most of the western economies. In order to react to demographic change the legally required retirement age in Germany has been increased to 67 years and is under discussion whether it needs to be further delayed. On the one hand, prolonging the participation of older people in the labour market is important to moderate the financial impact of demographic change. On the other hand, and this is the focus of this paper, labour market participation might help to maintain cognitive abilities for elderly. These are also important in order to remain active and independent in old age as long as possible.

The analysis is based on data of the National Educational Panel Study (NEPS) adult starting cohort. The NEPS provides data on the life course, educational and employment histories. Furthermore, NEPS provides data on the development of competencies over throughout the life course. Therefore, the data allows observing a change in cognitive performance in reading and mathematical competencies between the years 2011 and 2017 and labour participation between these two points in time.

Our results show that in the case of reading competences there is no evidence of a more rapid decile in these abilities in case of retirement. However, in the case of mathematical competences, we do observe that individuals who retire before the age of 65 are more likely to suffer a decline in these competences than individuals who remain active in the labour market.

Transition to Self-Employment in Later Life in Germany, Poland and Sweden – a Life Course Perspective

Franke, Annette Astrid [1], Stypinska, Justyna [2], Krekula, Clary [3]

[1]Protestant University of Applied Sciences Ludwigsburg, Germany; [2]Free University Berlin, Germany; [3]Karlstad University, Sweden

From a socio-political perspective becoming an entrepreneur in later life is seen as measure to extend working lives in Europe and beyond, as an effective active ageing policy or simply appraised as a „panacea for all" (Lewis and Walker, 2011). The problematic has been studied empirically for over three decades revealing many facets of this type of activity. However, still little is known about the construction of life courses of mature entrepreneurs – their trajectories, transitions and anticipations. Or, in other words "the shadows of past" and the "shadows of the future" (Bernardi, Huinink and Settersten, 2019).

This paper presents findings from two parallel research projects in Sweden, Germany and Poland, which compare the life courses of older entrepreneurs and their embeddedness in different welfare regimes. The projects take on a dynamic perspective on the process of becoming an entrepreneur and look at macro-, meso-, and micro- factors determining the transition into self-employment in later life. The empirical material used for this presentation comprises of individual in-depth interviews with mature entrepreneurs.

Results indicate the intersecting role of agency and structure in the formation of life courses of older entrepreneurs in the three countries. Furthermore, the analysis revealed different types of mature entrepreneurs and identified social differences (e.g., gender specific) transitions, trajectories and turning points on the path to self-employment.

Still Working? Negotiating Age and Worth at the Workplace Between the Second and the Third Age

Gorm Larsen, Marie; Folker Christensen, Louise; Steen Bygballe, Line; Juul Lassen, Aske

Copenhagen Centre for Health Research in the Humanities, Saxo-Institute, University of Copenhagen

Senior employees and their pathways to retirement have become a subject of scrutiny by scholars and governments due to the current focus on the prolongation of work-life in the EU and beyond. With an ethnographic approach we have studied senior employees at work at small and medium sized companies in the finance and production industries in Denmark. This approach highlights how age and worth is negotiated in the everyday work practices as well as in the senior policies of the companies.

We investigate how the senior workers are perceived to embody specific qualifications, but also how these tend to oppose the imaginary of the older person at the workplace as fragile and in a state of decay. We find a discrepancy between the specific older worker and the imaginary of the older person. We use this ambiguity to describe how the diverging ideas of the older workforce are performed through senior policies and their measures, e.g., so-called senior-interviews undertaken by the companies.

We show how older workers themselves consider the ambiguity when they negotiate their future work-life and retirement plans. Our fieldwork shows how the contemplations of the senior workers are changeable and perceived to be part of the private sphere. This clashes with the assumed openness and public dialogue performed in the measures of the senior policies offered from the companies. Here we argue that the conflict between what is considered private and what is considered public by senior policies, managers and senior employees respectively is fundamental to understanding the slow uptake of gradual and flexible transitions to retirement.

Care services

"Is Social Spending for Elderly People Unsustainable? The Social and Economic Impact of Home Care"

Recuenco, Luis

Universitat Pompeu Fabra, Spain

Social spending on elderly people will increase greatly in the future due to population ageing, and European countries will not be able to afford it financially. This insight is alarmist and very widely broadcast by the communication media, which does not consider that long term care policy is currently creating increased employment and will continue to grow in Europe in the future. This paper empirically demonstrates the social and economic effect to be developed to increase the home care services in a large European city, with underdeveloped services, such as Barcelona. The estimation for Barcelona is based on Copenhagen model, one of the most developed services internationally. The number of elderly people receiving attention in Barcelona will grow from the 23.811 at present to 46.571, implementing the Copenhagen model. The increase in the number of elderly people attended to would allow the 4,000 present Barcelona care job positions to reach 9.495, following the Copenhagen model. This growth in employment would increase social spending, although this would be compensated for by some great financial returns, representing 59% of the social spending mentioned. For every million Euros invested in dependency aid within the public sector, 590.000 Euros would be recovered through different taxes such as social security quotas, Income Tax, VAT or Corporate Tax. The social spending invested in the elderly should not be considered exclusively as spending, since greater social investment creates wealth, new jobs and subsequently new income by way of different taxes.

123

The Interplay of Health and Age in the Receipt of Different Types of Home Care. A Study on Older Adults in Switzerland

Zaccaria, Daniele [1], Masotti, Barbara [1], Cavalli, Stefano [1], Jopp, Daniela S.[2,3]

[1]Centre of Competence on Ageing, University of Applied Sciences and Arts of Southern Switzerland (SUPSI); [2]Research Center for Psychology of Health, Aging and Sport Examination, University of Lausanne (UNIL); [3]Swiss Centre of Expertise in Life Course Research (LIVES)

In many Western countries, a high number of older adults continue to live at home until very old age despite health problems, thanks to informal and/or formal support. Previous research rarely offers a detailed approach to home care receipt while simply distinguishing between the use of no care, informal care only, formal care only, or mixed forms of care. With our study, we include the multiple domains where both family and professional services act (e.g., daily activities, housekeeping, companionship). We take into account health limitations and consider the stage in the life course at which the person had care needs. Thus, the main goal of this work is to evaluate how the interplay of health and age influences the probability of care receiving during later life. Analysis are based on a subsample of people aged 65 and older living at home who participated in the Swiss Vivre/Leben/Vivere (VLV) cross-sectional survey (N=2'912). We estimate a series of logistic regression models to analyse the association of health status (dependent, frail, robust) and age with each type of received help, controlling for sociodemographic characteristics. Then, we focus on how the effect of health on the probability of receiving helps varies by age. Findings, consistent with previous research evidences, show that health strongly explains home care receipt among older adults, independently from the type of help. However, its effect changes with age, depending on the nature of care. Results are discussed taking into account context's specificities, in terms of resources and needs that affect very old Swiss people.

Home Care Strategies for Older Dependents and the Influence of Neighbourhood Socioeconomic Status

Julià, Albert [1,2], Escapa, Sandra [2], Gallo, Pedro [2]

[1]Barcelona Institute of Regional and Metropolitan Studies (IERMB); [2]Department of Sociology, University of Barcelona, Spain

The choice of care option in adult age is a complex, dynamic social phenomenon that is influenced by not only individuals or network characteristics, but also contextual factors. Most of previous studies that take into account contextual factors have focused on the comparison between rural and urban environments. The objective of this study is to determine whether the socioeconomic profile of neighbourhoods in the same urban context are associated to the use of family care, public services or private care at home.

We applied marginal effects from multivariable logistic regression analysis to data from the Survey of People in a Situation of Dependence 2018 (n=530; 55 years old and over). We analyse the effect of the type of neighbourhood in the choice of care option in Barcelona city (Spain).

In neighbourhoods with a high socioeconomic level, dependents are more likely to use private services and less likely to use informal care services and public services, even after controlling for socioeconomic and sociodemographic variables. Our results suggest that differences in urban socioeconomic contexts determine some inequalities in the use of services even after controlling for socioeconomic individual differences. Understanding the factors that determine the use of public care services, private care services or family caregiving is important due to the increment in the number of older people in the population, and should be considered to adjust care policies for older dependents.

124

Approaching Workforce Diversity in Care Homes

Casal Sanchez, Lola

Robert Gordons University, Spain

Despite the ageing of the population having prompted an increment demand in care home services, and the degree of cultural diversity increasing in the workforce of care homes, little is known about the implication of workforce diversity in care homes and its impact on quality care, employee's well-being, and organisational performance in care homes.

This presentation addresses this knowledge deficit and with the aim of gaining an understanding of the influences and implications of the cultural complexity that care homes might face due to the increasing degree of diversity in the workforce and the ageing population. The presentation is based on the scoping literature review study conducted to explore the implications of workforce diversity on the well-functioning dynamics of the care team workforce as well as on the quality of care. The outcomes of the study aim to identify gaps that might contribute to eliminate any potential disadvantages for the older age groups as well as for migrant workers or workers from minority groups.

RN02 | Sociology of the Arts

RN02_T01_01 | INVENT: Mapping the Social Preconditions for Inclusive Cultural Policies across Europe

Who Supports or Opposes Public Funding of Culture? Comparing the Social Correlates of People's Attitudes towards Public Funding of Culture across Europe

Janssen, Susanne[1], Zdravković, Željka[2], Lebaron, Frédéric[3], Rössel, Jörg[4]

[1]Erasmus University Rotterdam, The Netherlands; [2]Institute of Social Sciences Ivo Pilar, Croatia; [3]Ecole normale supérieure Paris-Saclay, France; [4]University of Zürich, Switzerland

Public opinion on government funding of culture is highly relevant to politicians, cultural policy makers, and other stakeholders in the cultural field. As such, social and culture surveys commissioned by the European commission or national governments occasionally examine to what extent citizens support or oppose public funding of culture or particular sub-areas thereof such as, for example, cultural heritage (Eurobarometer 2017). However, only few studies have looked more in-depth into the various factors that may shape people's attitudes toward government funding of the arts, pointing to the importance of education, political orientation, region of residence, arts attendance, aesthetic dispositions, and national cultural policy models (see Katz-Gerro 2012). This prior public opinion research mainly focused on the United States and/or attitudes toward public funding of fine arts.

The present paper builds on these previous studies, but extends their scope significantly. First, we examine to what extent different areas of culture should receive public funding according to representative samples of the population in nine European countries. Second, we analyses how individual-level variables — e.g. social background characteristics, cultural participation, access to culture, and political orientation - affect attitudes toward public funding of culture. Third, we explore how the impact of individual level variables is shaped by contextual, country level variables — e.g. national cultural policy models and cultural infrastructure. For our exploration, we draw on comparative survey data which were collected in 2021 for the INVENT project among national representative samples in nine European countries (Croatia, Denmark, Finland, France, The Netherlands, Serbia, Spain, Switzerland, and the UK).

Cultural Cosmopolitanism in Diverse Contexts: Mapping and Comparing Cultural Cosmopolitanism across European Countries and Localities

126

Katz-Gerro, Tally [1], Janssen, Susanne [2], Yodovich, Neta [1], Verboord, Marc [2], Llonch Andreu, Joan [3]

[1]University of Haifa, Israel; [2]Erasmus University Rotterdam, the Netherlands; [3]Universitat Autònoma de Barcelona, Spain

Across the world, scholars have identified a general trend of an increase in stated cosmopolitan preferences or tastes, and actual consumption of globally diverse cultural products. This is often deemed a favourable development because of the alleged positive association between cosmopolitan cultural consumption and cultural openness and inclusiveness more generally. On the other hand, scholars have also found significant differences in cultural cosmopolitanism between social groups, to the extent that some scholars view it as a new form of cultural capital and cultural distinction (Igarashi and Saito 2014; Varriale 2016; Cicchelli et al. 2018).

The potential impacts of cultural cosmopolitanism on social divides makes it particularly relevant in contemporary, globalized societies that are home to increasingly diverse populations. Differences between European societies in their degrees of cultural openness have been found in previous studies (Katz-Gerro 2017;

Verboord, 2017), but explanations are limited. Here, we focus on the role of people's living environment: we expect within-country differences between residents of more of less culturally heterogeneous regions or areas.

Our contribution in this paper is threefold. First, we present several different measures of cultural cosmopolitanism. Second, we analyse the way these different measures associate with a suite of socio-demographic characteristics. Third, whereas previous studies tend to focus on nationwide data for single countries, we analyse differences in these associations across three European countries with increasingly diverse populations (the Netherlands, Spain, and the United Kingdom) as well as different localities (e.g. urban vs. rural areas; more vs. less diverse regions or urban settings).

Does Culture foster Integration? How the perception of European Culture is related to support for European Integration

Rössel, Jörg [1], Katz-Gerro, Tally[2], Weingartner, Sebastian [1], Lopez, Pilar [3], Simon, Walo [1]

[1]University of Zurich, Switzerland; [2]University of Haifa; [3]Universitat Autonoma de Barcelona

We study how individuals in different European countries perceive European culture and how this perception is related to support for the process of European integration. With regard to European culture, we focus on the question, if European respondents perceive (a) a common European culture, (b) if they consider this culture to be of higher value than other cultures and (c) if they are open to cultures different than their national one. Based on previous research on European integration, we hypothesize that individuals benefiting from the process of European integration and having many intra-European experiences and exchanges are open to the cultures of other countries and perceive a shared European culture. Thus, we study how individual differences in the perception of European culture covary with individual social background, as well as how such perceptions differ between individuals from different European countries. Finally, we study if and how the perception of European culture is related to support for European integration. We address these questions based on a broad, comparative survey, which was conducted in 2021 as part of the Horizon 2020 project titled INVENT. Focusing on survey results from Spain, Switzerland and the United Kingdom, these data allow us to compare perceptions of European culture and support for European integration between an EU member state, a non-EU member state, and one former EU member state.

Understandings of Culture: A European Cross-National Bottom-Up Study

Purhonen, Semi[1], Nørgaard Kristensen, Nete[2], Sirkka, Ossi[1], Marquart, Franziska[2], Verboord, Marc [3], Weingartner, Sebastian[4], Kim, Jinju [5], Walo, Simon [4]

[1]Tampere University, Finland; [2]University of Copenhagen, Denmark; [3]Erasmus University Rotterdam, The Netherlands; [4]University of Zurich, Switzerland; [5]Universitat Autònoma de Barcelona, Spain

The concept of culture is notoriously multifaceted. In the past decades, hierarchical and 'universal' notions of culture have been challenged, and more attention is paid to how culture is experienced by lay persons and in various localities. Yet, little is systematically known about (1) how different understandings of culture are patterned among people in present European societies, (2) what kind of tensions and hierarchies there are between these understandings, and (3) to what degree the understandings (3a) depend on the national context and (3b) associate with sociodemographic divisions, thus potentially reflecting and even contributing to social conflicts and inequalities. This paper applies a bottom-up, audience perspective in addressing these questions based on a wide-ranging survey research conducted in 2021 as part of the H2020-project, INVENT. It provides first results about Europeans' understandings of culture, using data of more than 10,000 respondents to nationally representative surveys collected in Croatia, Denmark, Finland, France, The Netherlands, Serbia, Spain, Switzerland, and the UK. In this paper we study how citizens understand the concept of culture, by looking into their evaluations of cultural items varying in nature, popularity, and artistic legitimacy. We hypothesize that the classical division between a narrow (exclusive) understanding of culture as the arts and a broad (inclusive) understanding of culture as the way of life, still structures Europeans' understandings of culture, but with significant national and sociodemographic variations. Knowledge on such variations may come in useful for developing European cultural policies.

The sounds of the Covid-19 Pandemic

Lost And Found Sounds. A Comparative Study On The Relationships Between Uncertain DIY Careers, COVID-19 And Digital Worlds

Guerra, Paula [1], Bennett, Andy [2], Green, Ben [2], Howard, Frances [3], Oliveira, Ana [4], Sofija, Ernesta [2], Sousa, Sofia [5]

[1]University of Porto, Portugal; [2]Griffith University, Australia; [3]Nottingham Trent University, United Kingdom; [4]Iscte – University Institute of Lisbon, DINÂMIA'CET, Portugal; [5]Faculty of Arts and Humanities of the University of Porto, Portugal

It is undeniable that the pandemic of COVID-19 has impacted the music industry worldwide, especially with regard to metropolitan areas which assume themselves as the epicentre of live music circuits and stand out as the main source of income for artists and musicians. There will not be a uniform model for musicians to face this crisis. For the most part, we are talking about independent workers in terms of careers, with precarious work contracts and with difficulties in accessing social protection schemes. COVID-19 has accentuated the inequalities previously experienced in the careers - generally based on a DIY ethos - of these workers in comparison to others. This paper reports on one aspect of our international collaboration research between Portugal, United Kingdom and Australia: the use of digital strategies as a way of promoting sustainable DIY careers during the lockdown. Drawing on interview data of 77 young music-makers, aged between 18 to 35, we intend to report on the different ways in which young musicians have used digital platforms to maintain their careers, especially regarding the processes of music making (musical and lyrical composition, rehearsals), mediation (gigs, podcasts, streaming), and marketing/management (relationship and engagement with audiences, management, social networks, sponsors). Although COVID-19 has had profound repercussions on the livelihoods of musicians, ways and forms of coping emerge, especially regarding the use, often in a DIY logic, of digital platforms as a way of promoting and maintaining their music careers, all the more so because these are uncertain and unstable.

Music in Times of COVID-19 Pandemic – Sociological Reflections

Jabłońska, Barbara

JAGIELLONIAN UNIVERSITY, Poland

The main task of the paper is to show the role and significance of music during the COVID-19 pandemic. The pandemic times have redefined most areas of social life, including the broadly understood world of arts and music. The virus itself - paradoxically - turned out to be a kind of "catalyst for culture". The aim of the article is to present - at the exploratory level - the problems of musical practices of people in the times of the COVID-19 pandemic. The text will discuss selected phenomena and processes related to musical practices. The role of the new media in supporting the musical practices of the society will be shown.

There will be discussed such phenomena and processes as domestication, virtualization and networking of musical life, the transformation of the musical public sphere, online musical deliberation, the convergence of musical practices, the domination of the culture of real virtuality, as well as the power of the public and the democratization of the musical public sphere. Discursive practices related to the functioning of the world of music in covid times will also be analyzed, using the assumptions of discourse analysis.

In conclusion, the main axis of considerations will be an attempt to show how the everyday musical life of society - necessarily trapped in the Internet - changed during pandemic times.

128

Singing Together Apart: Online Choirs in the Age of COVID-19

Alexander, Victoria D.; Peterson Gilbert, Oliver

Goldsmiths, University of London, United Kingdom

Amateur choirs are a common way for people to create and consume musical materials. Such choirs provide benefits to individual singers and to communities. With the spread of coronavirus during the global pandemic, choir singers were unable to meet in person; consequently, many choirs decided to move rehearsals, and sometimes performances, online. Based on research conducted as part of the EU-funded project, UNCHARTED: Understanding, Fostering and Capturing the Societal Values of Culture, this talk explores how choral singers and choir organisers perceive the cultural values of choirs in an online setting.

We interviewed singers and choir leaders from four, London-based online choirs that sing either a classical or a popular repertoire, to understand how choir members value their participation in a now digitally mediated choir environment. Specifically, we seek to compare the value attribution of traditional choirs singing classical repertoires (which tend to attract older singers) to newer choirs singing a popular repertoire (which tend to attract younger ones) when in-person co-presence is replaced by individualised, digitally mediated participation via virtual meeting software. We focus on four overlapping processes relating to values (interaction rituals, emotional regulation, identity formation, and collective flourishing) as we explore participants' perceptions of the costs and benefits of singing together apart. This allows us to understand the micro-socialities of value attribution.

Plush Panda and Mashups: A Case Study of Music Production During the Pandemic

Şahin, Nevin [1,2]

[1]Orient-Institut Istanbul, Turkey; [2]Hacettepe University, Turkey

More than a year into the global health crisis, people have been stuck at home, trying to homeschool kids while working home office, left with no social gatherings outside home, let alone public events like crowded concerts or premieres of operas or theaters. Within the challenge of the pandemic, most musicians lost their income and were forced to keep producing music without experiencing the intact social aspect of music. Yet another challenge for musicians was the global move to the online, where better technological equipment and faster bandwidth matters, putting musicians with limited access to technology or to financial means to access the technology in a vulnerable position. How can musicians, under the pressure of not only health but also financial sustainability, overcome the challenges and keep being creative? How can they construct their audience to share their music and survive the limitations eliminating all conventional musicking practices? This paper, in an effort to answer questions and identify strategies related to music production and solidarity against the backdrop of the pandemic, focuses on a music group founded in Turkey during the pandemic, named Pandami Music with reference to not only the pandemic but also to the plush panda appearing in their videos, as a case study. With this aim, data is collected through an online focus group discussion with the band members, content analysis of comments for the band's music on social media platforms such as YouTube and Instagram, and musicological analyses of the songs recorded by the band.

RN02_T01_03 |
Museums – changing circumstances and competitors

Anthropocene Era in Museum. The role of Museums in the Climate Change Debate

Nieroba, Elżbieta

Opole University, Poland

The main objective of the paper is to reconstruct how museums contribute to the debate on climate change, its causes and consequences.

Museums enjoy a high level of public trust and give way only to scientific institutions as a source of reliable information on climate change. Such a position of the museum in the public space gives it legitimacy to take on the role of a key participant in the debate that takes part in constructing and communicating the narrative on climate change. The involvement of the museum in the climate change discourse seems particularly important in a situation where the global warming process and the legitimacy of long-term action are questioned.

The research material collected within the paper will allow answering the question of what kind of climate change explanations and understanding patterns are provided by words, images and spatial arrangements present in museums.

Objective no. 1 concerns the recognition of ways of presenting the issue of climate change and the Anthropocene era in a museum, namely the diagnosis of whether exhibition practices fit into the dominant discourses on this subject, or whether they propose a new way (but what kind?) of presenting this issue.

Objective no. 2 concerns the reconstruction of the models of communication with the public dominating in the museum space, namely whether they are beneficial for strengthening the mechanisms of engaging in activities.

The main subject of the analysis will be exhibitions devoted to climate change and its accompanying content.

The analysis of empirical material will be based on qualitative analysis of discourse from the sociological perspective. The activity of 10 Polish museums between 2020 and 2021 will be analysed.

Corporate collectors, Corporate Collections & Public Art Museums: Success or Collaborative Minefields?

Hagen, Målfrid Irene

MI Hagen, Norway

In many countries great art museums are founded or supported by corporate founders, leaders and art collectors. For example the Museum of Modern Art, the Guggenheim Museum of Art and the Metropolitan Museum of Art, all located in New York. Such great art museums are usually embraced and loved by the art audience as well as by people in general. Although they have also been criticized, for example by artists who conducted Institutional Critic through their art expressions towards the end of the 1900s, and by feminine art activists such as the Guerilla Girls who criticize art museums for excluding female artists, corporate support is crucial for the existence of many great art museums around the world. This is particularly the case in countries where the public economical support to art and culture is weak. Oppositional, in Norway most art museums are public, national or municipal, with weak traditions for corporate economical support. However, during the last two decades, there has been a significant change. Several new art museums and sculpture parks have been established by corporate collectors, as well as public and national art museums today seek collaboration with corporate art collectors and art collections. This has been strongly criticized by the art audience and others in the pubic discourse, and led to several media storms. Here I discuss and compare the critique on some of these cases of public and private art collaboration, and seek to reveal some of the reasons for the harsh critique.

The State Russian Museum After Coronavirus Lockdown: The First Visitors

Potyukova, Ekaterina

The State Russian Museum, Russian Federation

The Russian Museum (St. Petersburg) is the largest museum of National Russian Art. The museum, including the complex of 7 buildings and 2 gardens, was closed due to the coronavirus lockdown from 18 March to July 2020. The main museum exposition, presenting all types and genres, trends and schools of Russian Art over more than a thousand years (from the Xth to the XXth century) reopened to visitors on the 15th of July. The other buildings of museum complex resumed their activity later in July.

The surveys of the museum audiences have been carried out in the first 6 days after the museum's reopening, and spanned about 650 respondents.

The report focuses on the visitiors' attitude to the pandemic precautions, reduced capacity of the museum expositions and timed entry, as well as on the portrait features of the first museum visitors (social demography, motives of visiting).

The study has shown that under the conditions of the introduced precautions most of the respondents generally were satisfied of visit: their «expectations were met», while very high rating of the visit was given by about 20% (lower than usual). The majority of visitors (60%) were «tolerant, with understanding» to the introduced precautions. «Limited number of people» was called the most important / effective security measure among those undertaken by the museum. The established visiting routes are convenient for half of the visitors. There was a record high ratio of newcomers to the total number of visitors. The share of regular museum visitors was twice as small as compared to summer seasons in pre-epidemic years.

The report based on materials of the temporary storage of archive of the Russian Museum.

RN02_T02_01 | Aesthetic taste and contestation

'So That's Exactly the Art I Don't Understand'. Reflections from the Art-elicitation Interviews on Aesthetic Taste

Wladyniak, Ludmila

Charles University, Czech Republic

There is a long tradition in sociology, and in cultural sociology in particular, to perceive fine art as a social phenomenon composed of knowledge and products that are to be classified as social. Nonetheless, the relationship between those two is 'a complicated one' (according to Bourdieu, due to artists' oversensitive attitude towards their own discipline). The goal of this study is to investigate the employed logics of taste in fine art among young people (university students) while evaluating pieces representing various art styles—classic, abstract, non-Western, and so forth. The research was designed to answer two main questions: (1) How do young people (university students) value fine art, understood as cultural expression? (2) What categories of evaluation claims are used by the studied group to support their taste in fine art—what logics are being used? The study is based on data gathered within a study (art-elicitation interviews) designed to imitate a situation that triggers certain cultural schemes through conversation and confrontation with displayed pieces of fine art (reproductions of paintings) since conversation is regarded as, among other things, a possible activator. The study might also be placed in the discussion over the current context of cultural omnivorousness and the blurring boundaries between highbrow and lowbrow culture in everyday life.

Omnivorousness Alla Polacca - Musical Tastes And The Stratification Of Culture In Post-transformational Poland

Domański, Henryk; Przybysz, Dariusz; Wyrzykowska, Katarzyna; Zawadzka, Kinga

Institute of Philosophy and Sociology, Polish Academy of Sciences, Poland

Research conducted in different countries (e.g. Alderson et al. 2007, Olliver 2008, Jaeger & Katz-Gero 2011) shows that omnivorousness is not an universal invariant, but occurs in many forms, which are often marked by national/local particularities.

The main aim of our presentation is an attempt to show the specificity of musical omnivorism in Poland. What types of omnivorism display, which are dominant, and to what extent they depend on the class position? The data come from research (nationwide random sample) carried out in 2019 as part of a research project „Musical distinctions. Musical tastes and social stratification in process of Poles lifestyles formation" (www.md.ifispan.pl).

Based on our findings we argue that the musical omnivorousness in Poland is mostly expressed as semi-omnivorism. The most popular type is simultaneous liking of disco polo, pop and rock, followed by a combination of disco polo and folk music. According to expectations, omnivorism is associated with the class position but, unlike in other societies, omnivorousness is particularly strong among owners (apart from farmers), which seems to be attributed to the specificity of the systemic transition to the market society. The owners are a relatively new occupational category in Poland, which developed and gained financial prospects only after the change of the political system. Therefore they might be strongly motivated to learn new things and demonstrate appreciation of a variety of musical genres.

Private Taste and Public Space: the Controversies Surrounding a Privately Initiated Sculpture Park in Oslo

Larsen, Håkon

Oslo Metropolitan University, Norway

In 2013, a sculpture park initiated and financed by billionaire Christian Ringnes opened to the public in Oslo. Based around his private collections of female sculptures and placed in a part of nature close to the city center, the idea of such a park had spurred a lot of criticism for many years prior to the opening of the park. Residents, politicians, art critics and newspaper columnists had been highly engaged in discussing the park, and critiques had been performed in newspapers, at the actual cite for the construction of the park, in the City Hall and through the legal system. Based on an analysis of the media debate about the park, I will seek to understand why this became such a contested issue. I will follow the media representations of the debate throughout the years leading up to its opening in order to investigate what influence the protesters had on the process of realizing the park, and how Ringnes and Oslo Municipality set out to accommodate some of their demands in finalizing the park. In the analysis, I will engage with theories and research into the public sphere, the sociology of the arts, and arts and culture policies.

132

RN02_T02_02 | Gender and queering the arts

Camping At The MET

Pușcașiu, Voica

„Babeș-Bolyai" University, Romania

By choosing "camp" as the theme for the 2019 edition of their annual blockbuster fashion art exhibition – and subsequent gala, the Metropolitan Museum of Art's Costume Institute, brought this concept to a mainstream audience. On this occasion, people who might've never even heard of it before were suddenly interested in debating which celebrity guest 'nailed' the costume this year, and who was found to be insufficiently campy. However, the curator's approach based almost exclusively on Susan Sontag's 1964 essay Notes on Camp

did little to pinpoint an already elusive term, leaving plenty to ponder on its exact meaning. Besides the obviously favorable climate for the (LGBT)Queer(+) community, which has once more received recognition – in this case for its particular brand of creativity and over-the-top exuberance which has influenced high fashion, Sontag's 2 nd wave feminism does not particularly touch on the issue of diversity in the camp genre. This leads to a gap in the understanding of the meaning behind the term and its usage. It is the case with many subcultures that even when they do eventually surface only a small fraction of them is visible; this superficial and frankly quite elitist view, that showcases Oscar Wilde but forgets to mention the Polari language, with infinitely more complex implications, suggests that the intention might have been to build up the prestige of the phenomenon through a scholarly approach. But camp is ironic and so is the fact that taking things too seriously is the un-campiest thing they could have done.

Queering the Art Museum

Grácio, Rita

Lusófona University, Portugal

How have museums begun to address LGBTQI+ and feminist issues in the 21st century? This paper adresses this debate, by presenting a case study from Portugal, a particularly interesting country to answer to these. While Portugal holds some of the most advanced legislation on LGBTQI+ rights in Europe (Santos, 2012), it does not resonate in Portuguese museums, neither from the organisational perspective, nor from a gender museology perspective (Vaquinhas, 2014). This paper presents a qualitative study of the audiences that attended the initiative Bringing the Margin to the Centre, an initiative led by the small-group FACA, an intersectional feminist curatorial activist collective. This initiative was hosted by Berardo Collection Museum, hailed the main modern and contemporary art museum in Portugal. This study consisted of participant observation at two of the three events which constitued the initiative Bringing the Margin to the Centre, at which an adapted version of the Personal Meaning Mapping technique (Falk and Storksdieck 2005) was applied; semi-structured phone interviews with participants were then conducted after the event. The main findings show this event raised awareness among cisgender visitors with heteronormative perspectives and provided a space for counter-narratives of the queer community, showing the role of collective curatorial activism and museums in promoting gender equality and inclusiveness, if acting as gate-leakers, rather than as gatekeepers. Hence,

museums can provide lessons to other organisations interested in promoting diversity and inclusion.

75 Years of Musical Hits: Male Domination and Female Revolt?

Juan Bautista García Cabezudo, Verónica Àlvarez Martínez, Marta Càrceles García, Mireia Casado Olivas, Almodis Cebrià Salvador, Bernat González Ripoll, Carla Moncau Santaana, Gino Ricci López, Anna Sabater Montaner, José Marco Salcedo

University of Barcelona, Spain

The aim of this article is to relate social change in gender relations with popular music through the discourse analysis of those songs with high audiences. The terms and expressions used reflect the values, habits and other cultural traits that characterize gender relations in the different stages of the recent history of our society. However, it is interesting to know the evolution of terminology related to patriarchy, feminism and sex.

The article summarizes the quantitative and qualitative exploitation of a primary database that collects the most listened songs in the last 75 years of Spanish history (1946-2020). Since 1966, the most listened song of each week has been recollected on the radio station "Los 40 Principales". The sociodemographic profile of the listener of the station is varied enough for the database to be sufficiently representative. For the period 1946-1965 - prior to the weekly number 1 hit of "Los 40 Principales" - , various sources have been worked on to establish the great hits of each year. Quantitative analysis counts and analyzes the terms used and establishes correlations with significant variables. Qualitative analysis is based on the study of discourse and a novel intergenerational interpretation.

The results allowed to distinguish 3 significative stages in the social structure and in the gender discourse over this 75 years, the post war generation (1946-1970), the development and transition generation (1971-1995) and the stalemate generation (1996-2020), each of them with significant characteristics when we analyze the lyrics of the song, focused specially in gender relations.

Gender Melancholia: Representations of the Visibility of Female Artists in the National Greek Glyptotheque

Christina Botsou

Panteion University of Social and Political Sciences, Greece

The present study attempts to unveil gender-based inequalities in the presentation and mediation of arts, engraved by Greek female artists in their sculptural work, as presented in the National Greek Glyptotheque. Under the term Gender Melancholia, we refer to several representations of the female body, conceptualized by female artists, addressing the inequality of opportunities in the creative industries. Studying the qualities of the so-called melancholy, we analyze the works exhibited in the National Glyptotheque, considering the depiction of the act of self-injury, genital mutilation, suicide, and other representations of withdrawal from personal and professional life from female artists. The examination of the content analysis of the presented artworks consists of three major units of analysis: the description of the technical and aesthetic aspects of the artwork, the study context that provides us with the socio-historical background of the artist, as well as the interpretation of the artwork's metonymic significance. Furthermore, the study focuses on the cultural and symbolic structures of gender-based inequality, as noticed in its institutional manifestations, as well as its ideological affirmations, through the position of the female body in state-exhibited art. Examining the case study of the National Greek Glyptotheque, we have the opportunity to delve further into the study of the creative industries from a macro- sociological perspective. The present research attempts to detect the social significance of these depictions, as well as to identify and analyze their gender-related aspects.

RN02_T02_03 | Evaluation and elevation in the arts

"Cultural Policies and the Emergence of Artistic and Cultural Production Scenarios. The Case of Artistic Craftsmanship in Cuba."

Arianni Batista Rodríguez

University of Barcelona, Spain

During the last decades the study of cultural policies has been of special interest both for the field of sociology of arts and culture, and theory of arts. Certainly, there are significant differences between them regarding to the aforementioned topic, for example: 1) the analytical strategy (comparative/associative and explanatory/causal), 2) the main object of study (cultural policies and artistic production), and 3) the context variables (macro and micro level, respectively). As a result, the sociology of arts and culture has generated relevant analytical abstractions in relation to cultural policies at a global level, on the other hand, cultural policies have been situated by arts theory as part of the social and historical context where artistic production takes place.

How, then, to study cultural policies beyond the scheme of relations with the State or with specific types of artistic productions? One possibility could be a meso-level design, as well as the analytical perspective proposed by the sociologist of culture Rodríguez Morató (2012) for whom cultural policies should be studied in relation to institutional contexts, the socio-historical and procedural point of view, as well as the social relations that constitute them.

In this sense, the study aims to analyze the incidence of cultural policies in the conformation of emerging scenarios of artistic and cultural production. Starting from a singular case study methodology, the proposal contemplates an explanatory approach by contrast between three fundamentals actors: producers, institutional workers, and scholars. The main sources are documentary materials and interviews.

134

Practices of Valuation and Evaluation in Architectural Projects in Barcelona

Matias Ignacio Zarlenga

University of Barcelona and University of Tres de Febrero

The main aim of this communication is to analyze the social values of culture that emerging and shaping the architectural production from a sociological perspective. The communication shows parts of the preliminary results of the project UNCHARTED "Understanding, Capturing and Fostering the Societal Value of Culture" (European Union's Horizon 2020 research and innovation programme). The fundamental aims of the UNCHARTED are to elaborate a general vision of the societal value of culture in Europe and a road map for cultural policy action favorable to the plurality of cultural values. Within this framework, we part from the idea that cultural values are intrinsically plural. However, the plurality value of culture is largely lost due to the economism that currently prevails. In order to cover the greatest number of values that are put into play in architectural production we select three types of architecture firms of the city of Barcelona. We took as a unit of analysis the valuative and evaluative practices that were put into play by professional architects in the realization of two recent architectural projects of each selected architectural firm. From a perspective of pragmatic sociology, we take into account for our analysis the contexts (situation, actors and actions), practices (dynamics of classification and legitimation) and grammars (principles of justification, agreements and disagreements, criticisms) of valuation and evaluation that guided the different phases of development of the selected architectural projects. The interview techniques and the focus group were used to identify the plurality of values existing in the professional architects who work in architects' firms selected.

The Creative Process of Gastronomic Experience. Beefsteak Fat on Mugaritz, from Assemblage to Resemblance.

Asier Amezaga

University of the Basque Country, Spain

Halfway between science and arts, haute cuisine deals with a constant creation and recreation –cooking—of an elusive object. Food vanishes as it is tasted, which demands a constant reproduction of the plate. Accordingly, cookery deals with both the phenomenological dimension of the tasting of an elusive object and the systemic dimension of the standardization of the recipe. Such particularities become the haute cuisine an opportunity to extend the understanding of the creativity process involved beyond. Ultimately, haute cuisine share with arts its attempt to bring customers to new sensations and meanings.

This communication is based on ethnographical observation of the process of creativity of one of the most significant haute-cuisine restaurants in Basque Country, included in the 7th post of the World's Fifty Best Restaurant ranking. The presentation focuses on the plate as it analyses how the sociotechnical construction is unfold in it, through different places and departments and moments –creativity, degustation, opening and end of season.

Following the Actor Network Theory, the creativity process of the Mugaritz could be boiled down to one of it plates, 'terrine of peppers': a kind of trompe-l'œil of Basque beef large steak almost entirely made of what it is supposed to be its size dish, red pepper. The plate folds a set of human and non-human actors through the fat of beefsteak. The controversies arisen from the persistent attempts to assemble all the elements together made the dish to resemble beefsteak. It reminds us the collective and non-linear essence of creativity process.

The Double-edged Knife: Art, Collecting And The Consecration Of Contemporary Artists

Henrique Grimaldi Figueredo

UNICAMP, Brazil - EHESS, France

This work is part of the debates on contemporary art and its markets after the 1980s, a period characterized by an inflection in capitalist modes of operation (globalization of markets) and by the accelerated financialization of art (privatization of culture). With the central objective of drawing a panoramic diagnosis about the triad relationship between collection-institution-artists, this work is supported both in a conceptual approach and in research data. Firstly, it is necessary to identify that we do not deal with collectors in general, but rather a very specific group whose accumulation of capital and authorities allows them to arbitrate about art. Taking as a theoretical scope the idea of field in Pierre Bourdieu, formalized through its incessant disputes over cultural arbitrary, we will investigate this social space from its double aspect, that is, what is positive and negative in the emergence and growing participation of collectors in contemporaneity. Thereby, if on the one hand it becomes imperative to compute the centrality that some collectors assume in the processes of legitimizing art after the 1980s (in the promotion of "small historical events" or even in the artificial processes of artification, that is, of social recognition of art), on the other it is also necessary to understand the crucial aspects of certain collections as agents of circulation. Taking collectors such as Cisneros, Pinchuk, Saatchi, Pinault and Arnault as heuristic examples, we intend to demonstrate the real reach of collecting in the consecration of contemporary art.

RN02_T03_01 | Migrant artists

The Logics of Artistic Migration in a "Globalized" Art World: the Spanish Case

Gloria Guirao Soro

Universitat de Barcelona, Spain - Université Paris 8, France

Long-established hierarchies of power between territories persist in the so-called global art world. Migration flows by artists, curators and art professionals from the peripheries to the centers have intensified in the last decades. In the European Union, individuals take advantage of the free movement regime to internationalise their profiles and improve their chances of global success by migrating to capital cities like Berlin, Paris or London that function as international art hubs. However, individual social characteristics and resources available to make the international move seem to influence the election of a specific destination and the choice of a strategy for professional development abroad. Taking Spanish contemporary art professionals currently living in European capitals as a case study, this communication will present different sets of profiles that emerge when combining destinations, professional development strategies and social characteristics such as gender and class background, as well as age, educational attainment and professional status prior to migration. The results arise from a methodological design based on a qualitative approach (multi-sited ethnography in three cities, including 105 semi-directive interviews and participant observation).

Local art networks in the context of migration: Visual Artists from Turkey in Berlin

Niepel, Verena

Newcastle, Germany

In research, there has been an increased interest in art production by artists from abroad in Germany in the context of recent studies in art and migration. My paper investigates networks that are created through exhibitions in the timeframe between 2010 and 2018 with visual artists who recently moved from Turkey to Berlin, to make operations in cultural networks explicit. Narrative interviews, observations and document analysis are part of my methodological approach on networks as case-studies.

My research question is: How are perceived values and forms of classificatory knowledge created through interactions between artists from Turkey and cultural networks in Berlin?

It seems that art production by artists from abroad is connected to the formation of value judgements. I argue that values are not pointing at the singularity of processes that form an exhibition but that they are projected on artistic work and perceived as such by the public. An intial analysis indicates that cultural actors in Berlin make use of a certain language and terminology in interactions with migrated artists, e.g. exhibition catalogues. In order to analyse how language is used to form knowledge, I apply a theoretical approach combining institutional pragmatism and a poststructuralist perspective. A pluralistic conceptual framework will help to provide a precise analysis of changes in networks and show how those affect the work of Turkish artists and cultural decision makers.

By researching macro-level processes in art and migration and combining concepts of Art Sociology, I will encourage to take on a new perspective in research and artistic occupations. Moreover, the changes that I will make explicit point at dynamics in a wider context of current political and social instability.

The Transitional Aspect Of Artist Identities At ATime of Changed Uncertainties

Katalin, Soós [1], Kéri Rita[2]

[1]Eötvös Loránd University Faculty of Social Sciences; [2]Independent artist, researcher

Transition, change and adaptability is a basic element of the artist experience, and increasingly so in the past century and decades. Kata Soós has been exploring this aspect of the artist existence with relation to identities, coping strategies, self image and public image, and strategies of artists' positioning of themselves in the art scene. She has also sought to find parallels between transitionality in the artist experience and the migrant experience in general, and working also with migrant artsist specifically.

Suspending the frames that provided the stability of our social existence and adapting to a kind of permanent transitionality are exactly the kinds of demands that the global pandemic situation has faced society at large with. Therefore, with this research focus we can expect new insights in this rapidly changing context. The present work takes a look at the same phenomena in this new light. The research of the past several years has yielded a conceptual framework for grasping these states of constant transition and shifting identities. We now use this same framework and look at the developments of the past year with some of the same subjects. We were interested in whether these same strategies apply and prove helpful in the present context, whether and how they needed to be adjusted or revised. Based on the existing results and new interviews and field study, we revisit the aspect of transitionality in artist and migrant identities, and explore how it has been reinforced, changed or transformed.

RN02_T03_02 | Art, health and education: effects on children and young people

South of Aesthetics

Raffaella Frascarelli

Sapienza University of Rome, Italy | Nomas Foundation

The paper focuses on how artists are challenging the educational system by de-modernizing and de-colonizing learning through an interpersonal horizon and transformative process of mutual learning that are reconfiguring social life.

How to imagine and cultivate a self-reflexive education capable of generating knowledge, equity, solidarity outside the neoliberalist sphere? 'The Southern Question' by Antonio Gramsci and the 'Epistemologies of the South' by Boaventura de Sousa Santos are the socio-cultural, aesthetic, and theoretical perspectives motivating artist Valerio Rocco Orlando to found a new school in Matera, in southern Italy. By involving the multidisciplinary independent communities established by Adrian Paci in Albania (Art House, Shkodër), Wael Shawky in Egypt (MASS, Alexandria), Yto Barrada in Morocco (Cinémathèque de Tanger and Atelier Kissaria, Tangier), the artist arranges a series of itinerant workshops inviting local communities to mobilize and deploy their own socio-cultural resources to imagine together an educational action and a pedagogical pathway drawing on the unconventional knowledge of the southern demo–diversities. The archives of knowledge generated by these workshops and itinerant encounters are the educational resources and map of the new school in Matera.

Following the path of sociological imagination, such a case-study offers the chance to analyze how the approaches of the artist are formulating an alternative discourse within and outside modernity, rethinking the educational practices, challenging the borders of education, reinventing the sociocultural imaginations by promoting self-reflexivity, inclusion, solidarity, mutual understanding.

The Arts of Photography and Painting as Means of Communication and Socializing in Primary Education: a Case Study

Calliope Tsantali[1], Symeon Nikolidakis[2]

[1]University of Western Macedonia, Greece, Greece; [2]University of Western Attica, Greece, Greece

This paper discusses the use of photography and painting as means to showcase local environmental problems on the island of Paros, Cyclades, Greece. At the same time, these types of art are also utilized to promote socializing among the students involved in the specific environmental project. The project was carried out from January until February 2021 in a Primary school of Paroikia, Paros, Cyclades. Eighteen 5th grade male and female students were involved in it aiming at putting forward local environmental problems and possible solutions. Through photography the students managed to thoroughly present the problem of littering. Their presentation was further supported by individual paintings which depicted the degree of the problem. Moreover, photography and painting were utilized to provide suggestions and solutions to the problem and activate the school community and broader society toward assuming responsibility and taking action.

The primary aim was the students' contact with art on the one hand and their continuous contact with issues of culture and the management of problems regarding both the environment and their social relations. In this frame, the goals of the specific project centered round skills development tied to the current everyday life as well as to lifelong education and sensitization for environmental and social interaction issues.

Upon the completion of the project it was found that the students developed deep understanding about current environmental problems and their on-going responsibility toward their surrounding environment and broader society. Additionally, they realized that through their social interaction and involvement in prolific dialogue they were able to broaden their horizons and develop significant lifelong social skills that can equip them as future citizens of the civic society.

What Do We Know About Why Schoolchildren Who Engage In Expressive Artistic Activities Feel Worse Than Those Who Don't?

Chris Mathieu[1], Gökhan Kaya[2]

[1]Lund University, Sweden; [2]Uppsala University, Sweden

In a recent analysis of a large population-based survey of school-aged children in a region of Sweden (the Folkhälsoenkät Barn och Unga i Skåne 2016; Kaya & Mathieu 2019) we found that children who engaged in creative/expressive artistic activities were found to feel worse on a synthetic ill-being scale than those who did not engage in such activities. Similar patterns emerge from an analysis of the UK Household Longitudinal Study (UKHLS). These findings challenge the blanket assumption that engaging in artistic activity is pleasurable and beneficial for wellbeing, spurring a search for potential explanations.

On the empirical level it raised the question of what and how much we actually know about the coupling of artistic activities and well-being among school-aged youths and young people? What do we know about the social world of youth and adolescent arts engagement from a well-being perspective? Much of what we know about the coupling of health and activities like singing in choirs, creative writing, playing music among (amateur) adults finds positive health benefits. Our findings run counter to this and may be more linked to production or autonomy factors. Might the socio-psychic factors that artistically active youths experience be more like occupational artists than amateur adults who engage in expressive and artistic activities for pleasure and with limited aspirations; more eudaimonic than hedonic (Deci & Ryan 2008; Huta 2013, 2017)? Is it more like work, requiring rather than affording relaxation and recovery (Berga, & Muzikante, 2017)? Or is artistic practice among youths a unique social form which may have common structural dimensions as well as harbouring and rendering individual variation in interpretation and effects?

Music Transforms Life… From The "Orquestra Geração" To Infinity. Analysis Of Life Trajectoriesof. Of Young Musicians, Between 2015- 2018

Rute Teixeira

Faculdade de Letras, Universidade do Porto, Portugal

The outline of the PhD project in Sociology, carried out at the University of Porto proposes to analyze the "Orquestra Geração" as an instrument of social inclusion, through learning music to allow Social and Cultural qualification of the population, an integrated development of local communities.

The project aims to demonstrate the socio-cultural impact of learning music, in unequal facets of the social actor's life. It is intended to analyze and reflect on the impacts, at the individual and collective level, of the frequency of young people, in the "Orquestra" in its life path, between 2015-2018.

The processes of (re) socialization, (re) structuring of the life trajectories of 18 young people of the the "Orquestra" were analyzed, in different dynamics, after the end of their musical path in Basic Education. Subsequently, they were contacted for a formal interview, through which information was collected on their life trajectories in High School and University,

Thus, it was intended to critically observe the changes that occurred in the various individual and collective dispositions of the students, having as a backdrop the "Orquestra".

The methodology used was the Sociological Portraits, by Lahire (2005), through which the concept of Plural Actor. Through an analysis and triangulation of data, the enunciation of "Group Typologies" was accomplished, through the analysis, reflection and comparison of the 18 Sociological Portraits. Theoretically, it was shown that the social production of individual, deeply anchored in the collective, is not limited to this, being present in the most unique characteristics of each person (Lahire, 2005).

RN02_T04_01 | Art and migration

Giving Voice To The Immigrants And Imagining A Better World. Tensions And Paradoxes In Participatory Theatre (Turin, Italy)

Francesca Quercia

HETSL, Switzerland

For the past thirty years, with the redefinition of cultural and urban policies, artists have been assigned to social missions: strengthening social ties, contributing to overcoming working-class neighbourhoods and to integrate immigrants (Blondel 2001; Briata, Bricocoli, et Tedesco 2009; Bureau, Perrenoud, et Shapiro 2009). That process has been taking hold in many European countries, including Italy. As part of urban renewal programmes, a large number of theatre artists have taken over working-class neighbourhoods. They have proposed artistic projects with immigrants and have been displaying an objective of "empowerment" of projects' participants (Pontremoli 2005). They usually show their determination in giving voice to minorities and they describe theatre as an important way to imagine a "better world" in which Italians and immigrants could live together in peace and harmony. However, these artists most often belong to the majority group in the host society (in terms of nationality and ethnicity). How can they represent groups which they don't belong?

This paper is based on a four-year ethnographic survey carried out within a theatre association (Quercia, 2020). It questions how her director succeeds in forging a recongnized professionnal role, by self-designating as en intermediary between immigrants and Italians. She tries to emancipate immigrants and to give them opportunities for a better future, but she faces many contradictions during the implementation of projects. Despite her antiracist believes, she ends up producing minorization of immigrants (Guillaumin 2002). Based on a triple dynamics – of « racialization » (Guillaumin 2002; 2016), « ethnicization »(Jounin, Palomares, et Rabaud 2008) and « culturalization » (De Rudder, Poiret, et Vourc'h 2000) - this process assigns minorities to radical otherness, over which they have little power.

Migration Photography and Its Role in the Research of Migration Processes

Anna Fin

Pedagogical University in Krakow, Poland

The submitted paper is in line with the sociology of art as well as with visual sociology and history. Its main goal is to analyze migration photography, its role and functions, and to start a discussion on potential applications of such type of photography in sociological research of migration processes. Migration photography is a kind of thematic photography, being part of social and anthropological, as well as artistic photography. Such kind of photography has been developing since late 19th century and its main aim is to record fragments of immigrant social reality and the changes taking place within it. Migration photography gives i.a. an insight into the sphere of activity and behavior of migrants at specific historical moments, into their lifestyles and relations with the environment, the ways of manifesting their identities, etc. Nowadays, we can extract useful information about the culture and the society in a given period from migration photography. During the conference, particular consideration will be given to short presentation of achievements of migration photography and the key topics it undertakes. I will also attempt to show how a visual representations of migrants and migration phenomena may be a source material in the research of migration processes. The basis for analysis will be i.a. „IMMIGRANTOPOLIS" photography project, which has been designed as a collaborative endeavor of scholars, curators and photographers and which aim was visualizing the existence and presence of immigrants in urban space.

140

The Art Of Arriving: 'Refugee Integration' Through The Lens Of Artistic Practices

Michael Parzer, Ana Mijic, Lisa Bock

University of Vienna, Austria

'Migration and integration' are not only the subject of sociological research, but also a main topic in artistic practices that aim to challenge established views on (forced) migrants and to provide forms of representation that go beyond ethnic ascriptions or even images of alternative (utopian) realities. However, to date, there has been a negligible interexchange between such artistic practices and migration sociology. Exploring the art's transformative potential for the sociology of migration and integration is the main objective or our transdisciplinary and arts-based research project 'The Art of Arriving: Reframing "Refugee Integration"' (FWF – Austrian Science Fund). By going beyond conventional sociological research—we are creating a real-world laboratory, where sociologists accompany artists with creating and recipients with interpreting aesthetic expressions—the project focuses on contesting and revising the traditional sociological toolkit for understanding integration, which shows serious limitations when applied to contemporary societies. The concepts of 'assimilation' or 'acculturation', for instance, are of no analytical value in research on 'postmigrant societies' (Foroutan), characterized by super-diversity (Vertovec) and new majority-minority relations (Crul; Jiménez). In our prestation we will discuss the potentials as well as the limitations of our transdisciplinary approach by particularly focusing on the different logics of knowledge production in science and the artistic field and by shedding light on the challenges of mutual translation between sociology and the arts.

How Art Mediates Migration: a Case of Migrant Artists in Russia

Varvara Kobyshcha

University of Helsinki, Finland / HSE University, Russian Federation

The emergent interdisciplinary field of art and migration studies currently has been developing around two thematic areas: a) how migration shapes the patterns of individual trajectories within creative fields; b) how art enables and mediates collective (post-)migration diasporic or cosmopolitan communities. My study aims at revealing the third aspect of art-and-migration phenomena: how art shapes the migration experiences of migrant artists. To put it simply, what does it mean to be a migrant when you are an artist?

The paper is based on interviews with migrant visual and plastic artists who came to Russia from neighbouring (former Soviet) countries that I have been collecting since August 2020. The sample includes the creators from Kyrgyzstan, Ukraine, Kazakhstan, and Uzbekistan who moved to Moscow and Saint-Petersburg in the last two decades.

I will look deeper into the interrelations of 'social' and 'aesthetic' dimensions of migration. Moving between the countries as an artist implies a shift between the nationally defined art fields. However, it may also require a change in artistic genre or aesthetic tradition within which a migrant artist develops. The directions and trajectories of migration may vary greatly for different artists and sometimes appear just opposite to one another.

For instance, for artists trained in the realistic tradition of academic art, moving to Russia (even as a labour-migrant initially) means accessing the 'heart' of their own aesthetic universe. For a person trained in applied arts and 'Central-Asian' aesthetics, it would require significant adjustments to the 'Russian' style, which may feel unwanted and be even resisted despite the artist's desire to become a Russian citizen and be recognized as belonging to the 'Russian culture'.

RN02_T04_02 | Job preferences and economic choices of artists

Motivations for Self-Employed Artistic Work: Evidence from Contingent Worker Surveys

Tal Feder[1], Joanna Woronkowicz[2]

[1]Sapir College, Sheffield University; [2]Indiana University

Self-employment is much more frequent among artists and creative workers compared to other professions. This has led to the emergence of the notion of the 'artist-entrepreneur'. However, we need to better understand how artist-entrepreneurs differ from non-artists, especially their work motivations. This study starts identifying motivations for self-employed artistic work by using data from five waves of the Contingent Worker Surveys (CWS), a supplement to the Current Population Survey (CPS), and comparing these motivations to other categories of self-employed workers. We model the choice to be a self-employed artist using data on observable characteristics of workers, as well as information provided by workers about their motivations for work. As a result, we identify distinct motivations, stemming from employment conditions, which affect the artists' choice of self-employment. We find artists are less likely to be 'pulled' toward self-employment for the economic benefits, and more likely to be 'pushed' by having no choice. Artists are most likely to choose self-employment in order to increase their professional autonomy (i.e., have more independence and control of their time. However, the findings make us question the notion of the 'artist-entrepreneur' by showing that both artists and non-artists (with the exception of 'core artistic occupations') have similar motivations related to seeking professional self-determination in choosing self-employment.

Artistic Activities Express Artistic Identity: How Japanese Artists Explain Their Status

Kaori Takahashi

Rikkyo University, Japan

This study looks at how artists present themselves by focusing on what they are doing. The status of artists reveals both their occupation and way of life, and discussion about artistic identification involves confusion and dispute. Bohemian and entrepreneurial artist stereotypes provide a reference point for artists to describe themselves, but these sometimes involve misleading images and prejudice. Previous research has described artists' strategies to self-identify by positioning themselves between the two roles as a reason why they have issues with their identities. This study reveals a way to solve this problematic situation. To avoid misunderstanding, Japanese artists interviewed in Berlin explain themselves by what they are doing, such as painting, playing a musical instrument, or working in a theatre company. Their artistic activities thus become a better way to express their artistic lives than using the word "artist." Also, these people refer to themselves as artists in English or German but not in Japanese because the word "artist" in Japanese is problematic. When they want to go into detail, they find it useful to self-identify based on their activities. These descriptions adjust the image of the artist. Sociological research should consider artists not only as having an objective status but also through their subjective interpretations.

142

Career Expectations: Self--Fulfillment in the Eyes of Contemporary Visual Artists-the Israeli Case.

Graciela Trajtenberg

The Academic College of Tel Aviv-Yafo, Israel

According to Menger, artists' activity, in contemporary societies, follows an uncertain course, and its endpoint is neither defined nor guarantee (2014). This uncertain path embraces two related but not always overlapping aspects: under what conditions artistic success is achieved and how artists earn their living.

Studies conducted over the last decade have shown that visual artists are multiple job-holding (Menger, 2014, Throsby and Zednik, 2010; Arts Nation-Australia, 2015; Throsby and Petetskaya, 2017). There are considerable inequalities among visual artists in how much they work and what they earn. Most visual artists earn low incomes and very few earn high ones. Interestingly, this situation crosses national boundaries and different kinds of public cultural policy (Abbing, 2008; Menger, 2014). This polarized distribution of income in contemporary fields of visual art probably reflects the 'star system' phenomenon (Menger, 2014). This situation does not prevent either Israeli young people to study fine arts or established artists from pursuing self-fulfillment. They show a considerable high level of optimism. Half of the artists (56.2%) believe that their financial situation will improve in five years and less than 10% (8.3%) believe their financial situation will turn worse (Trajtenberg and Adler). The article analyses the ways Israeli visual artists explain their determination and perseverance.

The Meaningfulness and Value-Orientation of Artistic Work: The Case of Socially Engaged Musicians

Sari Karttunen

University of the Arts Helsinki, Finland

The artists' work is often said to be personally or psychically so rewarding that they are willing to sacrifice pecuniary incomes for the chance to concentrate on their art. While such narratives usually refer to art that is made from purely intrinsic motives, i.e., for the sake of art, this paper focuses on musicians who have chosen to mix musical aims with social goals. They work, for in-stance, with disabled people, marginalised neighbour-hoods, refugee communities, prisoners and ex-convicts, drug addicts, senior citizens living in care homes, palliative care or dementia patients, or families with challenges in child-parent relations. Music making in these circumstances is process-oriented ('musicking') but may also yield public performances. The paper focuses on the motives and values of socially engaged musicians, their professional aims and self-assessed achievements, the pleasures and the other benefits of their work to themselves and to the involved communities. Most socially engaged musicians have expanded their practice from narrower musicianship, and they often use the term 'meaningful' to describe their current work. The presentation draws upon survey responses and in-depth interviews with Finnish musicians that were collected between October 2020 and September 2021 as part an international project, "Music for Social Impact: Practitioners' work, contexts, and beliefs", which began in January 2020 and runs for three years. The research is carried out in Columbia, Belgium, Finland, and the UK, and funded by the UK Arts and Humanities Research Council.

RN02_T05_01 | Art and public memory

Moniuszko on Upper Silesia 200 years after the day of birdths of composer. Sociological studies

Maja Drzazga-Lech

University of Silesia, Poland

Stanisław Moniuszko was a Polish National Composer (1819 - 1872). It was the time when the Polish state did not exist, the time of partitions. His figure and the most popular musical works like songs and the operas Halka or Hunted Minor functioned as a symbol of Polishness for the Polish nation in the XIX century because of the process of reception. He has never been to Upper Silesia during his life. There is no evidence that his musical pieces were played in this region during his life. However, at the end of the XIX century, the process of reception of the composer figures and his most popular works as a symbol of the Polishness of Upper Silesia had started. In those times Upper Silesian was a border region in political and cultural meaning. There were German, Polish, and Chech influences. At the end of the world ward 1918, Polish State was restituted. However, the affiliation of Upper Silesia was disputed. there were three Silesian Uprising and plebiscites. After those events, in 1922, Upper Silesia was divided between Polish and German states. Till the end of The Second World War figure of Stanisław Moniuszko still functioned as a symbol of the Polishness of Upper Silesia. It became a part of the social memory of this region. In 2019 we celebrated the 200th birthday of Stanisław Moniuszko in Poland. I have conducted sociological researches about the reception of his figures at Upper Silesia. A quantitative and qualitative investigation was organized. I was interested in the contemporary meaning of his figures for Upper Silesians and if it still remains a part of the social memory of Upper Silesians.

Documents of the Pandemic. Between Social Art and Collective Memory

Katarzyna Niziołek

University of Białystok, Poland

The Covid-19 pandemic has not only been creating new, largely Internet-based, contexts and practices in almost every walk of social life, but also a collective memory of its own, or – to use the phrase coined by the Nobel Prize winner Svetlana Alexievich in 'Chernobyl Prayer' for another catastrophe – 'a chronicle of the future.' Among the numerous networking activities initiated online, a trend for documentation of this traumatic global experience and its local variations has grown, taking the form of public calls to chronicle and share narratives and images of life under the pandemic, merging art (or at least creative expression) and social inquiry, and resulting in a number of collectively built digital collections of prospective cultural and historical value. Among these initiatives, there are: 1) curatorial projects, 2) social and community archives, and 3) autoethnographies of different kind – based on both private, and public, professional, and amateur, collaborative, and individual effort. What a number of these projects have in common is that they are participatory, cooperative and inclusive in the sense that can be linked to the notions of civil society, public space, and cultural democracy. This paper, informed by the concepts of collective memory and social art, offers a selection of examples of the online 'documents of the pandemic,' and a preliminary study of the memory of the pandemic mediated by such projects. It is guided by the prognostic function of social research, as expressed in the question: What (and how) will we remember from this crisis?

Behind The Scenes Of Personal Stories: "Dzyga" As A Community Experience

Marija Kozak

Ukrainian Catholic University, Ukraine

«Dzyga» is a nonprofitable art centre in Lviv, Ukraine, founded in 1993 by local artists and public activists. It plays a crucial role in the city's cultural life, being an open environment for artists, musicians, and writers. Recently, the art centre was bought by a large company associated with "touristy" consumption spaces and rapid commercialisation of the city centre. This has raised a debate on systemic problems of the city's cultural realm such as the dominance of business interests over culture and art.

In this case study, I analyse the environment surrounding "Dzyga" through social, cultural, and political lenses. The experiences of the key actors that have contributed to the formation and development of this environment are revealed through categories of power, knowledge and subjectivity, and placed in the urban and historical contexts.

The main focus is on the cultural, social, and political backgrounds of the key personalities of the late 80s and early 90s local art community. "Dzyga" was conceived as a combination of literature, music and art realms that would undermine the Soviet reality with alternative visions and practices while building a horizontal organisation of work in the community.

The theoretical approach of this research draws upon Robert Desjarlais's notion of "experience", introduced in his work "Shelter Blues", as well as on Padraic Kenney's study of protest movements within the street carnival on the eve of the Velvet Revolutions in 1989.

The main research methods are qualitative in-depth interviewing and analysis of documents (journals, newspapers, etc.)

"Conquering Lost Memories. The Role of Artistic Practices on the Italian Colonial Past in Public Discourse."

Francesca Maria Fiorella

University of Salento, Italy

This contribution offers a reflection on the role of art in processes of reconstruction and objectification of collective and individual memory related to the controversial Italian colonial history in Lybia and the Horn of Africa, for which memory transmission has been hindered by the dominant power. We'll make use of qualitative social investigation to draw focus on cultural artefacts and their ability to influence the activation of a discourse of decolonisation and public memory. More specifically, we review contemporary visual work that in the last fifteen years has taken on critically the colonial and postcolonial question in Italy, in its attempt to pressure and promote attention on a topic never debated in depth, that nonetheless continues to have social repercussions today as observed in the regurgitation of fascist culture and ideology, ethnic and gender discrimination, political agenda and economic inequality. The research reveals how visual art is actively contributing to loosening a social knot, tackling the problem at its root. Wielding memory as a weapon, artistic production and practice present themselves not as the solution to a problem but rather as generators of critical conscience and knowledge, through which the spectator (as well as the social researcher) is given the chance to start discussion based on this counter-narrative of the past, ultimately effective in the present and aimed at the future.

RN02_T05_02 | Arts envisioning the future

Flickers of the Future: A Case Study in Engaging Filmmakers in the Creation of Positive Visions of Sustainable Worlds.

Anastasia Loukianov, Kate Burningham

University of Surrey, United Kingdom

In the face of the environmental and social crisis, positive visions and stories of the future have been acknowledged to be essential to a transition towards more just and sustainable futures. Images are likely to become particularly important resources in the creation and broadcasting of positive stories and visions in the wealthy and high environmental impact societies of North America, Europe, and Australasia, both due to their increasing ubiquity and to the special status they hold in these societies. Flickers of the Future is a public engagement project led by Global Action Plan (GAP) which involves filmmakers aged 18-29 in a competition to create positive visions for the future and aims to support the production of the most successful idea(s) into TV series. While researchers agree that creative outlets are fruitful spaces for the exploration of imaginary worlds and for the facilitation of shifts of perspectives, artistic practices cannot be unproblematically equated with beneficial outcomes for human flourishing. Artistic practices are both constrained and enabled by their existing traditions and the contexts in which they develop. Based on interviews with 13 of the filmmakers and a content analysis of the mood boards and synopsises they produced for the competition, we explore the challenges faced by the filmmakers in using film and images to represent futures which are fair, sustainable, and compelling to today's audiences.

Building the Future of Popular Culture Together: The Transformative Capacity of Engineered Pluralistic Collaborative Circles

Harkaitz Zubiri-Esnaola[1], Maite Santiago Garabieta[2]

[1]University of the Basque Country, Spain; [2]University of Deusto, Spain

Access to culture is a fundamental human right that is essential for sustainable development. It generates social energy, trust and commitment, improves people's lives and help imagine alternative futures. Collaborative Circles are proven to be effective in boosting creativity. Nevertheless, they were initially conceived as groups formed by chance or improvisation by people with homogeneous characteristics, not engineered by planned socio-cultural intervention. The present study analyses the case of Engineered Pluralistic Collaborative Circles (EPCC) in bertsolaritza, which is the art of improvised verse singing following metric and rhyme patterns in the Basque language. From a Communicative approach, this study conducted 32 in-depth interviews with experts in bertsolaritza. In addition, 3,644 surveys of bertsolaritza fans were carried out. Results show that bertsolaritza's policy has had EPCCs at its core. EPPCs have been able to attract people from more diverse socio-linguistic and socio-cultural backgrounds. Women have been able to enter the art through participation in EPPCs. EPPCs offer opportunities to train in the art as well as to generate friendship networks and to overcome loss of meaning and anomie, which are common in modernity. This policy has meant that bertsolaritza is no longer in danger of disappearing because the art has thrived considerably, the number of improvisers and bertsolaritza events has tripled in the last 30 years, and the volume of audiences is the largest in many decades and is more pluralistic in terms of age, gender and socio-cultural background.

146

Mapping the Anthropocene in The Deep Wealth of this Nation, Scotland and Th'Fleety Wud

Inge Panneels

Edinburgh Napier University, United Kingdom

This paper considers The Deep Wealth of this Nation, Scotland (2018) by eco-art pioneers Helen Mayer and Newton Harrison, known as the Harrisons, alongside Th'Fleety Wud (2017) by artist and poet Alec Finlay. The Harrisons explored through mapping how a future Scotland could thrive and create surplus of ecological resources and for the 'life-web' to flourish. Their future casting is founded on deep scientific ecological knowledge and social arts practice. This case study is contrasted with Finlay's work, whose linguistic mapping brings alive past ways of knowing the landscape and transposes them to the contemporary landscape of the South of Scotland Tweed valley. These case studies are placed in context of the legacy of 20th century avant-garde artist and ecological pioneer Joseph Beuys' Social Sculpture and 19th century sociologist and town-planner Patrick Geddes. These case studies are presented as significant models of Cultural Ecosystem Services where mapping and hacking are methods for collaborative, often interdisciplinary, art practices which, by specifically homing in on the local, highlight interconnectedness to global ecosystems. It proposes that they are underused and undervalued tools for policy-makers, to be reconsidered in context of the new ontopolitics of the Anthropocene, one of enmeshment and entanglement of culture and nature. Thus, these art projects help us to both understand our past landscapes in the present and forecast to the future in the context of climate change which will require cultural and societal shifts.

RN02_T06_01 | Artistic utopias and practices in urban spaces

Ensounding the City for the Breathable Future.

Polina Golovátina-Mora[1], Hernando Blandón Gómez[1], Jorge Barco[2]

[1]Universidad Pontificia Bolivariana, Colombia; [2]Medellin Modern Art Museum, Colombia

As critical meta-synthesis this paper revises the urban art- and, particularly, sound-based projects connected to the urban environmental problems to discuss the creative potential of the sound to sensify the invisible and silenced. More specifically, the paper addresses artistic expressions of the social representations of urban nature, air in particular, and the ability of sound to deconstruct the patterns of social imaginary, translate scientific knowledge and facilitate the scientifically and socially deeper understanding of the urban environmental problems and so more informed public support for ambitious local policy action in the Medellin metropolitan area.

Air quality issues in Medellin led to a public health burden often disproportionately affecting the more vulnerable. With decades-long air quality policies in place the core problem has not yet been addressed: poor understanding of the sources of air pollution, benefits of the actions, and the nature of the air itself couples with seasonal saturation of information on the air quality crisis.

Critical sonic studies explore sound together with other senses as a site for questioning subjectivity, reality, its dominating order and relations with the other. Sound is used to explain the complexity and reciprocity in interaction and highlight the productivity of diversity. The rich organizational system of musical literacy also offers a methodology to quantify the multidimensional impact of interaction. The COVID-19 lockdowns evidenced the possibility of the cleaner air and also offered a new meaning for sound as an alternative media of sense making under the necessity of social distancing.

Artistic Utopian Spaces and the Promise of Urban Development

Kerstin Niemann[1], Volker Kirchberg[2]

[1]HafenCity University Hamburg, Germany; [2]Leuphana University, Lüneburg, Germany

Artistic utopian spaces in cities are places of social transformation whose original place usages have been abandoned. Post-industrial transitions encourage urban development in conjunction with art and community engagement. The impetus for these developments comes from civil society initiatives, artists, and residents who appropriate spaces independently of official planning processes. This discourse is primarily based on the resistance against neoliberal growth ideologies (e.g. Gill et al. 2019), and the corresponding study of utopian urban spaces as a part of this resistance (e.g. Wright 2010). Artists have emerged as important actors in this inclusive, regenerative placemaking by providing alternatives. Socially engaged artistic practices have given the promise of alternative urban development a new spirit that goes beyond the concept of a creative city (e.g. Frasz and Sidford 2017). The paper looks at the processes and strategies of planning and realizing artistic use concepts of urban spaces. We compare experimental spaces, creative quarters and green spaces in the sister cities of Chicago and Hamburg. In Chicago, our case studies were the conversion of the Bloomingdale railway line, Experimental Station in Woodlawn, and the Rebuild Foundation in the South Side. In Hamburg, we illuminated the participatory Alster-Bille-Elbe PARKS project and the fux eG creative cooperative in Altona. Under Corona conditions, during the summer of 2020, we applied digital ethnography methods for data gathering and analysis; dwelling into local contexts by analysing web sites, documents, and conducting online interviews and workshops to engage with local artistic and creative actors involved in the planning process.

Urban Art Laboratory as a Form of Engaging with Everyday Life

Aleksandra Nenko

ITMO University, Centre for German and European Studies St. Petersburg State University, Russian Federation

The paper reflects upon the author's curatorial experience of a multidisciplinary urban art laboratory conducted as a 1-month group process in St. Petersburg, Russia, entitled "25 lines" as a dedication to the streets (lines) of Vasilevsky Island where it took place. The main thesis of the lab is Guy Debord's "art should return to everyday life". Through an autoethnographic lens, visual and text analysis of lab materials and personal interviews the paper reveals the processuality of the lab, which was built as an intermixture of lectures and readings based on French critical urban theory and performative situated practices, which formed a common ground for 50 participants with different backgrounds, who then were led through a process of urban research to the final phase of creating artifacts representing the everydayness of the lines. The paper shows different research techniques (e.g. drift, dialogue, rhythm analysis, mapping) used and tactics of appropriating the urban space were performed by participants based on the context of the line itself and the personal knowledge and attitudes of the members. The paper also discusses the emergent 25 mediums, which have translated sensual and conceptual experience of engagement with the lines in a variety of forms - games, installations, artbooks, alternative maps, video-guides, sculptures - and broadcasted the direct speech and materiality of the inhabitants' personal worlds, places of memory, maps of movements, and other "documents" of everydayness. Finally the lab is considered as an educational and community making format linking art, urban studies and everyday life critical reflection.

The Role of Music Education Centres in the Construction of the Barcelona Art Scene

Marta Casals-Balaguer

University of Barcelona, Spain

This communication will present the case of Barcelona as a city that concentrates a great diversity of music schools, both public and private, where studies are offered at different levels of education. From this point of view, emphasis will be placed on the centres of higher musical education and the role they play in the constitution of the artistic and cultural scene of the city. The first section will present different theoretical discussions on the constitution of cultural scenes and the city concerning artistic education centres. The second section will focus on the context of Barcelona in relation to music schools. The third section will analyse, from a qualitative perspective, the role of schools and conservatories of higher education in music in Barcelona regarding two dimensions: i) musicians' individual and collective careers, and ii) the artistic scene of the city. For this research, a qualitative methodology was applied and the main data collection techniques were the participant observation and semi-structured interviews, that were carried out with more than 50 professional musicians from the Barcelona music scene and agents from the education sector.

Keywords: music schools, musical scene, artistic education, Barcelona

RN02_T06_02 | Contemporary art markets

The Internationalization of Art Market in Emerging Economies: Evidence from Contemporary Istanbul Art Fair

Burhan Findikli[1], Busra Hasboyaci[2]

[1]University of Bergen, Norway; [2]Fine Art Agent London Ltd

149

The markets for contemporary art have been in the limelight over the last decades in relation to the ongoing academic debate on cultural globalization and its outcomes. The growing literature on the global art market provides some evidence of its emergence and structure, documenting how art galleries, auction houses, collectors, artists, and their works come together in global art fairs. The emerging economies – countries such as Mexico and Turkey and the BRICS countries – have considerably contributed to this process by organizing their own markets for contemporary art through art fairs.

This paper seeks to contribute to the relevant literature on the globalization of art markets by focusing on the case of the Contemporary Istanbul, the premier art fair that has been organized annually since 2006 in Turkey. We will scrutinize data to assess the extent to which the Contemporary Istanbul art fair globalized. Drawing upon quantitative data (i.e., the annual reports of the organization) providing information about the participants (galleries, artists, and buyers) and sales, the paper seeks to answer the question that: is it really a festivity of transboundary art market bringing a broad array of foreign actors or, to the contrary, does it predominantly put works of art by local artists on the market to be collected by local buyers?

Trending in the Margins: Contemporary art from Nigeria in the global markets

Jonathan Adeyemi

Queen's University Belfast, United Kingdom

Earlier studies have established that the value of art is socially constructed in the global markets. Drawing on the artistic field, feminist and postcolonial theories, this research explored the circumstances regarding the international obscurity and under-representation of contemporary art from Nigeria by examining the extent of its internationalisation. Integrating historical research with in-depth semi-structured interviews, the research reveals a weak internationalisation of contemporary art from Nigeria. This weakness is partly due to the systemic hegemonic marginalization and mainly to debilitating domestic socio-political factors, supporting Bourdieu's claim that agents' position in the artistic field is determined by their cultural, social and economic capital. The study argues that for Nigeria to become a center of art, supporting a robust domestic market and meaningful international engagements, it must develop adequate arts infrastructure and explore alternative global networks. While the government may not support these on its own, considering pressing fundamental demands, it should establish a supportive legislative framework to drive sustainable private interventions. The research highlights the underlying prejudice and contradictions in the positive assessment of foreign influences (including Africa's) on European art and the negative responses to Western inspirations in African modernist approaches. In addition to expanding the frontiers of knowledge in art history, sociology of art, and cultural policy studies, it also enhances our understanding of internationalising contemporary art's exigencies from marginalized contexts. Furthermore, it strengthens the arguments for global modernisms and the correctives to Eurocentric art historiography by establishing the aesthetic equivalence of Western and non-Western modernisms.

What can be the Future of Contemporary Art Galleries in the Age of Covid-19?

Alain Philippe Quemin

Université Paris-8 / Institut Universitaire de France / GEMASS, France

Traditionally, the development of contemporary art galleries is very dependent on 3 factors : 1- their own physical space, their address being very important as it plays a major role in their qualification as properly contemporary structures and as it must provide a direct access to collectors ; 2- the use of an internet site, which, once again, must show that the codes that indicate that a gallery is properly contemporary are fully mastered :it provides information on the activity of the gallery and especially on its artists (its « roster ») ; 3 -the third factor, the infuence of which increased tremendously from the 1990's, is the participation to art fairs. For many structures, the sales generated by art fairs could recently represent as much as 50 or even 70% of their sales and many of the most successful galleries participated to no less than 12 art fairs annually (or even as many as 20 in the most extreme cases !). Still, the Covid-19 epidemic broke out... and radically impacted the activity of contemporary art galleries, especially leading ones, which are emblematic of the sector to the general public. In this communication, we will analyse to what extent the business model of contemporary art galleries which had progressively emerged at the very end of the 20th Century is impacted and can be redefined by the new epidemic. How can galleries react to the new context and how cant they reinvent their model to adapt both to the Covid era and to the post-Covid one?

150

Evaluating Contemporary Artworks – Future`s Call is Waiting

Anina Engelhardt

Technische Universität Berlin, Germany

Contemporary artworks as novelties point to the future, in which they must prove their aesthetic value and economic worth. An appropriate form of evaluation has yet to be found. How do people determine value or worth of artworks despite little consensus about standards?

The inherent uncertainty of evaluating artistic goods relates to their quality of being novelties. Despite artworks simply being new in themselves, "novelty" is also a criterion in evaluative processes. The meaning and value of novelties consolidates throughout the evaluation process. Other quality attributes replace "novelty", which create and perpetuate an artworks meaning. However, novelty as a value in itself holds no meaning and says little about quality. It is not a sign of quality or value. How to solve the problem that currently appreciated novelties can claim little validity for the future? In this regard, evaluating novel artworks is exemplary for how to manage the uncertainty of future expectations.

A discourse analysis regarding an "economization" of contemporary art shows how novelty both causes and contributes to uncertainty when aesthetic and economic values collide. Multi-sited data interweave analytically identified aspects within the process of evaluation of novelties on the levels of interaction and discourse. This study utilizes 14 books, 11 interviews and supplementary ethnographic observations.

I argue that the criterion "novelty" leads to the destabilization of the evaluation and legitimation process. The indeterminacy of novelty exacerbates problems of aesthetic evaluation and obstructs establishing validity.

RN02_T07_01 | Promoting art

Preparing For The Future: The Process Of Production, Distribution, Promotion and Marketing Of the Works Of P. Modiano Before Winning The Nobel Prize

Clara Levy, Alain Quemin

Universite Paris 8, France

151

On 9 October 2014, the Nobel Prize for Literature was awarded to the French writer Patrick Modiano. Even if Patrick Modiano's reputation, which was strong in France, was more tenuous abroad, some of the literary prizes obtained before 2014 attest to his recognition outside the French literary field. The aim of our communication will therefore be to show how his publishing house, Gallimard, developed strategies so that Modiano be awarded the Nobel Prize for Literature. First, we will explain how the Swedish Academy works and the mechanism that leads, each year, to the awarding of the Prize to the winning writer. Secondly, we will highlight the fact that - and this is crucial for winning the Nobel Prize - Modiano's work had long been accessible in many foreign languages. Before he was awarded the Nobel Prize, his books had already been translated into 36 languages, including English since 1971, and even - and this is of course crucial for winning a prize, the Nobel, that is awarded by a Swedish jury - Swedish since 1970; moreover, from 2012 onwards, his texts had been published by a Swedish publishing house, Elisabeth Grate, that is notoriously close to the members of the Committee. Finally, in a third phase, we will look at how, once awarded, this literary prize, the most prestigious in the world, could further strengthen and intensify the dissemination of Modiano's works throughout the world, by multiplying the number of translations available (sometimes re-translations of the same work) and by increasing sales abroad tenfold.

Promotion, Aura, Performance: Studying the Use of Social Media by Italian Contemporary Theatre Companies

Stefano Brilli, Laura Gemini

Università degli Studi di Urbino Carlo Bo, Italy

In the last decade, the use of social media in the theatre sector has fuelled debates on the possibility to redefine the performer-audience relationship. However, insufficient attention has been paid to empirically study how performance artists balance their use of social media between the need to promote their work and the ambition to experiment creatively on the medium affordances. This paper explores the use of social media (Facebook, Instagram, YouTube) by Italian contemporary theatre artists and companies. The study explores performance artists' relational labour in tracing the boundaries between online/offline performativity and between personal self-narration and artistic promotion. Through a combination of profile analysis and in-depth interviews, we want to understand how this artistic scene, which always experimented with intermedial and participatory possibilities, makes sense of social media. Preliminary results show how social media interaction and content production is becoming an integrated part of companies working routines. Companies position their online activity outside a purely promotional logic. A logic of 'artistic aura construction' is preferred. The lexicon of the 'aura' appears as a modality to extend the artistic field's autonomy to typically heteronomous components (such as social media para-textual contents). This anti-promotional ethos translates to a lack of efficacy in strategic communication, but it also lays the basis for using social media to expand performative practices. Although the interviewed companies do not exclude such a possibility, they lament their current inability in making such an attempt, due to scarce resources and refusal to compromise with online platforms' constraints.

Promoting Art Performances Through SNS Synthesized Interactions

Satomi Ura

Meisei University, Japan

COVID-19 pandemic had given tremendous impacts on performing art all over the world. How do art performers get audiences back to theaters?

This study employs virtual ethnography (Steinmetz, 2012) to explore the art performance on the internet promoting audience to come back to live theaters. People stopped going to theaters under a state of emergency for a couple of months in Japan. Uncertainty brought an assumption that gathering in the theater was thought as the source of virus infections.

In the middle of an uncertain situation, the world-famous jazz pianist, Makoto Ozone provided his live performance on YouTube for fifty-three nights. He took requests from viewers through YouTube comments, while he was performing. Every night five thousand, six thousand of the virtual audience tuned in his live performance. These comments from virtual audiences and the artist's asymmetry ethnographic messages created synthetic interactions. How rich interactions emerged virtually. Furthermore, that situated interaction promoted physical live performance in theaters. In this study, I will analysis comments and performance which stimulated artists and audience form multimodal sociolinguistic perspective.

152

Branding the Essence of J.S. Bach. Composers as 'retro brands' in amateur musical ensembles

Sigrun Lilja Einarsdottir, Einar Svansson

Bifrost University, Iceland

In the last decades, music from various genres and periods has been used in branding products in consumer/retail marketing. Historically, artists and musicians have used various methods to create their own images to stand out from the crowd. The reality that amateur and semi-professional choirs deal with today are various: Firstly, there is the challenge of recruiting talented singers to draw in new members (essential for maintaining musical standards and for financial purposes). Secondly, to draw audience to their performances to collect ticket revenues and thirdly to create a positive reputation and image to gain a certain status in the local cultural life, specifically to receive grants and funding from public and private bodies. This paper will observe one case study: an English amateur Bach choir. Data was collected through participant observation, semi-structured interviews, and a paper-based survey. Findings indicate that Bach, in the context of choral music, is considered synonymous for challenging repertoire, indicating a strategy or a declaration of quality performance. Most Bach choirs in the UK can be classified as semi-professional choirs, which applies to quality features in the brand essence and auditions being like minimal quality standards. Furthermore, the image of Bach consisted of dominating historical representations of him as the modest, religious church servant who happened to be a musical genius, demonstrating hard, protestant work ethic while raising a big family. In a way, J. S. Bach has some of the characteristics of a brand personality, associated with the historical representations of his character.

RN02_T07_02 | Art and health

Cancer in Words and Images: Telling the Stories of Eight Women Between Social Science and Art

Susana Noronha

University of Coimbra, Portugal

Merging two fields, health and the arts, this presentation summarizes a postdoctoral sociological research about cancer experiences that have taken place in a southern European country, Portugal, pointing to the outline of another ontology, epistemology and methodology, a "third half" where people, experiences, and different forms of knowledge are parts of an undivided and indivisible sum. Retelling the stories of eight Portuguese women from the researcher's relational circle, it combines embodied knowledge, oral narrative, anthropo-sociological reasoning, and art, reinventing social science, scientific illustration, and ethnographic drawing, enhancing them with metaphor and imagination. Resulting from informal interviews and conversations, giving shape to the metaphors and the events deemed as relevant from these women's point of view, it blends words, text and images, transforming cancer into something that can be read, seen and felt. These stories redefine understandings of wholeness and disability, focusing in what remains unchanged after cancer; they also clarify how a process of ontological growth or shrinkage can affect the way cancer is perceived, altering its impact on a woman's life; additionally, they dismantle any understanding of cancer as an individual occurrence, describing it as a shared event, beyond body divisions or separations; and finally they demonstrate that resisting and surviving often implies silencing cancer, forgetting the story, "deleting" the past. Art or creative scientific illustration is used, not as a representation of cancer, but as a constitutive part of experience and a performative form of knowledge, acting and creating change.

153

"The Worse it Goes, the Greater it Is" – Impact of Arts in Physical Activities of Young People with Severe or Profound Intellectual Disabilities

Susan Marie Eriksson[1], Eero Saukkonen[2]

[1]South Eastern Finland University of Applied Sciences, Finland; [2]University of Helsinki, Finland

We show a few basic results of an ongoing research project dealing with opportunities of young people with severe or profound intellectual disabilities to have physical exercise as leisure, funded by ministry of education and culture in Finland.

The research methodology entails multi-sited ethnography in locations where physical activities take place, such as residential institutions, special education institutions, day activity centers, sports venues, youth clubs and nature, as well as themed interviews of persons close to them, e.g. family members and staff in disability, education and leisure services.

During fieldwork, we found out that physical activity of those young people relates to large extent to other types of leisure activities than sports, such as performative arts with various kinds of sensory stimulation. Physical exercise is inherent in many art-based leisure practices. Especially the effect of artistic performances is important in fostering individual abilities, both physical and social.

By looking at activities in social circus and sensory club settings especially, we shed light into such elements in arts that promote opportunities and encourage physical activity, and further its impact to social relations, social statuses and practices of participation.

„Arts and Science in Midwifery": a Case Study in Integrating Arts in Midwifery Education

Triin Jerlei, Katrin Klein, Silja Mets-Oja

Tallinn Health Care College, Estonia

This presentation explores the ways arts can be used in teaching midwifery students, both in practice and theory. The focus case study is the analysis of a pilot year of a new course, „Arts and science in midwifery", held at Tallinn Health Care College in 2020/2021. The design of the course involved specialists from both related fields, midwifery and arts. The course introduced arts into health care education in two ways. Firstly, theory and history of visual arts were employed as a source material for teaching history and philosophy of midwifery as an occupation and of women as the central subject of midwifery care. Secondly, the final assignment was a collaborative exhibition of student artworks.

The presentation consists of two parts: theory of teaching medical and health care humanities, focusing on arts, and the analysis of its application. An overview of different studies in health care humanities education is presented, followed by an introduction into the pilot year of the analysed course. The case study analysis combines the evaluations of the course and its potential benefits from both students and lecturers involved. This presentation aids in rethinking the designs of curricula within health care in order to teach students a more holistic approach and presents a case study of integration of arts, social studies and health care.

154

RN02_T08_01 | Seeing film: purposes and perspectives

The Vulnerable Spectator

Cicek Usumezgezer[1,2]

[1]Kirklareli University, Turkey; [2]Mimar Sinan Fine Arts University, Turkey

Although the way of use differs according to the changing needs of each discipline, vulnerability is an important research area in many different disciplines. Judith Butler's works on vulnerability have led to a more widespread use of the concept, particularly in the field of social sciences, which addresses not only the negative implications of vulnerability such as precariousness and unequal distribution of welfare but also a common condition of life, the mutual dependency, and openness of our bodies. Despite this, the number of studies on vulnerability in the sociology of arts and film studies is limited and most of these studies focus on the representation of vulnerable characters. In contrast to the previous studies, vulnerability is discussed in this study through the relationship of the spectator with her embodied film experience. In this study, vulnerability is transferred from the representation of vulnerable one to the spectator's vulnerability and the fragility of cinematic form.

For to do so, in this study, the films of Austrian director Michael Haneke are discussed through the possibilities of opening an ethical space between the spectator, the film, and the director for to make the spectator "vulnerable". It is pointed out that the film experience as the promise of Haneke's cinema where cinematic forms are made fragile, is an experience that opens the spectator to vulnerability. It has been suggested that this experience may allow for consideration of the spectator's own embodiment, shared vulnerability, and unequal distribution of vulnerability.

Visual Construction of Modernity: The Case of Cinematography of Socialist Yugoslavia

Luka Antonina

University of Zadar, Croatia

The largely state-funded film art system of the former socialist Yugoslavia was a vital and productive one, albeit still largely underexplored by the historians of art and sociologists. Owing to the specific position (the Non-Aligned movement founding member) that this former socialist federation of states occupied in the geopolitical constellation of powers during the so-called Cold War period, this allowed for a rich and heterogeneous cinematographic experience, ranging from the offical state-funded war spectacles on a Hollywood scale of production to the more intimately focused works boldly treading into new territories, that sometimes fell out of line and favour from the ruling Communist Party. The aim of this paper is to disclose predominant narrative strategies and visual patterns of representation in some of those films, while analyzing them through the prism of modernity as a cultural paradigm or, more specifically, against cultural (cinematic) practices of socialist modernism and its various aspects. Starting from Eisenstadt's thesis on multiple modernities, such historically-oriented, macro-sociological perspective on film art production and mediation should allow for new explanations of discursive strategies employed by the actors involved in different aspects of cinematic production, distribution, reception and consumption in former Yugoslavia.

Keywords: modernity, cinematography, socialist modernism, discursive strategies

Films As An Instrument Of Disseminating Nationalist Values: The Potential Effects Of Solidarity And Exclusion From The Film Directors' Perspective

Baiba Tjarve, Liene Ozoliņa, Anda Laķe

Latvian Academy of Culture, Latvia

While art often works as a form of protest and resistance (Smidchens 2014, Martinez 2019), an increasing number of studies are focusing on the arts as an instrument of cultivating and disseminating populist and nationalist ideas in contemporary Europe (e.g. Teitelbaum 2017, Caiani and Padoan 2020). The aim of this study is to investigate how artists interpret their work when their work is commissioned by the state in order to foster national identity. The study explores how artists reflect on the potential effects their creative work has on fostering belonging and solidarity or, on the contrary, exclusion and symbolic violence among different groups in society (such as ethnic or sexual minorities, and others). Films as an art form hold a particularly significant potential in terms of their social effects, considering the reach and structure of their audiences (Lindenfeld and Mcgreavy 2015, Rahimi and Amirian 2017). Taking this into account, the empirical focus of this study is on the experiences and views of Latvian film directors. The study draws on qualitative methodology, using the films (N=16) funded and produced as part of the Latvian centenary (2018) celebration as a case study. On the basis of the empirical findings, the paper seeks to make a contribution to theorisations of new nationalism in contemporary Europe as an exclusionary discourse as well as a source of solidarity.

Beyond Cinema? – Cultural Policies and Non-Commercial Exhibition. Contributions from the Analysis of the Portuguese Institute of Cinema and Audiovisual Database, 2007-2017

Helena Santos[1,3], Marta Miranda[1,2], Luísa Barbosa[2]

[1]Faculty of Economics, University of Porto, Portugal; [2]PORDATA-Francisco Manuel dos Santos Foundation; [3]CITCEM

Cinema is a complex sector, in-between market-driven and cultural logics. When focusing on exhibition, available information is still rare, particularly concerning minority segments like non-commercial ('alternative') film exhibition (NCE). NCE has been acknowledged by European cultural policies (as well as national policies), especially due to technological changes such as digitisation and streaming. NCE poses important issues regarding the potentiality of cinema, not only for film itself, but for a wider reflection about cultural accessibility and diversity. Although this is not a new subject, in the sense that it results from the on-going digital transformation, the current pandemic is accelerating some changes, such as the uses of film within performative and visual arts, and the challenging of the cultural-artistic dimension of cinema. This situation is a key cultural policy matter, sociological knowledge and discussion being critical to inform contemporary policies. Our research on NCE aims to contribute to this reflection. After having mapped and characterized NCE in Portugal, we accomplished the analysis of the Portuguese Institute of Cinema and Audiovisual (ICA) database (2007-2017). The database includes detailed information concerning all the registered film sessions, such as: characteristics of the exhibitors; time, date, place and regularity of the sessions; comprehensive info about the films exhibited; attendance.

We will present the main results of our analysis, aiming at demonstrating the key-importance of alternative (non-commercial) exhibition for cultural policies in near future.

RN02_T08_02 | Inclusion and equality in the art profession

A Life for Art? A Qualitative Study on Students at Italian Secondary Art Schools.

Anna Uboldi

University of Torino, Italy

Artistic education has received focused but limited attention from sociology, as part of an increasing interest towards cultural labour. However, Italian artistic schools remain a neglected research theme. The proposed study on secondary art schools aims to explore certain early dynamics of creative fields in Milan.

This work examines the educational experiences of students at secondary art schools through the lenses of cultural class differences. The research is based on in-depth interviews and focus groups with these students and their parents. Students' class culture contributes to their forming different scholastic dispositions and, above all, different outlooks on the future. The notions of cultural capital and habitus allow certain dynamics of the aspiring young creatives' process of self-formation to be examined.

Art school has an ambivalent position in the field of upper secondary education: it calls into question the hierarchy between intellectual and manual work that orders the social world. This school, therefore, represents a meeting point and, above all, a sorting point, between young people from different class cultures. Having in common an interest in art, its pupils demonstrate differences in their ways of experiencing and interpreting their choice and envisaging the future. This study calls for further investigation on social inequalities in artistic, educational and employment pathways.

Envisioning Fair Equality of Opportunity in the Arts

Kathryn Brown[1], Alain Quemin[2], Glòria Guiro Soro[2], Yoram Eshkol-Rokach[1], Océane Sailly[2], Franziska Wilmsen[1]

[1]Loughborough University, United Kingdom; [2]Institut d'études européenes, Université Paris 8

This paper examines tensions surrounding the achievement of equality of opportunity in the visual arts. Against a background of increasing market pressures, the rise of art as an asset class, the commercialization of museums, corporate sponsorship of the arts, the power of mega-dealers, and the influence of private collectors on cultural landscapes, it has become urgent to address the wider social factors that promote or impede the careers of individual artists at both national and international levels. This paper draws on new empirical data that this inter-disciplinary research team has gathered in France and the United Kingdom relating to the impact of gender and ethnicity on exhibition practices, the award of art prizes, and the shaping of cultural policies. The authors use this data to examine structural imbalances in the art world and to debate the kinds of change needed to foster greater cultural democracy. It is argued that the logic underpinning a 'winner-takes-all' art market has shaped artists' success in wider arenas, including dealer representation and exhibition opportunities. Drawing on ideas from contemporary political philosophy, we approach the notion of fairness from two perspectives (1) 'institutional fairness', understood as the extent to which art institutions generate or reinforce inequality; and (2) 'procedural fairness' considered as the processes by which some individuals in the art world receive advantages while others do not. It is argued that reimagining the infrastructure of the art world is a lens through which to examine wider issues of social justice.

The Visible Third – Female Artists' Participation in the Portuguese Contemporary Art World

Sónia Bernardo Correia

ISCTE-IUL, Portugal

This paper is part of an ongoing research that aims to understand the role of gender in the composition of the Portuguese contemporary art world and the possibilities and limits to the success of the professional paths of women and men artists.

The field of visual arts is gender sensitive as it differentiates the positions occupied by artists in terms of visibility and recognition. Women artists occupy a peripheral space, which may hinder the progression of their professional careers.

Based on the collection of data on the participation of artists in Portuguese exhibitions, art fairs, auctions and art awards between 2012 and 2019, the goal of this study is to portray female artists' participation as a condition of professional, social and cultural visibility.

From the analysis of a significant sample of institutions from the artistic field, it was possible to observe that the works of female authors are under exhibited, never exceeding one third of the total of exhibitions. Male artists also enjoy a comfortable majority as gallery artists (around 70%) and as part of institutional collections (around 80%). However, when analysing the younger age cohorts of artists by gender, it appears that there is representation parity, which may be a good sign of change.

The data shows that there are persistent gender inequalities in accessing the artist profession. Women are not yet occupying positions of exposure, recognition and legitimation in the market similar to those of their male counterparts, suggesting that they may face greater obstacles in experiencing successful professional trajectories.

RN02_T09_01 | Literature, publishing and papers

The Catalan Novel from 1965 to 1975: a Contribution of Publishing Industry to Innovation

Ariadna Peralta Llado

Universitat de Barcelona, Spain

Catalan novel during the last decade of Franco's dictatorship is considered innovative and varied. Following the production of culture perspective (p.eg. Peterson and Anand, 2004), I analyse how structure and organization of the publishing industry played a role to explain this literary revival. However, from a comprehensive perspective, tensions between economic, aesthetic and even political values have an impact on literary work (regarding writers, see Heinich, 2000). Consequently, I also reconstruct which values guided publishers' activity. All these features cannot be understood without paying attention to a repressive legal frame which diminished market dynamics (both supply and demand). The research is based on document analysis from public archives; also, from other primary and secondary sources. I focus on five enterprises that published the vast majority of Catalan novels' during the period. Results show that, in the sixties, variety and innovation emerged because political and aesthetic values were strengthened by publishing houses organization. On the contrary, economic values were undermined. In the seventies, the oversupply lead to a crisis and only publishing houses that found a balance between political, aesthetic and economic values were able to survive. Again, their organization was determinant. These results point to the importance of combining different sociological approaches, but also to take into account the particularities of each reality.

The Impact of the COVID-19 Pandemic on the Life and Work of Fiction Writers

Henrik Fürst

Uppsala University, Sweden

Many cultural and creative industries are in a crisis. Creative workers have been severely affected by the pandemic, not being able to carry out their trade and meet audiences. While many performing creative workers are struggling, the situation for book publishing and fiction authors is different. In Sweden, fiction books have generally sold well during the first year of the pandemic, and no major layoffs at publishing houses were announced. This presentation draws on online video-interviews with fiction authors to outline the ways in which they have been affected by the pandemic. The presentation covers the economic, social, and creative impacts of the pandemic on the life and work of authors. The presentation shows how the identity of being a fiction author relates to the conditions for the creation and production of culture during the pandemic.

The Social Representation Of The Lower Classes On Two Established Literary Works: Dostoevsky's Poor Folk And Saramago's Raised from the Ground

Igor Felix Pinheiro Nolasco

Faculdade de Letras da Universidade do Porto, Portugal

The lower classes tend to be socially represented in the cultural sphere in a "cliché" manner: they are usually portrayed in a "secondary" position, as beings that work with their hands and live hard and dull lives. The two works chosen for this research present a different perspective: the lower classes are the protagonists and they are represented as complex individuals that have contradictions and constantly reflect and react on the reality that surrounds them. Both of these works exhibit the physical and psychological obstacles produced by the social and economical inequalities that exist within our societies.

The dominant classes have a wide economical capital and with that they seek to legitimize its domination through the symbolic production of works and ideals that serve only their own interests. With that in mind, the literary works that contradict the dominant ideology and at the same time have established themselves in the literary field are special and deserve attention.

The main objective of this research is to analyse how the lower classes are socially represented in two established literary works: Dostoevsky's "Poor Folk" and Saramago's "Raised from the Ground". This research focuses in the following aspects of analysis: i) work; ii) religion; iii) women's role iv) habitus; v) housing; vi) the lower class by the eyes of others; vii) the lower classes' view of self.

The "content analysis" combined with a sociological analysis allowed that the hidden meanings and structures of these literary works could be deciphered, once not just the works but also the literary fields, the social trajectory and the main influences of the authors were studied and utilized in the construction of this research.

The Social Foundations of Literary Success and Failure: the Case of Roberto Bolaño

Hector Romero

UNED, Spain

In this paper we will analyze the literary career of the Chilean writer Roberto Bolaño (1953-2003) using the conceptual tools of the sociology of literature. Deceased at the age of 50, Bolaño obtained belated recognition and enormous posthumous success. Starting from a theoretical proposal that articulates the macro (literary field, enclaves of cultural innovation, social spaces of creation) and micro dimension (ritual and internalist interactionist, that is, attentive to the stylistic, thematic and rhetorical dimension of the literary work) of the relation between literature and society, we will study the keys to that late success. We will also pay special attention to the relation that the success or failure of creation has with the local structure of cultural production, in which institutional, organizational and symbolic factors converge.

RN02_T09_02 | Disturbing and disrupting art

From Vandalism to Art: Developments and Transformation Processes in Graffiti

Yulia Belinskaya, Olga Kolokytha

University of Vienna, Austria

Graffiti is a common phenomenon in contemporary urban cultural life. For the decades it has been associated with vandalism as well as with crime and gangs (Moreau and Alderman, 2011), and as such, has also been perceived as an undesirable and socially unacceptable practice, with measures against it ranging from fines to imprisonment. Graffiti has also been studied in association with its political connotation, with resistance and protest (Zaimakis, 2015). Graffiti is, on the other hand, an established form of urban communication and cultural expression (Christensen and Thor, 2017).

Our contribution examines new development and transformation processes of graffiti, such as institutionalisation, legalisation, commodification and industrialisation. Our research is based on empirical material consisting of qualitative interviews with graffiti artists and institutions in Bulgaria, Austria and the Russian Federation.

We observe the communication patterns emerging between the graffiti artists and institutions, in major defined by the level of trust in the institutions ranging from very low to very high. We also identify other tensions and common points, such as the conceptual differentiation between various forms of street art, or the questions of legality. We map the transformation of the practices of certain artists from illegal to more commercial and identify processes of conversion of vandalism into art.

New Ultra-Conservative Discourse in The Polish Field of Visual Arts

Paweł Możdżyński

University of Warsaw, Poland

The direction of the discourse of contemporary visual arts was determined by the avant-garde and neo avant-garde of the 20th century. Progress, social emancipation aimed at the protection of minorities, deconstruction of institutionalized religions and national histories, and transgressions of norms and conventions have been permanently inscribed in the ideological arsenal of artists, as well as the shock strategy designed to cause a radical change in the audience.

However, despite the avant-garde, subversive, and transgressive orientation inscribed in the foundation of the world of art, for at least 10 years a discourse has been developing in the Polish field of visual arts, trying to unite ultra-conservative axiology with contemporary art. This discourse has a strong national Catholic and anti-modernization tone. Pictures, videos, installations, performances, and other works are against tolerance towards sexual minorities, the equality of women, the values adopted by the EU. These artists and curators are fighting against postmodernism, "political correctness", feminism, „LGBT ideology", deconstruction of Polish history, atheisation of Polish society, and every „left-wing arts". The words of curator and critic, one of the most important animators of the right-wing artistic discourse, can be considered emblematic: "contemporary art does not have to be leftist at all". The artists and curators developing this ultraconservative artistic trend are strongly supported by the Polish authorities.

The paper will refer qualitative research of the discourse in the Polish field of visual arts.

Getting On Like A House On Fire: Theatre Censorship And Conditions Of Crisis In Greece Post-2010.

Olga Kolokytha[1], Matina Magkou[2]

[1]University of Vienna Austria; [2]SIC.Lab Méditeranée University of Côte d'Azur

Although censorship committees in Greece were abolished in 1986, censorship practices continue, especially in the arts and culture. Our proposal looks into theatre censorship in Greece post- 2010, identifies and maps the association of censorship with conditions of crisis, and how direct and indirect processes and mechanisms of censorship operate. We identify the different contexts and reasons behind censorship in theatre and discuss how audiences, culture professionals and cultural organisations participate in and/or react to different censorship practices in Greece.

We examine the press coverage of selected cases to identify how they were received and portrayed by the press and the ways voice has been given (or not) to different opinions, but also interview artists and administrators to get an insight on the views of people involved.

We argue that it is not a coincidence that those cases took place during the past decade, a time when the country suffered from the most acute crisis of its recent history. The fact that censorship has been abolished in press earlier than in the theatre in Greece, reveals the extent to which theatre is politicised, the dynamics of its audiences and the influence of different censorship-related narratives in the Greek society during times of crisis.

"The Crisis as Catalyst for a New Relationship between Policy and People in the Arts."

Johan Kolsteeg[1], Lisa Gaupp[2]

[1]Rijksuniversiteit Groningen, Netherlands, The;
[2]Leuphana University

The covid crisis has forced cultural producers to make drastic decisions in their day to day operations, like reducing live visitor numbers in museums or moving concerts and festivals online.

The impact of these choices on audience experience we are just beginning to explore.

Also, the crisis is sometimes also framed as an opportunity for realising – overdue – changes in the cultural field, which fuels the need to revisit contentions underpinning its practices, for example in the field of audience engagement.

Exploring the tacit knowledge from embodied practices developed in these recent developments could help translate into policy advice when looking at it from a transdisciplinary perspective.

In this argument the concept of cultural democracy is instrumental, when approached along the cultural and the politicological perspectives, here taken as learning to live with cultural differences and/or increasing cultural representation of underrepresented people.

This paper investigates how forced changes may engender an agenda for cultural democracy and future relationships between audiences, cultural producers and cultural policy makers.

RN02_T10_01 | Organizing the arts

Arts Organizing before Precarity and Crisis: The Case of Portuguese Art Workers

Joana Marques[1,2], Luísa Veloso[1,2,3]

[1]A3S; [2]CIES-Iscte; [3]Iscte - Instituto Universitário de Lisboa (ISCTE-IUL)

The outbreak of Covid-19 pandemic has thrown a spotlight on the arts sector worldwide. In Portugal, art workers immediately responded to provide access to culture and citizenship in unconventional places and to adapt to an online presence performing mostly free work. Simultaneously, the sector's structural precarity, that had always existed, has been chronically exposed, also raising the visibility of non-creative professionals in the art worlds (mediators, operators, technicians). On the private sector side, some reference cultural institutions took advantage of the crisis to advance neoliberal agendas of cuts and dismissals. Before the absence of government response to a sector comprised mainly by independent and informal workers, arts professionals started an unprecedented and persistent process of organizing for claiming urgency measures addressing their basic survival needs, but also a consistent policy and statute for the sector. This paper will discuss the changes happening in the Portuguese art worlds from two main standpoints: (1) the role of the State in the (de)regulation and (de)professionalization of the sector, when great responsibility should be exercised in the definition of public policies guaranteeing access to adequate labour rights and social protection to all workers; and (2) the ways arts professionals have been organizing to cope with precarity and crisis, through different forms of collective organization (worker collectives, shared service cooperatives, mutual support systems, inter-organizational collaboration, protest and collective action). The Portuguese case is taken as a case study of a reality that is affecting arts professionals worldwide, demanding a discussion at national and supranational levels.

Benefit as a Standard Unit of Measure for Arts Program Design, Management, and Evaluation

Constance DeVereaux[1], Kate Keeney[2]

[1]University of Connecticut, United States of America; [2]College of Charleston, United States of America

The need to establish impact for arts and cultural organizations has increased from the 20th to the 21st century (Courtney 2018) under political climates that question arts and culture benefits resulting from participation or attendance. "Benefit" is the most commonly used concept to express positive outcomes from the arts, which range from the practical: economic, educational, and health to the intangible: life satisfaction, well-being civic engagement, and social cohesion. There is difference, however, between claiming overall benefit from the arts, and benefits from the particular art experiences offered by arts organizations. Indeed, "Instead of questioning whether or not the arts actually do have the impacts claimed for them, researchers [direct] their efforts to coming up with evidence that they do" resulting in numerous "methodological flaws, which have been subjected to quite extensive scholarly critique" (Belfiore and Bennett 2009, 17). Since many benefits are intangible rather than concrete, many arts organizations are hard pressed to prove their claims and may be limited by modes of measurement not suited to the task. The inherent ambiguity of "benefit" and its popular application to a broad range of arts experiences, arts activities, and arts services raises issues for research, decision-making, program design, and evaluation. We address these challenges by exploring "benefit" as a standard unit of measure for design and evaluation of arts organization services. We use conceptual analysis to test the suitability and fit of a standard Benefit Unit. Benefit analysis, transaction theory, and theory of change are theoretical frames for introducing this conceptually grounded measure. Two case studies where, the Benefit Unit framework has been tested, are presented.

Cultural Organizations in Transition – The Role of the Organization

Julian Stahl

Zeppelin University, Germany

Our society faces multiple fundamental challenges such as technological, ecological or societal transformations. They are characterized by a complex interplay of different actors on different levels. These developments also affect organizations of the cultural sector and their institutional embedding, be it through new cultural policy demands, new technologies or new collaborations. However, the organizations are not only passively exposed to these developments; they are an active part of the transformation processes and play a significant role in shaping them.

At the same time, a look at current research on organizations in the cultural sector shows that the concept of organization/organizing itself is often not considered with the same precision as other aspects, e.g., institutions, legitimacy, leadership, innovation or business models. However, it can be assumed that a precise understanding of the organization of cultural organizations is necessary in order to reflect on and shape their role in the context of current societal developments.

Against this background, the contribution presents initial findings from two extensive ethnographic field studies (one of which was digital due to the pandemic) that examined organizational practices in two production houses in the field of contemporary visual and performing arts in Germany over the last year (2020).

Simmel and the Arts: An ethnographic observation of the Biennale

Dafne Muntanyola Saura

UNIVERSITAT AUTONOMA DE BARCELONA, Spain

How do we look and talk at the Venice Biennale? Following Simmel (in Frisby and Featherstone, 1997) we claim that international art exhibitions are the result of the generalisation of the social template of the money economy. There is much that is common between international 'trade fairs' at the turn of the past century and contemporary international art exhibitions such as the Venice Biennale. All are attempts to condense into a single time and space a 'representative sample' of contents. They exhibit a competitive element between the objects on display, and stress observation over purchase. Simmel isolates four aesthetic tendencies at work in exhibition environments: transience, shop-window aesthetic, stylistic relativity and amusement. His classic analysis goes hand in hand with current pragmatic and ethnomethodological theories on artistic judgement (Hennion, 2000; Heinich, 2014, Zembylas, 2014). We present here a longitudinal audiovisual and participant observation of the Biennale exhibits in 2013, 2015, 2017, and 2019. We thus present evidence of the visitors use of space, type of participation, multimodal communication patterns, use of the body and the aesthetics of the artistic displays. The findings show how the key principles oulined by Simmel are still in play. However, dress, conversations, and artistic evaluations take after the volatility of hyperconnected sociality, both intense and fragmented. The boundaries between the artists and the visitors, so clear in Simmel's times, are blurred in the contemporary Biennale exhibitions.

163

RN02_T10_02 | Artistic Identities and identification

"I am not an Artist, I Make Art": Amateur Artists in Israel - A Case Study

Shahar Marnin-Distelfeld[1], Uri Dorchin[2]

[1]Zefat Academic College, Israel; [2]University of Colorado, USA

This study deals with the dichotomy between amateurs and professionals in the visual arts in Israel, a topic scarcely researched. The Library and Memorial Center in Kiryat Tiv'on, Israel, in which there are two galleries – was chosen as a case study. The Israeli Art Gallery, supported by the Ministry of Culture is considered "professional", while the Upper-Floor Gallery (UFG) is considered "Amateurish". The study focused on thirty self-taught visual artists who are considered "amateurish" due to their lack of academic background in the arts, their relatively old age, and the kind of art most of them create. All of them have exhibited in the UFG recently. The aim was to understand the widespread phenomenon of retired people who dedicate their everyday life to art, as a second career, investing time, energy and money in becoming "professional", while yet encounter lack of official recognition, obstacles in displaying their art and low remunerations. The methodology applied combined in-depth interviews with these artists, along with a visual analysis of their artwork. We adopted the theory of serious leisure perspective (SLP) by Robert A. Stebbins (2015). According to the findings we claim these artists to be located on an axis between "amateurish" and "professional" within a fluid area of "serious leisure".

Aside from their marginal position in the art field, we detected a few characteristics distinguishing their artwork from that of "professionals".

"The Misunderstandings in the Field of Professional Identity - Designers Vs. Artists"

Paulina Rojek-Adamek

Pedagogical University of Cracow, Poland

The main goal of the presentation is to show how the role of designer is perceived nowadays. It will be described by the tasks and functions assigned to contemporary professional definition, and by misunderstandings accompany these descriptions. Designer's work is often identified with purely artistic work, which cannot be considered the only and proper way to define it. However, there are common elements that have foundations both in the method of education and in the functions prescribed to art and design.

In order to to justify the aims of the presentation, this description will be made through the prism of the relationship between the role of the designer and the role of the artist. The theoretical perspective is, among others, the sociological concept of the art field (Bourdieu 1992/2001) and the art world (Becker 1982/2008), supported by the contemporary concept of design and critical design (Dunne, Raby 2001).

As part of the considerations – at first, it will be introduced the concept of design and its functions connoting close relations with the field of art; second – defined the features distinguish the role of a designer and an artist. This part is based on individual statements of professionals within this field collected by the author.

Keywords: design, designers, artists, professional role

Connected to A Better World Through Chopin: The Social and Cognitive Impact of Chopin-Related Polish Music Events on Japanese Musicians and Amateurs

Yasuko Shibata

Polish-Japanese Academy of Information Technology, Poland

The paper considers the social and cognitive effects of webcasted Polish Chopin events on Japanese pianists and classical music lovers.

The Polish ways of celebrating Fryderyk Chopin's music shifted to the space of flows to let their loyal and latest fans engage themselves with newer forms of musical communication. Besides canonical on-demand clips of "Polish" performances of Chopin's works characterized by an exquisite balance of musicality, artistic individualism and spirituality, livestreaming of Chopin competitions, festivals and related events, organized in Poland yet free from its conventional concert rituals, attracts a growing number of participants worldwide including those from Japan. The virtual audience, conditioned by the values of their personal world rooted in the space of places, commune with the livestreaming performers over cultural meanings and transcendent values of Chopin's music.

How does digital musical communication via Chopin's works affect the somatic and psychological senses of self of Japanese musicians and amateurs? What are the effects of the listeners' virtual contexts on their appreciation of particular values of Chopin's music? How can the feelings generated through livestreamed Chopin's music serve their personal resilience and social relationship under the coronavirus pandemic?

On the basis of in-depth interviews with Japanese pianists and in-depth/focus-group interviews with Japanese amateurs who participate in Chopin-related events run and aired online by Polish institutions, the norms and practices of the cyber Chopin community nurturing intimate humanity and negating political conflict, as well as their impact on the way Japanese perceive and face the world, will be critically analyzed.

Challenged By The Pandemic: Socially Responsive Responsible Art And Design As Living-Thinking

Hernando Blandón Gómez, Polina Golovátina-Mora

Universidad Pontificia Bolivariana, Colombia

The present paper discusses the challenges the pandemic COVID-19 posed for engaging with and teaching socially responsible design. Remote teaching/learning, social distancing and the threat of the disease transmission, in addition to other new threats that the vulnerable territories in Medellin, Colombia, has faced during the pandemic significantly limited the traditional and contact-based methods of data collection and learning the territory. Lockdowns caused by the pandemic made walking and travelling around the city impossible, difficult or more dangerous.

Nevertheless, the pandemic and its limitations made both a student and an instructor reconsider their teaching/learning and research methods, question the existing knowledge and sense hierarchies and explore new ways and realities of knowing and learning towards the new freedom and inclusion. Instead of the extensive methods and "travelling" outside, the design had to explore more intensive methods and the "travelling" inside, "still travelling" (Deleuze and Guattari). This initiated re-thinking of the subjectivity, and facilitated reflexivity, construction of the new sensibilities and empathies.

The paper presents the collaborative work conducted in a socially responsible design methods course at a Colombian private university during two semesters (2020-2 and 2021-1), discusses the new dynamics emerged in/beyond the classroom towards socially responsible design and art more sensitive and responsive to the vulnerability and marginalisation; art and design as the way of quotidian sense making, learning, of living-thinking. The paper analyses the practical examples of the design and artistic elements, materials, sources and methods of social and community knowledge.

RN03 | Biographical Perspectives on European Societies

RN03_T01 | Theory and methodology of biographical research

Critical Reflections onEthical Dimensions of the Biographic Narrative Interpretive Method (BNIM): The Multidimensionality of Risk and Trauma in BNIM Panel Analysis

Lisa Moran

Edge Hill University, UK

The Biographic Narrative Interpretive Method (BNIM) is accorded prominence in social scientific research in various (and interlinking) social scientific domains including social work, social care, education, and health research. Much extant literature focuses on the BNIM interviewing technique. However, the literature on BNIM analysis is exceptionally sparse. BNIM is characterised by specific interviewing and analysis approaches; it is comprised of interlinking sub-sessions and 'pushing' for Personal Incident Narratives (PINs). Despite its usage with vulnerable groups including young people in state care, care leavers and women experiencing unplanned pregnancies, sparse research exists on ethical dimensions of BNIM interviewing or analysis. BNIM analysis comprises interpretive panels of people from diverse backgrounds exploring how interviewees would have experienced particular life events in different contexts. This paper asks ethical questions about the potential of causing emotional harm to BNIM panel participants, given the range of traumatic encounters people negotiate across the lived life. These questions are under-explored in existing research and more research into BNIM analysis is required overall.

In 'Anticipation Of The Future': Biographical Research In Piecing Together Fragmented Lives

Maggie O'Neill[1], Lyudmila Nurse[2]

[1]University College Cork, United Kingdom; [2]Oxford XX1 Think Tank, United Kingdon

In April 2020, six colleagues from the Research Network 03 'Biographical perspectives on European societies' including the authors took on a "walking" journey as a response to the call for papers from the ESA to share our experiences of lockdown. Using the methodology of the walking interview as a biographical method (O'Neill and Roberts, 2020) our walks were recorded and reflected upon, producing snapshots of our everyday lives, memories of the past. Walking helps us to form a sense of our past, present and future. The act of giving a personal account takes place within the flow of time, and is situated within social interactions, environments, landscapes and 'ongoing' biography. Having been physically locked down in our houses, flats, cities and countries and socially distanced in our own public spaces we have tried to establish a meaning of lockdowns for us and for the biographical methods that we all practice: the new meaning of 'time', 'space', means of 'communication'. Timing of the twists and turns in human lives that are commonly described in the analysis of the biographical narratives have always come with the anticipation of the future, expectations and plans. This faculty of the biographical method have to be fully engaged in providing the in-sights on what the after-pandemic us and society would look like. Our biographical walks reflected on the lost connections, forgotten episodes and people, books and treasured moments in lives - these would be the building blocks on piecing together fragmented lives of individuals, families, communities, countries. It is the time for the researchers to look forward.

166

Ethnography and Biography: Towards an Interpretation of Transnational Lives

Thales Speroni

Universitat Autònoma de Barcelona - UAB, Spain

The transnationalization of social life creates significant challenges for the interpretation of contemporary biographies. In what ways can we reconstruct transnational narratives and understand new ways of relating to time and space? This communication addresses this emerging issue and is organized into three main parts. First, it proposes the combination of three theoretical and methodological principles: I) the interpretive sociology, which recognizes the simultaneous and interwoven constitution of action and social structures; II) the methodological transnationalism, which problematizes methodological nationalism, ethnic essentialism, and the researcher positionality; III) and a relational perspective of social space that refutes reductive conceptions of a substantialist nature. Second, we advocate for the articulation between biographical and ethnographic methods. Specifically, we discuss the potential and compatibility between the multi-sited ethnography proposed by George Markus (particularly in the modality of "following" people) and the Biographic-Narrative Interpretive Method created by Gabriele Rosenthal and her colleagues. Third, we present a multi-sited ethnographic study developed through the "following" of immigrants' biographies and their families between Bolivia and the cities of São Paulo and Barcelona. In particular, it is discussed how the articulation between ethnography and biography enabled the interpretation of transgenerational and transnational (de)construction and circulation of health and education concepts and strategies. To conclude, it is argued that one of the main potentials of the articulation between ethnography and biography is the possibility of a non-ethnocentric and non-essentialist interpretation of social life.

RN03_T02 | Biographical research: analysis and interpretation

Entering the Research Field: Affective Autoethnographic Encounters

Minna-Kristiina Ruokonen-Engler

Institute for Social Research Frankfurt, Germany

Doing biographical research under COVID-19 pandemic places not only the research participants, but the researchers themselves in a more or less vulnerable position. The pandemic situation forces researchers not only to take care of the research subjects and their well-being, but to reflect on their own embodied, gendered, and affective involvement in the
research process. This situation has led to an increased amount of written autobiographical reflexion that can be found in blogs, corona diaries, newsletters, and journals. The need to reflect own everyday experiences and to share these autobiographical accounts with other people seem to be means to make sense of the collective confusion that we are all confronted with. In my paper, I ask what we can learn from such autobiographical reflexive accounts and discuss how such reflexive writing can support a research process under conditions of a global
crises. In my discussion, I draw upon my own research process, as I started to work on a new research project on social upward mobility experiences and their intergenerational negotiations in migrant families just in the middle of COVID-19 pandemic. I show how the reflexion of my own embodied positionality with the help of autoethnographic writing enabled me to cope with the emotions and affects, methodological and methodical challenges that the pandemic situation had caused and finally to start with my research project. In consequence, I argue that autoethnographic writing offers a creative, reflexive epistemological tool that can support the entry into the research field in the context of uncertain societal conditions.

Abuses and Misuses of the Concept of Trajectory

Katarzyna Waniek[1], Andrzej Czyżewski[2]

[1]University of Lodz, Poland; [2]University of Lodz, Poland

The following considerations are rooted in Fritz Schütze's approach to the biographical research and refer to one of the key concepts developed in that field – trajectory. Although it is the most often and meticulously described biographical process structure, it is – as we can observe – abused and misused in many different ways. In many cases it is applied (not generated from the research process) without the in-depth understanding of its ontological and epistemic foundations. This causes loss of its meaning and explanatory power.

We will therefore look at a few selected cases in which the narrators' experiences are misinterpreted (or, on the contrary, are not recognized) as a trajectory of suffering, and we will try to explain why this is so. We will show that many researchers referring to the concept of trajectory tend to take shortcuts in accordance with the requirements of the alliance of common sense with social psychology. Consequently, the trajectory is misdiagnosed (or emphasized) where it is absent and, conversely, not noticed (or diminished) where it really is. This is often related to the difficulty of suspending common knowledge and the tendency to introduce psychologizing explanations.

We will also provide examples to illustrate profound terminological and definition misunderstandings and discuss the resulting misunderstandings. For trajectory is often understood as the course (whole or stage) of life or any biographical process, or as the only way of experiencing social reality by a passive individual subjected to anonymous external pressure.

What is Left Unsaid: Omission in Biographical Narratives

Anabela da Conceição Pereira, Sónia Bernardo Correia, Magda Nico, Ana Caetano

Iscte -Instituto Universitário de Lisboa, Portugal

When we ask people to tell us the story of their lives, it is not the full extent of their biographies, events, experiences and subjectivities that we have access to, but only to a partial version of it. Biographical narratives are permeated by processes of selection, memory and also omission. There is a number of issues that research participants choose not to share or disclose in an interview context. Most of the times, what is left unsaid cannot be acknowledged, since we can only work with what is discursively revealed. In the scope of the "Biographical echoes: triangulation in the study of life histories" research project we were able to identify significant events, moments and relationships in a person's life that were not disclosed in auto-biographical accounts, but that were unveiled in hetero-biographical ones, by close people that were interviewed about that person's life. The triangulation of this data allowed us to access important elements of a biography that otherwise would have remained unseen. We argue that omission in this context plays an important role (i) in controlling the presentation of the self, (ii) and of a coherent biography, in people's self-protection in the face of (iii) negative emotions, (iv) tabus and (v) private matters that they do not want to share, and (vi) in the process of depreciation of events that are not considered relevant to be included in the life story. We also analyse the mismatch between the auto and hetero disclosure of such happenings or processes.

Law, Drama and AdaptingTestimonies of Survivors of Mass Atrocity Crimes for Performance

Jane Arnfield[1], Agata Fijalkowski[2]

[1]Northumbria University UK, United Kingdom; [2]Leeds Beckett University UK, United Kingdom

Collaborations between law and drama are a powerful means to bring individuals together in times of crises. Exchanges between academics, actors, and students of law and drama can push disciplinary boundaries bringing stories of hope and survival to diverse audiences. Our paper considers the way that testimonies can inform our understanding of mass atrocity crimes when adapted for performance. We focus on accounts from WW2, drawing on our respective research on /adaption of genocide (Fijalkowski, Law &Humanities, forthcoming; Arnfield, The Tin Ring, 2010). Testimonies are powerful legal tools containing enduring messages of hope. Testimonies preserve a record, which challenges the perceived notion of trials (Ashby Wilson, Writing History in International Criminal Trials, 2011). War crimes trials, such as Nuremberg (1945-1949), achieved some level of accountability. Testimonies played a pivotal role in these trials, comprising documents collected by the Polish Main Commission for the Investigation of Nazi War Crimes. Yet, the law has limits, and the performance of an account is pursued in order to get closer to the truth about events. Our focus will begin with Zofia Nałkowska, the renowned Polish writer, who assisted in gathering evidence, alongside her legal counterparts, in her post at the Commission. Her experience resulted in the book Medallions (1946) seven short stories written in documentary style about the victims and witnesses of the genocide in Poland. Adapting such a work for performance challenges our perceptions of the role of evidence in criminal trials and in shaping historical understandings of mass atrocity crimes. This convergence of law and drama, where the solidity of memory and the fluidity of truth, and its opposite, merits further exploration.

Postmemories of Unnarrated Family Stories

Outi Kähäri, Elina Turjanmaa

University of Oulu, Finland

In this paper, we explore how the memories of forced migration and family separation occur in the second and third generation. We use and further develop the concept of postmemory in order to understand how often traumatic experiences of the parents are transmitted to children and to some extent even to grandchildren. By applying the biographical method and keeping a detailed research diary, we combine the analysis of the biographical interviews with a close reading of the research diary. We reconceptualize postmemory to better adapt to our study context including fragmented or absent family narratives of the Ingrian families. We argue that postmemory is not necessarily narrated but may rather be sensed and emotionally remembered.

The interviewees of the study are children and grandchildren of Ingrians living in Finland, Estonia and Sweden. Their ancestors lived in the area of Saint Petersburg in Russia and experienced persecution, deportations and/or forced migration(s) during and after the Russian Revolution, in the Stalin era, and Word War II. The families of the interviewees were dispersed and the status of those Ingrians who ended up staying outside the Soviet Union was unsecure. In our study, we ask how these experiences are transmitted to the next generations and what becomes hidden over time. We inquire what happens to the process of intergenerational memory sharing – and, hence, the creation of postmemories – when the nation-states' borders and memory politics actively push for silencing and forgetting.

169

Affective Solidarity through commemorative practices

Elena Rozhdestvenskaya

HSE University, Russian Federation

The museum representation of Stalinism is adjacent to memory spaces of the city, which can be characterized as an "emotional capture" of the city. It builds conceptually on Massumi's theory of affect and his understanding of affect as the ability to affect and be affected, which indicates involvement in performative action. Important theoretical findings by Massumi and Stern include the concept of affective synchronization, which denotes the attunement of a performance's participants with each other through their bodies and senses. Such performances mostly include public rituals and commemorative activities. The sociologically important implication of the works by Bösel and Santino is the connection between rhythmic involvement (getting into the rhythm of a group performance) and the synchronization of community members, because this generates emotional involvement and eventually - solidarity.

The gaps existing in the historical memory of Russians as well as the allocation of official and alternative memories generate extra-institutional commemorative practices that can be endowed with the status of an "around-museum". The ethnomethodological analysis focuses on three urban activities exercised in Moscow and in other cities across Russia (Restoring the Names, the annual commemoration of the repressed at the Solovetsky Stone in Moscow, the Last Address project commemorating victims of repressions, and the Topography of Terror tour). This grassroots level of solidarity in commemorative civil society initiatives fulfills an important function of social cohesion of those social groups that keep the memory of Stalin's repressions visible in the discursive field.

Silesian Urban Area Divided By An Invisible Border – A Biographical Perspective On Economic Differentiation

Kala Dobosz[1], Paweł Lenartowicz[2]

[1]University of Lodz, Poland; [2]Independent researcher

Silesian conurbation belongs to one administrative area and struggles with the problem of the collapse of industry in a transformation period. However, taking into account economic indicators one part of the region with cities like Bytom and Zabrze is doing significantly worse than the rest of the conurbation. This part of the conurbation did experience mass resettlement of inhabitants after WWII. Nearly half of the inhabitants left or were deported to Germany, where the Polish mostly rural population was resettled into mentioned cities. These events were connected to large conflicts in the newly created community.

The research aim is to trace the link between economic differentiation and demographic history. We use the biographical method to study three generations in two neighboring cities, Bytom and Chorzów. Those cities contrast sharply in both demographic and economic spheres. The unemployment rate was 18,5% in Bytom, 8,9% in Chorzów in 2015, GDP was 90% and 145% of the country average respectively. The biographical studies on family generations from neighboring but distinct areas may help us understand how differences in family trajectories result in different individual choices. We assume that personal gestalt of life history reflects salient economic behaviours. Our effort is to combine economics with sociological perspectives within biographical studies.

The study could help diagnose the problems faced by the Silesian community in the period of transformation, which may help policymakers to meet another transformation due to global warming.

RN03_T04 | Biographies and identities

Biographies Of Roma Motherhood In Contemporary Czechia. Tapestry Of Multi-ethnic Identity, Marginalized Social Position And Emancipation Challenges

Jana Obrovská[1], Katerina Sidiropulu Janku[2]

[1]Masaryk University, Czech Republic; [2]Carinthia University of Applied Sciences, Austria

The paper is based on the thematic narrative analysis of 25 in-depth biographical interviews conducted in Czechia with Romani mothers in 2018 within the larger scope of international project ISOTIS. We focus on the constructions of multiple roles and identities Czech Roma mothers experience while often living in highly marginalized contexts with regard to their ethnic minority and low-income backgrounds. Their life narratives reveal the patterns of motherhood in their families of origin, how they were becoming mothers, what does it mean to be a mother for them, as well as how they are reflecting in their own socialization input on their own daughters, assuming that they will be becoming mothers one day too. These forms of motherhood intertwined in their biographical stories are sometimes in line with more traditional family role models, while other times they represent Roma women' complicated efforts of becoming emancipated from the larger family, poverty and social marginalization. The narratives present the symptomatic struggle between traditional expectations and changing social conditions that suggest for more emancipated conduct. This struggle is nevertheless highly influenced by racialized discourse that prevails in contemporary Czechia. These complex intersectional structures are inscribed into Roma mothers' experiences of becoming and being a mother. Thus, we will present the inner resources of motherhood in the context of Czech Roma women experience with raising children and more generally care in the private sphere.

New Framing of Migration: Construction of Emigration and Return in Magazin IR

Baiba Bela

University of Latvia, Latvia

Migration in Latvia is often at the centre of public attention, with emigration rates still exceeding immigration rates and young people leaving the most, which in turn amplifies the social problems caused by low birth rates and ageing population. Return migration is seen as very important for the future of Latvia's development and for the future of the nation. Therefore remigration is at the focus of the government, researchers and the media.

The aim is to explore the construction of return migrants' experiences of emigration and return in the magazine IR thematic series "Back Home", published in 2018 and 2019. Interviews are based on biographical narratives, covering the reasons for migration, experiences gained, resulting changes and accounts of return and reintegration. Interviews construct a certain portrait of the generation - the characters are young people, mainly in their 30s and 40s, who have made the choice to return after several years spent abroad.

Theoretical frame is based on assumption that people can craft personal and professional lives that span beyond nation-state borders and boundaries by creating new social, cultural and political meaning around events, actions and beliefs (Ozkazanc-Pan, 2019). These narratives recognize mobility as a new ontological condition (Calás and Smircich, 2011; Ozkazanc-Pan and Calás, 2015) and allows to understand the ways in which humans forge new experiences, lives and selves under conditions of mobility (Levitt and Jaworsky, 2007).

Let's Talk About Identity: (Re)constructing Ethnicity, 'Race' and The Irish Nation

Yaqoub Jemil BouAynaya

Institute of Art, Design and Technology, Ireland

This article provides a contribution towards studies of Irish identity and broader sociological understandings of the socially constructed nature of identities. Based on qualitative research it documents empirical data obtained from eight focus group discussions conducted across Ireland.

Identified heretofore are findings that emerge in the social (re)construction of Irish identity within the continuum of liquid modernity. Most noteworthy is the unambiguous centrality of essentialist notions of race within the social construction of Irishness. Although numerous mechanisms affecting identity formation were identified, several fundamental processes in the (re)construction of perceived 'Irish' identity are discussed. Particularly detailed is how compounded ethno-racial distinctions are reified and conceived of in essentialist terms; the singular idealised notion of 'Irish' identity is extrapolated and superimposed onto the collective.

Overall, comprehension of the Irish social fabric is achieved through a compounding of intrinsic notions of evolutionary change within the context of history, together with the reification of ethno-racial distinctions, ethnocentrisms, as well as the belief that society can be and is shaped by environmental externalities. Such an interpretation of social order and potential societal progress conveys a level of illogicality. It suggests that through social interaction, between members of the dominant normative group within Irish society, a blending occurs to facilitate transmission of racial/ethnocentric and conversely anti-essentialist values, which merge within the psyche of individuals. Although socio-psychological conditions perpetuate ethnocentric biases, conversely there is a cognisant understanding that such ideas of the inherent are actually quite fragile, baseless and abstract.

To conclude, although such a process is reconciled by individuals, through the preservation of conformity, it is seen as constraining conceptions of identity as fluid.

Social Biography As a Narrative Tool for Developing Awareness. A Pilot Study in Nonprofit Organisations in Southern Italy

Isabel Alfano, Alessio Ceccherelli

University of Rome Tor Vergata, Italy

The social biography is a useful tool of self-writing to "calibrate" one's point of view, to investigate one's way of thinking and perceiving the world, to analyze those elements that distinguish us and make our personal history unique, even though we have similarities with others.

The social biography is a narrative of the most salient turning points (Meo, 2007) that characterise our social histories, because it is through narration that individuals are able to construct their own realities, shaping their knowledge and experiences (Bruner, 2007). Thanks to some technical indications able to stimulate a process of self-awareness of one's own experience, social biography can be a useful method for all those professions whose main objective is to relate to others It allows us to modify stereotypes and improve the way we engage and develop interpersonal communication.

The purpose of this article is to present a research work carried out in six Italian Regions, through 250 social biographies written by managers of nonprofit organizations. In an ethnological perspective (Bertaux, 2008), life stories become tools for developing a reflection based on history, social identity and personal experience which, as underlined by Bauman (2003), allow the sociologist to build generalizations starting from the uniqueness of personal stories.

RN03_T05 | Challenged by the Pandemic: Biographies in Health and Social Care

An English Biographical Researcher Turns to Flânerie to Give the Isolated Elderly a Voice

Hazel Rosemary Wright

Anglia Ruskin University, United Kingdom

My customary practice, gathering people's stories through conversational interviews, was precluded by the pandemic, forcing me to adapt my methods. And like many others, my close-up contact shrank to immediate family and locality; a bubble of three that included an elderly relation who previously had functioned autonomously. Through a process I term 'care-creep', I began an insidious descent into carer as her need to isolate and avoid public transport, together with the closure of nearby facilities, restricted her opportunities to live independently. I began to 'listen' to life as seen by my elderly relative, learning more from the stories she told me about her friends and contacts, and – seeking to anonymise the data – turned the policy on daily exercise and social distancing to one of advantage. Together, these policies brought life out onto the pavement in a way that was clearly audible to those nearby – whether walking past or behind at a 'safe' two metres – enabling me to become a biographical flâneur. I began to broaden my perspective on 'being elderly', gleaning ideas from watching, listening and occasionally talking with neighbours as I wandered the village. This gave my walks a new purpose, as I imagined life through the eyes of an elderly companion, later capturing this in a single anonymised narrative voice as a form of "Impressionistic Research". Through this account, I draw attention to the frustrations and difficulties faced by cared 'for' and carer in a rural English village in lockdown, a situation that isolation, otherwise, renders invisible.

Asylum Seekers' Narratives Of Health And Illness. A Research In An Italian Hospital

Giulia Mezzetti

Università Cattolica del Sacro Cuore, Milano, Italy

This paper presents the preliminary findings of a research conducted with asylum seekers and beneficiaries of international protection accessing an ad-hoc clinic (ambulatory) set up for these patients by a hospital in Rome. Based on the insights provided by studies in cross-cultural medicine (Sannella 2021) and drawing from the methodology developed in the fields of "narrative medicine" (Charon 2006) and medical humanities (Crawford 2015), the project seeks to reconstruct the "stories of health" and "stories of illness" of these patients through interviews akin to life stories, collected with the aid of cultural mediators. The aim is to outline the medical needs of this population, investigating how such patients perceive their health status prior to accessing the clinic and after the medical consultations, while analysing their expectations about the hospital as an "institution" and their judgements about the treatments received. The paper evaluates the advantages and challenges of the deployed methodology. This type of interview provides ample room for the interviewee's self-expression and seems suitable to grasp the patients' feelings and necessities. However, establishing rapport with these interviewees may prove difficult: considering they are often traumatized by the experience of displacement and that representations of something so intimate as the body's suffering are culturally-laden, they may unwillingly retrace their health trajectory with someone who is not even a doctor, but a somewhat "baffling" researcher. While offering a reflection about positionality(ies), this methodological discussion shows the implications of the encounter between different "cultures of care" for the practice of medicine.

173

Individualized Biography at the Edge

Kali Carrigan

University of Amsterdam

The notion that modernity has transformed the self into a reflexive and biographical project has been the mainstay of the individualization thesis proposed by sociologists Ulrich Beck and Elisabeth Beck-Gernsheim, Zygmunt Bauman, and Anthony Giddens. In all aspects of life, the properties, functions, and activities previously attributed to social systems such as the nation-state, welfare state, the family, etc. have been increasingly "displaced onto global instances, while others have been intensively displaced onto the individual" (Beck & Beck-Gernsheim 2002: x). For persons reaching the end of life, this internal displacement of value meanings into individualized instances is thought to pose a significant threat to self-identity. For sociologists, one way in which the embodied tension of aged and dying bodies to the reflexive construction of self has been settled has been by the assumption that death naturally leads to a fragmentation in individualized biography. Dying individuals are thought to defend themselves against ontological insecurity by focusing on the health of their bodies, and adopting 'survival strategies' in which life options are strategically manoeuvered to reduce bodily risk and stave off physical decay. Grounded on in-depth biographical interviews carried out with individuals planning an assisted suicide in Switzerland, I will challenge the assumption that the approach of death leads to biographical rupture. I will present some of the ways in which individuals facing the end continue to reflexively shape their identities, and rely on previous experience and membership to imagined communities such as gender, ethnic group, and socio-economic status in order to resist biographical disruption and achieve a good 'death of their own'.

RN03_T06 | Visual and digital biographical research

Back to Basics? Photographic Portraits of Domestic Confinement During the Covid-19 Pandemic

Ana Caetano[1], John Goodwin[2], Magda Nico[1], Anabela da Conceição Pereira[1], Sónia Bernardo Correia[1]

[1]Iscte-University Institute of Lisbon, Portugal; [2]University of Leicester, UK

The emergence of the Covid-19 pandemic had multiple implications in research, namely in the development of ongoing or planned fieldwork. In the research project "Biographical Echoes: triangulation in the study of life-histories" we were forced to interrupt the co-presence biographical interviews we were carrying out. Due to this suspension, we had to rethink the project's design and find alternative ways to accomplish the research goals. The solution found was to maintain contact with the participants who had already been interviewed to understand how their lives had been altered by the pandemic, and how they were experiencing those changes. Telephone interviews were conducted and photos illustrating their daily lives during the first lockdown period were sent to us regularly. The analysis of the interviews and of the 210 photographs collected (between April and June 2020) configures what we named as "back to basics" at two different levels. First, from a biographical point of view, in the sense that the structuring of everyday routines, such as hygiene and eating habits, which generally operate on a non-conscious level, moved not only to the forefront of the daily organisation of time, space and relationships, but also to a more conscious level about oneself and the others. And, second, sociologically, because, despite being faced with an unprecedented reality, everything about the pandemic and its consequences concerns elementary social processes and societal dynamics of existence, that are already an integral part of the conceptual nucleus and of the body of knowledge of sociology.

174

"Draw My Life Internet Video- as an Example of a Micro Life Story"

Kaja Kaźmierska

Univeristy of Lodz, Poland

Draw My Life is an Internet phenomenon which is known enough to have its own description in Wikipedia, where we can read that it is "a type of Internet video in which the author narrates their life history, set to a fast-motion video of the author drawing illustrations on a whiteboard of key figures and events in their life". The videos began with Irish YouTuber and musician Bry in 2011 and in 2013 became very popular. Many well-known YouTubers posted such videos. They last several minutes and are a general overview of the whole life, told in an authorial (original) way and at the same time attractive enough to be watched by millions of Internet users. Also today we can find new videos. In my presentation I will analyse these films focusing on their structure, the way YouTubers present themselves, the events they expose in such short story. Above all, I will try to answer the question to what extent such biographical micro-stories can become analytical material for biographical research.

Viral Epistolary: Digital Collective Letter-Writing in Time of Pandemic

Anita Franceschi[1], Flavia Serio[1], Caterina Benelli[2], Ciro De Vincenzo[1]

[1]Department of Philosophy, Sociology, Education and Applied Psychology, University of Padova; [2]Department of Ancient and Modern Civilizations, University of Messina

Like many other countries, Italy faced the most severe and restrictive lockdown measures during the first SARS-CoV-2 so-called wave, from March to June 2020.
In this period, we promoted an online letter-writing and letter-sharing community project called "Viral Epistolary" (VE). VE lasted three months, collected more than 500 letters, and connected thousands of people from all over the country. VE's aims were to promote a digital space aimed at sharing domestic isolation, physical distancing, and pandemic experiences, as well as providing mutual and community support, by using letters as a mediation, meaning-making, and auto/biographical tool.

Our paper foresees two parts. Firstly, we will present the main findings of the preliminary phase of our research, where we conducted an inter-disciplinary narrative analysis of the letters collected. Hence, we will highlight how digital and community writing can be understood as a sort of "meanwhile" liminal space. The pandemic as a social total fact is rearranged through resistance, survival, and social relationships-restoring frames. Particularly, we will see how personal and biographical resources are used to deal with and understand social phenomena and how different personal and social backgrounds emerge from a shared narrative pretext.
In the second part, we will discuss methodological issues related to the second-ongoing phase of our research, which involves EV's participants through new writing opportunities and interviews. The scope will be to deepen the understanding of how their experiences related to the pandemic have changed through time and within the transformation of overall pandemic social-framing processes.

Photo-elicitation techniques in autobiographical interviews with Black Poles (work-in-progress).

Piotr Szenajch

University of Łódź, Poland

This paper will discuss introducing visual interviewing techniques into a biographical research design. It will also comment on preliminary results of a pilot study.
The project aims at producing a sociography of the experience of being a black Pole based on life stories of adult mixed-race Poles, raised in Poland and identifying themselves as Polish, with at least one immigrant parent. A generation of people has come of age, who were born into families started by immigrants coming to Poland from Africa and Asia still under communism and in the 1990s.
Despite a significant wave of immigration in recent years, Polish society is still uniquely mono-ethnic and mono-cultural. There is little anti-discriminatory or multi-cultural education in the public school curriculum. The representation of non-white Poles in the public discourse and popular culture is sparse. Is such a society, being mixed-race means bearing signs of otherness which are at all times 'hurled in the immediacy of the visual encounter' (W.J.T. Mitchell).
Photo-elicitation techniques may help in reaching aspects of experience not evoked through narrative constraints of an oral interview. Images may elicit autobiographical

175

stories in a distinct non-linear and non-chronological fashion. As most of the interviewees are young adults, accounting for audiovisual, digital online forms of autobiographical expression, typical for their generation, seems vital.

The autobiographical narrative section of the interviews will be followed by a photo-elicitation section, consisting of four stages, corresponding to selected strategies of visual interviewing. These will include visual documentation and asking for comment on photos from interviewees' family photographic collection, photos shared on social media, as well as significant objects, symbols, souvenirs or clothes from the interviewee's private environment.

RN03_T07 | Biographical and life course research

From Victims to Survivors of Gender-based Violence in Universities.

Ana Vidu[1], Mengna Guo[2]

[1]University of Deusto, Spain; [2]University of Barcelona, Spain

There is increasing research on the experiences suffered by sexual harassment victims, as well as on their processes of disclosure and resilience. Some research suggested that the recovery of GBV victims usually depends on the responses they receive from other people. This paper analyzes the process from victims to survivors of GBV victims in universities, from two perspectives. On the one hand, we analyze to what extent the increase in disclosures depends on having successful referents, that is, other victims who have experienced positive consequences after breaking their silence, and have moved through the process of victims to survivors with personal and professional success. On the other hand, this study incorporates the socio-neuroscience perspective, studying the impact in our memory of hard episodes experienced throughout life. Some neuroscientists reveal that autobiographical memory has a prospective function, so depending on how we remember the past, we project and act in the future. Thus, considering GBV one of the episodes that most affect our memory, addressing this issue properly is key to a satisfactory life. Along these lines, our results indicate that communicative interactions among peers and support networks influence memory and have an

impact on its transformation, which prevents future negative consequences, that in some cases have been shown to happen when violent episodes have occurred in the past. This paper emphasizes the relevance of promoting spaces for dialogue and trust so that, victims may decide to review their past situations, from a positive and transformative approach, while becoming successful survivors.

The Role of Prison in Mafia Women Life Course. The Normalization of the Imprisonment Experience.

Martina Panzarasa

University of Milan, Italy

The ecological and systemic approaches to the study of human development made clear that challenges are defined by resources, and vice versa; this is why it is crucial to explore the relationship between these two dimensions in order to understand how individuals experience life transitions. Imprisonment can be considered a hard challenge in human life course, capable of triggering situations of stagnation or decay. However, for families involved in mafia activities, it is a very common experience. Due to the illicit nature of mafia organisation, imprisonment is at least expected and, at times, necessary to advance in the criminal careers. Since it is not prescribed, but common and socially expected, prison experience seems to be a quasi-normative shift (Hendry and Kloep 2010) in mafia fellows' life course. This paper deals with mafia members' representation of this transition and their resources to face it. It focuses on the case of mafia women and it is based on 18 in-depth interviews with women involved in mafia organizations imprisoned in an Italian high security section. It shows that mafia women access some peculiar resources to face prison challenge. These resources are rooted in a twofold previous experience: the one they "have" thanks to the sharing of knowledge about prison within the family, and the one they "make" by visiting detained relatives. Relying on these resources the challenge of imprisonment tends to be represented through a normalization discourse.

176

Biographical Metamorphoses of Upwardly-Mobile Academics from East-Central Europe

Olga Kurek-Ochmanska[1], Anna Dolinska[3], Kamil Luczaj[1], Sylwia Mikrut[1], Monika Struck-Peregonczyk[1], Edyta Tobiasiewicz[2]

[1]University of Information Technology and Management, Poland; [2]Jagiellonian University, Poland; [3]Independent Researcher

This study derives from a larger project on the biographies of working-class academics in Poland which focuses on showing how the experience of social mobility shapes the cultural practices and social taste of upwardly mobile academics. In the study, based on three narrative interviews with upwardly mobile PhDs in their mid-thirties, we demonstrate that these narrations are devoid of a clear action plan to become an academic. It was to some extent by accident and coincidence of various circumstances that they pursued careers in the academia. The analyzed career paths were accelerated by (significant) others who inspired the upwardly-mobile academics to get involved in scientific student organizations or made it possible to take up an academic post. Although they faced different institutional expectation patterns (from undermining the value of academic education, through indifference, to full support), they had all undergone biographical metamorphoses. Even if now all three have academic achievements, their relationship with the academia has always been complicated. Rather than a career, they were always seeking a job to make for a living, and some of the alternative choices were different precarious positions. In this paper, we compare these biographies with the life stories of the elite Polish academics employed by top world universities in the US and the UK. Their narrations are in sharp contrast with the narrations of the upwardly-mobile academics. Instead of precariousness, they speak of academic privilege, instead of profound biographical metamorphoses, they experienced perfectly orchestrated institutional expectations and long-term biographical action plans (often created in early childhood), and the feeling of insecurity is replaced with a sense of self-confidence.

A Child's Right To Know? Intersex Adults' Reflections On Childhood Medical Intervention

Maria Feeney, Tanya Ní Mhuirthile, Mel Duffy

Dublin City University, Ireland

Intersex people have bodies that are born different to typical male-female ones. Intersex is an umbrella term that includes more than thirty ways the human body differs according to its sex characteristics (i.e. genitalia, hormones, chromosomes, sex organs).

Some differences are determined at birth, in other cases, a person may not realise they are intersex until late adolescence when delayed physical growth/menstruation may prompt medical investigation. Furthermore, law and policy does not benefit intersex people to the same extent that the non-intersex population benefit. Issues arise relating to: the rights of the child, bodily autonomy and integrity, to name but a few.

Traditionally, intersex variations were pathologised in a medicalised disability model that sought to correct/fix the 'problem'. Often, babies, children, and adolescents were subjected to unnecessary interventions on their bodies that they did not consent to in an attempt to 'normalise' their bodies according to the male-female biological binary.

Using hermeneutical phenomenology, we interviewed intersex adults some of whom discussed what it means to have endured such interventions. They described growing up not knowing what had happened to them and how they eventually learned the truth about what happened. The ongoing harmful effects of such interventions prevail and feature in their daily lives - in some instances, they prevent them from living 'normal' lives. Psychological trauma abounds. Feeling violated and questioning their self-worth are some of the deeply traumatic realities they struggle with as they navigate adulthood. Furthermore, the role of parents and doctors emerge as problematic.

Let's Map Our Neighbourhood: Girls' Participation and Critical Sexuality Education

Parul Malik

University of Delhi, India

'Space' is understood to be a non-homogenous concept with ever-shifting dichotomies of public-private, work-leisure and geographical-imaginary (Butalia, 2012). It encompasses physical demarcations and structures, and carries latent socio-political and subjective meanings. Notions, for instance, of personal safety or casual loitering come to be conditioned by one's intersectional social position (Phadke, Khan and Ranade, 2011).

This paper is part of a doctoral study about Critical Sexuality Education (CSE) and children's agency. It builds on frameworks of critical pedagogy (Sanjakdar et al, 2015; Freire, 2005) and participatory research (Siry, 2015) to engage with ideas of equity and social justice through one example. It explores the role gender plays in the lives of school going adolescent girls living at a Shelter Home for street children in Delhi (India), as they relate to spaces, familiar and imagined. We developed a mapping exercise and identified locations and civic facilities that mark everyday engagement with and navigation of public spaces with hostility. Spaces were understood not only through the lens of 'safety' or 'risk', but also through perspectives of desire, say, of leisure or having 'fun'. We reflected on questions like: Who can claim public spaces? How do spaces produce unequal citizens? How does one's lack of ownership over spaces translate to a loss of agency and opportunities? Can we reimagine and reclaim spaces?

The intervention was grounded in girls' everyday lived realities. The control over content and manner of engagement also lay with them. Girls' participation, thereby, enabled them to actively define their own learning, while collaboratively nurturing the process of research (Rampal, 2008). This amounted to pedagogical and research implications for a comprehensive, applied and relevant understanding of CSE.

Children in the Digital Economy: Rethinking and Broadening our Understanding of Child Labor

Angel Lara

State University of New York, College at Old Westbury, United States of America

Digital and platform economy is being boosted by a model of accumulation based on the exploitation of the sociality of Internet users. Internet-using activity embodies a dense flow of constant interactions that, conveniently algorithmized, becomes invisible and unpaid digital labor- productive performances dispossessed of formal recognition and status.

Although social research focused on the problematization of digital labor has proliferated over the past decade, there is a remarkable lack of studies focusing on the analysis of the digital activity developed by children- a magma of massive digital practices in social networks, platforms and applications that, conveniently commodified by the digital corporations, becomes authentic labor, that is to say, a myriad of economically exploitative activities performed by children.

Based on these assumptions, the traditional patterns of categorization of child labor by instances such as the International Labor Organization need to be urgently broadened and updated. To this end, this paper offers a sociological analysis of the qualities of the digital labor developed by children in online networks and platforms, as well as a description of some anthropological implications of child Internet-using, particularly with regard to the interactions with the virtual assistant Alexa (Amazon) and the performances developed through the video-sharing social networking service TikTok.

The ENEM Exam As A Rite Of Passage For Brazilian Children And Youth - A Netnography Of Digital Representations

André Cardozo Sarli

University of Geneva, Switzerland

The National High School Exam ("ENEM") in Brazil is a massive yearly admission test, which is attended by millions of applicants. The exam leads, for instance, to admission in public and private universities in Brazil, as well in some tertiary institutes in Portugal and the United Kingdom, among others. The applicants can therefore land places in some of the most competitive schools and effectively shape their capabilities. The event is extremely relevant for adolescents and young adults, which sum to at least 60% of the participants (INEP 2020). As such, my hypothesis is that the ENEM holds a special place as a rite of passage for Brazilian children and youth, a perspective that I will explore through netnography (Kozinets, 2015) via digital representations in two social medias in which children and youth are heavy users: Youtube (ICT Kids Online, 2019) and Tiktok (Sensor Tower, 2020). Beyond school effectiveness, which is well served in terms of research (Travitzky et al, 2014, Locco, 2005), this paper will engage in analysing the symbology of the exam as a cultural mark, through manifestations such as posts, videos and memes, seeing it as a potential rite of passage, but not only limited to towards adulthood.

The theoretical framework is based on the works of James and Prout (1997) and Irwin (2013), in childhood and rites of passage; Livingstone (2000) and Third et. al (2013) on children and media, including some analysis of the Sociology of Memes (Chen, 2012, Varis and Blommaert, 2015).

Keywords:
Digital representations, Admission Exam, Brazil, Childhood, Rites

Unequal Closing and Opening of Places and Spaces: Children's Perspectives on Well-Being During COVID-19

Sergiu Baltatescu[1], Susann Fegter[2], Christine Hunner-Kreisel[3], Claudia Bacter[1]

[1]University of Oradea, Romania; [2]Technische Universität Berlin, Germany; [3]University of Vechta, Germany

Places affect children's concepts of well-being (Coulton & Spilsbury 2014: 1307), and one consequence of policies dealing with COVID-19 is the closure of places of daily life. For children, these are primarily school, public play and recreational facilities. The closure of places is accompanied by a change in the structure of the day and, accordingly, of everyday life and space - conceptualized here as a relational arrangement of social goods and living beings in places (Löw 2015; OECD 2020). Parallel to the closure of places, others opened up, for example through online education.

Our qualitative research focused the opening up of other places and spaces in and beyond traditional institutional settings. The paper will present how children position themselves in the context of the transformation of institutionalized places and spaces and how their concepts of well-being reveal themselves in this process. Our findings are based on interviews with 20 children in Romania and 20 in Germany (collected within the projects Children's Understandings of Well-being – global and local Contexts and Child Well-being in Romania). Using an intersectional approach (Hill Collins & Bilge 2016) we explored the relevance of unequal social orders for children's positionings and their concepts of well-being (Hunner-Kreisel & März 2018). In doing so, we 1) reconstructed spatial dimensions (Fegter 2014: 530) in concepts of well-being and 2) their interconnectedness with further social dimensions. We show 3) with reference to the pandemic situation shifts in spatial order and reflect 4) how these shifts inscribe into children's understandings of well-being and reshape their institutional relationships respectively. Our reconstructions present local specificities and global commonalities using cross-cultural comparison between Romania and Germany.

From Distance Learning to "Schools for Future": The space-time generational divide and children's activism in the Covid-19 era

Caterina Satta

University of Cagliari, Italy

Italy closed its schools longer than any other European country in order to contain the first wave of the coronavirus pandemic. In October 2020, when the trend in infections rose again, middle and high schools were shut down, switching back to distance learning. This impacted not only children's education but their lives (with unequal impacts on children in the most vulnerable situations), revealing the "cultural politics of childhood" and the "generational order" of a society afflicted by "adultism" and familism.

This proposal aims to analyse the public discourse (in major newspapers and online), divided over the closing/reopening of schools, emphasizing how much space and time can be indicators of inequalities played out on a generational level as well as the driving forces of budding social movements initiated by children and youth.

While the place allowed or denied to children shows their margins of inclusion or exclusion in the public sphere, being denied returning to school is tied to their present/future. Within this context, we can frame the unprecedented student activism by 12-years-olds in Italy in the "Schools for Future" movement that tactically used urban space both as a stage for protest and as an object to claim. Through the bodily reappropriation of public space to claim their right to the future, this movement demonstrates how, in a space-time dialectic, children experience cultural determinants and processes that regulate and control their lives, and how they try to influence their form and direction.

Imagining The Future: Intergenerational Solidarity, Agency, Trust In Primary School Children's Narratives During The Covid-19 Pandemic In London

Federico Farini[1], Angela Scollan[2]

[1]University of Northampton, United Kingdom;
[2]Middlesex University, United Kingdom

Children in Europe are living through and contributing to unusual times. This statement is particularly apt to describe the experience of children in education. In the last two years, the geography of education has been radically altered. However, the voices of children have been often surrogated by the voices of adults, speaking on behalf of children. By discussing data produced in London schools with children age 9-11, this presentation aims to bring to the fore the voices of children.

The audio-recording of lessons in 2 London schools had been planned as part of an ongoing Horizon2020 project (www.child-up.eu) to allow a sociological analysis of educational interactions. Audio-recordings took place in December 2020 following 4-weeks closures due to several cases of Covid-19. Before the closure of all schools in the context of a third national lockdown, 20 hours were audio-recorded.

Transcriptions of data, suggested new directions for investigation. Data showed that on return to school in December, teachers were inviting children to share stories of their experiences during the 4-weeks absence. Children's stories were analytically approached with the instruments offered by narrative analysis, consequently to the idea that narratives were used by children to interpret and present their realities, making sense of events in a situation of generalized uncertainty. The presentation will discuss three themes highlighted by narrative analysis:

1) Solidarity between children and parents, in form of intergenerational collaboration in home schooling and the re-design of domestic spaces and family time;
1) Perceptions of pandemic-related health and economic uncertainty and authorship of imagined futures;
2) Changes in the dynamics of intergenerational trust, including display of agency as active participation in the management of family challenges.

RN04 | Sociology of Children and Childhood

Screens And Body Maps. Participatory Research On Children's Time Use In Times Of The Covid_19 Pandemic

Lucia del Moral-Espín[1], Mónica Domínguez-Serrano[2], Alicia Pérez-García[3]

[1]University of Cadiz, Spain; [2]University Pablo de Olavide, Spain; [3]University of Seville, Spain

Information on children's use of time and daily activities may enrich our comprehension of children's well-being, particularly concerning self-satisfaction and specific capabilities development and flourishing. However, Time Use Studies and the Sociology of Children and Childhood have primarily advanced in parallel but not permanently interconnected paths. Although time use surveys, Time Use researcher's iconic tool, collects very relevant quantitative information, these instruments can not address critical qualitative aspects and complexities such as meanings, conflicts, freedoms. To tackle these issues and contribute to a better understanding of the children's temporal experiences, we are committed to participatory approaches that involve children in the whole research process and not only as informants. The pandemic context and the need for physical distance have posed a series of barriers to moving forward in this line and have urged us to use our creativity. Our paper describes the development of a participatory process based on online workshops and artistic practices to address children's time experiences and well-being and illustrates some ways to articulate these research practices with a more traditional survey-based time use research approach. We address children's participation in their families, schools, and communities in decisions concerning how they use their time, as well as about how participatory research practices can potentially enhance the participatory (and other) capabilities of those engaged in the co-creation of knowledge. To conclude, we include some final reflection on the pandemic's challenges and opportunities to develop participatory research.

Born into Care – The Effects of Area-level Deprivation on Children Entering Care Proceedings in Wales

Stefanie Doebler[1], Karen Broadhurst1, Bachar Alrouh[1], Linda Cusworth[1], Lucy Griffiths[2], David V. Ford[2]

[1]Lancaster University, United Kingdom; [2]Swansea University, United Kingdom

For family courts, ordering the removal of children from their families is the last resort when their safety and wellbeing are in danger. Removals take place when the parents cannot cope and are unable to give their child a safe and stable home. In many cases, there is a presence of domestic abuse, severe mental health struggles, and substance misuse in the parental household. This has been labelled "the toxic trio" in some of the literature in the field (Brandon 2009). However, this label has been criticized by scholars emphasizing the role of contextual factors such as area deprivation and unemployment (Duschinsky, Skinner, Hutchinson, Clements, Bilson & Bywaters 2020.

This paper analyses rich Cafcass data on family court proceedings in Wales linked to area-deprivation data using statistical modelling. The research team is part of the Family Justice Data Partnership, a collaboration between Lancaster and Swansea Universities (funded by the Nuffield Foundation). The data is held in the SAIL Databank at Swansea University. Our focus is on how different deprivation domains affect the incidence rates of children in Welsh local authorities undergoing care proceedings between 2014 and 2019. The findings indicate that especially employment deprivation, but also income, educational and health deprivation are linked to increased incidence rates. Environmental factors such as the physical, housing and access to services domain are not statistically related to the risk of children to end up in court. The paper adds important insights on the importance of the wider policy context for the social wellbeing of children in local communities.

Well-Being and Rights Of Children Under The Protection System

Andrea Jover Pujol

Universitat Autònoma de Barcelona, Spain

Following the principles of the Convention on the Rights of the Child, children that are in risk at home must be protected and cared for by Public Administration. The Child Protection System in Catalonia includes multidisciplinar work teams called EAIA, which have a key role: they assess the situation of each child, propose the most appropriate measure and follow up to ensure and promote their protection and well-being. But are these interventions really based on promoting their well-being? Do they fulfill the rights of this children? This research analyzes how the EAIA's job impacts on children's well-being and on their rights. It explores why is important to generate mechanisms to assess both objective and subjective well-being within the protection system and proposes a system of indicators.

This is a case of study that uses the triangulation of the three agents involved: children (aged 8-17 years old), families and professionals. Through a sequential mixed-method it's noted that the measure to protect these children does not always translate into an increase in their well-being. The findings highlight the effects of inequalities, resulting from the intersectional bias of the population attended by the protection system, not only in children's rights and their well-being but also in that of their families.

Key-words: Children in public care, well-being, inequalities, assessment.

182

Child Rights Literacy and Misguided Practices amongst Professionals of the Romanian Child Protection Services

Ovidiu Oltean, Viorela Ducu (Telegdi-Csetri), Alina Bota, Fernando Varga, Mara Birou

Babeș-Bolyai University, Romania

Although significant developments have taken place in the past decades in the field of child rights and child welfare in Romania, rights literacy and observance of child rights remains a problem in the daily practice of the Romanian child welfare system. Respecting and applying the main principles and driving lines of child rights intersects structures of ethnic and gender discrimination, institutional and social hierarchies, and cultural norms, as well as an insufficient understanding of child rights and their norms of application within the existent institutional settings. Drawing on a recent set of semi-structured interviews (29) with employees of the child protections services, lawmakers, social work professionals and experts in Romania, the current research tackles the understanding and usage of child protection principles and norms in the Romanian child protection system, unearthing the numerous contradictions between legal norms, existent lines of recommendation and discourses, and the daily practices of child protection workers. While most social workers and child protection professionals pay lip servce to child rights and acknowledge their importance, very few manage to observe them in practice and translate them in institutional norms and practices. The research will therefore attempt to uncover these lines of tension and open-up possible directions of change that could improve the performance and services of child protection system in Romania.

RN04_T03 | Custody, ECEC and privacy

The Procusto's myth and the Neoliberal policies in Early Childhood Education: discourses and practices in Portugal

Catarina Tomás[1], Manuela Ferreira[2]

[1]Escola Superior de Educação de Lisboa and CICS.NOVA, Portugal; [2]Universidade do Porto, Portugal

In the international and national context, we have witnessed an intense debate around the role and function of Early Childhood Education (ECE), above all due to the enormous pressure that the demands of neoliberal society place on its professionals, families and children. The neoliberal discourses based on the apology of performativity, flexibility, individual choice, accountability, rankings, and meritocracy, are mirrored in early promotion of the development of school skills and curriculum narrowing, along with its pedagogical practices. The almost absence of these research in the field of ECE and, even more, focusing on the way children experience these demands and the principles of democracy, equity and participation made possible by the right to play, generate tensions and changes in everyday life. Drawing into Sociology of Childhood and Education and Educational Sciences we aim to analyse these tensions/changes to apprehend how the children and educators deal with them. Observations and interviews carried out in several kindergarten, public and private, located in three different cities in Portugal (Lisbon, Porto and Braga), between 2017 and 2019, allow us to highlight the "weight" of schoolification processes and the devaluation of play as a right and a particular mode of children's participation - traits that reconfigure the child in 'ideal learner', educators as primary teachers and the ECE like the primary education.

183

Material Practices of Children in Shared Custody Arrangements: Dealing with, and Making Sense of, a World in Motion

Bérengère Nobels, Laura Merla

University of Louvain, Belgium

This proposal focuses on multilocal families and more specifically on the lived experiences of children of separated parents, aged between 10 and 16, and living between two fixed households. Our main aim is to highlight, through materiality, different daily practices that children develop to deal with these absences and presences. Based on semi-structured interviews with 20 Belgian children mobilizing participatory methods, we analyze how the objects that surround these young people help them organize their world into a lived space (Rolshoven, 2008) and establish links and continuities that offer them a certain stability in the experience of mobility. Two sets of material practices emerge from our data. The first consists of fixing "stationary objects" to order, distinguish and be anchored in each living space. The second consists of creating permanence and continuity in movement with "objects in transition" that travel with children. We show that these practices and the meaning given to them are constructed at the crossroads between children's own aspirations and the affordances and limitations set by their family environment (marked by material and spatial constraints, educational values and styles, and specific temporalities).

Being an Individual and a Sibling: Battles for Privacy within Sibling Relationships in Turkey

Hamide Elif Uzumcu

University of Padova, Italy

Sibling relationships may involve an abundance of solidarity as well as conflicts. Children's individual privacy, however, may be one of the most contested and conflicted themes for some sibships. In Turkey, the concept privacy is often associated with an Islamic culture that organises most aspects of the everyday life.

Building on a larger corpus of privacy theories transcending the social and cultural constructions of privacy, this research aims to explore how siblings make sense of their own and each other's individual privacy in their everyday interactions. Arguing privacy as a significant concept to childhood studies, it scrutinises over interactional and informational contacts among siblings. The empirical material is drawn from an ethnographic fieldwork conducted with 33 families in Eskisehir in Turkey. Initially, qualitative interviews that were carried out with the target children aged 10 to 14, their parents and siblings. This followed a series of revisits to the participant families. Findings suggested that most siblings aimed primarily at intruding in physical, intellectual and emotional spheres of one another. Some of their ways of violating their siblings' individual privacy included attacking, showing over-affectionate behaviours (squeezing in lieu of hugging, biting etc.), getting into their personal belongings, undermining their artistic, academic or sportive achievements, making each other feel teased and embarrassed. The generational order and siblings' gender were one of the key influences over their experience of individual privacy. The younger and the female children seemed to be less privileged and showed subtler resistance in terms of violations of their privacy.

RN04_T04_01 | Culture and consumption

Chips for Tea: Discourses about Children and Food from the 1980s to Today

Deniz Arzuk

University College London, United Kingdom

In Britain, the disruption of food distribution at schools during the Covid-19 pandemic, and the subsequent Free School Meals campaign, brought back attention to children and food. Notably, several themes in the public discussion echoed discourses that emerged in the last quarter of the 20th century, when British newspapers decided to put what children ate on the table, assuming a drastic change in food "preferences", from elaborate family meals to "junk" food. This focus had disregarded political-economic factors that determined what children had to eat, as well as the social and symbolic dimensions of food, reducing children's relationship with food to

choosing, consuming and eating to maintain their bodies as an asset.

Based on a critical reading of the news coverage of topics such as junk food, child obesity, and school meals in the 1980s, and drawing parallels between contemporary discussions, this paper will examine discourses about children and food, and particularly about the financialisation of food provision for children. The aim is to raise questions about the possibilities of turning back to the past, not as a series of prophecies, but as a series of potentialities, as we remake the future.

The paper is an output of the European Commission funded MSCA project CHIBRIT "Is There No Such Thing As Childhood? New Childhoods in Britain and Turkey between 1976 and 1997" which investigates changing ideas about children and childhood, and a shift from social to familial and individual responsibility in response to the shared global processes of the period.

Shut Up And Smile: A Study Of The Attitudes, Experiences And Practices Of Photographing And Sharing Images Of Children In Ireland

Glenn Doyle

Dundalk Institute of Technology, Ireland

This research responds to changing sensitivities toward the photographing of children. It investigates Irish adults' attitudes toward and practices around the capturing and sharing of everyday images of children across both traditional and social media platforms.

Drawing on previous work by (Cohen, 1972), Higonnet (1998), Holland (2004) and Rose (2010) the study considers how contemporary discourses around childhood, children's rights, paedophilia, privacy, consent and Internet safety are impacting on the practices and attitudes of adults in Ireland around the everyday photographing of children.

Applying a mixed-methods approach, the research is based on surveys and individual interviews. Data was analyzed from 360 online and offline surveys. A thematic analysis of this data set generated themes further explored through 12 semi-structured interviews. Supported by field notes gathered during interviews noting the archiving, displaying and sharing of images of children in participants homes, this design allowed for the triangulation of the data that resulted in a rich and complex analysis of contemporary attitudes and practices in Ireland

The study finds that a range of contemporary discourses exert a very significant and tangible effect on how people think about and engage in practices of photographing and sharing images of children. Finally, it considers what longer-term impact this is likely to have on family photography, memories of childhood and attitudes toward childhood more generally.

RN04_T04_02 | Migration

Friends That Matter: Extending, Developing and Missing Friendships Among CEE-born Children Migrating To Sweden

Oksana Shmulyar Gréen, Charlotte Melander, Ingrid Höjer

University of Gothenburg, Sweden

185

The aim of this paper is to widen our understanding of how friendships change in the course of transnational migration and through the life-course of the young European migrants growing up in Sweden. This paper draws on the ongoing research project on Transnational childhoods. The project's broader objective is to shed some light on the experiences of re-defining and creating significant social relationships by young people, moving to Sweden under the age of 18 from Poland and Romania as a result of their family' mobility after the EU enlargement in 2004. Children' and youth's mobility in this context is frequently studied in relation to their familial and school adaptations in a new country. Migrant children's transnationalism, not the least in relation to old and new friendships, tends to be taken for granted. Studying children as active agents in migration we combine two steps qualitative interviews, network maps and life lines, to map out friendships young people´s value the most, both retrospectively and at present. Drawing on conceptualisations by Haikkola (2011), and Bagwell& Schmidt (2013) we show that friendships are complex social relationships, with potential of being both a buffer and a hinder to social adjustments post-migration. Besides, children's assumed transnationalism is restricted in number of ways. In the paper, we analyse the changing dynamics of migrant children' friendships in relation to three important dimensions: young migrants' struggles in negotiating transnational friendships; social arenas for building new inter-and intra-ethnic friendships

in Sweden, as well as the role of friends that matter for the young migrants' identity construction and a sense of belonging.

Comparative Analysis of socio-cultural backgrounds on Protecting Children's Rights in Latvia and Sri Lanka (Asian and European Contexts)

Shelomi Promoshitha Perera[1], Ilze Trapenciere[2], Lolita Vilka[3]

[1]Riga Stradins University, Latvia; [2]Riga Stradins University, Latvia; [3]Riga Stradins University, Latvia

The study focuses on comparing the implementation of children's rights in diverse socio-cultural backgrounds - Latvia and Sri Lanka. This study discloses the situation in society regarding implementing children's rights and finds out similarities and differences of social and cultural backgrounds in two countries, with the base of the United Nations Convention on the Rights of the Child (UNCRC). In the theoretical part, it's discussed the concepts of children's rights and how these key concepts meet together, and it discussed cultural relativity of different local contexts affects upholding children's rights in Latvia and Sri Lanka. If ratifying UNCRC brings universal uniformity for implementing children's rights in a global context, the situation considerably diverse in different socio-cultural backgrounds. Practically working with children-related issues encounter challenges in competing claims of rights on sensitive issues on particular cultural backgrounds. The research conducted by quantitative survey with social work professionals. The study analyzes and compares children's quality of life, living conditions, and environments, the standard of living, Education, Satisfaction level of Institutional care, Children's engagement to employments, adequate free time, Reasons for challenging to remove children from risk environments, attitude about giving physical punishments, and other factors affect accomplishing the rights of children in the two countries. Enhancing children's rights within diverse cultural backgrounds may challenge. If UNCRC is the most widely ratified human rights treaty all over the world, children's rights are not sustained completely, and there are many examples demonstrating that practices essentially violate them. Cultural factors cause a huge impact on determining the reasons why a child may prevent from meeting to have their rights.

Contested Right to Education: Young Refugees' Struggles to Access Public Education and to Self- organize Learning in two Greek Camps.

Sofia Sonia Vlachou

Panteion University of Social and Political Sciences, Greece

The last year in Greece has been marked by country - wide student protests against authoritarian policies that further subjugate public education to the capitalist doctrine of "less state" in favor of an "ever-growing market". In a parallel world out of civil society's sight, refugee children placed in mass accommodation and detention structures are being on the whole excluded from the public school system, which constitutes their only chance for social integration and their only hope for the foundation of a sustainable future. The social landscape of the COVID-19 pandemic that is already characterized by rigid discriminations exacerbates those children's exclusion, by providing the state with an excuse to launch additional enclosure- and segregation measures.

However, even within those spaces of exception and under protracted emergency circumstances resistance keeps on emerging. My presentation will delineate some of the refugee children's own initiatives to amend the educational and social deficit inflicted upon them by the restrictive policies that the current Greek government is zealously implementing. Based on the premise that the management of migration offers a "privileged" field for the primary fundamental neoliberal experimentation involving the disintegration of human rights and the deterioration of public welfare, in order for these processes to be extended to other subaltern subjects later on, I will attempt to discuss the potential impact that the interconnection of resistances could bear on positive social change.

186

Language And Cultural Mediation As An Alternative Future For The Inclusion Of Migrant Children In The Education System

Claudio Baraldi

University of Modena and Reggio Emilia, Italy

Language barriers are one of the most relevant problems that must be overcome to improve migrant children's inclusion in the education system. These barriers can undermine children's understanding and their possible inclusion. Language barriers can be overcome by teaching second (national/local) language and by providing language and cultural mediation. Language and cultural mediation may be seen as a way of providing intercultural adaptation, since it allows the enrichment of linguistic and cultural complexity of a society. This presentation focuses on cultural and language mediation provided in some Italian primary schools, analysing audio-recorded mediated encounters between Italian teachers and Arabic/Chinese parents and children, concerning children's performances and behaviours in the classroom. Mediators are former migrants who became professionals and work for specialised cooperatives. The analysis concerns mediated interaction, in particular, mediators' actions that coordinate this interaction and thus can (or cannot) enhance migrants' agency. This presentation focuses on the ways in which mediators' coordination of the interaction enhances migrant children's agency. It shows (1) the difficulties of this task in an educational context which is dominated by talk about children, rather than with children, and (2) the ways in which, in this context, children are considered either "ratified" persons, i.e. social agents, or non-persons, i.e. non-agents, in the interactions. This analysis can help to understand in which ways mediation could support the future inclusion of these children. For this purpose, the presentation combines Childhood Studies with social systems theory, positioning theory, Goffman's analysis of participation and studies on interpreter-mediated interactions.

RN04_T06 | Covid19_II

Investigating Children's Participation While Dealing with the Unexpected. Adapting the Research with Students in Times of Pandemic.

Sara Amadasi

Dipartimento di Studi Linguistici e Culturali, Università di Modena e Reggio Emilia, Italy

In February 2020, when the Covid-19 outbreak hit Italy, the partners of a European project coordinated by an Italian University had just started to collect qualitative data on the inclusion of children with migrant-background in their national education system, with a particular focus on classroom interactions. The research methods included interviews, focus groups and video-observation of activities which aim to promote dialogic practices within schools.

Although each national team adopted several strategies to carry on the research, in relation to the local pandemic management and negotiations with teachers and professionals, in this paper I focus on the actions taken by the Italian team to face this unexpected situation which affected the research fieldwork. In Italy the return to school was delayed to September 2020, therefore, we adapted the methods for the investigation to the conditions caused by social distancing and the physical absence of children within schools. Moreover, while fieldwork opportunities were lacking, reflections on children's participation and spaces to promote it became as urgent as ever, given the absence of children's personal expression in public debates on aspects that strongly affect their life such as school closures, or, more generally, new experiences of schooling and restrictions of social interactions.

In this presentation I will provide some of the qualitative data collected with children on their experiences of the pandemic and some of the unexpected methodological changes and considerations that the situation demanded. These unexpected changes can actually become an opportunity to promote alternative futures for sociological research.

187

Politics, Participation And Accountability: Young People Giving Meaning To Active Citizenship During The Pandemic

Barry Percy-Smith[1], Sara Rizzo[2], Leanne Monchuk[1], Laurie Day[2], Malika Shah[2]

[1]University of Huddersfield, United Kingdom; [2]Ecorys, UK

The Nuffield Foundation 'Growing up under Covid' participatory action research project reveals how many young people feel their voices and concerns have not been acknowledged as societies figure out how to respond to the impacts of living through a pandemic. Even in the UK with a strong culture of youth participation, young people have found it difficult to have their voices heard during the pandemic. In response to the perceived shortfalls, confusion and double standards young people see in the way political leaders have managed responses to the pandemic, young people have developed increased levels of interest in politics and (new) possibilities of their own democratic roles. This has been fuelled by a growing awareness as real life events unfold around them such as systemic racial injustice and more immediate and perversely mundane issues of ensuring children do not go hungry.

This paper draws on ongoing participatory research with young people across 7 countries to discuss young people's reactions to what they perceive as the failings and injustices of the political classes and in turn how young people have responded through their own everyday acts of citizenships including self-help and community initiatives. The paper reflects on how young people feel about the state of the democracies they are growing up in, and their visions for the future rooted in notions of communitarianism and a moral commitment to fairness and hope for the future and a belief in their own political agency.

Child Well-Being in COVID-19. Ensuring Childhood Welfare through Dialogic Literary Gatherings Transferred to Homes

Susana León-Jiménez, Adriana Aubert-Simón, Sara Gómez-Cuevas
Barcelona, Spain

COVID-19 pandemic, activity interruption and the closure of schools brought an unexpected situation with a negative impact on childhood. Children became exposed to a new environment, plenty of bleak news and conversations, social distance, routine adjustments and home confinement. This new context is especially worrisome when talking about vulnerable children, with developmental issues, family disruptions or a trauma history. The consequences on their health and well-being turn to an emergency, which urges attention and demands collective action for reinventing education, to give continuity to learning and ensuring child well-being. International recommendations stress the importance of community actions and family implication. In the search for educational alternatives, some schools decided to implement Dialogic Literary Gatherings (DLG) online, which is a Successful Educational Action (SEA) that has always undergone presencially, where students share dialogues about classical books while creating new meanings jointly and sharing values, feelings and knowledge. The aim of this study has been to analyse the impact of implementing DLG online on subjective child well-being, i.e. the participants' perception of happiness and welfare. Six DLG have been analysed, being three of them with more than a 30% of children in vulnerable conditions. Data has been gathered through communicative life-stories, semi-structured interviews and communicative groups, addressed to children, parents and teachers, respectively. Results show a positive impact on child well-being, among them, improvements in educational participation and learning; on quality relationships, and in the strengthening of friendships, self-stem, motivation or happiness, as well as closer bonds between parents and their children.

Climate change

Youth's Everyday Environmentalism and Green Lifestyles: Performing Interpretive Agency in the Era of Climate Change

Turkan Firinci Orman

Independent Researcher, Finland

When youth agency and climate change are understood conventionally as 'having a voice' or in the context of Politics, it does not reflect young people's everyday realities and their youthful ways of engaging with climate change-related issues. Thus, this paper is focusing on both formal and informal spaces of young people's lived worlds and presents a broader theoretical framing of youthful political agency in the context of their environmental citizenship. Debating different modes of youth participation in the context of climate-change we refer to four basic types of lived political positionings: 'victim', 'free to choose', 'free to reject', and 'interpreter'. Building on the contra-legal conceptions of Isin's (2008) performative understanding of citizenship, we debate youthful interpretations of everyday environmentalism and green lifestyles through which young people perform their critical agency. We conclude that young people challenge adult-led conceptualizations of environmental ideologies by implicitly or explicitly performing green lifestyles and interpreting green values while engaging with different climate change issues in their everyday experiences (e.g. social injustice, poverty, violence, consumerism, pollution, biodiversity loss, etc.). Keywords: Youth's political participation, climate change, green citizenship, interpretive agency, consumerism.

The Transactional Horizons Of Greta Thunberg: Towards Ontological Regrounding Of Childhood Studies

Daniel Stoecklin

University of Geneva, Switzerland

Perspectives of children and young people on alternative futures, social and political justice (or injustice) are not independent from the material environment they experience. New constructions of children and childhoods are originating in the materiality of climate change. The author analyses the speeches of Greta Thunberg through the lenses of "transactional horizons" that foster changing inclusions, and hence identities, as the planet is integrated in the Self (Mead 1934). Voices and perspectives raised by young climate activists are seen as indicators of shifting movements among broader cosmologies (Descola 2014). This example highlights the regressive paradox of social constructionism: in order to have cultural constructions of nature, there must be a pre-cultural nature to build these constructions on (Descola, 2014). Nature and culture are two "complexly intervowen ecological systems" (Stephens 1994, p. 4) that childhood studies need to better understand if they want to bypass the trap of abstracted social constructionism and possibly achieve an "ontological turn" (Spyrou 2019, Alanen 2017). In Beyond Nature and Culture (2014), Philippe Descola analyses the schemes used around the globe to equate and differentiate human and non-human ontologies. He identifies four cosmologies (naturalism, animism, totemism and analogism) and suggests that the dualism nature/culture is bound to naturalism, prevalent in modernity. Modern naturalism is just one variant among the possible combinations of schemes governing the objectivation of the world, and hence theories of identity and alterity. This illuminates the limits of social constructionism (Alanen 2015) and offers insights for ontological regrounding of childhood studies.
Keywords: climate justice, dualism, ontologies, social constructionism, transactional horizons

'The Slow Pandemic': Youth's Climate Justice Activism and the Stakes for Youth Movements Under Covid-19

Georgina Christou[1], Eleni Theodorou[2], Spyros Spyrou[3]

[1]University of Cyprus, Cyprus; [2]European University Cyprus; [3]European University Cyprus

Through ongoing ethnographic research with Youth for Climate Cyprus, a group of young Cypriot climate justice activists (YCJA), associated with the global Fridays for Future movement, we explore their strategies during Covid-19 which focus on the production and online promotion of antagonistic framings of the pandemic that challenge its governmental misframing as an unprecedented crisis. We further reflect on the potential consequences of Covid-19 on the particularities of youth engagement in social movements. First, we explore how YCJA make meaning of the pandemic and how they frame it in order to promote particular ideas about alternative futures. We argue that most YCJA do not perceive the pandemic as a radical break, but as a condition that complements the existing anxiety-ridden environment in which they live, associated with the climate change crisis which they term as 'the slow pandemic'. Secondly, we reflect on the impact of Covid-19 on non-institutional youth activism. We argue that youth movements emerge and operate within particular conditions which are currently under threat given the distinct mechanisms of governing populations engineered during Covid-19. With this paper we aim to contribute to current debates on understandings of climate change by YCJA and explore how then these become associated with their movement strategies during the pandemic period. We further aim to contribute to emerging literature on social movement action under Covid-19 and reflect on the dangers that the pandemic might engender for children's and young people's political participation.

RN04_T08 | Street children and methodological issues

Streetography: A Sociology of Accra's Street Children

Phillip Mizen

Aston University, United Kingdom

This paper provides a streetography of street children in Accra, Ghana. By streetograhy, it focuses on aggregate data collected from over 120 street children accumulated in the course of open-ended research and which allows us to generalise, among other things, about their origins, parental and family situations, educational experiences and arrival in Accra. Yet, in undertaking this streetography this paper further considers the implications of following this approach for the study of street children in particular and possibly for the social studies of childhood more generally. On the one hand, to aggregate data in this way is to confront the social studies of childhood's emphasis on knowing children's worlds through their uniqueness, particularities and voices in ways that demand ethnographic scrutiny (Gigengack 2008; Hecht 1998). On the other hand, and more fundamentally, this streetography also means confronting the prevalent view that street children are a discursive convention 'deftly manipulated to reflect the various agendas and interests of stakeholders such as welfare agencies' (Panter Brick 2002, p. 153; see also Glauser 1990). In response, it will be argued that the problems often associated with this streeotgraphy's 'numbers game' (Thomas de Benetez 2007, p. 65) offer no fundamental objections to knowing about street children's lives in this way. Moreover, it will also be argued that quantification is not necessarily complicit in the reproduction of an essentialising ideology of the pathological street child living in 'disorganised, illegal misery' (Ennew 1994, p. 409) as is often argued.

190

Ndoro Ndoro: Children at the centre of their communities

Vicky Johnson[1], Tessa Lewin[2]

[1]University of the Highlands and Islands, United Kingdom; [2]Institute of Development Studies, UK

This paper presents a socio-ecological model - Ndoro-Ndoro (meaning spiral in Shona), which positions children at the centre of their communities. It argues that there needs to be more attention to how children and youth, with the adequate support, can contribute to rejuvenating communities. This model builds on the change-scape approach (Johnson 2011) developed in international revisits to implementation and evaluation programmes that were inclusive of children and youth. Reflection on the application, emerging theorisation and development of the change-scape over the past decade, is followed by presentation of key findings from review of child/ youth-centred and led projects. This analysis of 'a living archive' of over 100 documents from published and organizational reports, and over 40 interviews with field experts across global contexts, situates the emergent Ndoro Ndoro in the context of the Rejuvenate project. The paper discusses how Ndoro Ndoro interacts with the re-conceptualisation of child rights by Hanson, Nieuwenhuys and colleagues (2013), comprising of three pillars of: living rights, translation and social justice, and with notions of relational agency (for example, Oswell, 2013). Ndoro Ndoro centres children and youth as agents of change, affected by their cultural, environmental and political contexts. Rejuvenate therefore recognizes the centrality of including children and youth whose innovative ideas can offer creative solutions that can help to negotiate intergenerational relationships and social norms, advance social justice and navigate fragile environments.

Ethical Issues and Methodological Choices in Health Research with Children

Stefania Fucci[1], Francesca Zaltron[2]

[1]University of Parma, Italy; [2]University of Eastern Piedmont, Italy

Doing research with children means recognising their competencies and their capacity for participation as well as considering their point of view as a privileged tool in order to give them "a voice at all levels of the decision-making process" (Lewis and Lindsay, 2000). This contribution intends to offer an ethical-methodological critical reflection on the meanings attributed to the concepts of "giving a voice" (Mazzei, 2009; Spyrou, 2016) and listening, starting from the research carried out with children suffering from chronic illnesses. An extensive literature (Komulainen, 2007; Mazzei, Jackson, 2009; Spyrou, 2016) highlights, in fact, the importance of deconstructing the concept of children's voices, questioning primarily the processes, including the research process itself, through which children's voices are produced. This means, on the one hand, paying attention to the contextual nature of the voice, in the construction of which the researcher himself participates; on the other hand, grasping its polyvocal or multi-layered character (Spyrou, 2001). For this reason, it is increasingly important for researchers to adopt a reflexive approach, enabling them to become aware of the risks and power imbalances that are inherent in research with children, as well as to develop sensitivity to the immanent nature of ethical dilemmas within the research relationship. This sensitivity is even more important when we conduct qualitative health research, because the asymmetry and power differential between adults and children in this context is further amplified by the fact that children are subject to multiple asymmetries, being at the same time children, sick people, patients.

Ethical Problems in Some French Sociological Studies of Children's Socialisation and Children's Answers to Adults' Domination

Pascale Garnier

Université Sorbonne Paris Nord, France

This proposal is centred on recent French sociological researches on young children which aim to demonstrate social inequalities among them and how children themselves participate in their reproduction. In order to show this the sociologists put the children in tests such as school exercices which reproduce the work they have to do at preschool or they organize focus groups where children are invited to depreciate each other in relations to the hierarchy of their parents' works. Grounded on dispositionalist approaches, more or less inspired by Bourdieu's habitus theory, this kind of researches raises numerous ethical questions about research on young children (the lack of children's consent, the abuse of adults' power, the adults' centred questions, etc.). It also questions the qualification of childrens' identies by the social properties of their parents (ie: "child of a middle class family") which creates a circle in the demonstration of social reproduction. But the data can also show children's "vulnerability in resistance" (Butler et al, 2016) and their "tactics" (De Certeau, 1980) for avoiding the complete domination of adults such as imaginary stories, silence and body' reactions (stress, tiredness, violence, etc.). Paradoxically children's weakness may be a force they show in such tests. But definitively as sociologist (Garnier, 2020) we prefer different methodologies (visual, game...) and the principle of uncertainty of children's identities.

Making Change Possible In Schools: 'A Safe Space Where We Can Truly Reflect And Be Ourselves'

Deborah Jane Crook

University of Central Lancashire, United Kingdom

This presentation will consider the first stages of research with young people in a secondary school in the north of England to investigate and make sense of participation across different school arenas. A group of young people have suggested that how they participate at school is both a problem and empowering feature of their lives. Prior to embarking on collaborative research to explore this further, they identified the importance of safe spaces in school to enable them to identify problems, understand their situations and creatively imagine potential for change. Important to this were the evolving relationships between the young researchers, their youth workers, teachers and academic researcher as the process of participatory action research developed. Complexity thinking is proposed as a way to consider the ethical questions that arise as the young people explore and strive for alternative futures.

Local Intervention in Pandemic Times: What Solutions to Ensure Children's Right to Participation?

Gabriela de Pina Trevisan[1], Manuel Jacinto Sarmento[2], Inês Guedes De Oliveira[3], Teresa Freire[2], Mariana Carvalho[1], Cidália Silva[2]

[1]ProChild CoLAB against Poverty and Social Exclusion, Portugal; [2]University of Minho; [3]University of Aveiro

The pandemic context experienced by communities and children, specifically, by the territory of Guimarães raised the need for a more complex intervention that could respond to the exceptionality of a time of children without school and without access to public space. As home became a central space for life, a need to reinforce intervention with children and their families was obvious. The Collaborative Laboratory ProChild CoLAB against Poverty and Social Exclusion is a research institution aiming to develop a national strategy against child poverty and social exclusion. By relying on a multidisciplinary and multilevel approach, the CoLAB aims to break the cycle of poverty and to promote children's rights and well-being. At present times, as different reports have suggested different needs and rights of children and YP have been endangered significantly, making it urgent to find alternative ways to restore them, as far as possible. The theoretical background for our interventions are grounded on the sociology of childhood, social exclusion and territorialised social participation. In order to ensure children's rights and participation in different activities during the lockdowns, we developed a set of projects with local school and community intervention projects, especially with children aged 6-10 years old, that could promote them. We will present the framework, theoretical background, goals and activities of 3 different projects: the Prochild kit(e), the School upside down Project and mapping exercises of the lived territory of children and young people, especially during lockdown. Results of these projects will be presented and discussed.

Seen, Heard, and (Un)welcome: Polish Teens' Civic Engagement and Intergenerational Allyships

Maja Brzozowska-Brywczynska, Agnieszka Nymś-Górna

Adam Mickiewicz University Poznań, Poland

Even though Polish teens' civic participation has long been seen through the lenses of democratic deficit affecting their generation, the recent intense period of both domestic politics-induced crises and pandemic-related challenges resulted in a dramatic and unprecedented surge in civic engagement among young people in Poland. We would like to offer a preliminary analysis of this "generational rebellion" focusing on three contexts of Polish teens' intensified participation: education, climate, and human rights. Protests in these areas - against educational reforms, climate changes, hatred towards the LGBT+ community, and violation of women's rights - have all shown not only the emergence of young voices in traditionally "children should be seen but not heard" culture but also offered new platforms for possible intergenerational allyships. We will trace this presence and identify these alliances by looking at public and media discourses surrounding the protests and non-adult protesters and by juxtaposing them with young citizens' own interpretations and justifications of their civic activities via in-depth interviews with teen activists. The resulting map of this newfound civic engagement and possible areas of intergenerational solidarities and alliances definitely disturbs the hitherto prevailing local beliefs that children and young people are civically disengaged and that intergenerational relations are necessarily based on conflict. The recent context of protests against issues transgressing the narrow frames of "children's vs adults' matters" offers a more critical look at the dichotomous relations between children and adults, allowing us to notice their interdependence and the complex nature of young people's position as subjects of political rights.

193

Broadening Child Participation, the Case of Children Advisory Groups in Complex Research Projects

Jessica Ozan, Gary Pollock, Aleksandra Szymczyk@mmu.ac.uk, Haridhan Goswami

Manchester Metropolitan Society, United Kingdom

Child participation is becoming a norm in many disciplines including sociology. The field is, however, theoretically dominated by advocates of child-led approaches, but very much polarised in practice as some still do not recognise the importance and benefits of engaging children in complex research projects. Furthermore, children are not yet sufficiently included at various levels of the research process. They are particularly absent in the early stages of research design. Drawing on two large European projects (MyWeb, Measuring Child Well-Being, and the European Cohort Development Project), this paper demonstrates how children can be actively engaged in large and complex research projects focusing on longitudinal surveys, notably through the establishment of Children Advisory Groups. It will reflect on the benefits and challenges encountered during the implementation of those groups in England and Croatia, and provide guidance to those who may want to use this approach in the future. The paper argues that in such context, and in many others, the most appropriate approach is one that manages to balance policy priorities, scientific rigor, and children's voices.

RN04_T11 | Boundaries, class and poverty

The Un/Deserving Child: Neo-Philanthropic Philosophies and Practices in Combating Child Poverty

Griet Marijke Roets[1], Nicolas Jacquet[2], Caroline Vandekinderen[4], Coline Generet[2], Daniel Zamora Vargas[3], Didier Vrancken[2]

[1]Ghent University, Belgium; [2]Université de Liège; [3]Université Libre de Bruxelles; [4]University College Ghent

Child poverty remains a complex and multi-dimensional social problem in most Western societies. In the context of the changing relationship between citizens, the welfare state, civil society, and the market, a complex historical reconfiguration of the institutional welfare state framework can be observed in relation to charity- and rights-oriented assumptions in anti-poverty strategies towards children in poverty situations. Whereas critical scholars have referred to newly emerging ideas referred to as 'neo-philanthropy', 'new philanthropy', and 'new charity economy', we tackle how a discursive distinction between un/deserving children can be at stake in anti-poverty strategies, based on blaming 'incapable' parents for being responsible for the structural conditions and inequalities in which their children live. We focus on a qualitative research project in which we investigate the philanthropic philosophy and practice of a foundation that provides support to ensure food security and educational and leisure time activities for children in poverty in collaboration with social partners. While exploring the practices and normative value orientations of the foundation's social partners, we tease out whether, and if so, how the foundation might be a little stone in the shoe of public actors in the welfare state.

194

How Children Negotiate And Make Sense Of Social Class Boundaries

Imane Kostet, Gert Verschraegen, Noel Clycq

University of Antwerp, Belgium

A small but growing body of literature has suggested that children, regardless of social class background, tend to self-identify as rich nor poor but as somewhere 'around the middle', which raises the question of how children imagine and experience social class (e.g., Mistry et al. 2015; Kustatscher 2017; Rauscher et al. 2017; Sutton 2009). Until now, compared to race, ethnicity and gender, researchers have not examined the social construction and negotiation of class position among children in much detail (Rauscher, Friedline, and Benerjee 2017). Based on 47 in-depth interviews with children aged 11 to 13, this paper presentation aims to fill this gap by providing a deeper understanding of children's active negotiation of their social position in a super-diverse urban environment. In this context, which is characterized by high rates of ethnic diversity as well as poverty, we study how a diverse group of children give meaning to class differences and how they position themselves with regard to different social class groups. We argue that children not only show an acute awareness of class differences but also engage in symbolic boundary-making to secure a positive self-identity. We show how children describe the 'middle-class' according to their own position, to present themselves as rich nor poor but as 'normal' or 'ordinary'. However, as the children's narratives reveal very different life chances, they use different identity management strategies and repertoires to construct their own 'ordinariness'.

Family, Children and Companion Animals: Educational Goals and Practices

Verónica Policarpo, Ana Nunes Almeida, Henrique Tereno

Instituto de Ciências Sociais da Universidade de Lisboa

This presentation follows up on project CLAN (PTDC/SOC-SOC 28415/2017), and the joint lives of the participant children and companion animals. It focuses on a particular topic pencilled in the exploratory phase: how does the family dynamics frame the ongoing tensions between parental educative goals pertaining children and animals' interactions, on the one hand; and effective educational methods to put them into practice, on the other. We sketch an exploratory answer to this question drawing on 48 interviews conducted in 24 Portuguese families, to children aged 8-14, and one parent, in the first stage of the fieldwork; plus 12 photo-eliciting interviews to the children, in the second stage. All families lived at least with one dog and/or one cat, for at least six months.

While goals and strategies to educate children sometimes overlap with those involving animals, they also often conflict. We explore the conditions in which this happens, how it impacts the way children relate to animals, as well as their mutual wellbeing. It is our hypothesis that the educational styles of the Portuguese, middle class, parents in the sample help to shed light into how animals are being cared for within families. The question is: do these styles contribute to break the species boundary, challenging assumptions on human exceptionalism and primacy? Or do they reinstall and reinforce traditional, romanticized views about children's natural innocent relations with companion animals at home? Taking conflict as a productive entrance into educational relations involving parents, children and companion animals, it is our aim to unveil some challenges of multispecies entanglements during childhood.

RN05 | Sociology of Consumption

RN05_T01_01 | Digitalisation, Markets and Media

Transformation in the Swedish fashion industry

Gabriella Wulff[1,2]

[1]Gothenburg Research Institute, Sweden; [2]The Swedish School of Textiles, University of Borås, Sweden

Consumption and consumer behaviours has changed because of the spread of COVID-19, where for example online shopping has gained market shares. In Sweden, the government and the Public Health Agency of Sweden opted for recommendations, rather than lockdowns. Nevertheless, consumption and consumer behaviour has changed also in Sweden. The changes are not only due to changing consumer behaviours, but due to also changing retailers' behaviours, where retailers started to reconsider their current practices. One example is the Swedish fashion industry, which has been hit by the effects of the pandemic but also by the government's actions to combat the pandemic. Throughout the year, the industry reported on double-digit losses, which reflects the challenging situation for the retailers in staying profitable and pursuing one's business.

This study focus on the transformation of the Swedish fashion industry during the pandemic in 2020, with particular focus on the retailers' actions. The study has been carried out through interviews with representatives from Swedish fashion companies, as well as observations in social media and physical stores. The preliminary findings show how the companies changed both their marketing practices and flows of goods in favour of online stores, how retailers shifted the product range towards more functional clothing and how they addressed the question of social sustainability during the pandemic. The study concludes that the Swedish fashion industry has undergone a transformation, where there has been an acceleration of digitalisation, a stagnation on experience design and a modification of the concept of social sustainability.

Promises And Expectations In Curated Shopping - The Service Relationship And Its Characterization In The Digital Space

Nico Maximilian Steinmann, Paul Eisewicht

TU Dortmund, Germany

In recent years, vendors have established services on the Internet that present potential customers a ("personalized") personal or algorithmized typified product pre-selection, thus reducing the number of possible choices. Here, reduction can be understood not only in quantitative terms, but also with a reduction in the customer's consumption risk by offering products of high quality or a specific composition of several products. This service model is negotiated under the buzzwords of curated shopping or curated commerce and is a remarkable phenomenon in view of the typical lack of service personnel in the digital space and the associated self-responsible consumption decisions.

This article analyzes curated shopping using the product field of fashion as an example and focuses on two levels: On the one hand, we examine the presentation of the offer and the (consumption-)promises formulated therein on the basis of the homepages of the vendors. On the other hand, we use qualitative, guideline-based interviews to reconstruct the perspective, the motives, and the decisions of the customers.

The data show that such services are characterized and advertised by (a) various forms of relief (including time savings and existing expertise) and (b) promises of experience (inspiration, surprise). However, compliance with these promises, especially in the case of personal service offerings, is linked to the design of the cooperative relationship between the service and the customer. Customers must therefore be willing and able to co-create the service by evaluating it several times and providing information about themselves. The study thus offers an opportunity to discuss the relationship between digitality, product purchasing, and service and consulting offerings. In this context the term curated shopping will be framed theoretically.

196

RN05_T01_02 | Material Cultures in Consumption

Hidden Things and the Ordering of Domestic Spaces

Sophie Woodward[1], Cornelia Mayr[2]

[1]School of Social Sciences University of Manchester; [2]Alpen-Adria-Universität Klagenfurt, Austria

The paper centres hidden things in the home to explore how objects stored or accidentally stashed, form and maintain meaningful relations to their possessor(s), other things, and places within the home. By drawing on previous work on dormant things (Woodward) and sex toys, such as vibrators (Mayr), we seek to develop these multi-faceted object relations with reference to examples of things that are deliberately hidden away, concealed, or just 'end up' stashed in a drawer. We think through these hidden things to explore the relations they have to normative orders of the home. Drawing from Douglas, we develop an understanding of the power of things in creating and disrupting domestic ordering. Drawing from interviews and ethnographic research, we highlight how these hidden things link to social order through (1) normative ordering and the spatial belonging of things (2) temporal relations of use, disuse and potential futures; and (3) accidental or intentional (dis)attention of the object. We aim to expand the scope of consumption by looking at things and their spatial and material relations beyond the remit of what is used or active practices. The multifaceted approach (spatial, temporal and relational) will bring us closer to an understanding of the material and symbolic potency of hidden things within the organization of everyday domestic life.

Individual Consequences of Building Identity By Displaying Consumer Experiences on Social Networks

Laura Aso Miranda, José Luis Condom Bosch

University of Barcelona, Spain

In the curret scenario characterised by the values of individualis, change, immediacy or exaltation of happiness, one major issue among sociologists is the growing importance of consumption both in the social and the personal spheres of life. In a previous paper, the concepts of consumption of new experiences and dissemination of this kind of consumption on social networks such as Instagram or Facebook were introduced along with their influence on identity construction. Grounding on narrative analysis and communicative methodology, which paves the way to collect quotidian insights of social actors from an intersubjective perspective while generating new sociological theory, a qualitative research including 30 participants was carried out in Spain in 2019 with the aim to explain the consequences of building identity through the mentioned concepts, turned into well-regarded social trends reflected on the colloquialism FOMO (fear of missing out), which operationalises these trends.

Several conclusions are drawn about the ensuing identity: 1) it is dependent on the logic of the market and the behaviour of peers; 2) it changes to the rhythm of the legitimised mechanism of fashion while continuously amended through publications on social networks; 3) it is not anchored in the real world but in a virtual one due to the online nature of social networks and the emotional imaginary component of consumption. As a result, three types of identity are distinguished at an analytical sociological level: standardised, revisable and imaginary. Additionally, other psychological consequences concerning emotions emerge from the research: lack of self-esteem, fake expectations, dissatisfaction, lack of meaning and opportunity cost. Studying the effects of COVID-19 on consumer experiences patterns is expected in the framework of this line of research.

197

Young Adults' Home Making with Inherited and Second-hand Furniture – Taming Used Object into Sustainable Decoration Style

Jani Varpa, Minna Autio, Jaakko Autio

University of Helsinki, Finland

Home constitutes our everyday lives and it has ideological and practical meanings. Home decoration is seen as one visible form of consumption that both communicates the home makers' lifestyle and values. Young people usually have limited financial recourses, which narrows down their consumption choices concerning their home decor. In our study we analyse how furniture as material object is negotiated as a part of interior design style among young adults in Helsinki metropolitan area (n=11), in Berlin (n=11) and in Gothenburg metropolitan area (n=13). Themes of interviews focused on acquisition, possession and conceptual understanding of furniture. We apply practice theoretical approach to analyse meanings and materials. To fit the furniture to one's own style and having a home-like feeling, one needs to 'tame' it – to make it feel as their own. If this negotiating process fails, it easily leads to rejection of the furniture. The young adults use second-hand and inherited furniture as form of cultural and ecological sustainability. The object seems to be expected to tell a story that young people can identify with. Inherited objects link the generational experiences of grandparents and childhood home with young homemaker's lifestyle. The nature of second-hand furniture is based on exchange of money and it is negotiated either with practicality or one's decoration style. Second-hand furniture is a novelty that are tamed and re-negotiated as a part of owner's life story.

Creating Social Identity Through Symbolic Consumption: Bookstore-themed Cafes in Istanbul

Meryem Zişan Köker[1], Eda Ünlü-Yücesoy[2]

[1]Independent Researcher; [2]Istanbul Technical University

The bookstore-themed cafes have become the new hype commercial investment in many metropolitan cities. In addition to consuming, spending, and utilizing, it is necessary to address a variety of different motivations that lead people to visit these places. This study examines the effect of the symbolic meaning of a place on an individual's identity. The connection between bookstore-themed cafes with people's social identity in the context of cultural activities is studied in two central districts of Istanbul. While taste, cultural and symbolic capitals, and conspicuous consumption are the main analytical frameworks for analysis, in-depth interviews, participant observations, and qualitative content analysis of social media reveal multifaceted motivations affecting people's choices. The paper addresses the inquiry for choice, the role of social media, visibility, social identity, and participation with regard to the symbolic consumption of urban space.

198

Changes in Consumer Desires in Different Age Groups Across 20 Years in Finland

Terhi-Anna Wilska, Gintautas Silinskas, Jussi Nyrhinen

University of Jyväskylä, Finland

In affluent societies, consumers are primarily guided by their desires (Belk et al. 2003; Boujbel & d'Astous, 2014), but for individual consumers, various financial, moral, or circumstantial reasons may lead one to control one's desires. This paper focuses on consumer desires of Finnish consumers of different ages by asking how they would change their consumption if they had more money at their disposal, in three points of time across 20 years. Although consumers are typically thought to fulfil their desires of luxury and status consumption if they had much more money, research on e.g. lottery winners in the Nordic countries reveal rather modest changes in actual consumption.

In this study, the alternatives for the desired consumption were e.g. travelling, self-pampering, culture, new car and other status purchases, investing, donations to charities, or saving. The data was derived from three repeated surveys collected in 1999, 2009 and 2019 in Finland (N=5361) and analysed with Principal Axis Factor Analysis and ANCOVA. The factor analysis extracted four types of desires: hedonistic, cultural-charitable, investment-oriented and saving-oriented. Hedonistic consumption desires were the most typical for the youngest age group (18-25), and investment-oriented desires were the highest for young adults aged 26-35 across all three years of measurement. Older people had the most charitably and culturally oriented desires in 1999, but in 2019 young people did. Interestingly, hedonistic consumption desires generally decreased over the years, particularly in young age groups. Conversely, young people's desire to save increased significantly in 20 years, whereas the oldest age groups saved less.

RN05_T02_01 | COVID: Consumption I: Food in a pandemic 1

Lifestyle Transformations: Revealing Changes in Sustainable Food Provisioning Practices in Italy During COVID-19

Mikko Laamanen[1], Francesca Forno[2], Stefan Wahlen[3]

[1]emlyon business school, France; [2]University of Trento, Italy; [3]University of Giessen, Germany

In this paper, we study how the global pandemic affects local food consumption and provisioning practices and how this transforms (at least temporarily) into new assemblages of more sustainable practices. We specifically focus on an initiative established by the Municipality of Trento in Italy during the first lockdown aimed at facilitating food procurement from local farmers transforming food provisioning and related practices. We specifically ask how the pandemic provoked new understandings, procedures and engagement with food by exploring changing routines and relations between practices. Using a mixed methods approach, we analysed survey data collected during the first lockdown of 68 individuals who joined the local food initiative and biographic-narrative interviews with 10 participants six months after. Our in-depth interviews with consumers involved in this local food initiative allowed for further exploration into the potential of a more profound change towards more sustainable provisioning. Initial results demonstrate how the lockdown attracted people previously not involved in alternative food networks who started to search for "good food" and take more time considering their provisioning and food storing practices (including refrigerators and pantries). This allowed them to prepare better: first looking at what they have available and then resupply. In this way, the weekly shopping practice but also other household routines changed as compared to the previously prevailing supply. With these insights, we highlight how COVID-19 disrupted assemblages of everyday practices and how such disruption, if accompanied with proper socio-technical innovations, can foster transformation toward a more diversified and sustainable food system.

Covid -19 Disruptions and Socio-Materially Bounded Experimentation in Food Practices: Insights from Seven Countries

199

Claire Hoolahan[1], Sigrid Wertheim-Heck[2], Lorenzo Domaneschi[3], Martina Schäfer[4], Ulrikke Bryn Wethal[5], Sophie Dubuisson-Quellier[6], Fanny Devaux[6], Elisabeth Süßbauer[4]

[1]Manchester University, UK; [2]Wageningen University, Netherlands; [3]University of Milano, Bicocca, Italy; [4]Technical University Berlin, Germany; [5]University of Oslo, Norway; [6]SciencesPo, France

COVID-19 has caused unprecedented disruption to stable routines and rhythms in everyday life, prompting forced experimentation as people in all kinds of different situations adjust to the new challenges in private and working life. This allows for uncovering potential trajectories for change towards more sustainable consumption. In this paper we examine food related practices (shopping, preparation, eating) in different country contexts (Norway, UK, France, Germany, Italy, Netherlands,Vietnam) to assess what can be learned from these disruptions and consecutive experimentation in accelerating the transition towards more sustainable food practices. Grounded in a practice theoretical

approach, our empirical analysis demonstrates how disruption of routines is leading to socio-materially bounded experimentation. We demonstrate commonalities across contexts in how lockdown measures restricted the performance of previously taken-for-granted practices, but also how responses to these discontinuities are diversified since food consumption is connected to multiple other activities that together constitute daily life. Firstly, our study portrays how householders deal with disruption in reshaping their food practices towards a more or less imagined sense of 'desirable' normality, demonstrating creativity in working within and around restrictions in which adaptation was driven by food to continue to provide services for everyday life, well beyond nourishment. Secondly, our study reveals that the capacity of experimentation is not evenly distributed among people. We identify the wider socio-material constraining and enabling conditions for re-adjusting, illustrating the role of food in relation to (i) rhythms, (ii) social connections, (iii) healthy lifestyles, (iv) leisure, and (v) taking care of oneself, family and others. COVID-19 created a space for purposeful, reflexive experimentation. Understanding disparities in experimentation capacities is informative when thinking about stimulating sustainability transformations in food consumption practices.

Experiences of solidarity economy in Italy

Mario Coscarello

University of Calabria, Italy

The paper presents a reflection on the responses to the Covid-19 emergency promoted by consumers, producers and other actors in the food chain that take the form of "solidarity economy" practices in Italy. Such experiences, which go beyond redefining the relationship between food production and consumption, seem to be relevant for the capacity they have assumed in fostering processes of social change in local food systems, in support of a production that follows the "peasant model", capable of both reproducing production resources and offering quality food.

A relevant experience is represented by the Solidarity Purchasing Groups (Gas), operating in the broader context of italian solidarity economy networks (www.economiasolidale.net), which, from a system of values and reference rules, organise collective purchases of food goods, but not only, according to the values of equity, social justice, environmental sustainability.

The measures adopted by the government in the lockdown phase have favoured the industrial agri-food chain and distribution models linked to the large-scale retail trade (GdO), but the GAS, also with the support of the national network, have identified ways to continue operating, continuing to support small producers. Interviews with privileged witnesses and GAS operators will make it possible to outline the effects of the Covid-19 emergency on the realities operating in the "alternative food chains".

Grocery Shopping Among Elderly During Corona - Changing Practices or Temporary Modifications?

Lena Hansson, Ulrika Holmberg, Anna Post

Centre for Consumption Research, University of Gothenburg, Sweden

During the Corona-pandemic, elderly people have had to limit their physical and social contacts, and consequently adjust several of their mundane routines. In this paper, we will discuss how routines and habits connected to food purchases have changed for elderly consumers (70+) during 2020. We specifically focus on the role of digital technology in the (new) shopping practices. Previous findings regarding importance of age versus experience of online shopping and mobile shopping are contradictory.

Theoretically, we draw on the concept of 'Shopping as practice' (Elms et al., 2016; Fuentes & Svingstedt, 2017) and the theory of social practice by Shove et al. (2012) for understanding the mundane habits and routines involved in practice of grocery shopping and how they can change. The findings are based on 35 interviews with elderly consumers in Sweden, 70 years or older. The grocery shopping practices described fall into 3 main subcategories: switching to online shopping, continuing to shop in a physical store, and acquiring help from friends and relatives. The practices have been reshaped, e.g., in terms of purchasing frequency, food range, offers, payments, ordering, and delivery options. Digital technology and digital competence are essential parts in all three, as is the meaning of independence, but how these elements interact and the type of opportunities and limitations produced vary greatly. We discuss if and how (some) reshaped and new practices become stabilised.

RN05_T02_02 | Consumption and Sustainability

Small is Beautiful? Carbon Footprint Distribution, Socio-demographic Trends and Stories of Small Households in Denmark

Tullia Jack, Diana Ivanova

Aalborg University, Denmark

Decreasing household size is a key challenge for sustainability, simultaneously decreasing sharing and increasing resource consumption. We use the Danish household budget survey and carbon intensities from EXIOBASE, to characterise small households in socio-demographic cohorts with both the highest and lowest carbon footprint. Single and dual occupant households represent 77% of the Danish carbon footprint and 73% of the population, making these households highly relevant for climate and social policy. We identify high carbon footprint cohorts to determine potential intervention targets such as wealthy males living alone and couples in suburban areas. To add emotional depth to these characteristics we provide three stories to our results. Illuminating characteristics of high impact households provides a foundation from which to design and implement interventions to reduce the carbon consequences of the growing trend towards living alone. Our study makes a contribution using storytelling is a step in the direction of increasing empathy and compassion for high carbon footprint cohorts and working toward socially and environmentally sustainable futures.

Re-visiting the Experience of Inconvenience and Everyday Life Practices: the Case of Waste Sorting

Lina Katan

Aalborg University, Denmark

Growing amounts of waste, is an acute issue on the circular economy agenda. Consumers play a key role by sorting recyclable materials from residual waste. In the literature the experience of inconvenience, is recurrently identified as a main barrier to sorting. Modeling inconvenience as the effort required for sorting, these studies suggest adjustments to communication and material arrangements making recycling easier.

This paper offers a reappraisal of the experience of inconvenience and its conditioning. Using ethnographic data I explore the incongruities between participants sayings and doings – their articulated agreement with sorting and there yet reluctant performance of same.

Waste-biographies indicate, that instead of overt efforts implied in the performance of sorting, embodied perceptions of normal waste practice govern what performances of sorting are experienced as inconvenience. I show how this pre-reflexive structuring of perception is anchored in and maintained by waste practices' relation to cooccurring practices. Waste practices are performed as 'secondary practices' enabling other practices, which orchestrate participants doings, and moreover their immediate discernments of what are dispensable, thus inconvening efforts.

I consequentially propose that 'convenience' be the experience to be able to proceed comfortably with one's primary practice, whilst efforts unnecessary for its accomplishment are perceived as 'inconvenience'. This perspective allows us to appreciate how primary practices hold waste practices in place, maintaining disposal as normal whilst making change towards sustainability inert. It might be, that instead of focusing on diminishing inconvenience efforts to increase sorting and other sustainable everyday life practices we need to adjust our target to normalization.

Ritual Contamination and Dress: Secondhand Clothes and Social Interaction in Romania

Iulia Gheorghiu

Hong Kong Baptist University, Hong Kong S.A.R. (China)

This presentation draws on 80 in-depth interviews in Romania, centering the relationship between dress and morality. Secondhand clothes were one instantiation of dress that research participants reflected on, with positionings ranging from full embracement as a sustainable and/or affordable option to utter rejection as a form of physical pollution and contamination. In this talk, I isolate the latter responses and argue that, rather than a fear of physical pollution or contracting diseases, the rejection of secondhand dress can be accounted for through the ritual and interactional troubles it poses. I show that wearing preowned clothes signifies, for some interviewees, a transgression of socially sanctioned rituals of interaction. Drawing on Erving Goffman's account of the sacrality of self and of the rituals in place for self-preservation, as well as Mary Douglas' conceptualization of ritual pollution, I discuss how dress functions as a device for bounding and containing social interaction. I focus on degrees of rejection spanning across disgust and fear of pollution to indignity and embarrassment all the way to feelings of incomplete ownership and conviction of the lasting presence of the previous owner, a stranger's presence inside one's clothes. Dress is endowed with the ability to preserve and contain the self and, once it is used in a ritually improper manner – wearing pre-owned clothes, with the capacity to unleash the self of the prior owner onto the one of current. This reveals two entities endowed with the same ontological status and confronts wearers with the fear that the self of the previous owner will spill over and take over, contaminate and dilute their own.

Understanding the Dynamic Relation Between Ethics and Practices of Energy Consumption

Anne Sofie Møller Askholm

Aalborg University, Copenhagen, Denmark

In contemporary practice theoretical research on consumption, ethics have to a great extent been dismissed. Possibly, because of its correlations with the cultural turn in sociology of consumption, symbolic conceptions and a consumption-as-culture understanding. However this may turn a blind eye to some parts of social life that become visible in empirical data. In the area of energy consumption there is a need for understanding how ethics play a role in practices for even though energy consumption predominantly is considered a mundane and invisible type of consumption it is becoming increasingly more contested and visible through media discourses, in politics and among some social groups. Understanding the relation between ethics and practices may help to understanding how reflexive and tacit parts of consumption are connected.

This paper contributes with empirical research on the dynamic relations between ethics, practices of energy consumption and ways of practicing sustainability. It will suggest how ethics as social and cultural phenomenon concerning ideas, knowledge and convictions about right and wrong are at work in everyday life, inveigled in social relations, experience, knowledge, resources and socio-economic position, and how ethics can take part in changing practices from a practice theoretical perspective.

The research is based on 3,5 months of fieldwork among consumers in a rural Danish municipality, using audiovisual ethnographic methods by working with a camera as a tool of inquiry and making relations between ethics and practices of consumption visible.

RN05_T02_03 | Food and Eating I

Eating as the reflection of Russian X, Y, Z generations lifestyle

Svetlana Ruslanovna Fedoseykina

Moscow State Linguistic University, Russian Federation

Examining eating as the reflection of Russian X, Y, Z generations lifestyle, this study demonstrates that the value gap between generation Z and X, Y exists and that food and eating differ in extracted typology of lifestyles. Evidence based on the 2020 Russian Generations Survey conducted by the author shows that adapted to food research Schwartz value survey has the most essential differentiation between generation cohorts. Z generation tend to individual value orientations, whereas X, Y to the collective ones. Typology of lifestyles, based on Pierre Bourdieu capitals theory reveal peculiarities of secondary needs of eco-friendly, healthy, and aesthetic nutrition and of system of taste preferences (habitus) via analysis of nutritionists' expert interview. Only those who represent high level of economic capital predisposed to healthy food and aesthetic behavior while eating. Eco-friendly nutrition is not typical for any lifestyle or generation. We discovered that due to Covid-19 generation Z started to snack more, while Y and X stockpile and buy products in panic. Furthermore, in this study we highlight the association between eating as the reflection of Russian X, Y, Z generations lifestyle and such indicators as the epidemiological period, BMI, and presence of diseases related to nutrition.

Ageing and Changes in Food Tastes: a Sociological Study using Epidemiologic Cohort Data

Marie Plessz, Séverine Gojard, Charlotte E Dion

INRAE, France

The paper examines dietary changes over age using a theoretical famework rooted in the sociology of taste and prospective data from an epidemiologic cohort in France. The sociology of taste has shown that tastes differ across social class, gender and age-group, and that various actors try to promote competing definitions of "good taste". In the case of eating, specific prescriptions target different age groups: focusing on the elderly, "healthy ageing" policies may support or conflict with people's views of "eating well". There is, however, little research on how tastes change when people age. Do people adopt new tastes or do different birth cohorts adopt tastes early on and stick to them?

The lack of empirical research on the way tastes change in France is largely due to the scarcity of relevant data. We used Gazel, a French epidemiologic cohort in which 20,000 men and women in their forties in 1989 have been surveyed every year since (4 waves of diet questionnaire between 1998 and 2014). Using factor analysis, we characterised diets along three tastes: the taste for sweet and salty foods; for fruits, vegetable and dairy; and for meat, wine and cheese. We connect them to definitions of "eating well" as promoted by the food industry, public health nutrition, and French gastronomy, respectively. We then track survey respondents in this three-dimensional space as they age from their 45 to their 70 years old.

Urban Food Deserts in China: a Disparity created by Hukou System

Lita Alita, Liesbeth Dries, Peter Oosterveer

Wageningen University, Netherlands, The

Evidence from the U.S. in the 2000s led to the notion of food deserts, areas where the socio-economically-disadvantaged population has inadequate access to healthy and diversified food, thereby leading to obesity and malnutrition. Rapid urban growth is creating potential food deserts in the Global South. This study aims to create a context-specific framework to detect the food desert in China, in which the residents lack safe and healthy food access. After collecting 4046 vegetable samples test results from the Chinese FDA homepage, we identify two critical threats to safe and healthy food provision. First, there is a high incidence of pesticides and heavy metal residues in fresh foods in China. Second, despite a high intake of fresh vegetables, Chinese consumers favor processed foods that often contain high concentrations of salt, nitrites and benzoate. The demographic data in the Shanghai Statistic Yearbook reveals that contaminated food and unhealthy processed food are significantly more prevalent in urban districts with high concentrations of domestic migrants without residence permit. Hence, the spatial pattern that we find in the urban food environment is connected to the disparity created by the household registration (hukou) system, which aims to control the urban population by restraining internal migrating. As a conclusion, we call for public attention and financial support for supplying safe and healthy food for the areas inhabited by the domestic migrants.

Practices of Commensality in Poland. Social Class, Social Capital and Eating Together

Michał Cebula

University of Wrocław, Poland

The aim of the presentation is to expand the body of knowledge on the social stratification of eating by exploring the issue of commensal practices. The main research question is how eating together is implicated in web of relations that may be understood as social capital and how is related to social class divisions. If eating at the same table is class-stratified and connected with accumulation of social resources, then we can show one of the mechanisms of social reproduction. Practices of commensality are operationalized by three variables: being a host, a guest in private homes and eating together. The research presented is based on survey data collected in 2017, on a locally representative sample of adults aged 18-75 years (research project financed by the National Science Centre in Poland). A stratified clustered random procedure was administered, providing a final sample of 1010 individuals who completed the computer-assisted face-to-face interview. The inquiry revolves around three hypothesis: (1) practices of eating together are more typical for people occupying higher social positions (i.e. those located in the upper area of the social space) and (2) for those better connected (i.e. those having access to socio-economic resources via social ties). According to third hypothesis, eating together goes hand in hand with culinary omnivorousness and "cosmopolitan" taste. Being familiar with many different foods may serve as symbolic currency that people exchange in social interaction or be the result of culinary encounters. Convergence of taste, practices of commensality and social capital show the potential strength of class barriers and inequality

RN05_T03_01 | COVID Consumption II: Food in a pandemic 2

Breadmaking and Excursion. The Effect of COVID-19 Pandemic on Middle Class Consumption Strategies

Luca Kristóf, Bernadett Csurgó, Boldizsár Megyesi

Centre for Social Sciences, Hungary

The COVID-19 pandemic and the related social and economic crisis has a different impact on different social groups. The aim of our research is to examine the reaction of the Hungarian middle class consumers on the crisis. How does the pandemic shape consumer behaviour and attitudes of this social group and what are its long term effects on the middle class?

Our approach is based on the line of literature originating from the classic works of Veblen and Bourdieu, focusing on the role of consumption on maintaining and signalling social status. Middle class consumer habitus is growingly post-material in Hungary. Consumers with high cultural capital tend to express their social and environmental commitments through their consumer choices. We assumed that in the middle class the pandemic even increased the prevalence of ethical, sustainable consumption.

The paper is based on an online survey of respondents representing the Hungarian population with at least high school graduation by age, gender and economic activity (N=618). The survey was carried out in September, 2020 and consisted questions on the consumption habits of the respondents before, during and after the three months long lockdown in the Spring of 2020. The data gathered by the online survey allowed us not only to follow changes in the consumption of the middle class, but also (by latent class analysis) to identify consumer types defined by different strategies. Several immediate effects of Covid-19 pandemic on middle class consumption and consumer behaviour have been identified. New and innovative ways to consume and experiment with old and new practices such as breadmaking seem common middle-class consumer responses to the pandemic.

At the Dawn of a Food-Related "New Normality": Early Findings from a Research on Eating Habits during the First Lockdown in Italy.

Maria Giovanna Onorati[1], Francesco Domenico d'Ovidio[2]

[1]University of Gastronomic Sciences in Pollenzo, Italy; [2]University of Bari "Aldo Moro ", Italy

The drastic measures taken by governments across the world to contain the contagion of COVID-19 demanded to review the daily habits of both individuals, and communities overnight. Daily food-related practices – from grocery shopping, to cooking, to gathering information on purchases, to all manner of meals – underwent significant changes: on the one hand they hastened already existing trends, on the other hand they exacerbated peoples' "antinomic" concerns (Warde 2016) about self-minding and biospheric care.

Starting from the awareness that consumer practices – especially eating – are "the locus of the social" (Schatzki 2001), the research focuses on the slight changes occurred in the household food habits during the lockdown in Italy, in the effort to glimpse the harbinger of a new social universe revolving around food. Based on a wide sample survey (3155 voluntary participants from all Italian regions), the research findings from both explorative and confirmative factorial analysis show that five main latent dimensions determined the most significant changes in eating practices. These dimensions outline an emergent, to some extent contradictory mindfulness, whose concerns are partly determined by structural factors – powerfully revived by a social world under attack – and partly sustained by the claims typical of the cultural omnivore. Hence, sociological investigation into the structuring of a 'new normal' eating requires insights into both the socially shaped sphere of practices, and the value-laden claims and beliefs sustaining the choices of an upset though mindful consumer. This also means to make room in the sociological analysis to those motivational, behavioural factors so far deemed as 'non-sociological' ones (Evans 2019).

205

Home Cosmopolitics: Cooking and Eating in Pandemic Times

Iñaki Martinez de Albeniz, Asier Amezaga

Universidad del País Vasco

The restrictive measures taken to tackle the pandemic has been possible by keeping home as the main black box these measures bump on ("stay home", it is still said). Leisure and working activities outside home has been restricted; bars and restaurants keep shut –as we write this, those measures as widespread in most of Europe. Accordingly, authorities and citizen themselves have confined eating-related social activities to home.

The pandemic situation permeate the way we eat and cook at home, hence we opened up home black box to deepen the controversies and representation on food and COVID at eating and cooking practices. For doing so, we are conducting six triangular groups of live-in partners of different household types (single parent, nuclear and extended family, working and studying flatmates) in the Basque Country. The live-in members has been asked to discuss on the different measures accomplished at home to deal with different contagious agents in the long process involving the eating and cooking, from the supply of raw material to table talk. Additionally, these results are being included in a larger sample of restaurant and delivery employee's interviews.

Hitherto, we have found different strategies accomplished by the live-in partners to stabilize contagious agents ranging from externalization and the black-boxing of the process –meals on wheels, take-away— to the internalization of controversies. These controversies open up possibilities of cosmopolitics to bring global pandemic home, opening the way to new alimentary representations of the pandemic and pandemic representations of cookery.

Eating Practices During the First Lockdown in Portugal: Results of a Mixed Method Approach

Monica Truninger, Vasco Ramos

Universidade de Lisboa, Instituto de Ciências Sociais, Portugal

Similar to many other countries in Europe and elsewhere the restrictions imposed to mitigate the spread of the infection Covid-19 were also applied in Portugal. The first lockdown took place between March 18 and May 2 2020, where 'stay-at-home' orders disrupted the spatial and temporalities of a series of practices of mobility, working, leisure, and also eating. In this paper, we focus on the disruption and reconfiguration of food practices. Drawing on a large non-probabilistic survey conducted through an online questionnaire applied in the first lockdown (19 and 24 march 2020) that obtained the responses from 11,508 Portuguese residents, and which combined both closed and open-ended questions, we address the views and opinions of the individuals regarding their lockdown's experiences. After presenting a cluster analysis of the results, we focus on a subset of the sample (n=2203) who replied to an open-ended question on the main positive and negative aspects of the lockdown referring to food practices. By adopting an informed practice theoretical approach applied to food (Warde, 2016) we focus on various dimensions of social life that interconnect with eating practices, considering the phases of acquisition, appropriation and appreciation of food (e.g. food shopping; cooking, social participation in food events, changes in eating practices). The article contributes to academic debates on how everyday food practices changed, reconfigured or triggered innovation (or resistance) in response to the Covid-19 pandemic and its implications for sustainability.

RN05_T03_02 | Food and Eating II

The Dissatisfaction of Spanish Consumers With The Food System

Guadalupe Ramos-Truchero[1,4], Cecilia Díaz-Méndez[2,4], Carmen Lozano-Cabedo[3,4]

[1]University of Valladolid, Spain; [2]University of Oviedo, Spain; [3]National University of Distance Education, Spain; [4]Sociology of Food Research Group- University of Oviedo

Gaps and contradictions in the conventional food system have generated a general discomfort with food in Spanish and European societies. This has increased during the COVID pandemic. Consumer discomfort with diet is evident in areas such as the growing distrust of institutions that protect the consumer, in food demands with its own characteristics (local, organic, vegan, fair trade, animal welfare, realfooders, etc.), changing eating habits and reflections about what is eaten, how it is produced, where it is bought; or the increase in political food consumption. Furthermore, this is also perceived in how farmers and producers adapt to more sustainable agricultural practices, institutional or commercial strategies that seek to satisfy consumers and citizens.

The aim of this presentation is a review of food distrust behaviours research and food system actors' answers to this criticism and dissatisfaction and how producers, food industry, food distribution or scientists are reacting to food discomfort. This paper contributes to knowing which is the ideal food model behind each of these reactions and we consider they are going to determine food in the future.

Feeling at Home Through Food: the Role of Eating and Cooking Practices in the Creation of Home

Mariana Dias

University of Manchester, United Kingdom

Based on a study that is being conducted with the purpose of understanding how Portuguese women feel at home when living in the UK, given their everyday practices, transnational relationships, place-attachment, and the processes of homemaking, this presentation aims to look at the ways through which they manage to create a home environment through eating and cooking practices. The research is using a multi-method approach with interviews, video house tours, diaries and timelines (drawn by the participants), and elicitation interviews, in order to better grasp those dimensions. The results show that there is a strong connection between the continuity of eating and cooking practices when living in the UK and their ability to feel at home, of creating a home atmosphere, of keeping their ways of being, in a country that is different from their homeland. These practices are enabled by the food they bring with them from Portugal, learning how to recreate Portuguese flavours by using British products, adapting recipes to the absence of certain foods. One other dimension explored in this study is the re-creation of home through the senses, namely taste and smell, by remembering and doing different dishes not only from Portugal but also, in a temporal dimension, from their childhood. The role of eating and cooking practices in the possibility of feeling at home in a migratory context is thus an essential one to investigate.

Media Diets Of Vegetarians. How News Consumption, Media Use And Communication With One's Social Environment Are Associated With Pursuing A Vegetarian Diet

Alicia Dunker, Stefanie Kley, Katharina Kleinen-von Königslöw

Universität Hamburg, Germany

Considering the impact of modern diets and food production on climate change, we want to get a deeper understanding of drivers of sustainable diet choices, especially regarding the avoidance of meat consumption. Whereas research so far has focused on individual motives and attitudes for vegetarianism, such as health or moral concern, the role of the social environment lacks attention. This is especially true for the role of (social) media. Since people nowadays often turn to the internet for information about food, and since communication about diets is prominent in social media platforms, more research needs to be done here. We therefore examine both, whether vegetarianism is associated with news consumption via different media, including social media, and whether having vegetarian friends and family-members or communicating about food play a role with this regard. The data comes from a tailor made survey with 1,311 respondents carried out in Hamburg, Germany, in 2018. We model the association between vegetarianism and news consumption, personal convictions, having vegetarians in the social environment, and communicating about food, controlling for individual characteristics. We find that following a vegetarian diet is significantly associated with having vegetarian friends and family-members. Additionally, vegetarians consume more news via social media, but not via 'traditional' media. As consuming tailored news in the social media is found to be associated with communicating about food via social media, our findings suggest that vegetarians are often embedded in a close knit of like-minded people with whom they often communicate via social media.

The Role of Food Outlets in Sustaining Healthy Eating Practices – Lessons from Costa Rica

Dalia Mattioni

Cardiff University, Italy

Decades of rsearch on the posited link between the retail food environment (RFE) and diets have yielded mixed results, suggesting the need to integrate metrics on proximity and density with socio-cultural variables. This paper proposes the use of social practice theory as a sociological framework that can better explain why individuals choose certain food outlets (beyond price), and to analyse the influence of the RFE on individual and collective practices. The paper contends that food outlets act as powerful cultural intermediaries that influence the meaning and competences that individuals have around food. The paper presents a case study of Farmers' Markets in Alajuela, Costa Rica. It used a mixed-methods approach to collect data on consumers' food practices, dietary patterns and the relative density of healthy/unhealthy food retail outlets. Results show that the food practices of those who visit the Feria regularly are governed by a concern for health and wholeness, which includes conviviality, and a domestic repertoire of justification based on trust and tradition. This, and the related suite of tacit and embodied competences that individuals have learnt and strengthened at the Feria, has had positive implications for their dietary patterns. The material organisation of the Feria has played a key role in sustaining and strengthening these healthy practices. The paper concludes by suggesting urban policy actions aimed at providing those material elements that can help construct, or maintain, practices that sustain healthy eating.

RN05_T04_01 |
COVID Consumption III

The impact of Covid 19 on consumer behavior: evidence from Italy

Ariela Mortara[1], Piergiorgio Degli Esposti[2], Geraldina Roberti[3]

[1]IULM University, Italy; [2]Alma Mater Studiorum – University of Bologna, Italy; [3]University of L'Aquila, Italy

The pandemic triggered by the spread of the COVID-19 virus has had a major impact on numerous collective behaviors, while also changing individuals' consumption choices. Thus, social researchers dealing with consumption patterns need to reflect on the changes of individual practices, also in view of the growing centrality in the public debate of issues related to the safeguard of health, sustainability and social distancing.

The paper presents the results of a quantitative research project aiming at understanding whether and how the outbreak of the pandemic impacted on young female university students' consumption behaviors with a focus on the topic of collaborative consumption practices.

Data have been gathered through an online self-completion questionnaire from October to December 2020, using a snowball procedure to collect the purposive sample of 411 questionnaires. The project has been presented during several classes in three different Italian universities, IULM University of Milan, Alma Mather Studiorum of Bolonia and University of L'Aquila. Most of the students are attending Communications or Education Sciences faculties.

According to the collected data, respondents increased the frequency of purchase of certain products such as books and TV series, while reducing the frequency of purchase of others, such as beauty care and clothing items. Furthermore, we found a decrease in the use of public transport and ridesharing, since respondents prefer to avoid contact with strangers on shared transportations means.

The Change in the Lifestyles and the Consumption Habits of Families During COVID-19 Pandemic: An Istanbul Example

Berfin Varışlı

Maltepe University, Turkey

The COVID-19 pandemic has caused many transformations in individual and social life. Many people have not been able to leave their homes for a long time due to the restrictions and curfews imposed by the state authorities. Families had to spend most of their time indoors. Some members of the families had to work from home, and some continued their education online. Individuals who cannot leave home for a long time have changes in their consumption needs, habits and behaviors. During the pandemic period, the differences in consumption habits and behaviors of individuals from different socio-economic status and age groups draw attention. This situation reveals that the pandemic is a transformation process for families characterized by class differences. This study aims to understand the transformation of life styles, consumption habits and behaviors of individuals of different age groups living in the families with different socio-economic background. In order to achieve this goal, 35 in-depth interviews were made with people living in Istanbul. As a result of the interviews, it was revealed that basic needs started to be provided from online platforms, consumption materials such as clothing and outerwear were consumed less and the comsumption of food and beverage items increased. Therefore, it was observed that there was a transformation in lifestyle, consumption habits and behaviors of families.

209

Covid-19 and Cleanliness: Changing meanings, materialities and practices

Cecilia Alda-Vidal, Ruby Smith, Natalie Clarke, Claire Hoolohan, Alison L Browne

University of Manchester

On 23rd March 2020 the UK government imposed coronavirus 'lockdown' measures. These restrictions had rapid implications for the understandings, materialities and spatio-temporalities of hygiene and sanitation, and resulted in measurable increases in overall domestic water demand and changes in domestic water use rhythms. This paper presents an evidence assessment of the changed patterns of water use observed since the beginning of the lockdown and critically reflects on these changes using data from 12 online focus groups conducted with participants in England and Wales between August - October 2020. The findings demonstrate that indoor water practices such as laundry, bathing, cleaning and handwashing have changed in response to the pandemic in some cases, but not consistently. Participants accounts reveal subtle adjustments to the meaning of 'contamination' and how 'clean' and 'dirty' bodies, clothes and homes are categorised and conceptualised during the pandemic. They also detail the socio-technical, socio-cultural, temporal and spatial dynamics underpinning these changes and reflect on the possible short- and long-term implications for water demand and associated energy use. This paper contributes to the burgeoning literature on everyday practices of health and wellbeing, emphasising how the changing everyday geographies and responsibilities of care (for home, things, self and others) has been effected by the pandemic.

Environmental Alternative Action Organizations and COVID-19: How Vienna's Sustainable Gardening, Sharing and Swapping Initiatives Adapt their Repertoire of Action under Conditions of the Pandemic

Michael Deflorian

Vienna University of Economics and Business, Austria

210

In recent years, Environmental Alternative Action Organizations (EAAOs) have received increasing attention, due to their strategic focus on altering the social order directly by mobilizing alternative everyday routines via low-threshold communities of practice (Zamponi & Bosi, Yates). Conceptually, this repertoire of action has produced very diverging interpretations, ranging from a new politics of sustainable materialism (Schlosberg) to post-political exclaves of simulative action (Blühdorn). Empirically, scholars have cautioned against all to 'neat theories' (MacGregor) and have called for nuanced analyses of the real-world tactics of EAAOs and their situatedness within geographical space and political-economic environment (De Moor et al., Varvarousis et al.). In this paper, I aim at contributing to this research agenda by studying three EAAOs in the city of Vienna. Unlike most places in which EAAOs have been investigated, Vienna has been untroubled by excessive austerity measures, yet, like virtually the whole world, the city has experienced social distancing and lockdown policies to confine COVID-19. For determining the effects of this context, I conduct theory-driven participant observation and problem-centered interviews with 27 practitioners from a community garden, a library of things and a clothing swap initiative. Preliminary results suggest that even though they do not operate under austerity, organizers avoid politicized framings, as they seek to change everyday routines of as many practitioners as possible. As such, the EAAOs constitute platforms for a myriad of different gardeners, sharers and swappers, yet they remain limited in their strategic scope to the realm of the mundane. Moreover, the pandemic has negative, positive or virtually no effects on the efforts of EAAOs, depending on the urban space in which an alternative everyday practice is being mobilized.

RN05_T04_02 | Food and Eating III

Tap Water Standards: A Qualitative Study On The Influence Of Stakeholder Evaluations

Madita Zöller-Cannito

Justus-Liebig-University of Giessen, Germany

In times of ecological crisis, the evaluation of tap water is subject to new social, ecological, economic and moral standards. These standards are associated with up- or downgrading tap water. The evaluations of stakeholders like consumer associations, lobbying organizations and other NGOs have a direct effect in everyday life. The objective of this paper is to better understand the complexity of communicative evaluation of the ecological resource water. The underlying hypothesis assumes (institutional, discursive) evaluations effecting the socio-cultural constitution of tap water. This work therefore asks the question of how stakeholder evaluations affect the consumption of tap water. A discursive analysis reveals different, interconnected levels of evaluation. Stakeholders' evaluations in the media are analysed. For example, the German consumer association watchdog "foodwatch" is calling for a more sensitive threshold level for uranium in tap water. They recommend that babies and small children should not be supplied with tap water beyond a stricter threshold level than currently set by governmental recommendations. Other examples point towards evaluations that are associated with the ecological understanding of using tap water. Discursive evaluation on hygiene and usability of tap water can be very contradictory. By a better understanding of evaluating tap water in society, measures can be taken to increase the sustainable use of this resource.

The new trends of food consumption: Liquid Food and Gastro-liquidity

Paolo Corvo

University of Gastronomic Sciences, Italy

Food has become a determining factor for the definition of individual identity and is at the center of attention of traditional media, social networks, consumer movements and associations. Grasping the new frontiers of gastronomy also represents a way to rethink consumption models, lifestyles and public policies. We are witnessing a plurality of choices and options available, without certain and absolute references, as never happened in the past, even if thirty years ago Fischler already spoke of gastro-anomia, describing a relationship with food characterized by a general absence of rules.

To describe the current situation in the world of food, it seems appropriate to refer to the thought of Zygmunt Bauman and his concept of a liquid society, whereby the globalized individual lives without certainty in an aesthetic and fragmented space. In this perspective, trying to define the current situation of the food world, we can perhaps speak of liquid food or gastro-liquidity, where the consumer's experience is very changing, between the development of automation, even in the restaurant sector (will we have the robot waiter or the robot chef?), and the rediscovery of a direct relationship with the producer, between the attention to local products and the attraction for fusion and multiethnic food, between the multisensory and taste experiences of food (I think to neuro-gastronomy theorized by Sheperd and the purchase of food online without any visual or tactile contact.

211

Labor Conciliation and Food Conciliation in Spain

Cecilia Díaz-Méndez[1], Javier Callejo[2]

[1]Universidad de Oviedo, Spain; [2]UNED, Spain

Adjustments in working time and personal and family time have become a fundamental organizational element in today's societies and, in this battle to resolve hegemony, working time has won an unquestionable victory. However, the times dedicated to food continue to show the conflicts between both spheres.

The lunch in Spain prints peculiarities in the organization of time since most of the population solves it at home and dedicates their time to consumption with relatives and to organize the preparation. This generates controversy between employers and workers, the latter prefer a temporary organization compatible with the Spanish food cultural patters.

The Time Use Survey allows us to analyze work-life balance and food balance, and in this paper, we are going to investigate the relationship between the type of working day and mealtimes. The objective is to know what circumstances favor or hinder the reconciliation of work and family life in both areas.

The data indicates that food conciliation works as a cultural trait that equalizes both sexes around a habit that encourages sharing time outside of work, but it is women's time that makes it possible.

Self-care, Embodied Experiences and the Politics of Counternutritional Communities

Marjaana Jones

Tampere University, Finland

Various diets are an integral part of food culture and influence individual food choices. They provide ways for people to look after their wellbeing. Additionally, dietary choices intertwine with people's sense of identity and consumer food choices can be seen as a form of political engagement. It has even been argued that dieter communities could constitute counternutritional movements, challenging exiting orthodoxies around healthy eating. This study focuses on one such 'movement' by exploring the perspective of self-proclaimed followers of low-carbohydrate diets. The aim is to analyse rationales behind food choices, how people

position themselves and how they negotiate and evaluate different sources of information regarding healthy eating. The materials consist of answers (n=741) to an open-ended question on food, health and wellbeing in a survey conducted through a national Finnish newspaper.

The findings indicate that low-carbohydrate diets are used for DIY illness prevention, everyday risk management and to maintain a socially desirable body weight and size. Food is used to treat a number of existing diagnosed and undiagnosed conditions and diets were portrayed as means to regain agency in situations where the participants had been unwell, vulnerable to illness or where health professionals had been unable to help them. The participants present themselves as exemplary health citizens who both consume and constrain themselves. By doing so, they were choosing health, choosing to take control and choosing to rely heavily on embodied experiences and on what they consider non-partial advice. However, by doing so, they are also engaged in implicitly and explicitly challenging traditional expert institutions and advice.

RN05_T05_01 | COVID Consumption IV 212

Disrupting Daily Urban Mobilities: A Cross-cultural Analysis of Dynamics in Household Mobilities in Response to COVID-19

Mary Greene[1], Johannes Holden[2], Katherine Ellsworth-Krebs[3], Manischa Anantharaman[4]

[1]Wageningen University, The Netherlands; [2]University of Oslo, Norway; [3]Lancaster University, UK; [4]St Mary's College, California, USA

The potential of disruptions of various forms and scales for inducing changes in daily transport practices is of central relevance for transport sociology and policy. However, as of yet little is known about how different social, cultural, and governing contexts shape mobility practices and their dynamics in response to major societal disruptions. The Covid-19 pandemic, in constituting a major systemic disruptive force affecting citizen mobility all over the world, provides a unique empirical context in which to uncover how disruptive

events impact practices across different cultural and governing contexts. Comparing the impact of the Covid-19 pandemic on mobility practice dynamics across cities in Ireland, Norway, and the USA, we combine contextual analysis of aggregate trends in modal shifts and Covid-19 regime measures with qualitative interviews with 63 householders to explore how urban mobilities have been disrupted and transformed during the Covid-19 pandemic. Our analysis reveals that already existing variation in mobility cultures and infrastructures are important contextual factors mediating the impact of disruption on daily mobility practices, shaping how changes in understandings and performances of mobilities play out. This suggests that changes to practices arising from major societal disruptions must always be considered against the backdrop of wider socio-historical and governing contexts. For instance, we reveal how underlying cultures and infrastructures of mobility shape the extent to which practitioners opt for cars versus more sustainable private mobility options in response to pandemic measures. These findings have important implications in considering the impact of disruptions for transitioning toward low-carbon mobilities.

Consumption and Shifting Temporalities of Daily Life During Disruption: Undoing and Reassembling Household Practices During COVID-19

Mary Greene[1], Arve Hansen[2], Claire Hoolohan[3], Elisabeth Süßbauer[4], Lorenzo Domaneschi[5]

[1]Wageningen University; [2]University of Oslo; [3]University of Manchester; [4]Technische Universität Berlin; [5]University of Milano-Bicocca

The way in which time is produced and consumed during everyday life has crucial implications for sustainable consumption. Social practice approaches have directed attention to the intersection of personal and social temporalities as important for the patterning of everyday consumption. However, as of yet, little research has explored how temporal dynamics of daily consumption are impacted by major societal disruptions of systemic scale and influence. This paper examines the temporal dynamics of social practices experienced in 'locked down' households in Germany, Ireland, Italy, Norway and the UK during the Covid-19 pandemic. Giving particular

attention to social differentiation in experiences of the lockdown, we discuss the temporal and relational dynamics shaping daily routine in terms of timing, sequence, coordination, duration and tempo of activities. Drawing on in-depth interviews with participants in all five countries, we investigate quotidian experiences of the breaking and (re-)making of daily routines in response to the pandemic and the temporal processes by which routines become undone, reassembled and reconfigured. Our analysis reveals not only the effects of disruption on practice configurations and outcomes per se, but also how disruption itself sheds light on the otherwise hidden temporal dynamics of everyday practice. We explore how disruption-induced changes to social institutions and systems of provision impact social groups in unequal ways. We further consider the implications of these socially differentiated experiences, first, for temporal organizations of daily life that support sustainable consumption of food and mobility, and, second, for informing sustainability governance and interventions.

Qualities Of Instituted Practices: Locking-Down And 'Domestic' Consumption

213

Torik Holmes

Cardiff University, United Kingdom

Due to the COVID-19 pandemic, governments around the world placed communities under 'lockdown'. As a result, various practices of consumption were uprooted from instituted settings and re-rooted in homes. This unprecedented mass reorganisation of normality resulted in increased domestic consumption, as practices typically occurring in social sites outside homes, such as offices, gyms and restaurants, were forced inside. We examine this transfer of practices, contributing to literature on COVID-19 and practice-based consumption research. Our account complicates overly optimistic narratives about the potential for the disruption caused by locking-down to downsize the consumer economy. By combining qualitative household interviews with secondary data about wider trends in consumption, we specifically reveal how the re-rooting of instituted practices results in lumpy patterns of resource use and desires for more space and larger homes. With many of the changes that came in response to the pandemic sticking, we conclude by arguing that future domestic consumption research and policy should attend to the instituted qualities of practices and how these could be reshaped to facilitate sustainability ambitions.

Cultural Consumption in the COVID-19 Era. Understanding the Impact of the Crisis on Cultural Participation and Engagement in Italy

Paola Panarese, Vittoria Azzarita

Sapienza, University of Rome, Italy

The COVID-19 crisis has had and will have an unprecedented impact on cultural participation and engagement (OECD, 2020). The social distancing measures have heavily affected all cultural experiences which rely mostly on physical attendance, determining deep changes in both cultural consumption and production (Bollo, 2020). In particular, the pandemic has fostered the digital transformation of cultural production, with a significant shift towards digital services; but it has also impacted the consumption's dimension, mitigating or even exacerbating the existing inequalities of cultural participation in terms of age, gender and income (Bourdieu 1979; Brook et al., 2020).

To better understand the status quo and imagine what might come next, this paper presents a twofold level of analysis. Firstly, we offer a general overview of the impact of COVID-19 on the behaviour of different cultural audiences, collecting and reviewing a range of evidences provided by different Italian surveys regarding a variety of cultural activities (such as visiting museums, attending theatres, concerts, festivals, etc.). Secondly, we present the results of a qualitative research conducted through semi-structured interviews with a significant sample of relevant Italian cultural institutions about how cultural consumption has changed during the pandemic, potential future behaviours in the aftermath of the crisis, and the emerging trends in the field of audience development and engagement.

On the basis of these findings, we identify the lessons learned from the crisis and suggest future research directions in order to provide an ever-richer understanding of cultural consumption in the COVID-19 era.

RN05_T05_02 | Food and Eating IV
Culinary Cosmopolitanism, Omnivorousness and the Boundaries of (In)tolerance

Taru Lindblom, Sami Koponen

University of Helsinki, Finland

Cultural sociological perspective on food and eating highlights the interlinkages between the so called ethos of discovery and one's elite status. Studies argue that the pursuit of exotic, authentic (Johnston & Baumann 2010) and cultivation through eating practices (Cappeliez & Johnston 2014), as well as tolerance for cultural diversity (Ollivier 2008; Koponen & Niva 2020) are coupled with beneficial social position and cultural resources. Correspondingly, studies recurrently confirm that growing suspicion and intolerance towards cultural objects considered foreign and unfamiliar are associated with conservative attitudes, and lesser cultural and economic resources, sometimes in very straightforward manner (Lindblom & Mustonen 2019; DellaPosta et al. 2015; Warde 2011). Yet relatively little is known about how people with different backgrounds and levels of cultural capital potentially cross these boundaries. This paper zooms in on the discourses of tolerance in eating. The paper demonstrates manifestations of (in)tolerance among and across food connoisseurs, "goodwill foodies", tentative culinary cosmopolitans and pragmatic food consumers. We draw on 28 semi-structured interviews of Finnish consumers collected in 2019-20. The interviewees were selected among the respondents to a nationally representative survey (Culture and Leisure in Finland 2018) on themes such as cultural taste, participation and leisure. Our results depict how the ethos of openness is recognized widely, and how food is identified as a field of culture that is understood and talked about in a manner typical to cultural capital. Apart from the omnivorous discourses that are clearly shaped by the oft-referred social forces, we also recognize rather surprising crossings of symbolic boundaries and indications of cultural (in)tolerance.

214

Patterns Of Animal Protein Consumption In Portugal: Current Trends And Food Policy Challenges

Vasco Ramos, Mónica Truninger

Instituto de Ciências Sociais da Universidade de Lisboa, Portugal

This paper examines patterns of animal protein consumption in Portugal between 2010 and 2016, relevant for the following reasons. Tracking the evolution of meat and fish consumption is relevant for a number of reasons. Firstly, excessive consumption of animal protein is increasingly perceived as a public health concern due to the incidence of health-related problems (e.g. obesity, cardiovascular diseases). Secondly, livestock production causes a significant environmental footprint (Graça et al, 2019). Thirdly, food consumption patterns are a proxy of food insecurity, a problem that re-emerged in force in Western Societies following the financial crisis of 2008 (Borch and Kjaernes, 2016). Additionally, while differences in animal-based dietary patterns may relate to religious, regional or national identities, they are often linked to class and unequal living standards (Franklin, 1999).

There is mounting pressure at the European policy level to reduce the consumption of animal-based foods and increase plant-based diets. Understanding patterns of animal-protein consumption is becoming increasingly germane to policymakers and regulatory agencies when formulating and assessing the impact of their interventions. Drawing on the national Household Budget Surveys of 2010/2011 and 2015/2016, this paper examines the evolution of animal protein consumption patterns; identifies the main socio-demographic characteristics of households according to type of consumption (heavy animal-based, flexitarians and plant-based households) and analyses how these groups and their social characteristics evolved during the two periods. The paper contributes to the bourgeoning literature on changing food diets (from animal to plant-based) and informs policy design to facilitate the shift towards reducing animal protein consumption.

Pathways Across Practices in Everyday Handling of Food and Health under Socio-Economic Disadvantage.

Lotte Holm, Bente Halkier, Kia Ditlevsen

University of Copenhagen, Denmark

In the research literature on the connections between food, dietary health and low socio-economic status, the sociological everyday life studies shed light upon how patterns of carrying out mundane food activities become related to less healthy diets (e.g. Wright et al, 2015). However, these studies tend to focus on a limited part of everyday life activities. In this paper, we investigate how processual pathways across a multiplicity of practices and bundles of practices shape relations between food consumption and dietary healthiness in the everyday lives of Danish socio-economically disadvantaged men and women. The theoretical perspective taken is a practice theoretical one (Warde, 2005), with a special focus on the unequal access to appropriate performing of practices and the hierarchical social regulation of performances. The data material consists of 30 qualitative interviews with Danish men and women with low income and short education, combined with a validated diet-quality index, based on simple food frequency questions (Toft et al, 2007). As key findings, we hope to analytically describe the details and varieties in how food conduct under conditioned agency and intersected with other practices and bundles of practices becomes 'translated' into different degrees of dietary healthiness. The contribution of the paper consist in the in-depth description of the variety of processes in the linking of food and health in socio-economically disadvantaged everyday lives.

215

Food Aid And Moral Economies

Anne-Laure Counilh[1], Laurence Ossipow[2], Yann Cerf[3]

[1]HES-SO, Switzerland; [2]HES-SO, Switzerland; [3]HES-SO, Switzerland

Based on research on food aid in Switzerland, primarily founded on participant observation and semi-directive interviews, we will discuss how different forms of food aid developed in ordinary times, as well as in the midst of a pandemic – with consequences on the reorganization of both distribution systems and food quality. We will focus on the moral economies involved in food aid. To address these questions, we will rely on the approach of activist-researchers in food aid initiatives, involving what they call "the right to food" and the "more than food" as well as the different citizens point of view (commitment to solidarity, civil charity, and social justice). We will also focus on food aid recipients and the promotor's discourses, in relation to food banks or associative distribution systems. We will analyse this data from an economic perspective (funding structures), a political one (negotiations between State and municipalities about tasks and modes of financing) and an ideological-moral agenda (anti-waste redistribution, anti-consumerism, circular economy and sustainable development). However, by tailoring it's discourses and practices to food recycling and yet humanitarian distribution is food aid not becoming a safety valve for more radical demands? Doesn't it contribute to manufacturing social peace at the expense of effective social justice?

RN05_T05_03 | Smart Tech in Consumption

Futureproofing Food: Authenticity And Automation in Sustainable Consumption

Roberta Discetti[1], Vincenzo Luise[2]

[1]Newcastle University; [2]University of Milan

While the current patterns of food production and consumption are progressively linked to environmental degradation, consumers, businesses and investors are increasingly looking into more sustainable alternatives. While some of the latter reproduce hegemonic frames of edibility and aesthetics, others future gaze into unchartered territories (farming insects, producing food with 3D printers, synthesizing artificial meat). How do automation and the quest for sustainability move the boundaries of what is "edible", "authentic" or "sustainable"? This paper combines interviews with high tech food startups with digital ethnographic methods to capture consumers' perspectives related to technologically mediated food. It looks into startuppers' and consumers' narratives revolving around the production and consumption of technological mediated food alternatives, to highlight emerging meanings and contradictions attached to these controversial practices. This research contributes to the literature on sustainable consumption by bridging it with the literature on food technology and the new food economy. By exploring the emerging and under-researched phenomenon of consumption of technological mediated food, it provides new insights into meaning-making efforts connected to re-imagining and re-making the future of food.

216

Consumers + smart meters = Better-informed or confused electricity consumers?

Torvald Tangeland, Gunnar Vitters, Harald Throne-Holst, Nina Heidenstrøm

OsloMet, SIFO, Norway

Smart meters have the potential to improve monitoring of, and eventually reduce, household electricity consumption. However, the social implications of this innovation are not being adequately addressed. According to the Norwegian Energy Regulatory Authority (NVE), 'Smart meters will provide consumers with better information about their electricity consumption and prices, and facilitate opportunities for new energy related services' [OBJ]. Between 2015 and 2019, smart meters were installed in 97 % of Norwegian households.

In this paper, we investigate changes in households' perceived overview of their electricity consumption after a smart meter has been installed, based on a nationally representative survey (N=1196) from 2019. The results show that 16 % reported a better overview of their electricity consumption, while 64% reported an unchanged overview. 20 % reported less overview. Possible explanations as to why smart meters have not improved the respondents' overview include less awareness because the respondents have stopped the manual monitoring of the household electricity consumption as well as a lack of trust in the smart meter technology. We anticipate (has yet to be analysed) important socio-demographic differences in the way the technology has been taken up. These differences must be addressed when developing electricity saving measures towards private households.

Smart Tech – A Salvation For Our Sustainable Future And/Or Part of the Problem? A Household Perspective

Dag Slettemeås, Ardis Storm-Mathisen

OsloMet, Norway

Smart technology, under the umbrella "internet of things" (IoT), promises both convenience and cost-saving for consumers and households. At the same time, in political/commercial/research discourse, IoT and the interconnectedness of people, things, homes and environments, is valued at the societal scale as potentially contributing to solving issues related to; 1) environmental sustainability, 2) alleviating the welfare state, 3) and securing infrastructures and nations. Interconnected people and devices are thus seen as "political tools" in the grander project of safeguarding our future. In such a prospect lies increased responsibilisation of consumers and households for "active contribution" (with digital data and ethical practices) in efforts to solve societal challenges. With this perspective, it is relevant to draw on theories of technology paradoxes; how technologies simultaneously solve AND contribute to the same problems they attempt to solve (or create new problems). Conceptually, the paper will concentrate on how households, purchasing ever more "smart home" products (e.g. for saving energy and to reduce CO2-footprints), can offset their well-intended practices and contribute to increasing EE-production and waste by allowing digitally-connected products into their home ecology. There are also unintended rebound effects that should be considered. In the paper, this challenge will be conceptually approached by introducing and merging theories of technology paradoxes (Mick & Fournier 1998, Feenberg 2010) with theories of domestication (Silverstone et al. 1992, Berker et al. 2006) paving way for empirical studies at the household level of how householders evaluate and negotiate apparent paradoxical positions related to smart technology in everyday life.

217

RN05_T06_01 | COVID Consumption V: Digitalisation in a pandemic

The Impact of Digitalization and Cryptocurrency Upon Consumption Practices. A Comparativa Study Between Italy and India

Piergiorgio Degli Esposti[1], Jillet Sam[2]

[1]University of Bologna, Italy; [2]Indian Institute of Technology, Kanpur, India

The context of contemporary consumption shows a transition from physical structures (brick & mortar) to digital structures (e-commerce) and hybrid realities (brick & click). This transition grounded upon prosumers activity has repercussions: in consumption practices, in the way goods and services are accessed, shared, and not least in the way they are paid. Our objective is, through a comparative study, to understand how the dynamics of consuming and sharing digital resources develop. We argue that shared use of platforms derives from their location in the socio-material tapestry of the extended familial networks and urban neighbourhoods.

In this paper, we examine the figure of the elderly and younger prosumer as they are located in the emerging platform societies of India and Italy.

The paper draws on the analysis of advertisements, reports and interviews in the public sphere to understand the representation of the elderly and younger as prosumers in a platform society. We also draw on detailed ethnographic interviews conducted with the elderly in the cities of Kolkata (India) and Bologna (Italy) to understand their self-representation and practises with regard to platforms. The internet landscape in both India and Italy has striking similarities since they are both dominated by the popular platform Facebook and its offshoot Whatsapp. Further, smartphones are the most common means of accessing the internet. Another important cultural similarity is that the extended family is considered to be the primary source of elder care, and younger support in both India and Italy. The paper is part of a larger project titled "Evolution of consumer behaviour. The impact of digitalization and cryptocurrency upon consumption practices, a comparative study between Italy and India digital".

Boundary Traffic in the Home-as-office: Experiences with Covid-19 Lock-down and the Future of Working from Home

Sejal Changede[2], Katherine Ellsworth-Krebs[2], Arve Hansen[1], Gert Spaargaren[3], Ulrikke Wethal[1]

[1]University of Oslo, Norway; [2]University of Lancaster; [3]Wageningen University

Due to confinement orders as part of governments' responses to the global Covid-19 pandemic, the number of people working from home (WFH) accelerated in an unprecedented way in 2020. WFH has previously attracted attention due to its potential environmental benefits, and has long been considered a central part of the future of work. In this paper, we reflect on the socio-material configurations influencing the potential for WFH to stick in the future, highlighting differences related to cultural and infrastructural contexts. To do this, we compare the results of qualitative investigation of WFH in the UK, US, Norway and the Netherlands following the first Covid-19 lockdowns in spring 2020. In our analysis, we build on insights from teleworking and boundary work, two prominent fields of scholarship related to WFH. We find that while teleworking literature tends to overemphasize how technological developments facilitate work 'anywhere, anytime', and overlooks additional work required to create boundaries in the home-as-office, the boundary work literature accentuates individual preferences and social roles, overlooking the significance of other social practices shaping WFH. We bring in insights from social practice theory, and emphasize how homes, and practices within them, are interconnected and dependent on existing socio-material arrangements. This paper introduces the concept of 'boundary traffic' to draw attention to the additional work required for practices previously fulfilled outside the home to be negotiated and re-bundled within the home. We offer recommendations for employers, policymakers, and researchers to be cognizant of cultural and household variation as well as spatial constraints that will ultimately impact a future of WFH.

218

Consuming in Lockdown and Beyond: Social Representations of Online Consumption in Spain During the Covid-19 Crisis

Carlos Jesús Fernández Rodríguez[1], Luis Enrique Alonso[1], Rafael Ibáñez Rojo[1], Carlos de Castro Pericacho[1], Maria Medina Vicent[2]

[1]Universidad Autónoma de Madrid, Spain; [2]Universitat Jaume I de Castelló, Spain

One of the most significant changes in the realm of consumption is the growing impact of new forms of electronic commerce linked to the so-called platform economy. The retail giant Amazon and platforms such as Uber or Deliveroo have become key providers of products and services. While their appeal to customers had been increasing throughout the last decade, the covid-19 pandemic may have been a turning point in terms of its role regarding consumption practices. The lockdowns forced many people to stay home and the choice of buying online with home delivery appeared as a safe and easy option to purchase goods and services. As the pandemic unfolds and digitalization increases, it would not be a surprise that online shopping becomes the key retail medium in the near future at the expense of high street shops and malls. In this paper, we present the results of an empirical research which is based on a series of online interviews on consumption habits to consumers carried out in the region of Madrid, Spain in the winter of 2020-2021. We aim to understand how users describe their consumption practices during this period of pandemic and lockdowns – Spain had at some point one of the strictest confinements in Europe -, but also and especially their use of platforms and other forms of electronic commerce during the last year, grasping the social representations of consumption during this crisis. This will help us to understand consumption practices during these difficult times.

Farmer's Markets and Hybridities of Consumption in the Pandemic – the Shift to Virtual

Sara Ursić[1], Nika Đuho[2], Anka Mišetić[3]

[1]Institute of Social Sciences Ivo Pilar; [2]Catholic University of Croatia; [3]Faculty of Architecture, University of Zagreb

Unforeseen crises such as pandemics affect the daily life of urban dwellers. Although economic and social dimensions of everyday spaces had already shifted to become virtual to some extent before the pandemic (for example, online stores, social networks), farmers markets are a rare urban public space that has grown more popular in the last decade while resisting the virtual. Rooted in the traditional urban tissue for centuries, farmers markets produce democratic social space par excellence as they host a wide range of social practices and relations among socially diverse populations.

The rise of a digitised model of farmers markets will impact both the identity of public space and consumer culture. What happens to social relations and the placeness of the farmers market once we shift it into the virtual? What do our communities gain and what do they lose in this transformation, and what can be learned about our culture and identities from this process? To answer these questions, we conducted an online survey on a sample of farmers market users in Croatian cities (N = 682). The results indicate the importance of hybridities of consumption and the shift in the traditional patterns of consumer culture towards new opportunities in digital society. The challenges are numerous and long term as both models are desirable but unreplaceable in some elements. The main task is to keep both alternative forms of farmers market available and compatible in the context of sustainable cities.

219

RN05_T06_02 |Body, Gender and Consumption

Who Performs Appearance Work And Who Believes Appearance Works?

Iida Kukkonen

University of Turku, Finland

In consumer culture, individuals are called upon to take responsibility over their body and invest in their looks. The invitation to work on one's looks comes with a promise of social and economic benefits: it entices people to believe in appearance as currency. Previous research shows that norms and consumer practices related to physical appearance are thoroughly gendered. In particular, women face strict appearance norms and are expected to engage in various appearance-related consumer practices. Such practices may be considered appearance work that individuals perform to obtain benefits (and avoid disadvantages) within a particular social hierarchy.

In this study I propose that the belief in appearance as currency may be a driver of daily appearance work. To empirically examine this proposition, I utilise nationally representative survey data from Finland (N= 1600), which I analyze descriptively and by means of multiple regression. I operationalize appearance work as self-reported daily time spent in front of the mirror.

I find that while the belief in appearance as currency is held equally by men and women in Finland, its practical daily implications are different between those groups. Women who believe appearance matters for success in life engage in appearance work significantly more than women who do not. However, men who believe in appearance as currency overall do not work much more on their appearance than men who do not hold such a belief. It thus appears the belief in appearance as currency works as part of an ideology that keeps women engaged in appearance work.

A (Toon) Gaze Beyond Gender? How Preschool Cartoons Could Introduce Stereotyped Characters to the Youngest Audience

Grazia Quercia, Giovanni Ciofalo, Silvia Leonzi

Sapienza University of Rome, Italy

The media representations are becoming more and more relevant to the sociology of consumption (Warde 2017) and they acquire even more relevance when referred to children products (Marsh 2014; Coyne et al. 2016), because they represent a source of entertainment, learning (Forge, Phemister 1987, Prosic-Santovac 2017; Cimmino 2020) and media construction of reality (Couldry, Hepp 2018).

Premises given, this paper represent an evolution of an already developed pilot research (Ciofalo, Leonzi, Quercia, submitted for publication) which observed the female representation in five preschool cartoons (Peppa Pig, PJ Masks, Masha and the Bear, Paw Patrol, Bing) through qualitative analysis. Based on the obtained results, the first idea of toon gaze, linked to the male gaze concept (Mulvey 1975), is here extended beyond the gender discourse.

Preschool cartoons seem to offer a hyper-simplified reality, meant to be easily understood, with the result of proposing stereotyped representations (Streicher 1974; Thompson, Zerbinos 1995; Walsh, Leaper 2020). Consequence is the presence of not a recurrent frame, but of an actual (toon) gaze undergoing social and cultural influences.

Therefore, this paper proposes both a quantitative and qualitative analysis of all protagonists of the first season of three shows available on Netflix Italia, such as 44 Gatti (2018-ongoing), Super Wings (2013-ongoing), PJ Masks (2015-ongoing). The cartoons are chosen by the presence of an ensemble of protagonists, popularity, and different nature of characters, explicitly animals, humans, and machines. The aim is to define the main characteristics of a toon gaze through which cartoon characters get represented, focusing on the risk of endorsing traditional models and nurturing some ideologies that contrast the narrative and technological evolution of cartoon production.

Hyper-Surveillance: A Foucauldian Understanding of Digital Body Modification Technologies

Katie Thompson[1], Rachel Ashman[1], Anthony Patterson[2], Simeon Yates[1]

[1]University of Liverpool, United Kingdom; [2]Lancaster University, United Kingdom

In this paper, we apply a Foucauldian lens to the context of digital body modification to offer fresh insights into the relationship between the body and power. Editing technologies powered by 3D facial modelling, artificial intelligence, and augmented reality allow individuals to modify and craft a perfected self-image (which is usually shared with others on Instagram) in a manner akin to 'digital plastic surgery'. Smartphone applications of this nature are being created and downloaded at an extraordinary rate. Despite their popularity, this phenomenon has received relatively scant academic attention, and an urgent call for empirical research has been issued. Using a netnographic approach which encompasses 17 depth interviews with 'digital body modifiers', we present an empirically grounded understanding of power operation embedded in individual experiences of this technology. To facilitate our understanding of these processes, we utilize a theoretical framework which incorporates the concept of the panopticon (the many watching the few), the synopticon (the few watching the many) and the digital doppelgänger, which traditionally originates in literature pertaining to the quantified self (QS). We show how individual experiences are mediated by a powerful Influencer culture on Instagram, the authority of quantified feedback, and the instructive design of the apps, all of which work to encourage the production of particular bodily designs. We find that this mediation results in an experience framed by hyper-surveillance directed towards the body/self, which in turn, leads to an intense identification with one's digital doppelgänger.

RN05_T06_03 | Food and Eating V

Consumer Values And Appreciation In The Context Of Food Consumption

Jana Olivia Dreyer, Lisa Christofzik, Silke Lichtenstein

Dr. Rainer Wild-Stiftung, Germany

This study explores the meaning of values and appreciation of food regarding food-related consumption behaviours of consumers. In the literature, values are described as subjective, conscious or unconscious perceptions whose development is determined by external influences and individual experiences. According to the literature, values do not provide directives for action, but they can have a guiding function for action and behaviour. Health and sustainability are leading societal values which is reflected in the strong wish of consumers for sustainable consumption. This is based on the increasing knowledge about the effects of individual consumption and the increased visibility of its consequences due to media attention and digitalization. However, food consumption-related actions do not always correspond to consumers' values. This can lead to inner conflicts and stress and as a consequence cause resignation among consumers.

The aim of the study is to answer the questions: What understandings of values and appreciation do interdisciplinary, scientific perspectives offer? In which categories can consumption-related values be bundled and what intersections or interactions can be identified? What is the meaning of values and appreciation for food-related consumer behaviour?

For this reason, an interdisciplinary systematic literature research will be conducted. The results will be merged and will provide the scientific basis for an interdisciplinary cooperation-project. In a further study, consumers will be asked via questionnaires and interviews about their consumption-related values and appreciation of food. The results are intended to help consumers make sustainable consumption decisions. The target groups for the results are education, politics and economics.

'I Don't Want to Taste Flawed Wines Because Someone else Thinks They Are Cool': Field Struggles and Generational Oppositions in Representations of Natural Wine

Elias le Grand

Stockholm University, Sweden

The last decades have seen a proliferation of 'alternative' food and drink networks formed around notions of authenticity, democracy and sustainability. In the field of fine wine, these developments are evident by the recent popularity of natural wine. This paper examines how representations of this wine category are bound up with classification struggles over cultural taste in the field of fine wine. To this end, the paper examines how natural wine is legitimated (or not) in two leading specialist wine magazines. The analysis shows that natural wine is represented as a trendy yet contested category associated with a young cosmopolitan generation of wine professionals and consumers. The natural wine category is frequently connected to sensory and aesthetic characteristics opposed to consecrated criteria for evaluation in the field of fine wine connected to conventional forms of fine wine. But while frequently associated with 'wine flaws' and hipster snobbery, natural wines are also regularly highly rated and recommended to readers in both magazines. In conclusion, its ambiguous status implies that natural wine has become a partially legitimated category in the fine wine field. Moreover, contestations of this wine category are indicative of symbolic struggles between generational groupings over cultural taste in the fine wine field.

The F-Word Unravelled: What Do We Talk About When We Talk About 'Foodyism'

Sami Koponen, Taru Lindblom

University of Helsinki, Finland

Several decades after the contentious terms were coined in popular food media, sociologists in both North America and Europe (and elsewhere) increasingly talk about 'foodies' and 'foodyism' in order to refer to contemporary enthusiasms around food and eating (e.g. Johnston & Baumann 2010, Warde 2015, Warde et al. 2020). Most studies appear to share the view of foodyism as some sort of an aesthetic food movement in the practices of which the aestheticization of eating (Warde 2016) perhaps most obviously crystallizes. Yet what is foodyism precisely about? In other words, and given the ambiguous nature of 'aestheticization' (Reckwitz 2017), what do the studies more or less touching upon foodyism precisely talk about when they highlight the role of 'aesthetics' for a growing number of food consumers? This paper compiles the existing sociological literature on foodies and foodyism. We reflect on the current and potential analytical value of the f-words and discuss whether the sociology of eating might benefit from adopting a narrower definition for the concepts. Our preliminary suggestion is that one way to fruitfully distinguish foodies analytically from, for instance, gastronomes or 'food lovers' (see Johnston & Baumann 2010), might be to define such consumers more exactly through 'aesthetic novelty', originality, authenticity, and other such 'artful' concepts that certain cultural sociologists have recently depicted as fundamental ideals of late modern (middle class, consumer) culture (e.g. Reckwitz 2017, see also Koponen & Lindblom, forthcoming).

Making Meat (Un)edible: Affective Practices among Finnish Consumers

Outi Koskinen

University of Helsinki, Finland

Though the harmful aspects related to meat are gaining more attention, its consumption remains widespread in the global north. In this presentation, I ask what kinds of affects, emotions, and sensual experiences are currently entangled in this contradictory situation. The presentation therefore connects to the interest in the visceral and embodied aspects of consumption. More specifically, I aim to answer the recent calls for studying the affective and visceral within meat consumption as a way of better understanding how, for example, sustainable eating or human-animal relations come to matter in relation to meat. In order to do this, I utilise Wetherell's concept of affective practices to analyse everyday meat eating practices. The data for the presentation consists of interviews and participant observations with Finnish consumers (N=19) who represent a wide variety of different ways of acquiring and eating meat. The analysis suggests that affective practices play a significant role in constructing the edibility of meat, influencing how it becomes something that is good to eat, or, conversely, how the edibility of meat is threatened or even denied in some occasions. Furthermore, affective practices seem to intertwine with care: the concrete labours of, e.g., making certain meats edible for loved ones, which brings forth the complex dynamics of affection and attentiveness as well as frustration and anxiety. As a whole, the presentation offers one alternative way of counterbalancing (cerebral) consumer choice by focussing on shared patterns of affective practices within consumption.

RN05_T07_01 | Alternative Consumption

Serious Make-Believe: Future Orientations in Prepper Consumption

Elias Mellander

University of Gothenburg, Sweden

The interest in prepping – i.e., the practice of preparing oneself and one's household for a future crisis – has grown in Sweden and other western countries in recent years, reaching a peak in the wake of the covid-19 pandemic. As a cultural phenomenon, prepping exists as an intersection of sub-cultural community, hobby activity and civil defense – often focusing on the development of skills and material 'prepps'. While preppers generally plan for futures where everyday consumption no longer is possible, acquiring the right goods in the present is an essential element of prepping practices. Concordantly, the landscape of prepper consumption flourishes, with a large number of commercial actors marketing foodstuffs with long shelf-life, preparedness kits and other survival equipment. In turn, there are numerous blogs, podcast and online forums where preppers review and discuss the right goods to buy and store in the event of a proverbial 'shit hits the fan' scenario – be it temporary blackouts, financial troubles or total societal collapse. In short, prepping can be understood as consumption for the future within what is perceived as an unsustainable society, where preparations in the here-and-now are ways of managing and investing material resources as well as emotions in the uncertainty of what is to come. Drawing on interviews and digital ethnography with Swedish preppers, this paper will discuss the relationship between consumption and orientations toward dystopic scenarios, highlighting the emotional ambiguity inherent in enjoying the process of preparing and consuming for that which one fears.

223

Ethics of Consumption and Deprivation

Beth Amelia Cloughton

University of Glasgow, United Kingdom

Baltic Street and its surrounding area is characterised by food deserts, high levels of deprivation, and a large amount of derelict land. This positions the area of Dalmarnock, Glasgow as spatially vulnerable, which means many of its residents are in a state of socio-material-economic disadvantage. In response to this, a primary remit of BSAP is to supply food to the area. Their activity further extends to include dominant ethical consumption forms like recycling and local food education . As a result, the residents of the area are engaging with mainstream forms of ethical consumption narratives, like low-resource consumption and a low carbon footprint, whilst not explicitly aligning to this framework.

A creation of a theoretical framework that proposes tension (stemming from ethical consumption) and possibility is actually a process of generating an ethics of consumption when consuming in a wider context of deprivation. Tension is both part of engaging with possible futures and possibility as a way of thinking about a different way of being as opposed to something that must be overcome or managed. Tension is actually a driver of and a satisfier of engaging in these possibilities. Possibility focuses on potential not deficit, the capacity of a space rather than what it lacks. Considering an ethics of consumption from this lens helps to construct an ethics of consumption rooted in a reorientation of the market, consumption practices and ethics that is not based on a cultural narrative of the middle class.

Determinants of food poverty in Ireland.

Majka Monika Ryan

University of Limerick, Ireland

In 1984, DeVault and Pitts, writing about experiences of hunger in the US, argued that the causes of food poverty lie in the social conditions that people endure and the institutions that structure their lives. Today, almost four decades later, the need for food emergency globally has reached alarming highs as the queues to soup kitchens, breakfast clubs and food banks are getting longer. Those who experience food insecurity today are not necessarily unemployed, migrants or homeless but also pensioners, students and employees. They are young and old.

In line with the neoliberal consumerist model, the Irish government's stance on food poverty is to focus on low-income families and their individual ability to make 'the right' choices in terms of the foods they eat and how they manage their finances (Dowler & O'Connor 2012). Thus, instead of structural causes of poverty, the policy focus is on the individual, their degree of deservingness to public resources, and their individual capacity to ensure their own well-being. In this context of welfare retrenchment, where the State has failed in its role to protect citizens from food deprivation, charitable organisations are sole bearers of responsibility for distribution of emergency food.

Based on empirical data from interviews and surveys conducted with food bank service users in the third largest city of Ireland, this presentation contributes to the international debate on food poverty. The presentation reveals why people experience food insecurity in Ireland, and locates this issue within the context of much larger social problems.

Alternative Consumption and Good Life

Renata Dopierała

224

University of Lodz, Poland

In the paper I consider the relationship between anti-consumerism and the idea of a good life (in particular happiness and well-being). I seek to answer the following questions: what does the good life mean to people who describe themselves as anti-consumerist?; how do these people implement the idea of the good life in their everyday lives? This involves comparing two versions of the good life - those associated with consumerism on the one hand, and anti-consumerist discourses on the other. Anti-consumerism – broadly speaking - does not equate the good life with increased material wealth and increased material consumption, it promotes intangible goods and post-materialist values. I examine what strategies individuals use to fulfil their needs in alternative (anti-consumerist) ways (e.g., minimizing costs, privatizing consumption), what services they use (or do not use), what goods and products they choose or reject (and why). I also highlight consumer practices related to sustainability and sharing economy. The context of coronavirus pandemic will be also important in considering the good life and alternative forms of consumption.

RN05_T07_02 | Consumption Inequalities I: Food

Fresh Produce: Living Organisms and Designed Goods.

Linda Hering[1], Julia Fülling[2]

[1]Technical University Berlin, Germany; [2]Humboldt University of Berlin, Germany

Fruits and vegetables are usually advertised in the supermarket with slogans such as fresh and natural. However, as crops, they have been sociotechnical shaped by humans for specific purposes for thousands of years. Though as living organisms' fruits and vegetables challenge the production network as they still prove resistance to certain interventions and constantly challenge people to take action. The involved actors have to invest a lot of manpower, technological innovations and professional knowledge to keep the living good at its best quality.

Referring to the concept of biofacts that understands fruits and vegetables as both living organisms and sociotechnical designed products, we will illustrate how specific parts of the production network are made visible in the supermarket for the purpose of valorization while others remain hidden.

Using fruits as an example it will become clear that some parts of the production network are rather difficult to integrate into stimulating storytelling. With associations to pristine landscapes and work carried out by hand, the cultivation side where fruits are grown can be wonderfully incorporated into a romanticizing narrative. In the supermarket, the living part of the goods is the main reference point when promoting fruits to the customers. In contrast, the logistics of goods, which is accomplished through container technology, and representing the sociotechnically designed part, offers hardly any points of connection to the subjective level and therefore generally remains in the background.

Based on these facts, it is questioned whether transparency is a useful means to promote sustainable shopping.

Food for Security: Evidence from Cauca, Colombia

Arne Dulsrud, Sabina Kuraj

OsloMet, Norway

While access is a key concept in the food security literature, few address bundles of entitlements or forms of access as they play out in everyday life. Entitlements—property rights, exchange entitlements, and social rights—are often studied individually, with emphasis on formal aspects. Conflicts over land use, migration, and low penetration of social policies challenge such entitlements. A key issue here will be how different relations to food markets influence vulnerability and resistance to food insecurity, distinguishing between subsistence farming, households producing for the market, and households acting primarily as buyers of food. Furthermore, the entitlement literature assumes that "the law stands between the food and the eater" (Sen 1982). This is based on significant empirical observations of food crises, but the approach still overlooks access to food via informal networks, reciprocity, and communitarian relationships as part of the dynamic between food security and conflict. Personal interviews with female household representatives, addressing food practices on the day before (inspired by nutritional 24-hour recall methods), allows us to directly link such activities to institutional frames, particularly with work, food provisioning, and their relations to social security concerns. It will also include sections on household demographics, employment, education, access to land, assets and strategies to cope with stress (e.g., displacement, climate change). The survey is implemented among a random sample of at least 250 households in each of 4 different settings, distinguished by urban-rural spaces, socio-economic, and cultural or ethnic lines.

225

Offering Shared Meals to Create Social Relations Beyond Socio-economic Frontiers? Two Qualitative Studies Analyzing Social Actions Using Commensality.

Margot Dyen, Maxime Michaud

Institut Paul Bocuse, France

Sharing a meal - commensality - is often seen as an opportunity to generate positive relationships between commensals - conviviality. The value of the shared meal has given rise to social actions aimed at combating situations of social isolation through meal sharing,. However, there is little data to qualitatively assess the mechanisms for creating social links through food. A first study conducted with ethnographic methods in retirees associations shows i) the necessity of participant selection – i.e. exclusion – to make commensality moments convivial and ii) the difficulties for commensality to transcend socio-economic categories. The second study deepens these aspects. It anchors in the transformative service research, whose objective is to question how the interactions between service entities and consumer entities influence the well-being outcomes of both. We study the experiences of the actors involved in two solidarity catering structures. Through participant observations and semi-structured interviews (27), this study shows that the structures are places where various expectations converge, and that the creation of social links emerges when these expectations are met. We show that individuals' expectations towards the structure can be characterized in two categories: i) a gradient from the search for similarities to the search for otherness, and ii) expectations in terms of the search for usefulness, whether for oneself, for others, or for a social project. This study provides a better understanding of the diversity of the mechanisms underlying the creation of social link, and thus makes it possible to suggest ways to support these mechanisms.

RN05_T08_01 | Consumption and Inequalities II: Mechanisms of stratification

Work in Academia: Prosuming Exclusions?

Rosana Córdova Guimarães, Marcia Cristiane Vaclavik, Andrea Oltramari

Federal University of Rio Grande do Sul, Brazil

226

The term prosumption was coined in1980 by American futurist Alvin Toffler and was widely used by many technology writers of the time. Technological breakthrough and a rise in user participation blurs the line between production and consumption activities, with the consumer becoming a prosumer. Prosumers have been defined as individuals who consume and produce value, either for self-consumption or consumption by others, and can receive implicit or explicit incentives from organizations involved in the exchange. Beyond its transformational and disruptive power, authors have pointed out a face of exploitation that can be perceived from the prosumer's figure. In this essay, we use a critical perspective to address prosumerism in the academic sphere. We argue that academia can be seen as an incomplete circuit of prosumerism that produces exclusion, especially those linked to free (although intellectualized) work. This phenomenon can be exemplified through the peer-reviewing process, a cornerstone of scientific publishing, especially in the early stages of an academic career (e.g., Ph.D. students, but not limited to). It is commonly viewed as a way to develop skills and join certain circles, strengthening networking and the curriculum. However, in most cases, this 'produced' labor, although crucial for the system, is not enough to allow the 'consumption' of the material it helped to produce. In this sense, the knowledge flows in an erratic and noncircular way, helping to reproduce exclusion.Therefore, to better understand the prosumption process, it is needed to deep and broad its all manifestations, including the critical ones.

Cultural Conversations: How They Demonstrate Cultural Capital and Facilitate Social Network Relations

Roza Meuleman

Radboud University, the Netherlands

Previous research has argued that through highbrow tastes, people from higher status positions identify (dis-)similar others and establish social ties with high status members whilst excluding people from lower status groups. Although the relation between cultural tastes and various social network characteristics has gained more attention over the last decade, up until recently, it remained relatively unclear to what extent cultural tastes assist in the formation of social network relations. Nevertheless, there are some recent studies that have shown that individuals' highbrow tastes are positively related to the number of higher socioeconomic network resources. These studies argue that people identify higher and lower socioeconomic status groups by discussing and demonstrating cultural tastes in social conversation. However, the underlying theoretical mechanism, i.e. that of cultural conversation, has not been tested empirically. So, although it has been shown that 'culture talk' frequency is stratified by socioeconomic status, it remains unclear to what extent this culture talk is actually mobilized into social relations, let alone, into higher socioeconomic status relations. The present study will therefore examine to what extent individuals' highbrow tastes are positively related to highbrow cultural conversations within their social network, and to what extent these highbrow cultural conversations are positively related to the socioeconomic status level of the social network. To answer this research question, a representative large scale panel study is used (Family Survey Dutch Population, 2017/2019, N≈1500). Preliminary results show that individuals with more highbrow tastes have more high status connections and this relationship is partly mediated by cultural conversations.

Ordinary Lifestyles And Material Configurations: When Culture Is No Match.

Maël Ginsburger

OSC, Sciences Po, Paris, France

Cultural capital, gender and generation appear as central variables in the analysis of the social space of lifestyles (Flemmen et al, 2018). But is that still true when this space is no longer based on cultural practices – as it is usual since the Distinction (Bourdieu, 1979) – but on ordinary consumption practices? Related to transportation, equipment, energy consumption, clothing and food, these practices are crucial in daily routines (Shove and Warde, 2003). They also contribute strongly to delineate boundaries between lifestyles and between social groups (Halbwachs, 1913), with a growing moral dimension related to environmentalism (Kennedy & Horne, 2020).

Relying on data from the French Households Budget Surveys between 1985 and 2017, I first study the social space of lifestyles and its evolution using a series of Multiple Factor Analysis on 28 ordinary consumption practices. I then relate households' coordinates in that social space to their positioning in two other spaces: the space of cultural configurations – mainly based on generational, cultural and gender variables – and the space of material configurations – mainly based on residential and budgetary variables.

I show that the position in the space of lifestyles is - and remains over the period – strongly associated with material configurations whereas the association with the cultural configurations remains weak. If they do not invalidate the symbolic and classifying dimension of these ordinary practices, these results promote a Marxist perspective on the study of lifestyles. They show that ordinary lifestyles primarily act as an intermediate layer that expresses the material conditions of existence and facilitates their symbolic and statutory appropriation.

227

The Role Of Status Goods In Competition For A Position In The Social Hierarchy. The Perspective Of Different Economic Conditions And Models Of Societies Based On Preliminary Comparative Studies in Poland, Russia And Denmark.

Lukasz Kiszkiel

University of Bialystok, Poland

The main prpose of the study conducted as part of a grant, postpned from 2020 to 2021 due to COVID-19, is a comparative analysis of countries with different economic conditions and models of societies in terms of categorization and role of status goods in the process of building the social position of the individual. Conspicuous consumption of luxury (as an economic phenomenon) is an extremely important (social) structure-forming mechanism - creating and maintaining social strata, classes and circles (T. Veblen). This mechanism is more pronounced the greater the income inequalities in society. The research hypothesis assumes that the greater the income stratification, the greater the social significance will be assigned to semiotic status emblems (brands, logos), and their emanations visible in public space (cars, clothes, real estates). This is due to the domination of material factors as the most effective capital-instrument for achieving a better social position (Poland, Russia). In Denmark, hypothetically, there will be a shift towards concealed consumption based on empirical categories - travel, food, etc. and the greater role of cultural capital embedded in common knowledge (R. J. Aumann, 1999). In addition, significant differences are assumed between selected countries in the context of: a) categorization and b) the different social perceptions about status symbols within individual classes within and between countries, and other gradations attributed to individual types of capital. I hope that the fresh results from quantitative research conducted in 2020 in three countries will allow for an interesting discussion and conclusions on the international forum on possible differences in view of competition for the position in the social hierarchy.

RN05_T08_02 | Ethics of Consumption

Making Ends Meet: The Stylisation of Vegetarianism Through Economic Justifications in India

Mathieu Ferry

Sciences Po (Observatoire Sociologique du Changement) & CREST (Pôle Sociologie)

Since Bourdieu's model of lifestyles in Distinction (1979), many contemporary sociological investigations have focused on symbolic consumption, often leaving food out of cultural stratification studies.

In India, Hindu upper castes, and especially Brahmins, display their higher social status by declaring themselves vegetarian, whereas Hindu lower castes tend to be more frequently non-vegetarian. Yet, while vegetarians usually justify their diet according to their caste position, upper castes also discursively downplay the privileges of their ascribed status position. So how do they assert vegetarianism as a status marker?

In this paper, I examine how objective cultural food distinctions relate to the subjective representation of ascriptive boundaries. I first study the social space of food practices by way of a Multiple Correspondence Analysis on an Indian representative large-scale survey. I identify the main patterns of food differentiation, including the vegetarian and non-vegetarian divide. Then, I relate these objective food differences to expressions of judgements based on 75 interviews conducted in a region of North India.

I argue that the symbolic boundary of vegetarianism draws from the material realm in which food is embedded. People's perception of the economic position of vegetarians and non-vegetarians as rich or poor leads them to mobilize these economic categories to judge their food practices. Hindu upper castes negatively perceive non-vegetarian practices among poor lower castes. The former consider that the latter misuse their economic resources in consuming non-vegetarian products. Among poor households, this repertoire is also articulated around the importance of self-discipline in managing the household budget.

The articulation of a moral economic repertoire thus reinforces the cultural legitimacy of vegetarianism by not openly displaying exclusive caste and religious status boundaries.

228

'Good Life for Animals' or 'Vegan Society'. Omnivore, Vegetarian and Vegan Accounts of Welfare and Rights of Farmed Animals

Mari Niva, Johanna Mäkelä

University of Helsinki, Finland

Ecological problems and concerns for animal rights and welfare are intensifying public criticism against the use of animals in food production. However, the volume of animal production remains high, and animal-based foods are routinized as part of Western everyday food practices. Consumers apply various ethical perspectives in evaluating animal production, and a variety arguments are used for justifying the eating of animal products.

In this paper we analyse the meanings that omnivores, vegetarians and vegans assign to animal rights and welfare, the ethical perspectives that they use in constructing such meanings, and the justifications applied in defence of animal production. The study is based on a survey conducted in co-operation with the Finnish newspaper Helsingin Sanomat, which invited readers to respond to a survey including questions on food and diets. One of the open-ended questions asked: 'In your opinion, how should animal welfare and rights be taken into account in food production?'. In total 22,803 readers completed the survey, and the data included in a qualitative content analysis for this paper comprise 5,933 answers to the question above.

Animal welfare gained support in all three groups, while animal rights were emphasised mainly by vegans and vegetarians. Omnivores' comments relied on a multitude of ethical perspectives, while vegetarians used hybrids of utilitarian and animal rights views, and vegans relied on animal rights perspective. The main justifications (by omnivores) for use of farmed animals included depicting humans as natural meat eaters, meat as a healthy food, and farmed animals as well-treated; emphasising the agricultural benefits of animal production; and denying animal rights. The results evidence the contested public views on the future of animal production and consumption.

Prefiguration And The Regimes Of Practices In Swiss Animal Advocacy

Irène Courtin

University of Geneva, France

Among the observable cleavages in animal advocacy, the place of political consumption and lifestyle commitment often returns in the debates: is this kind of engagement relevant towards social change in relation to abolitionist animal advocacy? Does it have to be combined with forms of collective experimentation, or with more classical repertoires of protest? Or does it have to be criticized as a depoliticized engagement, even complicit with a capitalist food industry? Based on fieldwork conducted in French-speaking Switzerland, understanding abolitionist animal advocacy in relation to consumerism in activist practices, and commitments to antispeciesism and veganism, is rendered more complex. Although these debates have not disappeared, they are not necessarily at the heart of the concerns and practices of animal rights activists today. This can be explained by the pre-eminence of other issues and constraints specific to the evolution of animal advocacy in this context. In particular, active engagement in illegal civil disobedience has resulted in a strong repression, which may have contributed to the redirection of militant energy. Beyond the question of individual consumption, the first results allow to identify different regimes of practices, more or less tied with a prefigurative politics. Three teleoaffective regimes have been identified:

- An efficiency regime marked by the will to rationalize practices and resources
- An utopian one marked by the will to "live the alternative" (and make it visible)
- A radical one tied with political references and a strong emphasis on alliances with other causes.

229

Ethics of Care and the Pathways to Sustainable Wellbeing

Laurence Godin[1], Justine Langlois[2], Émilie Dionne[3]

[1]Agri-Food Economics and Consumer Sciences Department, Université Laval, Canada; [2]Sociology Department, Université Laval, Canada; [3]VITAM Research Center for Sustainable Health and Université Laval

In this conceptual and methodological paper, we propose to explore the potential of feminist epistemologies and ethics of care for thinking about pathways to sustainable wellbeing, using food consumption as an example. Defined through the universal human needs of participation, autonomy and health, the notion of sustainable wellbeing is a heuristic tool for identifying the societal preconditions for fulfilling those needs for everybody and over time, which implies living within planetary limits (Gough 2017). One condition for achieving sustainable wellbeing is to transform our lifestyles and reduce consumption. At the household level, most of the consumption practices that are called to change, such as cooking, cleaning, heating or moving around, structure our everyday lives and imply care work. Consequently, transforming lifestyles for moving towards sustainable wellbeing relies on a historically unequal distribution of labor between genders and risks furthering these inequalities.

Based on a critical review of the literature on sustainable food consumption, we will describe the possibilities offered by care ethics for thinking about the transition towards sustainable wellbeing, along with the methodological and epistemological implications of this position. This presentation will thus be the occasion to outline a research agenda to better address social relations and underlying power structures in research on consumption and sustainable wellbeing.

RN05_T09_01 | Cultural Stratification and Participation

Audience Engagement as a Practice of Cultural Participation and Citizenship. An action research in the context of Creative Europe project "Performing Gender-Dancing in Your Shoes"

Giulia Allegrini

University of Bologna, Italy

Audience engagement is nowadays at the center of an interdisciplinary field of study. It is fostered also at European cultural policy level, trough studies and programs that invite art organizations and cultural institutions to put the audiences at the center of their attention and to elaborate ways of assessing the impact of culture.

The issues of the access to culture and cultural participation are nowadays even more essential considering the dramatic social impact of Covid-crisis.

However, the concept itself of audience engagement as well as the one of "value of culture" pose many analytical and methodological challenges. The debate reveals at the same time a number of both conceptual polarizations and ambivalences- such as "instrumental vs intrinsic value of art", "consumers vs co-creator".

In this contribution, based on an action-research actually ongoing in a Creative Eu funded project "Performing Gender- Dancing in Your Shoes" and on literature review, I will propose a number of analytical trajectories and conceptual shifts that acknowledge the audience engagement in terms of practice of cultural participation and citizenship.

230

Exploring the Limits and Overlaps Between Cultural and Political Valuations and Boundary-Drawing in Contemporary Finland

Sara Sivonen, Riie Heikkilä

Tampere University, Finland

Lifestyles and cultural practices are indisputably socially stratified. At the same time, they are also connected to political valuations and attitudes. Existing research has indeed indicated that these two are linked, often pointing to the direction of a negative relation between conservative attitudes and cultural capital. The aim of this paper is to examine whether political attitudes are intertwined with lifestyles and cultural participation in our era of "new politics", in which cultural and social values have an increasing influence, and if so, how and through what kinds of motivations and strategies do political valuations make their way into the area of the cultural. Our paper examines these questions in the light of follow-up interview data among 28 interviewees that had previously responded to a nationally representative survey (Culture and Leisure in Finland 2018) on tastes, lifestyles and attitudes. Using qualitative content analysis, the paper examines whether and how cultural and political valuations (that also can be understood as boundary-drawing) are connected at the individual level. Our empirical context is Finland, a Nordic egalitarian welfare state that has traditionally had comparatively little lifestyle stratification and a relatively stable political climate; however, Finland has been found to have largely similar cultural differentiation than other Western countries and for example a similar pattern of rise of populist movements as in many other contexts. Our analysis shows that the main division still runs between "liberal" and "conservative" political discourses but that both conceal various logics of adhering to cultural valuations.

Social Cleavages In The Dramatic Arts. Measuring Legitimacy And Visiting Intentions Of Theater Performances With A Factorial Survey

Gunnar Otte, Dave Balzer

Johannes Gutenberg-University Mainz, Germany

While the factorial survey method has been applied to diverse topics, it has rarely been used in the field of cultural consumption. In a large population survey on cultural participation conducted in Germany in 2018, a factorial survey module was implemented to measure social cleavages in the dramatic arts audience. The vignettes are short descriptions of performances and are intended to model facets that are contentious among drama visitors. They contain five dimensions: (a) large, festive vs. small, sober type of stage; (b) cheerful vs. thought-provoking play; (c) classic vs. new material in an original vs. modern production; (d) references to the current state of society; and (e) display of nudity and violence. For each portrayed performance, respondents are, firstly, asked to indicate their attitude towards public funding on an 11-point Likert scale. In a second step, two more dimensions are added to each vignette: (f) admission price; (g) positive vs. controversial critical reviews. Subsequently, respondents are asked to indicate, on the same rating scale, whether they are willing to visit the performance. In our D-efficient experimental design, each respondent evaluates one out of twelve decks with six vignettes. Employing multilevel modelling, we show which vignette dimensions and respondent characteristics are most influential for our two target variables. It appears that judgments vary primarily by age and education and that the performances' societal relevance and moral shock drive cultural legitimacy and visiting intentions.

Understanding the Unequal Structure of Children's Cultural Participation in the uk

Adrian Leguina[1], Irmak Karademir-Hazir[2]

[1]Loughborough University, United Kingdom; [2]Oxford Brookes University, United Kingdom

Cultural participation in childhood significantly impacts an individual's chances of future social mobility and well-being. So far, research has focused disproportionately on adult cultural practices, failing to comprehensively examine children's perspective. At the moment, there is a gap in our understanding of how far children's unequal access to culture is determined by schools, household background, parental disposition towards arts, sports and culture. This paper will address this gap by focusing on the cultural participation of children aged 5-10 and their relationship with parental capitals and cultural participation, by first identifying profiles of children engagement with culture, arts and sports, then mapping their cultural practices in relation to gender, class and ethnicity, and second, by exploring how parental economic and cultural capitals, alongside cultural participation explain children's participation in cultural activities at this crucial life stage.

To meet this aim, we combine children and parental data from the 2016/17 Taking Part Survey (UK), allowing us to address some of the limitations identified in previous studies. We will also critically assess the quality of available quantitative data on cultural participation of children. Our approach, part of the family of geometric data analysis methods (GDA), combines multiple correspondence analysis, cluster analysis and multinomial regressions and seeks to assess how the processes of intergenerational transmission of cultural capital operate in families with diverse backgrounds. Our analysis, which is in progress at the moment, will contribute to our understanding of reproduction of cultural capital and help us think about potential ways of eliminating inequality at the early stages of life.

RN05_T09_02 | Consumption and Inequalities III: Markets and competition

The 'Halaal' Economy in South Africa: Exploring the Effect of Religion on Consumption

Quraisha Dawood

IIE Varsity College, South Africa

The 'halaal economy' has acquired substantial fiscal prominence globally, underscored by values of ethical consumerism, investment, socioeconomic integrity, respect and cleanliness. The concept of 'halaal,' or Islamically permissible has permeated extensively into food, travel, healthcare, fashion and banking. Leaving imprints on fashion, food and lifestyle developments, the halaal economy impacts on wide-ranging markets, without compromising the doctrines of halaal. Authors indicate that in 2018, the global halaal market was valued at 2.2 trillion dollars, and it is predicted to realise a value of 3.2 trillion in 2024. The proliferating value indicates the significant impel of religion on consumers. South Africa's Muslims constitute 1.6% of the population accounting for 10% of the economy. Halaal initiatives endorsed by social media Muslim influencers on Instagram have played a significant role with increasing fiscal value.

This paper explores dynamics of the 'halaal' online economy in South Africa, a subject which is relatively under researched, with a specific focus on thriving female Muslim-owned businesses, operationalised on Instagram. The social media space presents a 24 hour 'shop' for the women to gain economic independence while maintaining hayaa (modesty) and her Islamic familial role.

Established on empirical evidence utilizing a mixed methodology, this paper uncovers the highly networked, gendered and lucrative social media realm of the online halaal economy of Muslim women in South Africa. To this end the paper will discuss research findings which point to boundaries of exclusivity, entrepreneurial strategies and tensions between modesty, materialism, consumerism and financial power.

232

Becoming a Competitive Consumer. The Subjectification of the Search for a New Home in the Viennese Private Housing Sector

Raphaela Kohout, Susanna Azevedo, Georg Wolfmayr, Ana Rogojanu

University of Vienna, Institute for European Ethnology, Austria

In relation to other European cities, Vienna has rather been spared from the housing crisis due to its strong subsidized housing sector. Nevertheless, a strong trend towards re-commodification of housing is in progress (Reinprecht 2017, Kadi 2015). Although the amount of social and communal housing is still high, the access is restricted and a growing amount of the Viennese population (2018: 40 %) is dependent on the private housing market.

In contrast to the subsidized housing sector, in the private sector people have to compete with others to get access to housing. To become a consumer and be included into the market, not only economic but socio-cultural resources are relevant since access to housing depends on the sympathy and preferences of landlords. Against this backdrop we examine the subjectification of the search for housing in the private housing sector, ask how housing seekers become competitive consumers and how they deal with inclusionary and exclusionary effects of ongoing structural changes. By accompanying people in different biographical situations and from different socio-economic contexts on their search for a new home, we analyze how they calculate and try to increase their chances through competitive practices.

This study is linked to the research project SPACE (Spatial Competition and Economic Policies; spatial-competition.com), which is dedicated to the search for housing and the negotiation of living space as a lifeworld resource and economic commodity and effects of increasing competitive logic in the field of housing.

Inequalities in a Consumerist Society: An Attempt to Intersect Exclusion from Consumption Practices and Negative Emotions

Françoise Bartiaux[1,2]

[1]Université catholique de Louvain, Belgium; [2]Fund for Scientific Research (FNRS), Belgium

For social practice theories, a shared claim is that practices are structuring social life. Taking this affirmation seriously, this contribution aims at studying how consumption practices that people are excluded from performing do intersect with negative emotions (such as depression, anxiety, loneliness, sadness, sense of emptiness). These practices include buying new clothes, inviting at home family or friends for a drink, or enjoying a one-week holiday elsewhere. These analyses contribute to discuss how social practice theories accommodate emotions. A further goal of this study is to examine whether these associations between non-performed practices and emotions are the same according to the social class. This analysis is related to a criticism sometimes made to social practice theories, namely their difficulty to handle social variations in practices' performance according to social classes. Results show indeed that the prevalence of negative emotions associated to the non-performance of the practices under study enables to discover that the most valued practice differs according to the social class. The database used (N=6990) is drawn from the quantitative survey that was realised in Belgium around the year 2009 under the Generation and Gender Programme, an international survey realised in many developed countries. The statistical methods used in this research mainly include variance analyses with pairwise comparisons with Bonferroni tests, both for defining social classes, and for examining which negative emotions significantly differ between practitioners and non-practitioners of a given consumption practice.

'Fashion Embodies Everything That's Wrong With Capitalism': Ideologizing Fashion In A Transnational Perspective

Luuc Brans

Catholic University of Leuven (KU Leuven), Belgium

As political activists replace fashion models in Vogue magazine, this paper explores how professionals in the European fashion industry experience and shape the ideologization of the transnational cultural field of fashion. Increasingly, cultural producers and consumers frame their tastes in ideological rather than aesthetic terms, and fashion is no exception. The transnational field of fashion has become an arena for ethical and political debates ranging from institutional racism to the industry's detrimental environmental impact. This paper looks at this ideologization through the eyes of transnational cultural intermediaries, in this case professionals at fashion magazines and labels.

Cultural intermediaries fulfill an important role in transnational cultural diffusion. By legitimizing some forms of culture over others, they shape tastes and the spread of cultural products. Prior research has evidenced how they reconcile logics of the cultural and the economical (Smith Maguire & Matthews 2012), the national and the transnational (Kuipers 2012) and production and consumption in cultural fields (Janssen & Verboord 2015). Ethical consumption literature has demonstrated how a political ideological logic is pervading (cultural) consumption (Barnett et al. 2017). Yet we lack proper insight into the ways cultural intermediaries navigate this new logic.

This insight is provided by my interviews with professionals at fashion magazines and labels at various positions along the transnational cultural chain. Presenting first results, I demonstrate how cultural intermediaries' experience of ideologization is shaped by their direct context and transnational positions. Ultimately, this explains why and how some ideological issues pervade cultural fields while others do not.

RN05_T10_01 | Cultural Stratification in National Contexts

Social Mobility And Cultural Stratification In Contemporary Finland

Jarmo Kallunki

Tampere University, Finland

The question of whether an individual's social origin or destination is more important for their cultural practices has been under debate for a while in cultural sociology. Researchers focusing on early socialisation emphasise that cultural dispositions acquired during childhood and youth carry on long into adulthood, amounting to relatively robust cultural reproduction. On the other hand, researchers studying socially mobile individuals have shown that mobile people exhibit more dissonant sets of cultural dispositions, combining practices from both early (primary) and subsequent (secondary) socialisation, thus suggesting that social mobility involves also cultural mobility.

We address this theme using two nationally representative cross-sectional survey data from Finland, collected in 2007 (N=1388) and in 2018 (N=1425). Finland offers an intriguing context for this analysis: the country has had high rates of social mobility both historically and compared to most other countries, but the cultural stratification seems to have remained surprisingly stable over the latter half of the 20th century despite the country's major social and economic changes during the period. We focus on middle-class Finns and define social mobility in terms of both level of education and occupational position. Our research question is whether and how the patterns of cultural practices differ between socially mobile and socially immobile middle-class individuals in contemporary Finland.

234

Elias, Dougals, and Bourdieu Visit Russia: Testing the Major Theories of Taste in a Post-Socialist Country

Mikhail Sokolov

European university at Saint Petersburg, Russian Federation

What is the formula of "good" taste, used in modern societies by privileged groups to exclude the less privileged ones? According to Elias, good taste is an expression of affect modeling, the ability to suppress spontaneous urges. According to Douglas, the good taste of contemporary societies is low-grid, celebrating transgressions of all sorts of symbolic boundaries. Bourdieu's theory is more complex and suggests that good taste corresponds to, first, refinement of codes one uses for deciphering cultural texts and, second, general preference towards distinctive, authentic, and, at the same time, disguising the signaling intentions. I attempt to test the three major competing theories directly by asking a representative sample of inhabitants of St.Petersburg, Russia (N=3200) a variety of questions including those on (1) their artistic preferences and rigidity of cultural boundaries (attitude towards controversial art); (2) preference for more or less refined food; (3) usage of cutlery; (4) classification of wine and beer; (5) which country would they choose for spending vacations; (6) adherence to the traditional gender roles; (7-9) vignettes inquiring if they would prefer objects with visible brand names, buy counterfeit goods, or refuse to buy a coat if others wear identical ones. The results are ambiguous: it seems that in urban Russia the boundary between low-and high grid corresponds to generational divides; preference for distinctive and authentic has a strong gender component; attitudes towards high culture and manners correlate with education, and none correlates with wealth. Important differences exist between taste domains – arts, food, dress, etc.

'You Will Get More from Tolstoy Than from Game of Thrones': Emerging Cultural Capital, Highbrow Culture and Cultural Hierarchy in Non-core Country

Ondrej Spacek

Charles University, Faculty of Humanities, Czech Republic

There is a broad consensus that cultural hierarchies are undergoing a significant transformation, particularly shift from consecration of traditional highbrow forms to new 'emerging' and 'cosmopolitan' forms (Prieur&Savage 2013). This new mode of distinction crosses cultural genres, uses repertoires of authenticity and irony (Peters et al. 2018, Pedersen et al. 2018). The cosmopolitan nature of emerging cultural capital also opens the under-researched issue of the relationship between countries' cultural fields. The global spread of popular and critically acclaimed cultural goods like Netflix and HBO series partially conceals differences among countries in their cultural hierarchies and dominant modes of consumption. It seems plausible to understand cultural space of countries outside the cultural core as driven by the latent struggle between traditional local-focus national principles and cosmopolitan global orientation. Question is how are particular cultural hierarchies shaped by both global and national cultural field.

This topic will be explored thru study of cultural hierarchies of Czech university students. The research combines survey data and semi-structured interviews to explore hierarchies of cultural taste and modes of appreciation. It will focus on the relationship between traditional established culture and emerging cultural hierarchies, with attention paid to institutionalized national culture. Preliminary analysis shows continuing deference to traditional highbrow culture (in line with Bourdieu's (1984) cultural goodwill) fused with mostly unquestioned consumption of mainstream popular culture with no sign of ironic, knowledgeable or savvy modes of consumption. It opens the question of uneven travel of cultural goods and modes of appropriation across varied national contexts, and the importance of hierarchical understanding of cross-national cultural flows.

Symbolic Space and Symbolic Violence in Three Nations

Will Atkinson

University of Bristol, United Kingdom

This paper reports on a comparative analysis of class, consumption and symbolic domination in three nations: Sweden, Germany and the US. Drawing on data from a specially commissioned survey and inspired by Pierre Bourdieu's analysis of 1970s France, it presents a model of the 'space of lifestyles' for each country and its homologies with indicators of social position. Mapped using multiple correspondence analysis and based on comparable indicators, the core conclusion is that, while there are some differences in substance, the fundamental structures of the three spaces and their relationships to class are the same – and, what is more, similar to those discovered by Bourdieu – and thus indicative of general features of Western capitalist societies. We are able, moreover, to document the prevalence and correspondence of symbolic domination in the spaces, finding that it is typically those with least cultural capital who tend to feel looked down upon by others.

RN05_T10_02 | Finance, Economics and Consumption Futures

The Sociology of Financial Consumption: Recent Trends and Future Avenues

Léna Pellandini-Simanyi

Universitá della Svizzera italiana, Switzerland

While the consumption of financial products has been rising steadily in recent years, financial consumption has received little attention in the sociology of consumption literature. This paper's programmatic aim is to outline avenues for the study of financial consumption practices from a sociology of consumption angle. To do that, it first reviews the four main strands of the sociological literature that addressed financial consumption in the past decade: the Foucauldian study on the financialization everyday life; Zelizerian economic sociology; the marketization research program involving Callonian, STS-inspired and performativity studies; and more traditional sociological approaches of inequality. It then situates these approaches in relation to recent sociology of consumption traditions and debates, showing how their theoretical questions, tools and methodologies diverge and converge. It argues that extending the sociology of consumption focus to financial practices does not only allow for 'claiming' a further area of research. Rather, due to the particular nature of finance vis-à-vis other goods and services studied currently, it offers novel avenues for theorizing consumption and its social consequences.

Where Does the Gambling Consumption Come From? A Theory of an Asymmetric Market

Pekka Sulkunen

University of Helsinki, Finland

Gambling generates a substantial amount of money to support governments' budgets and the third sector. Our study of 30 European gambling companies shows that most of them deliver a surplus to be used for "good cuses" that is more than fifty percent of their revenues remaining from wagers after winnings are paid out to gamblers. Gambling is a highly regulated business everywhere but out study shows that only a small part of the surplus is due to limited access that creates a monopoly rent. Other causes suggested by earlier research include marketing, addiction, losses disguised as wins and other misleading game characteristics. This paper analyses the source of the surplus from the perspective of Marxian labour theory of value and from the orthodox economic science based on marginal utility, and suggests that it sits in the use values of gambling as a commodity. Commercial gambling is an asymmetric market with three elements: asymmetries of information, of transaction, and of the relative positions of gambling providers and consumers. These asymmetries can be either eliminated or commodified as a cost to be distributed among the participants, as in other asymmetric markets, but this would most likely destroy the business.

Governmentality/ies And Consumer Protection Regime(s) Under Economic Crisis: Greek Political Parties' Discourse (2010-2017) On "Affected Consumer"

Dimitris Lallas, Maria {Mania} Sotiropoulou, Iasonas Zarikos

National Centre for Social (EKKE), Greece

237

As a dimension of politics of consumption, consumer regimes record government/state arrangements of standards, conditions, modes and means of consumption. Government/state interventions aspiring to establish specific consumer regimes take place in the name of consumer protection. Various versions of these regulative interventions draw on specific governmentalities, namely different assumptions about the (intervening) role of the state, the kinds of governance, the relationship among state, market and citizens-consumers, the civil society, and finally about the role, rights and agency of consumers.

In this announcement, we will present Greek political parties' parliamentary discourses and their subsequent governmentalities regarding two clusters of issues –one referring to the market and the other to the state–, that are up for discussion as "threatening" for the consumers under crisis condition. The representation of the consumer as "affected" seems to be a part of politics of the consumer's representation from an aspect of political system in the prospect of the establishment of the "appropriate" consumer protection regime. We focus on the analysis of political parties' discourse during the period 2010-2017 on the issues of consumption and economic crisis. The indexing of 244 parliamentary debates –relative with these issues– formed the sampling frame. Following the Grounded Theory methodology, and working on Nvivo 12, we concluded to a mental/thematic map that depicts general thematic categories and their interrelations.

Neoliberal De-development, COVID-19 and Social Reproduction in the Post-Soviet Space: the State, the Woman Question, and Ukraine

Yuliya Yurchenko

University of Greenwich, United Kingdom

COVID-19 pandemic suppression (mis)management exacerbated and exposed the worst of the 30 year-long market-orientated neoliberal reforms effects in the post-Soviet space. Since 1991 the region experienced institutional transformation, including redefinition of the role of the state in the economy, economic de-development, socio-economic degeneration and economically driven migration, often of overqualified persons for low-skilled, care and sex work. Women carry the weight of "transition to the market" in and on their bodies and experiences the most - transition scars are deeply sexed and gendered. Far from empowering or emancipating women, capitalist marketisation instead has eroded the social structural/institutional scaffolding that propped up production and social reproduction in the Soviet republics, presently shifting the weight of the latter from the previously socialized services back into the households, back onto the shoulders of women. How did the countries where sexed/gendered inequalities were deemed largely eradicated (with noteworthy regional variegation) get to lose those achievements? This paper discusses the condition of the post-Soviet women via a case study of Ukraine. It defines the social and economic guarantees women enjoyed as a class in the USSR as a result of the "woman question" orientated structural reforms following by the exposition of trajectories of their deterioration since 1991 that exerted multilevel pressure on women exposed most vividly during the COVID-19 pandemic (mis)management. I conclude with a theorization of the anti-feminist nature of the state in marketized economies and alternatives to it building on the unique historical experience of the post-Soviet women in the context of de-development by marketisation.

Post-Corona Capitalism: Implications for the Global Political Economy

Arie Krampf[1], Andreas Nölke[2]

[1]Academic College of Tel Aviv Yaffo, Israel; [2]Goethe-Universität Frankfurt am Main, Germany

The corona virus has initially triggered a health crisis, but it will be remembered in the history of the global economy primarily through the worst recession since World War II. From a critical political economy perspective, this leads to the issue of the structural changes that it will trigger in the longer term. In the past, severe economic crises were typically catalysts of far-reaching structural reforms. The Great Depression of the late 1920s led to the New Deal, but also to the rise of Fascism. The oil crises of the 1970s, and the subsequent period of stagflation, contributed to the rise of neoliberalism in the 1980s. It is therefore likely that the great recession that follows the original health crisis will also lead to fundamental changes in global capitalism. In our presentation, we discuss three possible and probable implications of the corona crisis on the global political economy: the impact on the structure of global value chains, the impact of the structure of foreign direct investment, and the impact of international hierarchies of power.

238

Precarious Life. Everyday Struggles and Protests in Refugee Camps During the Covid-19 Pandemic

Nikolai Huke

Christian-Albrechts-Universität zu Kiel, Germany

Refugees who must live in large refugee accommodations are particularly at risk of contracting COVID-19. The lack of private rooms and shared sanitary facilities make it impossible to protect oneself from infection through social distancing. If infections occur in the accommodation, chain quarantines lasting several weeks are sometimes the consequence: Refugees are not allowed to leave the accommodation for another 14 days with each new infection. Isolation and health threats in the camps cause severe distress for the residents, further deteriorating a situation already characterised by extreme stress before the pandemic (e.g. due to precarious residence permit status and fear of deportations). In many places in Germany - for example in Bremen's Lindenstraße or in Frankfurt's refugee shelter in Bonames - residents protested against the conditions that endangered their health. Drawing on qualitative empirical research, the contribution traces refugees' everyday struggles in German camps. It situates the struggles theoretically in debates on an imperial mode of living, globalised exploitation and resistance under Covid capitalism.

Neoliberal Politics for Tackling the Pandemic and Forms of Resistance: The Case of Greece

Maria Bakola

European University of Cyprus, Greece

The neoliberal discourse on the importance of free market and austerity, articulated in Greece after the Financial Crisis, appears to be suspended. In spite of the Greek government's attempt to save both the economy and its citizens from the consequences of the Covid-19 pandemic the right-wing government of New Democracy continues the implementation of a series of neoliberal policies, imposing at the same time a total lockdown and a strict stay at home curfew while cultivating emotions of anxiety and fear. These disciplinary measures are accompanied by a discourse that articulates the need for

safeguarding human life, drawing from the expert knowledge of epidemiologists. In spite of the curtailment of the rights to assemble and protest, Greece has witnessed a number of collective forms of resistance and a flaring up of community organizing. In this paper I investigate concomitant forms of resistance to an authoritarian neoliberalism that is supported by an imperative for protecting life. I explore this by analyzing the attempt of grassroots organizing and other collective forms of organization to overturn this sense of fear and anxiety and build a counter-hegemonic discourse. My examination demonstrates a tension between the ability to challenge neoliberal policies and the reality of the pandemic. I focus upon this tension and critically reflect upon the emerging academic debate on understanding the politics of the pandemic within a Foucauldian framework of analysis.

RN06_T02_01 | Feminist political economy, social reproduction, and Covid capitalism

Feminist Political Economy Beyond Productivism

Emma Dowling

University of Vienna, Austria

Productivism refers to the subordination of all aspects of social and economic life under a logic that is orientated towards productivity gains and economic growth. It is a logic that is paramount in contemporary capitalism. At the same time, low productivity and slow economic growth have become a sustained feature of advanced capitalist societies post-2008. Arguably, accumulation by dispossession is not only a prominent feature of contemporary capitalism, but is also a result of efforts to realise gains under post-growth conditions. Such efforts affect the care economy in particular, where the objects of dispossession are often public welfare funds, un(der)paid activities of care workers and the wellbeing of those cared for. Nonetheless, the quest for productivity and growth is still the hegemonic paradigm. Indeed, what we might call unbounded productivism is partly the cause of the multifaceted crisis we currently face globally and into which the coronavirus crisis inserted itself. While increasing productivity can make

sense in some parts of the economy, it is not a panacea. Consequently, this paper brings feminist political economy's concerns with gender justice and the better recognition of care work and unpaid reproductive labour together with critical political economy debates over destructive forms of productivism geared towards profitability and the accumulation of capital. The paper probes anti-productivist stances and progressive conceptions of productivity and assesses explicit as well as the latent forms of productivism that inform current proposals for post-covid recovery (including some feminist ones). The aim is to contribute to exploring the potentials of alternative political economies for transforming production, reproduction and globalised exploitation.

"A Room of One's Own": Remote Learning among Palestinian Female Students in the Israeli Periphery Following the COVID-19 Crisis

Tal Meler

Zefat Academic College, Israel

The COVID-19 pandemic has had a significant impact on the health, wellbeing, learning, living-arrangements, work and family life of students worldwide. This study analyzed the effect of the implementation of remote learning on Palestinian-Arab female students from a college in Israeli periphery. This paper aims to address the perpetuation of inequalities while applying feminist theory to examine the intersection of remote learning with gender and family relations in populations of disadvantaged social position as an ethno-national minority. My qualitative study of Palestinian-Arab female undergraduates during the crisis shows that students were forced to study in a shared family space because they did not have their own room and sometimes shared equipment. Furthermore, they were drawn into family obligations, which reinforced their traditional gender role. The data indicate that these circumstances impair their ability to study. The study sheds light on the role of gender and family relations in barriers to persistent devotion to higher education and success in attaining an undergraduate degree.

The insights gained from the study will provide necessary and much needed strategies and frameworks to ensure that policies and practices take into consideration the special needs of women across vast ethnic-cultural-class and educational backgrounds. Based on my analysis,

observed on local levels, I conclude that gender inequality in higher education as manifested in remote learning is not specific to the Israeli institution or for the individuals in it: it is structural and demonstrates how emergency time solutions combined with a social gender regime become an inequality mechanism.

Embodying Social Contradictions and the Care Form of Value?

Sourayan Mookerjea

University of Alberta, Canada

This paper draws upon my ongoing research on the intermediations of class and cultural politics on the bitumen commodity frontier in the Athabasca tar sands in Alberta, Canada and reconsiders our understanding of social contradictions through an interrogation of the deepening of socio-ecological crises of a resource cursed petro-state by pandemic, oil price collapse, austerity, green passive revolution and fascism redux.

Bringing together Cedric Robinson's pathbreaking account of racial capitalism (1983 [2000]) and its contemporary elaborations by David Pellow (2016), Laura Pulido (2015), Pulido and De Lara (2018), and Francoise Vergès (2017) into critical conversation with subsistence perspective, social reproduction and decolonial feminism (Federici 2004, Mies and Bennholdt-Thomsen 1999, Mies and Shiva 1993, Salleh 2017, Lugones 2010), and with world-ecology (Moore 2015), intermedia theory's multiple colonialisms framework (Mookerjea 2018, 2019) this paper constructs a critical perspective on green growth and green new deal ideologies which foregrounds the patriarchal colonialist intermedia matrix of capitalist accumulation strategies and the centrality of racist-sexist systemic violence and interlocking oppression to state responses to crisis in order to reconstruct a critical political economy able to attend to the significance of the cultural-political mobilization on the Right in a conjuncture of state capitalist passive revolution, climate crisis and runaway social inequality.

In this situation, does Indigenous sovereignty based climate justice activism defending and regenerating Indigenous commons lead us to discern the emergence of a problematic of a care form of value in contradiction with the colonial law of the commodity form of value?

240

Beyond The Triple Crisis: Contra Housewifisation In The Wake Of COVID-19

Aino Ursula Mäki

University of Manchester, United Kingdom

The catastrophical consequences of the ongoing pandemic only represent the crystallisation of pre-existing racialised and gendered crisis-tendencies of present neoliberal phase of global capitalism. A bona fide crisis of human and non-human 'reproductivity', the impacts of and responses to COVID-19 have reiterated what feminist economists and political ecologists have argued for years: that reliance on a patriarchal gender order and both epistemological and ontological sexual division of labour which assigns responsibility for social and ecological reproduction to women and feminises any actors assigned to this private sphere of necessity is fundamentally unsustainable, representing both a biopolitical contradiction and a short-sighted strategy of ongoing primitive accumulation. In this paper, I argue that a rejuvenated theory of 'housewifisation' drawing from the Bielefeld School of ecofeminism is sublimely equipped to provide alternative pathways for an improved theory of critical political economy and radical solutions for struggle and praxis, towards a holistic view of capitalism in terms of a unified process of social and ecological re/production embedded in society-nature relations beyond monetary exchange and valuation biases of masculinism of both critical and orthodox politico-economic analysis, a view ever-more important as the pandemic acts as a multiplier of the pre-existing triple-crisis of climate, care and finance.

New Precarities, New Resistances: Visibilising Protagonists of the Global #FeministStrike

Annette Veronica Maguire

University of Newcastle, Australia

The salience of the concept of precarity (Standing, 2015) has grown exponentially in the wake of the global pandemic, preceded as it was by the long recession that followed the GFC in 2007. Theorists such as Silvia Federici (2018) and Isabell Lorey (2015) offer an incisive analysis that reads precarity through a gendered lens, illuminating how the burden of reproductive labour, which continues to fall on the shoulders of women, crucially affects their overall position in the labour market. Indeed, neoliberal austerity intensifies this 'shadow work,' as governments and employers off-load their responsibilities for the health and welfare of the workforce (Harcourt, 2009). In the ongoing fallout of the global pandemic, this is clearer than ever.

In this context, the collusion of corporate feminism with neoliberalism is particularly egregious, of which Nancy Fraser (2019) is among the most trenchant critic. Her most recent book, with Tithi Bhattacharya and Cinzia Arruzza (2019), is a timely critique of neoliberal feminism from a critical political economy perspective, and a clarion call for an intersectional, anti-capitalist alternative. However, what their manifesto overlooks is the success with which social movements are constructing this alternative in the here and now, in the form of the international #FeministStrike. This paper hopes to spotlight the political subjects who are animating the Strike - feminists of the global South - from its birthplace in Argentina to the world. Through movement practices that politicise and collectivise the work of reproduction, these protagonists resignify concepts of work, class, and solidarity from a feminist standpoint. In so doing, they may be inventing the most effective challenge yet to the global malaise of precarity and it's proto-fascist political consequences.

241

RN06_T02_02 | Methods of resistance: forms of disobedience and struggle

The Prefigurative Legitimacy of Civil Disobedience

Oscar Berglund

University of Bristol, United Kingdom

This paper asks why social movements choose to practice civil disobedience out of a broader repertoire of contention. It is based on two case studies, the Spanish housing movement Plataforma de Afectados por la Hipoteca (PAH) and the British climate movement Extinction Rebellion (XR). The movements draw inspiration in different ways both from a legitimacy-focused liberal tradition of civil disobedience and from an anarchist tradition of prefigurative direct action. The paper argues that civil disobedience offers social movements a highly visible outward-looking prefigurative legitimacy that can prefigure a new world whilst directly challenging the old. Civil disobedience can thus both have more revolutionary potential than the liberal tradition allows for and be less insular and more outward-looking than the anarchist tradition tends to be. The paper further claims that the crisis of legitimacy in contemporary capitalist liberal democracies has ushered in an age of disobedience.

A Comparative Study Of Social And Labour Movements Responses To Covid-19.

Orestis Papadopoulos[1], Panos Retzelas[2], Dimitris Koilakos[3], Dimitris Kivotidis[4]

[1]Manchester Metropolitan University, United Kingdom; [2]Birmingham City University, United Kingdom; [3]University of West of Athens, Greece; [4]University of East London. United Kingdom

This paper aims to contribute a critical political economy perspective by exploring dissent and resistance under Capitalism in the context of the current pandemic. We examine the extent to which movements can sustain conflictual forms of resistance that maintain the prospect for a different socialist and sustainable world. Our central question is if social and labour movements can reconfigure their repertoires of contention and framing in order to accelerate the potential for progressive change in the current crisis and pandemic context.

To address this question, we examine the forms of resistance and framing of issues that have been adopted by different social and labour movements during the pandemic. The focus is to compare two different movements and examine how they have responded to the current social, economic, health and racial problems. In particular, we will compare and contrast the Black Lives Matter Movement (UK and USA cases) and the Greek class-oriented Labour Movement organised actions and demonstrations when social distancing restrictions were imposed because of the pandemic. The rationale of this comparison is to examine what organizational-ideological-political resources these two movements used and whether the mobilizing of those resources managed to sustain support towards the goals of the movements.

We argue that there is a scope for enriching critical political economy research through learning transfer as often social movements and labour movements research are not in direct communication, missing some important lessons that each movement has to offer. By elaborating on the forms of resistance that different movements have adopted to respond to the pandemic we explore what elements are more effective in each case and how these can be utilized by other movements.

Resistance in Covid Capitalism: change, accumulation, contestation

David J. Bailey

University of Birmingham, United Kingdom

This paper attempts to set out some of the main forms of resistance existent within contemporary covid capitalism. It adopts, and develops, a perspective in critical political economy in which resistance is conceptualised as essential to capitalist accumulation. Having done so, it seeks to set out the main forms of resistance that contemporary patterns of accumulation are experiencing in the current period of covid capitalism. Four key pressures for accumulation are identified: the ongoing shift in global production; the further rise of finance and fictitious capital; the increasingly disciplinary role of the state; and the production of political debates that seek to render popular dissent as manageable. In each case, the paper notes the forms of resistance that have occurred, and with what effect, highlighting the destabilisation, and therefore opportunities for more emancipatory movements to emerge, that these have generated.

Flexing the Eco-Leninist Perspective with 'Just Transition' seen as Revolutionary Struggle

Damian Gerald McIlroy

Queen's University Belfast, United Kingdom

In the Anthropocene humanity faces a binary of possible futures: (1) The Dystopian: Just Attrition, a barbaric future, increasingly defined by continued commodification within the eco-modernist myth and governed by the politics of illusion/Capitalism (2) The Utopian: Just Transition, an eco-social future, necessarily defined by the pursuit of functional abundance within ecological limits and administered through variations of democratic socialism. This is an antagonistic position, one of an ultimate class struggle and the boundaries must be uncompromisingly pushed in one direction, leftward. However, as a result of historical conditioning over the last three decades the theorists of ecosocialism have failed to consider the concrete conditions for the actuality of proletarian revolution in the Anthropocene and to utilise 'Just Transition' as its context, this must change. Just transition is a critical proposition that will define the future of humanity one way or the other. Just transition is both an historical opportunity and a lens through which the totality of capitalisms social and ecological inequities can be revealed, analysed, connected and opposed. This paper will argue that the opportunity for a just transition offers an overarching foundation for comradeship and anti-capitalist activism to move beyond ad hoc unity, to create a permanent opposition in revolutionary mode. An antagonistic opposition as a dynamic network of intersecting vanguards that recognise their coalitional diversity but are united in their universal understanding of just transition as an overarching revolutionary proposition. To do this we must put Lenin (and others) back into the frame. But we do not need a "Revolutionary Party" only a generally accepted "Revolutionary Party line" and to identify who 'we' are.

RN06_T03_01 | How far right? Authoritarian tendencies in contemporary European capitalism

The Spatially Mediated Legitimation Crisis of the Finance-Dominated Accumulation regime in Sweden: The Rise and Accommodation of the Sweden Democrats

Claes Belfrage[1], Markus Kallifatides[2]

[1]University of Liverpool; [2]Stockholm School of Economics

Exploring the spatial dimension of the unfolding structural crisis in the arguably most successful of the variations of the financialized accumulation regime, Sweden, this paper employs Regulation Theory and Critical Theory to make sense of the complex composition of the spatially mediated social forces sustaining it. We employ Regulation Theory to conceptualise the political economy of this accumulation regime, not least its redistributive consequences. Compared with its more famous predecessor, the new Swedish model revolves decreasingly around the export sector and increasingly around property investment and debt-led consumption. Ever-increasing levels of private sector, especially household, debt, a major driver of highly leveraged banking revenue, is at the core of this regime, as is rapidly rising real income and wealth inequality.

With the social costs and benefits of this regime distributed unequally, "populist" politics, especially on the right, have been articulated by social forces desiring to mobilise the constituencies disadvantaged by this accumulation regime. Drawing on Critical Theory, this paper conceptualises the spatial mediation of the structural crisis of the new Swedish model as a legitimation crisis taking the form of the rise of Sverigedemokraterna, but also their accommodation in the party political system. The political struggle is focused on the recruitment of two social groups: the self-understanding cosmopolitan home-owning urban and suburban middle classes and those disadvantaged by neoliberal globalisation and financialisation in the hinterland. Paradoxically, an ethnonationalist nostalgia for the "safety" of the nation-state, for many amplified by the fear of Covid-19, and the disarticulated Fordism of embedded liberalism of the post-WWII period is increasingly the sentiment shared by these two groups.

The national-populist hybridization of neoliberalism: State capitalism in Hungary

Gabor Scheiring

Bocconi University, Italy

New hybrid variants of capitalism are emerging around the globe, representing variegated, sometimes seemingly contradictory combinations of statism, nationalism, and the promotion of capital accumulation. Some see this new conjuncture as the demise of neoliberalism and the dawn of a new nationalist developmental state era. Hungary has often been represented as a paradigmatic case of this new national capitalist ascendancy. This article argues that instead of signaling the end of neoliberalism, Hungary's recent economic transformation represents a national-populist hybridization of neoliberalism. Using novel empirical material, the paper shows how the internal tensions of embedded cosmopolitan neoliberalism facilitated the rise of nationalism among domestic business elites and a group of nationalist technocrats. This endemic nationalism of the elites represented a structural opportunity for an economic-nationalist turn within the power bloc. Viktor Orban's Fidesz used these dynamics to broker a new power coalition, and institutionalized a set of new policies to facilitate capital accumulation. This regime reinforces the fundamental tenets of neoliberalism in terms of prioritizing external competitiveness through austerity and wage restraint, maintaining policy credibility with finance to ensure the central role of global capital as a source of finance, and maintaining trade and financial openness. The new national-populist embedding of neoliberalism has replaced the redistributionist embedding of cosmopolitan neoliberalism prevailing before 2010. This national-populist hybridization of neoliberalism functions as the software of authoritarian state capitalism in Hungary but falls short of a new developmental state. By strengthening the ties between the state and capital, it eroded the autonomous bureaucratic capacities.

Project Of Destruction – The Far-Right, Covid-19 And The Destabilization Of The European Union

Daniel Keil

University of Cologne, Germany

The last decade of the European Union was characterized by the converge of multiple crises and authoritarian developments. Thus, a political crisis emerged out of the Euro crisis, which was accompanied by a deep reaching ideological crisis of legitimacy. After these developments the unstable balance of compromises between ruling and subaltern class-fractions was disrupted. Thus, former compromises and alliances in the power bloc had been disengaged and new social alliances are now forming. The far-right project is a new alliance, coming out of those struggles and processes. Usually, such projects can be identified as hegemony projects, which are characterized by a shared rationality and at least a common future vision of how society should be shaped. After all, the European far-right project must be conceptualized in contrast as a project seeking to destabilize hegemony by means of attacking institutions and apparatuses of the integral state. It targets social compromise and societal mediation in general to establish forms of permanent mobilization and opportunities of immediate violence. The presentation will first theorize the development of the far-right project as part of the multiple crises, then show how it adapted to the Covid-19-Pandemic and how its strategies are fueled by it, especially those aiming to destroy the (epistemic) foundations of society on order to foster short-term-interests of capital in general. Third, I will conceptualize the far-right as project of destruction, its means and strategies, and its importance in the development of the pandemic crisis capitalism to deepen theoretical insights of these converging crises.

Far Right and the European Disintegration Crisis: from Passive Revolution to Caesarist Rule in Slovenia

Ana Podvrsic

Graz University, Austria

Rarely givenany space in international media, Slovenia filled the (web)pages of newspapers like Le Monde, the Guardian, etc. during 2020. Left-liberal media were sending warnings about the attacks on the rule of law and anti-European stance of the Slovenian ruling coalition under Janez Janša and his Slovenian Democratic Party (SDS), known for their ideological, political and financial links to Hungarian Fidesz. Such developments might come as a surprise to many who considered this small country as a neo-corporatist post-socialist exception whose recent political trajectory was characterized by the emergence of and entering into the Parliament of (radical) left-oriented Left Party in 2014. Following neo-Gramscian regulationist political economy, we argue that the rise of the far right in Slovenia should be contextualised within the European disintegration crises. The establishment of the current ruling coalition under SDS is only a peak Caesarist-like "moment" in the longer process of passive revolution that has been taking place in Slovenia since the outbreak of 2010 Eurozone crisis after late 2000s. Following the EU "austeritarian drive", the then "crisis" governments mainly combined technocratic rule-based policy-making with economic piecemeal measures that further reinforced the export based and low(er) wage character of the Slovenian economy and its vulnerabilities. However, despite many similarities between SDS, PiS and Fidezs, SDS does not challenge the EU core-periphery divides and lacks the essential tool to do it, namely, monetary sovereignty. Instead, its state project consists of making a far right-wing party state well entrenched on the Eurozone industrialized periphery.

RN06_T03_02 |
From critical to post-foundational political economy? Doing and thinking critique politically

Thinking Politically About Our Research, and Thinking Publicly About Political Economy Alternatives

Ian Bruff

University of Manchester, United Kingdom

The geographer Reecia Orzeck (2012: 1464) has argued that all research ought to be understood as intrinsically political, on account of how 'what topics we investigate, what questions we ask, and what count as valid answers are all shaped by the concerns and biases of the time and place in which we work; by the prevailing conditions of knowledge production in that time and place; by the state of our disciplines; and by our subject positions.' Moreover, she has asserted (ibid.: 1465) that the ultimate goal for critical researchers is to produce knowledge in the name of transforming 'the world on everyone's behalf: from a place where knowledge is an accumulation strategy for the few into one where both the means and fruits of knowledge production are, finally, truly public.'

This presentation builds on Orzeck's insightful comments in order to reflect on what the COVID-19 pandemic has highlighted for critical political economy endeavours. The pandemic has been widespread, multi-faceted, and fast-paced, and it has shown us how intertwined all aspects of life are. Of particular interest to critical political economists ought to be the enhanced visibility for the notion of 'public health'. Arguably, this notion can be deployed to bolster efforts to imagine alternative ways of 'knowing' the world and alternative political economies, too. On the former, all knowledge-producing practices are political and with immanent normative orientations; on the latter, what could a 'public' political economy look like? Overall, the presentation seeks to open up debate about the political nature of all research that we conduct, and about what it means to think publicly about alternatives.

Sexualities and Critiques of Capital

Mathias Klitgård[1], Liu Xin[2], Laura Horn[3]

[1]Centre for Gender Studies, University of Stavanger; [2]Helsinki Collegium for Advanced Studies, University of Helsinki; [3]Roskilde University

In the face of economic and ecological crisis, intensified political tensions and exacerbated socio-economic inequalities that are materialised through deeply gendered, sexualized, racialised and classed lines, we are witnessing an increased interest in thinking through issues pertaining to sexualities, bodies and desires as central to understanding and critiquing contemporary capitalism. Such work is often inter-disciplinary, or post-disciplinary, and brings together critical and creative insights from scholarly fields such as feminist post-/socialist theory, decolonial anti-capitalism, eco-socialist literature, anti-racist theory and queer and trans Marxisms. Another significant source of inspiration for this strand of work is the ongoing dialogue and collaboration with feminist anti-capitalist and anti-racist grassroots movements and activisms within and beyond academia.

This paper is the introduction to a special issue in Women, Gender and Research (2021) that provides a platform for critical analysis and debates that shed light on the complex and often contradictory ways through which sexualities and capital are related to, shaped by, and constitutive of each other.

246

The Caring Classes: Towards An Alternative Epistemology Of Political Economic Struggles

Lorenzo Filippo Velotti[1], Luca Michele Cigna[2]

[1]Scuola Normale Superiore, Italy; [2]European University Institute

An ever-increasing number of interconnected global crises – pandemic, environmental, climatic, economic, and of social reproduction – are killing lives on this planet. We conceptualize the sum of these crises as a planetary crisis of care. In the context of the latter, we notice the inability to construct a reacting historical subject – as it was, for example, the proletariat in the Fordist era, who was able to coalesce and collectively promote the establishment of social citizenship rights (Marshall 1963). Rallying around social movements, unions, and parties, the old industrial working class strongly contributed to the configuration of modern welfare states. In the neoliberal era, we assisted to the disappearance of a revolutionary subject able to create a shared sense of reality with a collective emancipatory potential, as old categories became increasingly inadequate and ineffective. The present pandemic worked as a magnifying glass on, as well as an exacerbator of, already-existing crises and inequalities. This, however, has not yet produced a collective reaction. Many essential workers, for example, despite being celebrated as "heroes" during the first wave of the pandemic, seem to be failing to leverage this potential toward an emancipatory horizon. Broadly drawing on feminist literature, we argue that looking at present crises through the lenses of care allows to identify in the caring classes (Graeber 2018) the potential construction of an intersectional collectivity that, by transforming current economic epistemologies, would be able to shift the focus from single issues – workers' rights, environment, women, racism etc. – to a common political economic framework of struggle.

Countering Financial Claims: The political economy of definancialisation

Sahil Dutta

Goldsmiths, United Kingdom

Advocates of de-financialization argue that the productive economy needs to be restored by loosening the financial sector's stranglehold over society. This entails reviving patient investment to governments and companies by tackling the 'marketization' of finance. This misreads the history and politics of financialization in three related ways. First, it relies on an excessively stark historical contrast between the postwar Golden Age of 'embedded' finance, and a neoliberal period of marketized finance. Second, it overlooks how the institutional infrastructure that underpins how financialization was constructed. Rather than amorphous 'markets', there are particular actors, institutions and practices that matter. Third, it depicts the politics of financialization as a problem of rentiers: focusing on how the ownership of financial assets allows the market power creditor classes to extract value from debtors. This underestimates the agency of those borrower governments, corporations and financial intermediaries that use financialization for their own empowerment. To counter the inequities of financialized capitalism and pursue an altnerative post-capitalist future, progressive economic discourse should instead examine how some actors use excessive leverage and how this capacity can be democratized.

247

RN06_T04_01 | Assets, property and law in contemporary capitalism

Venture Capitalists – Gatekeepers in the Asset Economy

Franziska Cooiman[1,2]

[1]Roskilde University, Denmark; [2]Weizenbaum Institute, Germany

Venture capital (VC) firms, a subset of the rising class of asset managers, are situated at the intersection of finance and the economy. I argue that venture capitalists function as gatekeepers to the asset economy, channel capital and expertise into startups, and transform them into financial assets with prospects of a lucrative exit to public or private markets. The gate they are keeping guards two inroads: on the one hand, institutional investors access to this lucrative asset class; on the other hand, the access of startups to the massive amounts of capital they structurally depend on. Consequentially, venture capitalists impact upon questions of wealth distribution and innovation / the shape of the economy. Interviews at European venture capital firms and digital ethnographies of specialist meet-ups, conferences, and talks form my argument's empirical foundation.

Theoretically, I draw from IPE and STS perspectives on the asset economy and assetization (Adkins et al., 2020; Birch & Muniesa, 2020; Braun, 2020; Langley, 2020). Accordingly, the paper begins by situating venture capital in the asset economy, connecting the rise of venture capital with broader transformations in the European political economy.

Methodologically, mirroring the dual theoretical perspective, I 'follow the money' in the classic IPE fashion and follow the investors. That is, first, I analyze the investment chain surrounding VC firms, identifying the economic logic governing the interactions between the different nods. Second, I zoom into the fund level studying the social and material practices of fund managers.

The Democratic Constitution of Property Rights in Contemporary Capitalism. Is There Still Room for a Social Function of Property?

Jordi Mundó

University of Barcelona, Spain

I) From the 18th century onwards there has been a growing predominance of an absolutist conception of property in economic and legal discourse, which Blackstone (1765) summed up so well by stating that "[t]here is nothing which so generally strikes the imagination, and engages the affections of mankind, as the right of property; or that sole and despotic dominion which one man exercises over the external things of the world, in total exclusion of any other individual in the universe", and the French Civil Code of 1804 defined as "the right to use and dispose of things in the most absolute manner". II) From this assumption, we will reflect on the fact that, although in the 20th century some political, economic and legal theories that advocated an absolutist conception of property rights were consolidated, we can find a wide variety of historical legal and social practices that were based on a non-absolutist conception of property (private, public or common). III) On these bases, we will develop a double reflection: (a) To what extent the Post War Social Contract and social democratic policies led the property issue to irrelevance in public debate? And (b), if we accept the thesis that this Contract resulted in a less than expected redistribution of resources and power, to what extent contemporary proposals such as predistribution, Basic Income or Sovereign Wealth Funds could be conceived as a revival of the social function of property?

248

Digital Platforms, Private Power and Law: Making Sense Of Legal Forms With Pashukanis

Mislav Žitko[1], Toni Prug[2], Paško Bilić[3]

[1]University of Zagreb, Department of Philosophy; [2]Independent researcher, Croatia; [3]Institute for Development and International Relations, Croatia

In light of the recent regulatory attempts in the United States and Europe driven by the need to address the concentration of power of the leading corporate platforms (GAFAM), we revisit the analysis of legal forms initially formulated by Evgeny Pashukanis. The rapid emergence of platform capitalism has compelled economists and legal scholar to question the prevailing doctrine concerning the meaning of monopoly and the effectiveness of anti-trust regulation and, thus, to bring forward a more structural understanding of the legal logic surrounding digital platforms in sharp contrast to the doctrine set by Robert Bork and the Chicago School. These are important developments which touch upon only one segment of the relationship between law and political economy within platform capitalism. A number of social policies and regulations – from legal grounds for ownership and monetization of knowledge and user data to taxes in line with the business objectives of digital platforms – have to be put in place in order to sustain the current trend of platform capitalism. Through the focus on legal forms as an element of social and economic determination of forms we show that law has always been the necessary ingredient of capital formation and platform capitalism is no exception. Moreover, the paper aims to identify and analyze the key aspects of the new forms of private power born out of the interplay of legal forms and technology extending thereby the standard Marxian concern with value-form present in Pashukanis' work.

RN06_T04_02 | Contemporary Capitalism and Its Others: Rent, Finance, Platforms and Alternatives

Theorising Residential Capitalism: Land Rent, Capital Accumulation, and Housing Provision

Javier Moreno Zacarés

University of Warwick, United Kingdom

Though housing has become a major locus of accumulation in an age of secular stagnation, critical political economy continues to lack theoretical frameworks to examine how capitalist development operates in and through residential provision. Existing approaches to housing place an excessive focus on how finance flows in and out of real estate, black boxing crucial aspects of housing provision, such as the process of residential production or the peculiarities of land rent. To address this, this paper sketches the contours of a historicist framework for the analysis of residential capitalist development. It starts out from the claim that residential capitalism is underpinned by an ambivalent relationship between land rent extraction and capitalist residential production. Whereas land rentierism involves a drive to monopolise scarce assets and drive up their price, the thrust of capitalist production is to increase output competitively via cost-effective production. In the housing sphere, both economic processes are locked in a dynamic tension that has contradictory ramifications for residential provision and for the capitalist economy at large. These contradictions result in multiple vectors of social conflict that require of constant political management to stabilise urban-social formations, which are always at risk of breakdown and restructuring. Through this prism, this framework theorises the process of capitalist housing provision, using historical examples from the nineteenth century to the current era of housing bubbles.

249

On The Concept Of A 'Financial Elite': A Critical Realist Intervention

Marie Moran[1], Flaherty Eoin[2]

[1]UCD, Dublin, Ireland; [2]National University of Ireland, Maynooth

Who are the financial elite, and how are they distinguished from other economically powerful groups? In this article, we adopt a critical realist approach in the service of developing a concept of financial elites, as distinct from other powerful social groups. Combining perspectives from distributive, categorical, and relational approaches to elite studies, we argue that an unresolved tension between agentic and structuralist accounts of elites has hampered clarification of their differentia specifica, and blunted the normative content of the concept. Drawing on the tools of critical realism, we develop a new concept of financial elites, combining insights from both elite studies, and the political economy of financialisation. We argue that the financial elite possess not only high quantities of income but income primarily derived from 'rentier' channels, as endowed by the institutional structures of financialisation. Financial elites demonstrate not only the capacity to capitalise on these new accumulation channels, but to shape the institutional and regulatory landscapes in which they operate. Our new approach to financial elites thus accounts for both these structural contexts, and loosely coordinated action-preference sets.

Continuity or Change? Conceptualizing Platform Capitalism

Aleksandra Piletić

University of Amsterdam, Netherlands, The

In recent years, a wide range of contributions (from disciplines as diverse as media studies, sociology, law, political economy, etc.) have sought to conceptualize the emergent effects of platforms on contemporary capitalism(s). One broad strand of literature has positioned platforms within the longue durée of capitalist transformation, analytically focusing on the continuities and path-dependencies of institutions that platforms have been embedded in. Another strand of literature has tended to emphasize the novelty of platforms, stressing the ways in which they have produced disruptions (whether technological, social, economic or political) to existing material practices and discourses. This paper seeks to bridge the divide between narratives that tend to predominantly emphasize either continuity or change and to conceptualize platforms as part of a new emergent mode of regulation seeking to stabilize the crisis-ridden neoliberal regime of accumulation following the 2008 financial crisis. It draws on regulationist scholarship to critically inquire into concepts such as 'platform capitalism,' 'the shared economy' and the 'gig economy' to provide a new lens for understanding platforms and the diverse institutional landscapes they have generated across geographies. In so doing, it also seeks to make sense of the effect that the Covid crisis has had on this new emergent mode of regulation, keeping in mind the perpetual question – are we still living in a neoliberal era or is this something entirely new?

Thankfulness and the Self: The Emotion and Ethics of Hazelnut Production in Turkey

Emine Erdogan

Giresun University, Turkey

This research examines the interconnections between economic and ethical change, based on an ethnography of hazelnut production in Turkey. The country is one of the largest producers and exporters of hazelnuts in the world. The local production system has some unique features, since it has long been protected by the state from the vicissitudes of the capitalist world economy. Until quite recently, the state protected the producers by regulating the price and guaranteeing the purchase of hazelnuts via producers' cooperatives. However, in the last fifteen years, the state has gradually reduced the purchasing amount and consequently prices have fallen. As this happened recently and the local production system is adapting to the change, the region offers a valuable opportunity to look at how the economic changes influence local people's ethical thinking. The study, therefore, looks at how rural populations are remaking their ethical thinking as a response to the rapid integration of Turkish agriculture and food industries into the global economy. The main purpose is to identify the coping strategies evolving in the local environment and their consequences for social relations and individual identity. Particularly, the research examines how local constructions of 'thankfulness' (to God, family and one's superiors) and ingratitude mediate the social relations between farmers, the global economy and its local

250

representatives, as well as its political consequences. 'Thankfulness' is a historical key component of normative relations in Turkey and has long moderated relations of respect and antagonism. However, my observations suggest that it is now becoming a key component of the moral economy in today's Turkey, and one which helps local producers and workers to cope with new forms of subordination.

RN06_T05_01 | Place-based Alternatives to Capitalism: Solidarity economies and community wealth building

Decreasing Dependency Through Self-Reliance: Strengthening Local Economies Through Community Wealth Building

Julia Eder

Johannes Kepler University Linz, Austria

In the aftermath of the global financial and economic crisis of 2007/8, some peripheral communities in countries of the global North, for instance Cleveland, Ohio, and Preston, UK, have decided to challenge their dependent, outward-oriented development model, shaped by structural dependency. They opted for a self-reliant development strategy termed 'community wealth building' that seeks to strengthen the local economy while respecting ecological boundaries and improving social and living standards in the community. This strategy has clear overlaps with other contemporary progressive movements and initiatives (e. g. solidarity economy, new municipalism, foundational economy or doughnut economics). However, there exist also relevant parallels to historical debates on and practices of 'self-reliance' in the global South that have not been systematically studied yet. Thus, I will examine what are the major similarities and differences between

community wealth building (CWB) and older self-reliance approaches. The central thesis is that – due to shared basic assumptions – the actors associated with CWB could benefit from engaging with the legacy of self-reliance to complement the theoretical foundation of their approach.

Methodologically, the paper draws on reports and documents from think tanks involved in CWB, on newspaper articles and on four explorative interviews with policy advisers and politicians linked to the posterchildren of CWB in the USA and in the UK, Cleveland and Preston.

Civic Food Networks During The Pandemic: An Alternative To Our Capitalist Food System?

Bernd Bonfert

Cardiff University, United Kingdom

The ongoing Covid-19 pandemic has exposed the vulnerabilities of global supply chains, while lockdown measures have clearly demonstrated which economic sectors are 'essential' for societal reproduction. In front of this backdrop, the demand for alternative forms of local, sustainable and solidarity-based food provision has rapidly increased across Europe, as more people rely on civic food networks such as community-supported agriculture (CSA) and solidarity purchasing groups (SPGs). Scholars and activists often regard these networks as parts of a transformative movement to decommodify and democratize our food system by subverting traditional producer-consumer relations and achieving relative autonomy from the market. In CSA this is done by re-organizing food production and distribution through collaborative planning, while SPGs distribute food directly from sustainable farms to (often low-income) households. However, both types of networks still need to generate commercial income, are difficult to scale up, and often lack social accessibility. This raises the question whether and how they can effectively offer an emancipatory alternative to the capitalist food system, particularly in response to the complex challenges and opportunities of the pandemic.

This paper therefore aims to discuss the transformative potential of CSA and SPGs from a critical political economy perspective, drawing on theories of the solidarity economy and social movements. It examines findings from qualitative case studies in the UK, Germany and Italy, based on archival research and interviews with CSA/SPG participants, to capture the pandemic-context, practices and scope of civic food networks and assess

251

their contribution to wider social struggles and transformations.

Entrepreneurializing Solidarity: The New Social Economy in (Post-)Austerity Greece

Dimitris Soudias

London School of Economics, United Kingdom

The anti-austerity movement in Greece brought forth novel modes of socio-economic organization based on co-operation and mutual aid, rather than competition and self-interest. By the mid-2010s, what started as protest had mushroomed into a (largely informal) solidarity economy, signifying both an answer to austerity, and an alternative to the neoliberalization of state-market-subject relations. Making good on their election promise to support this movement, the SYRIZA-led governments of 2015-2019 followed a policy-agenda of institutionalizing a new Social and Solidarity Economy sector (SSE) in Greece. By creating a legal framework to formalize solidarity structures and cooperatives towards the EU's definitions of 'social enterprise', and by facilitating the sector's growth with EU funds, the governmental rationality of this agenda mobilizes discourses of 'social innovation', 'entrepreneurship', and 'creativity', in order to incentivize the generation of 'social impact'. Though partly critical of the entrepreneurial dimensions of this agenda, critical research on the SSE in Greece concurs that these developments by and large prefigure post-capitalist forms of socio-economic organization.

My paper is sympathetic to the transformative potentialities of SSE organizations, but its intervention sheds light on the reproductive side of the coin. In elucidating the epistemics of assuming to be able to measure and organize 'impact', 'innovation', 'creativity', 'utility' and 'entrepreneurship', this paper delineates the ways in which (formalized) SSE organizations in Greece unwittingly reproduce the very neoliberal rationalities against which they stand. Coupled with the need to secure (EU) funding along impact-oriented requirements, I show how these epistemics contribute to the quantification and economization of the social, and the entrepreneurialization of solidarity. In trying to transgress these findings, I conclude with some theoretical considerations toward an alter-neoliberal epistemology.

Decommodifying Care: COVID-19 Mutual Aid Groups in the UK

Bilge Serin

University of Glasgow, United Kingdom

The COVID-19 pandemic, an unexpected global crisis, has changed everyday life in a short period of time while creating a global emergency. Communities have rapidly responded to this fast-moving situation by creating bottom-up initiatives. COVID-19 mutual aid groups have emerged under these circumstances as a key response by communities for communities. The paper explores the role of COVID-19 mutual aid groups as a community response in mitigating everyday life challenges emerging under a pandemic situation. The paper argues that COVID-19 mutual aid groups decommodify much-commodified care services under capitalist production relations, while discussing their transformative potential for the post-pandemic world.

RN06_T05_02 | Forms of domination and repression

252

Sharpening the Tools of Critical Political Economy: Impersonal Domination and Class Domination

Julio Martínez-Cava

University of Barcelona, Spain

Market imperatives are the driving force behind the development of global capitalism and its crisis, included the current Covid-19 crisis. In order to fulfil the cycles of accumulation, class domination is necessarily required. Political economy has dealt with these questions since its early origins. The first critics of capitalism assimilated this domination with earlier forms of power: military, corrupting, feudal. The capitalist was understood as a kind of monopolist. Nevertheless, a different critique was developed throughout the 19th and 20th centuries in which structural compulsion was highlighted as the

distinguishing feature of the new markets. The imperatives of competition, accumulation, and profit maximisation permeate all social relations: even capitalists are subject to the dictates of markets. Attention was turned from personal forms of domination to the very rules of the game, the so-called "impersonal domination".

However, impersonal domination is not the same as class domination. The former is pervasive and affects everyone in different ways, whereas the latter is executed by capitalist class and is only detrimental to working people. A member of the dispossessed is not dependent "on a particular person, but on the entire owning class" as Engels said in 1844.

Although some efforts have been made to conceptualise these types of domination (Gourevitch, 2015; Meiksins Wood, 2013; Roberts, 2016), the relationship between them remains unclear. In this conference, I will reassess those debates to show how they can contribute to a political economy for contemporary times.

Managing the Upper Class Through the Coming Transition

Erik Andersson

University of Gothenburg, Sweden

The aim of this theoretical paper is to chart four overlapping aspects of importance to manage the upper class through the coming sustainability transition we ares approaching. The upper class will have to do the biggest life-style changes when society becomes ecologically, socially and economically sustainable, in line with the SDGs and the Paris agreement. Their ecological footprint must shrink, income and wealth differences must shrink, and a large part of upper class resources will be needed for the transition. However, a vital part of decision-making and structural changes that transition will entail, will be to manage the upper class. The first aspect of this management concerns culture, which today is very much influenced by upper class style, norms and discourses that are not tenable, neither as social practices, nor as societal role models. The second aspect is ecological, where upper class life styles display energy and material use way beyond sustainable. The third aspect concerns the neoliberal growth model, which has promoted upper class investment choices and individual enrichment as motors for societal development. The upper class has so far shown little capacity to handle this role in concord with the Rio Declaration of 1992 or the Paris Accord and SDGs of 2015. The last aspect relates to security and the long tradition of upper class relations with the military and security apparatus of the modern state. The upper class is a small minority in society, but democratic handling of it and its interests needs to be done with care.

Debt-based and Asset-based Inequalities in the UK and US

Mareike Beck

King's College London, United Kingdom

Inequality has become a widespread concern in political economy and mainstream policy circles in OECD countries. Despite important advances that highlight wealth inequality as a crucial underlying trend of social stratification, mainstream understandings still conceptualise economic inequality as a sliding scale of income inequality or asset ownership. By contrast, this paper analyses new forms of asset- and debt-based inequalities by using a feminist political economy approach that demonstrates the close relationships of global finance with households. I apply the concept of the Minskyan household, developed by Adkins et al. (2020), which foregrounds the everyday liquidity constraints of households to understand their precarious integration into the contemporary financialised economy. Households must balance long-term investments, such as housing, with short-term income from declining real wages. Using this conception, I document household level debt and asset ownership in the UK and US since the 2008 financial crisis. Unsurprisingly, asset ownership is generally lower for income poor households, while asset titles increase with higher income levels. Interestingly, debt volumes are high relative to income levels in lower income quintiles, while high income households have exceptional levels of debt in absolute terms. High levels of debt might be a sign of both precarity and economic wealth. This suggests that the interrelations of household debt and asset ownership are crucial to a nuanced understanding of social stratification. Using this data, I demonstrate how an appreciation of the Minskyan household can improve conceptions of precarity and disparity with respect to assets and debt.

The Repressive State as an Ideological Apparatus

Ignasi Bernat Molina[1], Clara Camps Calvet[2]

[1]University of Winchester, UK; [2]University of Barcelona, Spain

According to Garland (2001), the transition to the modified welfare penal complex, punishment increasingly has a higher symbolic dimension in an outraged society by the normalization of crime. However, this is an element of the new culture of control that was already signalled by Durkheim when he discussed the social function of punishment which had as a key element to reassert the social mores threatened by deviant behaviour. From a critical point of view, this culturalist approach is reductionist somehow as it is unable to understand the political role played by the state's delivery of punishment..From the more spread marxist conceptualization of the state, usually the state is understood only in its repressive capacities forgetting its infraestructural role. This marxist dominant interpretation of the state is also reductionist as it is unable to capture the ideological and symbolic dimension of the repressive apparatuses (Poulantzas 1974). Departing from a case study, the repression of the self-determination movement in Catalonia from 2017 onwards, we will develop a more complex categorisation of the state's role in the suppression of dissent that combines both ideological and political facets of the state's distribution of legalized suffering.

RN06_T06_01 | social protection and (Covid) capitalism: present and past

Direct Payments to Citizens as a Policy Measure to Alleviate the Consequences of Covid-19 Crises

Päivi Helena Mäntyneva, Heikki Tuomas Hiilamo, Eeva-Leena Ketonen

University of Helsinki, Finland

Global crises, such as pandemics, which pose serious threats and uncertainties and therefore require rapid responses, serve as a stress test for welfare states and governments. Crises also present the governments with opportunities to try new and even radical policy options, which, if implemented, may create path-dependency for future policies. The economic fallout following the COVID-19 crisis has caused unprecedented insecurity and hardship across the world. Due to the lockdown measures, such as school and business closures, new kinds of needs for social protection have appeared. New measures to meet these needs are required not only to ensure immediate wellbeing of citizens but also to guarantee positive transitions through the crisis and enhance trust of the citizens. We aim to investigate and compare the social policy responses, aimed at mitigating the negative effects of the Covid-19 pandemic and ensuring the recovery of the welfare states. Many countries have implemented emergency basic income (EBI) or a similar direct income support as an income support for people in difficult situations. In our comparative study of 13 OECD countries representing different welfare state regimes, we use content analysis to examine the social policy responses to the corona crisis focusing on identifying new measures to support individuals and families economically. We study if these measures provide merely temporary relief or if they possess potential for transformation and paradigmatic shifts in welfare state.

Welfare Against Freedom? Pre-distribution and Decommodification in the Framework of Popular Political Economies

David Casassas, David Guerrero

University of Barcelona, Spain

Many recent debates on predistribution gather very old ideas of economic democracy: transformative or "popular" political economies, from the seventeenth to the twenty-first centuries, have always stressed the importance of an ex-ante guarantee of resources of various kinds, in line with the main intuitions of the republican tradition. A traceable commonplace among these old (and new) political-economic practices and ideas is the analytical and practical distinction between material well-being and freedom, which constitute two realities that tend to go hand in hand, but not in any manner.

The normative justification for the ex-ante distribution of resources in the republican tradition was not so much about ensuring a certain amount of material comfort or levelling per se, but, above all, guaranteeing access to the set of resources that make freedom possible, that allow independence from the arbitrary will of third parties. The priority of freedom over mere material well-being –or at least the distinction between both values– is a necessary element to develop a predistributive agenda truly open to (the possibility of) decommodification and, therefore, to economic democracy.

Rescuing the predistributive vestiges in 17th century agrarian republicanism seems necessary in light of some of the current approaches to predistribution, which simply present themselves as a welfare alternative to taxes and transfers –thus potentially undermining not only what is needed to establish the kind of regulatory frameworks that predistributionists claim to defend, but also the very sets of resources that are relevant for individuals and groups to pursue freer lives. This article seeks to understand unconditionality in the access to public/common resources as a predistributive tool beyond material welfare.

The Impossible Neoliberal Welfare State Under the Covid Magnifying Glass

Clemence Lucie Elise Fourton

Sciences Po Lille, France

This paper posits that the Covid conjuncture lays bare the key contradiction of neoliberal capitalism, ie the role of the State in organizing its own demise -- in the British context.

This exercise in Covid heuristics builds on a twofold argument:

1) the contradictory role of the State has been magnified under Covid because of the nature of the crisis (health-based) and of the crisis mangement policies which have been resorted to (test and trace, lockdown & suspension of labour for substantial streches of time). These two factors have meant that the welfare state has been relied upon as never before, both quantitatively (number of people on furlough and benefits or in hospital) and qualitatively (shift from benefits being used marginally to them being used somewhat universally).

2) the contradictory role of the State has been exposed as such during the crisis. First-hand accounts from NHS staff and from people surviving on out-of work benefits have played a key role: the subjective impact of neoliberal welfare state policies (opaque tendering of healthcare services, lack of investment & residual benefit system) has become a narrative one cannot ignore.

All in all I argue that the current crisis has led the central neoliberal contradiction of the role of the State to be recognized as such. I argue that so far, this exposure has translated into recognition politics (clap for carers, rainbows, Captain Tom mania, debate on £20 Universal Credit increase), but not in any structural reworking of the contradiction. In other words, the crisis has made it clear that there can be no proper Welfare State / State for Welfare under neoliberalism, without this turning into political change yet.

255

The Political Economy of Mental Health Awareness Campaigning in Times of COVID-19

Jana-Maria Fey

University of Sheffield, United Kingdom

My paper critically analyses the politics of mental health awareness as a project of sustaining untenable modes of capitalist living and accumulation. Through an exploration of the UK-based mental health anti-stigma 'Time to Change' campaign I draw attention to the discourse about the nature of stigma and mental illness that positions the individual and her biology as the principal site for intervention. The discourse in awareness campaigns is presented as 'scientific' and highlights the need for persons to remain in work and to be economically productive. In this manner, anti-stigma and awareness programmes draw awareness away from the socio-economic structures – such as austerity politics, capitalist exploitation, and neoliberalism – that contribute to the emergence of mental distress. The global rise of mental health awareness programmes is thus reproductive of contemporary economic hierarchies while normalising the experience of mental distress under capitalism. This is a particularly pertinent phenomenon during the COVID-19 pandemic because awareness discourse frequently dismisses adverse reactions as mental disorders which, in turn, determines the acceptable boundaries of expressing dissent to pandemic governance. Given the historical influence of pharmaceutical companies on the funding of mental health awareness programmes, I argue that the political economy of mental health awareness is an important theme to explore in order to make sense of both 'Covid capitalism' and the possibilities for resisting the perpetuation of capitalist modes of living.

RN06_T06_02 | Capitalism, Productivism, Capitalocene: Responding to Ecological crises

SARS-CoV-2 Pandemic As A Heterotopic Opening In The Capitalocene: Chances And Drawbacks For The Broken Planetary Metabolism And Its Environmental Complexity

Alexander Barta

exploring-economics.org

The great obsession of actual-existing capitalism is the apology of economics: with its themes of growth, equality of opportunity among homo oeconomicus, of cycles of boom and bust, of efficiency and profitability, with its greatest achievement of all: the mystification of so-called externalities. Beginning with the GFC in 2008 and through to the SARS-CoV-2 pandemic the discursive foundations and material effects of thereof have been challenged on an unprecedented scale and on various levels in particular. Externalities such as SARS-CoV-2 are a reminder that the world economy is to be regarded as embedded in a broader whole (Wallace, 2020): building up on Foucault's (1967) lecture on heterotopias, i.e. 'of other spaces', this argument predicates that the SARS-CoV-2 pandemic and its economic consequences can be theorised as a heterotopic opening, as a production of unorthodox, yet uncharted space/territory in which socio-political deliberation and the question and debate of the extent of the possible and feasible may once again resume. The pandemic thus happened to open a narrow window of opportunity in which the previously unthinkable became possible and potentially broadens the horizon of possibility for market civilisation in the near future in light of global organic crisis and possible systemic collapse arising from oncoming planetary boundaries and continued marketisation (Gill, 2016; Berardi, 2017). The central problématique this paper is concerned with is exploring the chances and drawbacks

this heterotopic opening may mean for the broken planetary metabolism and its environmental complexity in the age of the Capitalocene (Di Muzio, 2011; Moore, 2017ab).

Assessing the Economy & Environment Debate: the Ecological Crisis and the New Paradigm of Capitalist Accumulation

Maura Benegiamo[2], Emanuele Leonardi[1]

[1]University of Parma, Italy; [2]University of Trieste, Italy

The capital-nature relationship has oftentimes been described as predatory and extractive – especially when considering its conditions of re-production – built as it is on systemic social exclusion, prone as it is to frequent crises. Yet in recent times a profound transformation of the value-nature nexus occurred, such that capitalist elites could actually claim to be addressing the issue of physical limits through green growth.

Capitalist reorganization strategies suggest the idea that a speculative shift in the social perception of environmental constraints - in particular, climate change - is underway. It is a shift that turns the environment from obstacle to accumulation to value-driver. In our assessment we indicate three fields of application of such new paradigm: Green Economy (GE), Bioeconomy (BE), Circular Economy (CE). CE refers to processes of financialization of nature (most notably, carbon markets); BE relates to the technologization of the living as a basis for an unprecedented industrial revolution; CE reconceptualizes waste as raw material/energetic input for the new paradigm. Our assessment provides both a genealogical account of such interconnected discursive formations and a discussion of their poor environmental performance so far.

Furthermore, based on this theoretical map, we argue that exploring the nature-value nexus in the light of these transformations could open up a space for critical interventions also from an empirical perspective.

Transformational Strategies Towards a Plural, Democratic and Ecologic Model of Economic Development. Popular and Communitarian Economy' Responses to COVID Crisis in Catalunya.

Santiago Eizaguirre[1], Núria Reguero[2], Jordi Estivill[3]

[1]Universitat de Barcelona, Spain; [2]Xarxa d'Economia Solidària de Catalunya; [3]Xarxa d'Economia Solidària de Catalunya

During the pandemic outbreak, mutual support networks have provided care with a degree of universalization that in many senses has overcome statal politics. Popular structures around housing tenants' unions, communitarian management infrastructures, grass-roots urban gardens, self-managed production spaces or community fab labs, among many others, have faced recent critical events. In Catalonia, these collective forms of autonomous response may be explained by a Social and Solidarity Economy' sector with a long tradition organised on governing the commons, which has in collectivization processes during the Civil War an important historical point of reference. Nowadays more than 7,000 organizations are linked to the Social Economy Association of Catalonia involving a total estimate of 10,000 initiatives sharing a set code of shared values. Although the sector presents great diversity in many senses (formal, ideological, practical), it has fostered a strategic proposal for a new social agreement promoting transformational policies with a vision on a plural, democratic and ecological model of economic development.

Our communication focuses on how the social economy movement has been influential in crystallizing the need for an alternative economic model in a counter-hegemonic strategy called "Pact of the Economy for life". We observe how this strategy is aimed at the defence of Collective Health, Economic Democracy and Socio-Environmental Justice and we highlight its main lines through the lens of co-creation. Finally, we conclude our paper reflecting on the demands addressed to the administrations and the challenges and resistances involved in terms of critical political economy.

Countering Corporate Violence: Degrowth, Ecosocialism And Organising Beyond The Destructive Forces Of Capitalism

Ekaterina Chertkovskaya, Alexander Paulsson

Lund University, Sweden

Corporate violence is a form of organised violence motivated or caused by material interest, profit-seeking or economic expansion. It is inflicted on human beings or ecosystems. Complementing a Marxist theoretical frame with literature on ecosocialism and degrowth, we examine how corporate violence is inherent to and has been consistently encouraged by the capitalist mode of production. By drawing on the concepts of primitive accumulation and social metabolism, we visibilise how such violence is manifested within the productive forces of capitalism – natural resources, labour, technology and money. Corporate violence, we argue, may only be countered in a post-capitalist society where the productive forces are radically transformed. We build on degrowth principles to articulate how corporate violence may be countered and how post-growth organising of productive forces may look.

RN06_T07_01 | Growth, wealth and distribution

Growth-regime Transition And Organized Labour

Adrian Bua, Adam Fishwick

De Montfort University, United Kingdom

The "growth regime" (Baccaro and Pontusson 2016) literature attempts to explain institutional shifts underpinning different forms of capitalist accumulation. This literature theorizes dynamic change as driven through interaction between endogenous crises that create oportunities for rupture and regime change (Hopkin and Blyth 2018), that are constrained by path-dependencies shaped by global macro-economic effects (Blyth and Matthijs 2017). We argue that it does not cover the political processes through which change occurs at particular conjunctures. We thus bring it into conversation with Beramendi et al's (2015) theory of "constrained partisanship" and Baccaro and Pontusson's (2019) "social bloc" focus on growth-regimes. We also seek to theorize the role that organised labour plays in growth regime shifts. To this end, we draw on critical labour sociology (e.g. Schmalz et al 2018; 2019) theorizing how different forms, strategies and configurations of labour power restrict or enable labour unions to exercise powe fruitfully during the transformative potential of crises. This critique builds on previous critical work on comparative capitalisms, which informs this recent literature on growth regimes (Bohle & Regan 2020), highlighting the underpinning "capital-centrism" of the approach (Coates 2014; Bruff et al. 2015). Building on these two theoretical claims, we aim to develop hypotheses as to which forms of labour movement mobilisation and institutionalisation are most conducive to equitable, sustainable post-COVID regime transition.

Iceland's post crisis model: Keynesian triumph or North Atlantic Mirage?

Owen Worth

Limerick, Ireland

The Icelandic crisis in 2008/2009 was commonly seen as the most extreme of all respective downturns during the financial crisis. The collapse of an economic over dependent on facilitating a niche within high interest global banking and financial services led to a meltdown that had significant political and economic ramifications. Iceland's response to the crisis has likewise been seen as just as stark - capital controls, the restructuring of the banking system and the rejection of the sort of austerity levels since in Euro-Zone countries in favour of managed or 'progressive' austerity. As a result it was commonly hailed by many progressive economists (such as Stiglitz, Piketty and Krugman) as being a successful Keynesian alternative to those prudent models elsewhere.

This paper suggest that whilst there was indeed significant momentum behind the left-left coalition that were the architects of the restructuring plan, the post-growth Icelandic growth has instead been one that has maintained its vulnerability, tying itself to tourism and to industries that have seen growth at the global market. In this sense, Iceland has just maintained its history model of fragility; one that is marked by a cycle of boom and bust and dependency on specifically narrow sectors. It will also suggest that prior to COVID pandemic, the tourism bubble was on verge of collapse, with the halt in

form of the global market allowing it potentially to re-think such a dependence in a post-Covid world.

Japan's Struggle: Torn between Inclusion and Exclusion

Saori Shibata

Leiden University, United Kingdom

Traditionally, Japan has adopted a relatively inclusive approach to economic interdependence in Asia. This inclusive approach has fostered robust high-tech relationships with China and other regional partners, such as South Korea, despite political differences. The strength of these high-tech relationships is most evident in trade and investment, although less evident in flows of human capital and cross-border research. In some ways, this emphasis on inclusion continues: Japan joined RCEP in 2020, and it has not banned Huawei from its 5G market. Nonetheless, there are growing signs of a more exclusive approach in recent years. Tokyo supported the TPP, and it is unenthusiastic about the possibility of China joining the CPTPP. There is limited collaboration between Japanese affiliates in the ICT sector in China and China's start-up firms due to a lack of willingness on the side of Japanese firms and the Japanese government. Japan's continued close relations with the US in ICT area, including the US-Japan Science and Technology Cooperation, are likely to constrain collaboration with China further in the future. Japan has also begun to exclude South Korea in certain respects as that relationship has deteriorated, showing little enthusiasm for Seoul's membership in the CPTPP. This paper explores the range of considerations behind Japan's shifting and conflicted approach to China and South Korea, noting both strategic considerations and domestic political forces.

Competing Stories of Wealth Generation and Distribution

Paul Christopher Lewis

Birmingham, United Kingdom

Growth in the inequality of wealth and income are circularly related, each contributing to the other. However, wealth is an ill-defined concept, simultaneously physical and financial, often blurred with capital. While economic theories largely ignore the question of initial accumulation, they have developed utilising distinct physical and financial ontologies to explain the return generated by wealth in terms of either productive contribution (Clark 1965 [1899]) or a price of waiting and risk forbearance (Mossin 1966 cited in O'Sullivan, 2000; Markowitz 1952; Sharpe 1964). In mainstream economics and finance, these approaches provide a normative justification for further accumulation. Marx's critique of capitalism is also based upon productive contribution, relating to the expropriation of the surplus value produced by the only productive class, labour. Whilst containing many insights, this framework does not easily explain differences in wealth generation/extraction at the level of firms or within labour, and does not integrate finance.

The first contribution of this paper it to unpack the relationship between ontologies of wealth, economic theories of return, and normative positions on distribution. The second is to demonstrate the contradictions and limitations of the dominant frameworks. Third, we outline an alternative ontology, premised upon wealth as collectively produced, and distribution as determined by the power of competing stakeholders to lay to claim to it. We argue that such a framework is more realistic in 21st century capitalism for understanding how wealth is created and distributed, and opens new spaces for normative and policy debate on inequality.

RN06_T07_02 | Inside and Outside of EUrope

The Postfunctionalists Were (Almost) Right: The Analytical Consequences of 'Politicisation' and the EU Response to Covid-19

Amandine Crespy, Tiago Moreira Ramalho

Cevipol, Université libre de Bruxelles, Belgium

The postfunctionalist turn in integration scholarship has allowed for a much-needed incorporation of the role of politicisation in shaping EU integration dynamics. This stream, however, tends to assume a mechanical nexus between politicisation and interrupted integration, when not disintegration. In contrast, this paper suggests that the contingent nature of 'the political' should invite us to an understanding of both the sources and impacts of politicisation on integration in an increasingly contextual,

interpretive light. The recent turn from fiscal discipline and 'responsibility' to investment and 'solidarity' in the EU's response to the recession ensuing from the Covid-19 pandemic provides a critical empirical terrain to explore the open-ended character of the relationship between politicisation and EU integration. We propose an approach to politicization which analyses the ideational underpinnings and distributive consequences of a) how the crisis was construed; b) which policy solutions were prescribed; and c) how they made their way through the European multi-level, multi-arena deliberative process.

Still Embedded in Euro-corporatism? European Trade Unions Within the New European Economic Governance Regime

Vincenzo Maccarrone

University College Dublin, Ireland

The developments since the outbreak of the 'Great Recession' led to an increasing EU's intrusiveness in wages and workers' rights. What was therefore the strategy followed by organised labour vis-à-vis the EU's new economic governance (NEG) regime?

Historically, the European Trade Union Confederation (ETUC) has been in favour of further European integration. Jacques Delors' pledge to complement the process of market integration with the construction of a 'Social Europe' was fundamental for getting the support of trade unions to the renewed process of EU integration (van Apeldoorn, 2002). Since then, the ETUC has constantly supported European integration while continuing to ask for a greater EU social dimension (Horn, 2012), in a sort of 'symbolic Eurocorporatism' (Bieling and Schulten, 2003).

The outbreak of the 2008 economic crisis, followed by the establishment of a commodifying NEG regime (Erne, 2015; Jordan et al., 2020) seemed to lead to a change in the strategies of ETUC and its affiliates. For the first time in its history, the confederation rejected an EU treaty (the 'Fiscal Compact'), while promoting European counter-mobilisations. This led some scholars to wonder whether the ETUC had finally shifted its approach away from symbolic Euro-corporatism (Horn, 2012). Yet, already towards the end of the Barroso II Commission, the ETUC became increasingly embedded in new mechanisms of EU economic governance such as the European Semester.

Using a combination of semi-structured interviews and document analysis, this paper aims to describe the trajectory followed by the largest European trade union confederation vis-à-vis the new European economic governance framework. It does so through a multi-level research design which looks at the European level and at two country cases, Ireland and Italy.

The EU as an Arena of Struggling for Peace? Perspectives of Resisting the Militarization of the EU

Judith Dellheim[1], Frieder Otto Wolf[2]

[1]Rosa Luxemburg Foundation, Germany; [2]Freie Universität Berlin, Germany

The issue which will be discussed is the potential global role of the European Union, especially in promoting a socially and ecologically sustainable development. The decisive questions addressed are: what do the actors/agencies of the EU and what does the EU in total effectively do for peace?

We shall analyse what the answers to these questions do effectively mean, especially for the democratic anti-neoliberal forces in Europe? The paper argues for the following idea: The interests of the ruling actors/agencies within the EU, as well as their analysis and concepts of security, have a strong influence on the political, societal and ecological conditions of actors/agencies outside the EU which begin to aim at a socially and ecologically sustainable development. In this context the role of the military in the economies and in the policies of the EU member states is of special importance, as well as the politics effectively realized by the EU in its international relations. Consequently, the question will be analysed how far the current security priorities of the EU, and the resulting concrete processes of shaping law and regulations in the field of „defence" leave room for a resistance that can pave the way for an alternative, non-military development of international relations.

Value and the Total Labour Process in COVID Capitalism: Intersections of Transnational Mobility, Gender and Social Reproduction in Uneven and Combined Europe

Gregory Schwartz[1], Ania Plomien[2]

[1]University of Bristol, United Kingdom; [2]London School of Economics, United Kingdom

The onset of COVID-19 has disrupted processes by which workers and their families secure care, food and shelter. Uneven and combined Europe, strained by decades of neoliberalization, has come to rely on transnational labour mobility to secure the expanded reproduction of surplus value, while states have mediated the contradictions of value appropriation by proffering markets as the means of reproducing the conditions of possibility of wage labour. The contradictions of this process have gained greater recognition during the pandemic period, compelling discussions of 'value' of labour in the care, food and housing sectors. Based on interviews conducted before and during the pandemic with Ukrainian migrants in Poland and Polish migrants in the UK employed in these sectors, presents an analysis of the problem of value appropriation along the waged labour continuum, constituting social reproduction as an aspect of the total labour process. We demonstrate that social reproduction needs, when not met for free via households and unsupported via social wages and state services, are met through the wage economy dominated by a dynamic of devaluation of labour that involves the leveraging of gender and other inequalities, including pushing transnational labour into the caring and provisioning sectors. The fragility and injustices of this arrangement have been doubly exposed by the pandemic, simultaneously exacerbating needs, intensifying labour, and disrupting mobility. By demonstrating how social reproduction exists on a wage labour continuum (beyond unpaid care-work) and intersects with migration and gender, we underline its centrality to value as a social relation and to a labour process that surpasses the workplace as the locus of value.
Keywords: value, labour process, transnational mobility, social reproduction, gender

RN06_T08_01 | Imperialism, dependency, colonialism and decolonization

Capital, State, and Imperialism: Reflections on Turkey's 'Virus Diplomacy' in Sub-Saharan Africa

Gonenc Uysal

Osmaniye Korkut Ata University, Turkey

Turkey's proactive foreign policy in Sub-Saharan Africa has been examined by mainstream scholars with references to emerging market economy as well as neo-Ottomanism and pan-Islamism. Contrary to mainstream scholars, this paper borrows its theoretical and conceptual framework from Marxism in order to explore Turkish sub-imperialist foreign policy during the COVID-19 pandemic. In this regard, it accepts Turkey as a country that arrived late at capitalism, and thus, characterised as a periphery of the world capitalist system. It discusses Turkey's 'virus diplomacy' in Sub-Saharan Africa in relation to class antagonisms and contradictions of capital accumulation. In this way, it explores the interaction between Turkish foreign policy and the internationalisation of Turkish capitals subordinate to imperialist capitals, and Turkey's attempt at regional domination vis-à-vis Sub-Saharan Africa.

261

Systemic Hierarchies: The Subordination Of African States As A Monetary And Financial Phenomenon

Kai Koddenbrock

Goethe-University Frankfurt, Germany

The hierarchies debate in International Relations and International Political Economy has so far failed to take seriously the historical and contemporary experience of African countries with pronounced colonial legacies. Because of this, the fact that longstanding hierarchies are systemic has not received enough attention. This was a staple of debates around dependency and world systems theory until the 1980s but their lessons have been largely forgotten This article sets out to rectify this by substantiating a systemic understanding of monetary and financial hierarchies by focusing on the international monetary system and domestic banking and finance in Senegal. Two facets of systemic hierarchy come into view. On the one hand, capitalist competition and trade in commodities denominated in currencies requires a lead currency as approximation of world money and bestows systemic benefits and privileges on the dominant economic and political power as its issuer. On the other, the actors and practices of foreign finance have worked as an extractive force, hardly to the benefit of the broader population. Seen from Senegal, this double-constraint acts as a key mechanism of subordination. The restructuration and reorientation towards domestic resource mobilization is essential but has failed so far, because of the continuous reimposition of systemic hierarchies that come with the international monetary system and the extroverted nature of the domestic financial and banking system.

Dependent Monetary Strategies in Latin America: Between struggling for autonomy and sub-regional dominance

Johannes Jäger[1], Claes Belfrage[2], Adriana Nilsson[2]

[1]University of Applied Sciences BFI Vienna, Austria; [2]University of Liverpool, UK

Over the past decades, Latin American countries have experienced different and changing forms of monetary dependency but also struggled for monetary autonomy. These struggles have taken place against the background of changing global financial structures, characterised by an increasing importance of China. However, also within Latin America there are important differences and relations of dependency. Against this background, different and competing forms of regional monetary cooperation within the Mercosur and within ALBA have emerged. The paper adopts a critical political economy perspective and uses insights form dependency theory and regulation theory to explain these developments. It is concluded that different growth regimes are linked to different monetary strategies. Moreover, given the dependent character of development in Latin America, the dynamics of class struggles within different countries and the existence of regional sub-imperialist strategies and struggles, regional monetary arrangements are characterised by a high degree of instability.

262

Decolonizing Renewable Energy Finance in Africa

Simone Claar[1], Nomaswazi Mthombeni[1,2]

[1]University of Kassel, Germany; [2]University of Witswaterrand, South Africa

Even though the Corona pandemic has significantly impacted our lives and changed life as we once knew it, the impacts of climate change still continue to plague the world. It is necessary to tackle the climate crisis: One way is a shift from fossil fuel to renewable energy-focused capitalism. The pandemic slowed down the process of renewable energy (RE), but it is part of the international 'Building back better' strategy. We have complex landscapes of RE financing programs and funds, particularly in Africa. They aim to provide financial

resources through equity or debt and rely starkly on the capital market and development finance institutions. Consequently, this has created and entrenched financial dependencies on African economies. Our paper aims to examine how RE funds foster dependencies between 'the global north' and African economies, on one hand and on the other, it explores the role that local African stakeholders' play in the funds.

In order to do this, we engage with different theoretical perspectives: International Political Economy (e.g., Cox 1981, Poulantzas, Katz-Rosene/Paterson 2018), postcolonial ideas (e.g., Bartolovich/Lazarus 2002, Chakrabarty 2011), and Nkrumah's (1965) conceptualization of Neocolonialism. Methodically, the analysis draws on a novel case of two funds namely: Actis and ResponsAbility. We seek to get an in-depth understanding of the continuity of dependencies through financing RE projects on the African continent. Finally, we attempt to develop some alternative ideas on how RE funds can be decolonized and alternatives to its current capital driven landscape.

RN06_T08_02 | Neoliberal hegemony and domination

The "Submerged" and the "Saved": The Hegemony of Neoliberal Culture and the "Symbolic Violence" of the State in Italy During the Covid-19 Pandemic

Elena Gremigni

University of Pisa, Italy

The ongoing emergency situation caused by the Covid-19 pandemic has underlined the shortcomings of healthcare systems that have undergone a progressive reduction in funding by Western states. In these circumstances, neoliberalism has clearly manifested itself at the "superstructural" level in choices made through "political acts intended to have effects in the social world" (Bourdieu 1989-1992/2014: 10).

Departing from reflections by Gramsci and Bourdieu, this presentation seeks to highlight how measures adopted during the pandemic presuppose a prevailing view of citizens as tools: forced to work in conditions of risk, but deprived of liberty in their free time. Political decrees have generally been internalized by the 'dominated' as a natural consequence of the health emergency, while States continued to save money on public health by avoiding the purchase of adequate quantities of effective but expensive drugs that were accessible to the dominant class.

Utilizing the "clue paradigm" method (Ginzburg 1979), some sources will be examined in order to "unveil" the ideological roots upon which they are based. In particular, an attempt will be made to demonstrate how the adoption of economic categories, like the term "resource consuming" (SIAARTI 2020) in reference to patients' conditions in Italy, represents a dangerous aberration produced by the cultural hegemony of neoliberalism. In this sense, the instrumental "ratio" which aimed to distinguish "useless" old and disabled persons from "useful" young workers seems quite similar to the scientific management practices that led to the elimination of certain categories of people in the past (Bauman 1989).

Hegemony of Belt-tightening: Case of Communal Services Commercialisation in Ukraine

263

Alona Liasheva

University of Bremen, Germany

Since 2015 communal services in Ukraine were rapidly commercialised. As a result the utility bills came to comprise the larger part of the household budget for both homeowners and tenants, negatively affecting their (respective) quality of life. Such social changes produce multiple understandings of the reasons and consequences of such reform varying from structured and rationalistic demands of the IMF to pursue the reform in order to develop Ukrainian economy to conspiracy theories opposing these changes.

In this article I look at the normalisation of the neoliberal policy doctrine prescribed by the IMF and the conflicts it brings to. The following research question is posed: how do everyday life practices of households legitimise and/or oppose the reform? Through participatory observations, in-depth interviews and social media analysis I show how the established narratives and practices of individualised coping strategies enable accumulation of capital by both the foreign and domestic corporations.

A 'Pandemic of Police Powers': COVID-19, Authoritarian Neoliberalism and the Police in Britain

Malte Michael Laub

King's College London, United Kingdom

For billions of people, the restrictions and lockdowns imposed by governments around the world following the outbreak of COVID-19 in early 2020 meant massive limitations to their daily lives. For British police officers, the country's Coronavirus Act 2020 meant one of the largest expansions of their powers in peace times. Forces did make immediate and extensive use of these powers - so much so, that already in July 2020 the civil liberties organisation Liberty diagnosed a 'pandemic of police powers'.

By analysing the policing of the pandemic, this paper makes two main contributions to our understanding of (British) COVID capitalism:

Firstly, it shows that this expansion of police powers was crucial to the management of British COVID capitalism and has reinforced existing societal inequalities, especially along colour-lines. Thereby it amplfed the already unequal consequences of the pandemic. Moreover, by framing (the discourse of) COVID-19 and the appropriate response to it as problems of law and order, the expansion of police powers has served to shift blame for the high British infection and death rates onto (allegedly) rule-breaking individuals and away from the government.

Secondly, focussing on policing helps to demonstrate that British COVID capitalism is not a break with previous British (authoritarian) neoliberalism - despite minister's committments to the end of austerity and massive public spending. Indeed, the expanded role of the police in the management of COIVD-19 is not only in line but enabled by longer-term authoritarian reconfigurations of the British state in the neoliberal era. Thus, to understand the 'pandemic of police powers', it is crucial to understand the pivotal role of the police for British authoritarian neoliberalism.

Authoritarian Neoliberal Governance of the US-Mexico Border in the Trump Administration

Monica Clua-Losada, Michelle Keck

University of Texas Rio Grande Valley, United States of America

In this paper we propose to advance an understanding of Trump's Border Wall project as a mode of authoritarian neoliberal governance. We argue that US border policy, and in particular the attempt to build a border wall, is an example of the authoritarian neoliberal reorganization of the state under the Trump administration. We do so by examining how the border has developed into a site of accumulation for transnational capital and simultaneously as an insulator against opposition to neoliberal policies. Furthermore, the border wall in itself acts as an authoritarian populist way in which to frame border policy more broadly. The paper will be organized in three sections. First, we will offer a theoretical discussion of the concepts of authoritarian neoliberalism and authoritarian populism and how they can be used to understand not just the Trump presidency, but more specifically border policy during his term. Second, we will focus on the project to build a border wall and argue that the wall is an attempt to further develop the US-Mexico border as a site of capital accumulation. Finally, we will explore how the border wall, and immigration policy more extensively, during the past 4 years has been an effective populist mechanism to further insulate its neoliberal agenda.

RN06_T09_01 | Manufacturing, finance, instability, and struggle

The Service Economy, The Manufacturing Fetish And The Limits Of Capitalist Wealth

Alexis Moraitis

Lancaster University, United Kingdom

The post-2008 era witnessed a revival of the manufacturing fetish, the idea that manufacturing constitutes the flywheel of growth that can remedy stagnation and cure modern economies' addiction to finance. Across the Global North and South, voices are calling for a reversal of the trend towards deindustrialisation and for a revival of the manufacturing sector. Yet while today deindustrialisation is met with anxiety, in the 1930s and 1940s some economists not only predicted deindustrialisation but saw in it a process that would liberate humanity from the burdens of industrial society and pave the way for a post-industrial age based on material abundance and widespread economic security. Nevertheless, far from delivering this post-industrial utopia, deindustrialisation produced a precarious economic order marked by dysfunctional labour markets, economic stagnation and lost development opportunities for the Global South. What can be termed the Baumolian and Kaldorian frameworks, attribute this precarious reality to the inability of the service sector to replace manufacturing as a growth engine given its technologically stagnant nature. However, this paper argues that by focusing on the technical composition of different sectors such views miss a more fundamental social tension underpinning the capitalist economy between technology, productivity and wealth: while productivity-boosting technological innovations result in important increases in the material output, in the long run they undermine the production of the economic surplus that breathes life into the capitalist economy. The waning dynamisms of contemporary economies reveals limits beyond its sectoral composition that can be located back to value itself, a form of wealth that is peculiar to the capitalism.

How Power-Relations of Monetary and Fiscal Actors Shaped Types of Austerity in the UK and Germany in the 1970s

Inga Rademacher

King's College, London, United Kingdom

The growth model approach focuses on macroeconomic dynamics in the global economy while simultaneously acknowledging the differences of economic developments across economies. My paper applies this new notion of macroeconomic dynamics and divergence to moments of radical institutional change in developed economies in the 1970s, but focuses on fiscal and monetary institutions and analytically extending it to institutional dynamics within the state. I argue that capital mobility and power relations of fiscal and monetary actors can contribute to radical but differing institutional changes. Empirically, I assess this model through a process tracing approach based on the British and German macroeconomic shifts from Keynesianism to monetarism in the 1970s which were heavily driven by capital mobility but left the two economies with significantly different outcomes (one export-oriented, the other one finance oriented). I find that the institutional development paths were shaped by distribution of institutional power between the central bank and fiscal actors. In Germany, the Bundesbank held an asymmetric power position which ensured price stability and implicitly mandated the distribution of fiscal resources from consumption to exports. This was not the case in the UK where the powerful Treasury stopped overly ambitious increases in interest rate even under Thatcher, facilitating and maintaining comparably higher levels of consumption and consumer finance.

265

What Happened In March? Towards An Explanation Of The Financial Market Instability And 'Recovery' Of Spring 2020

Marie Hyllested Meyle

(Previously) SOAS, University of London, United Kingdom

During spring 2020 financial markets went through a dramatic couple of weeks with the fastest descent into a bear market in history followed by a speedy 'recovery'. As this recovery began, the real economy went into lockdown producing historic levels of jobless claims. What caused this turbulence? This paper aims at explaining what "really" happened in the US financial markets during the COVID-crash by conducting a partial conjunctural analysis using both descriptive statistics and a qualitative reading of financial news. It identifies four main elements to the event: i) a stock market crash, ii) a liquidity crunch, iii) turbulence in the productive economy and iv) unprecedented interventions by the Federal Reserve. Examining the relations and different temporalities of these elements, the analysis finds that the pronounced gap between the 'real' economy and financial markets was mainly caused by incredible interventions by the Fed, which did not trickle down from financial markets to the rest of the economy. Rather, this episode demonstrates the increasing relative autonomy of finance and the political nature of financial plumbing and access to liquidity. Analysing the events through a theoretical lens consisting of critical macro-finance, financialisation and the relative autonomy of finance the paper finds that the historic events of March and April 2020 highlight the distributional effects of central bank independence and the continuation and expansion of the post 2007-2009 crisis tendency of state-led financialisation.

Coronavirus And Class Struggle - An Investigation Of Employers' (Organisations'), Trade Unions' And Governmental Narratives About Safety At Work In 2020

Julia Lux

Liverpool Hope University, United Kingdom

While 'essential workers' had to continue going to work during all spikes of the Coronavirus pandemic, other groups of workers were asked to work from home or refrain from working entirely in the UK. The specific set of support measures and development of the pandemic soon led to discussion about public health versus 'the economy' in which many business groups pushed for a 'reopening' of the economy, while many trade unions were hesitant about exposing their members to increased risks of virus infection. In this paper, I trace and investigate the arguments for and against easing of lockdown restrictions as well as policy support in 2020. I will compare and contrast three key parts of the British economy, namely food delivery, hospitality (focussing on pubs and restaurants), and schools.

266

RN06_T09_02 | Alternative political economies

Diversity Beyond Capitalism In Makerspaces

Olga Koretskaya

Erasmus University Rotterdam, the Netherlands

This paper critically examines how capitalist, alternative capitalist and non-capitalist ontologies and practices are negotiated in makerspaces, usually defined as places in which people with interests in crafts, technology, design and product development work on projects while sharing ideas, equipment and knowledge. Makerspaces are seen as exemplars of the makers movement which has popularized ethos of active engagement with material things and post-consumer identities. It encompasses

small-scale craft and digital production that focuses rather on low-investment, open-source innovation. The existing scarce literature posits that makerspaces have the potential to undermine the process of modern capitalism, while prefiguring new economy based on small scale, locally organized networks of manufacturers and consumers. Yet very few scholars offer analysis of makerspaces in connection to diversity beyond capitalism. There is a lack of in-depth, case study work that provides an understanding of potentials that lie within makerspaces for the performance of collaborative, more sustainable 'other worlds'. In this paper, I employ an extended framework of diverse economies which understands capitalism not just as a form of socio-economic organization, but also cultural and political architecture. First I provide an overview of existing literature that sheds light on 'more-than-capitalist' dimensions of makerspaces. Then I explore a case-study of Keilewerf, a makerspace situated in Makers District in Rotterdam, the Netherlands, disentangling how capitalist, alternative capitalist or non-capitalist values of makers co-exist and conflict with economic practices, as well as knowledge production and relation with the state.

Take Back The Grid: Utility Justice and Re-Municipalisation During, And Beyond, Covid-19

Grace Brown

University of Glasgow, United Kingdom

Re-municipalisation sees privatised assets and services brought back into public ownership, management, and democratic control. A burgeoning epicentre of this trend is the United States, where the Democratic Socialists of America (DSA) are attempting to 'take back the grid' through the re-municipalisation of energy infrastructure in cities such as New York, Chicago, and Washington D.C. Central to the DSA's campaigns are narratives of utility justice. These narratives encompass a variety of struggles; from demands related to decarbonisation and a Green New Deal, to racial inequalities, housing (in)security, and debates around democratic public ownership. These struggles, and the demands of the Public Power movement, have been crystallised during the Covid-19 pandemic: not only did households spend $6 billion more on power bills in 2020 than in 2019, but a nationwide moratorium on utility shutoffs between March and November 2020 would have seen Covid-19 infection rates reduced by 8.7%, and deaths by 14.8%.
Beyond Covid-19, extreme weather events and climate change will have dramatic impacts on households and

utility infrastructure, exemplified in the recent 'Texas Freeze.' Responding to these challenges, and the political discourse upholding the primacy of fossil fuel interests, requires drastic transformation through sustained organising.
Drawing on a case study of New York's Public Power campaign, this paper examines how re-municipalisation has emerged from decades of neoliberalisation. It critically assesses how narratives of utility justice are employed in campaigns for energy re-municipalisation, and explores what these movements can offer for broader activism and research seeking alternative, emancipatory political economic models.

Re-municipalization of Urban Water Services Between Resistance and Reappropriation: the case of Naples, Italy

Gemma Gasseau

Scuola Normale Superiore, Italy

267

The Covid-19 crisis has on the one hand underlined the importance of basic services for human life, including water, if anything to wash hands; at the same time, it re-opened the debate on the role of the state and whether such services should be managed publicly or privately. Re-municipalization of urban water services (RWS) addresses such issues, as it provides a viable policy alternative to the ongoing privatization of water services enforced in the last thirty years.
The growing literature on RWS has thus far focused on counting the cases of re-municipalization worldwide and evaluating whether it is a trend or not, however little attention has been posed to in-depth investigation of particular cases. I aim at filling this gap by examining the re-municipalization of water services in Naples, Italy, which took place in 2013 following a successful referendum against water privatization promoted by a national mobilization. While social movements studies list such re-municipalization as a successful outcome, and legal and economic studies evaluate its consequences, I take instead a critical political economy approach, centered on social reproduction theory and political ecology, to look at re-municipalization as a process that different social forces continuously try to shape.
Therefore, I will examine the transition in the mode of governance: more specifically, to what extent the claims of the water movement translated into the re-municipalized company; how such company evolved in

the following years and what influence it had on the national and international level. The methods used are qualitative, based on interviews with local policy makers and activists, accompanied by content analysis on the documents produced by such actors.

The Search for Real Utopias in the Future of Care and Social Reproduction

Julie Monroe, Judith Watson

Newcastle University, United Kingdom

The Covid-19 pandemic has highlighted significant inequalities in UK care provision. While women are less likely to die from Covid-19 than men (Klein et al., 2020; Wenham et al., 2020), they are more likely to undertake unpaid care work (Andrew et al., 2020). An important social policy issue that impacts labour market participation negatively, unpaid work in the UK – including childcare and adult care - has been valued at £1.01tn, or 56% of GDP (ONS, 2016). This paper explores the future of care and social reproduction through Erik Olin Wright's (2010) Real Utopias project. Drawing on Wright's example of non-profit services in the Quebec social economy (day-care centres providing childcare and eldercare home services), we respond to the author's call to diagnose obstructions in 'the world of the actual' in order to create the context in which to explore 'the world of the possible' (Wright, 2010, p. 34). We frame our critique of the 'world of the actual' - where welfare institutions like maternity and paternity benefits are key factors limiting human flourishing - within feminist political economy. A 'regendering of care' perspective (Boyer et al., 2017; Longhurst, 2017) provides further avenues for research. Using data from two recent qualitative studies, we address the questions: what should the future of care look like? And, which forms of social reproduction should intensify and which should change? The paper concludes by discussing the potential for community and civil society organisations to provide solutions in the UK context.

RN06_T10_01 | Immovable Object? Eurozone `Design Failures' and the `Question of Germany'

Wither German Fiscal Conservatism in the EU? NextGenerationEU and Reconfigurations in the German Power Bloc in the Corona Crisis

Etienne Schneider

University of Vienna, Austria

The NextGenerationEU recovery instrument will be based on the EU's new capacity to issue bonds on the financial markets, a step which is widely considered as a major breakthrough in European fiscal integration by progressive and conservative commentators alike. This is astonishing as Germany hitherto blocked or at least deferred any steps towards a European fiscal union in the ongoing negotiations over the reform of the institutional architecture of the European Monetary Union. Against this background, the paper explores in how far the German power bloc has changed its position towards European economic integration in light of the Corona crisis, and which constellation of forces and interests is driving Germany's recent position-taking on European economic integration. The paper addresses this question through a historical-materialist policy analysis, based in particular on regulation theory and materialist state theory. Empirically, it is based on a qualitative analysis of position papers as well as expert interviews with German business associations, party representatives and ministry officials in Germany. The main argument is that Germany's push for a common EU debt instrument does not represent a fundamental paradigm shift within the German power bloc, but indeed constitutes a defeat of its 'hawkish' fraction, particularly within the German finance ministry. This shift occurs as part of an increasing 'geopoliticization' of the German power bloc's strategic calculations regarding European economic integration, evident also in major changes in its approach to EU industrial and competition policy, significantly altering

268

the premises of progressive transformative strategies towards European economic integration.

Wrestling with Unevenness: Global Rivalries, Corporate Interests and German Industrial Strategy

Julian Germann

University of Sussex

This paper offers a historical-materialist policy analysis of Germany's "National Industrial Strategy 2030"—an ambitious agenda of state intervention that breaks with ordoliberal orthodoxy and has been fiercely opposed by organised capital. To explain how and why the German state has advanced key aspects of the NIS 2030 despite near-unanimous business opposition, the first section places the initiative within the changing dynamics of capitalist globalisation. From the theoretical lens of "uneven and combined development", I argue that the twin challenge of a late industrialising China breaking into advanced manufacturing, and US multinationals financing and dominating a digital revolution, has yet to be felt by major social forces in Germany, but is contemplated as a serious threat in elite policy circles. In lieu of strong societal support, the second section argues, the German state has built upon structural and sectoral divisions within the ranks of capital to expand its regulatory capacities. It has mediated between big business and the Mittelstand by retooling competition policy, offering laxer regulation to the former and enhanced protection from US digital giants to the latter. And it has courted the electro-chemical and digital and defence industry, promising more generous state aid in the name of re-shoring value chains and restoring technological "sovereignty" that business as a whole views with alarm. The paper concludes that an incremental re-articulation of state and corporate interests may be in the making which, though far from a Keynesian turn, opens up new room for progressive forces.

From Silent to Passive Revolution: COVID-19, The European Green Deal, Socio-Ecological Transformation, and the German Question

Magnus Ryner

King's College London, United Kingdom

This paper makes three propositions about three major European Union initiatives developed in response to COVID-19 and ecological crisis: the ECB Pandemic Emergency Purchase Programme (PEPP), Next Generation EU, and the European Green Deal. First, they mark a new moment of EU crisis management, where what Barroso called the 'silent' revolution gives way to a Gramscian 'passive' revolution: Limitations to neoliberal reform through what Naomi Klein called the 'shock doctrine' is redressed through attempts to broaden the base of the reform coalition 'in a molecular fashion'. Second, the question of passive revolution in the EU should be posed in terms of Martin Nicolaus once called the 'universal contradiction' between the projection of hegemonic norms and the parochial interests entailed in German regional leadership. The initiatives are not flash-in-the-pan. They respond pragmatically to the long-term situation of German capital and its domestic power bloc. Third, in substantive terms the initiatives mark the continuation of disciplinary neoliberalism. Nevertheless, there are silver linings in the clouds for a project of progressive socio-ecological transformation in terms of form. The ruling power bloc finds it increasingly difficult to keep governance depoliticized. This should be seized upon by the European left.

A Marxist Account Of "Destiny 2": Using Videogame Production As A Case Study To Explore Changes In Contemporary Capitalism

Jamie Woodcock

The Open University, United Kingdom

Videogames are now a mainstream cultural phenomenon. Titles like Grand Theft Auto V and Cyberpunk 2077 have production budgets that rival Hollywood films. The focus of this paper, Destiny 2, has been played by an estimated 30 million people. It is an online multiplayer first-person shooter that can be used to draw out important dynamics of the videogames industry. The complex production of the game required the coordination of development studios, outsourcing companies, publishers, and so on, but also relies on the production of hardware and increasingly global chains of logistics. What is less known is how these connections between different kinds of labour and organisations are developing as videogames become an increasingly important commodity for contemporary capitalism. Covid-19 has had an important twofold impact: both the shifting of working relationships due to the pandemic, along with a sharp increase in videogame and hardware sales. By tracing the production of Destiny 2, particular shifts in contemporary capitalism can be critiqued. These include distinctions between immaterial and material labour, management strategies, new exploitative work practices, and forms of worker resistance. This is important not only for understanding how videogame production is changing, but also for examining the impact of these changes for worker organising. Over the past few years there has been a wave of game worker organising, with new unions and worker networks forming in different countries. The paper will reflect on how resistance and struggle has been a key part of the videogame industry and consider possible directions today.

Conceptualising Technology as Class Agent in the Digitalised Factory

Beatriz Casas González

ISF München / Hamburg University, Germany

The conflict between capital and labour in contemporary labour processes (LPs) is increasingly mediated through technology. In other words, class relations are, today more than ever, technological relations. Thus, I argue, to grasp domination in contemporary LPs - where it comes from, how it acts, and how to resist it -, we need to reconceptualise agency. That is, we have to rethink the subject and their relations with other non-human actors in the LP. Paraphrasing Burawoy*, "to restore the subjective moment of labour and stress the ubiquitous resistance of everyday life", we not only need to challenge the idea of "the subjectless subject", but also that of agencyless technology. This leads us to a fundamental question, namely: how do digital technology and workers become class agents through their interaction in the LP?

In order to answer that question, I propose a conceptual approach combining Labour Process Theory (LPT) and Actor-Network-Theory (ANT). The present paper aims to discuss the potentials and challenges of exploring domination, agency, and class formation from this hybrid perspective. In that sense, it conceptually expands on and qualifies some aspects of my previous work** on technology as a mediator of labour subjectivation.

Deepening Exploitation In The Banking Labour Process: Algorithmic Management, Computerisation And Teleworking.

Giorgio Boccardo, Valentina

University of Chile, Chile

The banking industry is undergoing an in-depth transformation (Boccardo, 2021). The introduction of new technologies, in particular algorithmic management and digital platforms, is changing the banking labour process. During the current COVID-19 pandemic, these technological transformations accelerated and were combined with teleworking.

The aim of this paper is to describe and analyse the intensification of exploitation in the chilenan banking labour process. First, the use of digital platforms and algorithmic management to organise the banking labour process is analysed. Second, risks of computerisation and teleworking in banking occupations and tasks are estimated. Finally, a conceptual framework is proposed linking these transformations and the methods in which exploitation is intensified in the banking labour process.

This research uses a mixed method design. The results are based on: i) content analysis of 30 in-depth interviews with workers, managers and union leaders -according to gender and labour experience- from 3 large private banks, 1 retail private bank and 1 insurance company in Chile; ii) estimation of a risk model of computerisation and teleworkability of occupations and tasks from the National Employment Survey; iii) documentary analysis of finance specialised press during 2018-2020.

The results show an increase in the intensity and modes of exploitation within the financial industry that challenge banking union resistances.

Boccardo, G. (2021). Can Robots Produce Customer Confidence? Contradictions Among Automation, New Mechanisms of Control and Resistances in the Banking Labour Process. In Moore, P. & Woodcock, J. (2021). Augmented Exploitation Artificial Intelligence, Automation and Work. Pluto Press.

RN06_T11_01 | Theorizing covid capitalism

Precarity Capitalism And Covid-19

Jaime Aznar Erasun, Daniel López Pérez

University of Kent, Belgium

The Covid-19 pandemic has put pressure on states to intervene the market, whether to protect it from its inefficiencies by creating a solid social base to tackle the crisis or to regulate it directly by addressing social policies. In this context, regarding recent Covid-19 related state interventionism, pundits have argued that Neoliberalism is dead for good. Paradoxically, while demands for state-led alternatives to economic success and further market intervention increase, permanent de-regulation and commodification of many public services have made us more reliant on the market for economic success than ever. Why is market regulation from the state still a relevant debate? This paper argues that despite the apparent novelty of the Covid-19 related State interventionism we have, for the last two decades, seen an active role of the state in redistributing debts and salvaging free markets in favour of the holders and producers of capital. However, at the turn of the XXth Century, the intervention of the state nurtured a distinct form of capitalism. Azmanova (2020) has coined this new modality as precarity capitalism, defined by a prominent intervention of the state in deepening people's reliance on the market.

271

Covid Capitalism and The Future(s) of Global Political Economy

Adriano Cozzolino, Diego Giannone

Università della Campania L. Vanvitelli, Italy

Since a decade or more, neoliberalism is said to be in a permanent phase of crisis. A crisis involving both the dimension of consensus and the 'economic' sphere. Thinking to the latter, the post-2008 global economy is marked by inequalities, poverty and unemployment. But also, on the side of capital, by a decline in investment and productivity rates, and – above all – a slowdown in the process of capital accumulation. Such longstanding imbalances are the background of the Covid-19 crisis. There is no need, here, to specify how profound this crisis is, and how it has impacted the society–nature relation, public health, and of course the economy, increasing the imbalances mentioned earlier.

In this framework, the question raised by the paper is not whether neoliberalism will end. Actually, the question is to understand how capitalism is evolving against its own contradictions, with what new contradictions, and finally the role that global institutional actors will play in this change. To do so, the paper critically analyses the policy strategy devised by the International Monetary Fund during the Covid-19 crisis, shedding light on several analytical dimensions such as fiscal policy, public investments, new forms of planning, the role of the government, wages, and so on. A critical political economy perspective is very well suited to reveal potential policy discontinuities and, above all, which social groups will they benefit – thus, a perspective keeping both feet planted in the ground of the (old and new) contradictions of capitalism. Finally, understanding possible future direction(s) in global political economy is necessary to shed light on possible new spaces for dissent and alternatives within the all-encompassing crises of our time.

The Covid-Crisis as a Breakdown of Economic De-politicization

Rune Møller Stahl

University of Copenhagen, Denmark

This paper offers an analysis of the crisis policies of the EU from 2008 onwards as a series of, ultimately unsuccessful, attempts at depoliticisation of fiscal and monetary policy. These attempts have been driven by an attempt of aligning the tensions between the structural conditions of global capitalism and popular democracy.

In this context the last decade of crisis management can be seen as an a contention between moments of de-politicization and re-politicization. One the one hand the formal rules have been made continually stricter through fiscal rules framework. On the other hand the enforcement of rules have been continuously bent and reinterpreted.

The construction of the Euro provided de-politicization to solve the inflationary crisis of the 1970s. The Eurozone crisis 2010-12 saw a reinforcement of the mechanism of de-politicization, with a distinct authoritarian element towards debtor countries. The later phase of the Eurozone crisis after 2012 saw the breakdown of the rules based order, leaving more and more to the discretion of the ECB. This meant a de-facto re-politicization of monetary politics, but where the main political actor is now the ECB. The Covid-crisis has seen a further re-politicization with the suspension of the fiscal rules framework, leaving the European states with greater fiscal space to face this crisis. This has not happened through any reform of the framework, but through a temporary suspension of rules. This leaves a potential for a (even stricter) return of rules based austerity when the existential crisis subsides.

272

Theorising Covid Capitalism from a Social Reproduction Perspective

Ania Plomien[1], Alexandra Scheele[2], Martina Sproll[3]

[1]London School of Economics, United Kingdom; [2]Universität Bielefeld, Germany; [3]Hochschule für Wirtschaft und Recht Berlin, Germany

This paper engages the global Covid-19 pandemic, and the state responses to it, as a lens through which to examine the deep-rooted transnational crisis of social reproduction. Rather than seeing Covid-19 as a discrete event, we take a broader perspective and understand its transnational gendered impact (contesting equality and exacerbating inequality) as inextricable from the crisis-prone state managed nexus of production and reproduction. Analysing state managed responses to the health, social, and economic dimensions of Covid-19 in selected countries representing different routes to and through the pandemic (Brazil, Germany, India, Poland, Spain, and United Kingdom) we consider the following questions: How far do the implemented policies reinforce or modify the "careless" capitalist economy, abstracting from those resources and services of "reproduction" which can only partly be turned into value? To what extent do they intensify or reconfigure existing gender inequalities? Drawing on feminist political economy, we show how the current crisis exposes long-standing contradictions in the capitalist economic and social order, on the one hand, and the gender order (as its constitutive moment), on the other. The state managed responses reshape, but do not transform, the relationship between the spheres of production and social reproduction. We interpret these as attempts to keep capitalism on the move without addressing the causal mechanisms that perpetuate the global social reproduction crisis and the crisis of capitalism. Hence, we address a central field of (global) contestations of women´s and gender rights - a necessary step for considering alternatives within and beyond capitalism.

Berlin's Cultural Sector and the Pandemic: From Virtual Reality to Flexible Spaces – Future Perspectives

Claudia Seldin

Technische Universität Berlin, Germany

The COVID-19 pandemic is having an enormous impact on the cultural sectors of several cities, with facilities being shut down or drastically diminishing their capacity. Taking into consideration that culture not only enables social exchanges but also plays a vital role for cities' economies today, we must ask ourselves how to mitigate the negative consequences of future crises on this sector. This paper proposes an interdisciplinary approach, mixing cultural sociology and urban planning, to investigate the response of cultural producers in Berlin (Germany) to the pandemic. Berlin was chosen because it is often cited as a paradigm for a creative city, filled with temporary subcultural spaces, frequently used in its urban branding and placemaking schemes as posters for authenticity. But how does this image live on after strict lockdowns?

The ethnographic research carried out in Berlin so far unveils the local cultural producers' attempts to keep their activities going, as well as the obstacles they have been facing. It uncovers two basic trends during the pandemic: virtual events and flexible spaces. While the first is becoming a global reality, the latter is connected to the city's culture of interim uses – a double-edged sword, which can lead to artwashing and even displacement.

By presenting case studies, such as the Pandion 4 Living, the Berliner Decks and the Insel Weißensee tiny houses, the paper defends the need for a more flexible/adaptable planning of cultural spaces and for more resistance against the manipulation of the cultural sector by private actors.

Fashion's Covid Futures: Imagining Gender Utopias and Dystopias for the Global Fashion Industry

Anna-Mari Almila

University of the Arts London, United Kingdom

Fashion industry is at the conjunction of numerous era-defining crises: it is one of world's biggest polluters, it operates on notoriously bad labour conditions, and the impact of Covid-19 has brought further devastating consequences to its vulnerable factory workers, as factories have closed, dismissing workers without any support, as powerful players in the global fashion field have sought to pass financial consequences down the production chain by cancelling orders without compensation, and as those fashion workers not (yet) dismissed continue to labour under hazardous conditions made worse by the risk of contracting the virus. The initial shock of the virus was made worse for the fashion industry due to a heavy dependence on China, both as one of world's biggest textile producers and as major luxury fashion consumer.

All these problems are fundamentally gendered and geopolitical. The most vulnerable workforce, subject to unsafe work environments and sexual harassment alike, are largely female. As pointed out by Black Lives Matter activists, fashion workforce is divided such that black and brown women in Asia and Africa enjoy least protection, while the European and north American white elite reap the benefits. As regards environmental sustainability, these elites are also amongst the few who can afford 'sustainable fashion' in the first place, while people in poorer locations face the more severe consequences from climate change. In this paper I ask whether fashion's future has to be dystopic, or whether it might be possible to imagine better futures, sustainable both environmentally and socially, what the consequences of such futures might be, and what sociologists' role in creating these can be.

Diminished Income, Lost Measures and Found Solidarities: The Impact of First Wave of COVID-19 Pandemic on the Cultural Sector in South-eastern Europe

Jaka Primorac

Institute for Development and International Relations, Croatia

The paper presents results of research on the impact of the first wave of the COVID-19 pandemic on life and work of cultural workers in South-eastern Europe (SEE), executed from May to July 2020. It shows how in that period in all of the researched countries (Bosnia and Herzegovina, Croatia, Northern Macedonia, Montenegro, Serbia and Slovenia) cultural workers note significant drop of income, expected decrease in total earnings and continued trend of the necessity of additional work and self-exploiting practices. The measures for minimizing the negative impact of the pandemic on the cultural sector were mainly not adopted at the local level, and if they were adopted on the national they predominately included one-time assistance to artists and cultural workers and selected indirect measures, where a difference between EU member states and those outside exist. Data shows limited influence of international foundations and networks on the sector, however one can note an increase of initiatives of solidarity of professional associations, NGOs and independent cultural workers. Research shows that for cultural sector in SEE the first wave of COVID-19 pandemic has brought about a number of negative consequences, while the early measures in most of the countries were of limited impact and scope. The positive effects are reflected in the strengthening of solidarity within the sector and greater networking among cultural workers, as well as in the strengthening of the view that a new, more sustainable approach to the cultural sector is needed, which is not based on the market logic.

RN07_T02_01 | Cultural meanings and discussion

The Meanings Of Culture: Findings From A Pilot Study In Spain

Jinju Kim, Jordi López Sintas

Universitat Autonoma De Barcelona, Spain

Cultural sociologists have studied the meaning of culture, how it differs among social groups, and how it changes over time for the same social groups. First, the civilization concept was opposed to culture. The former meant the imperial culture was imposed on the culture of the colonized. Culture was used to describe the practices of dominated social groups. After the independence of colonies, the idea of different cultures gains full social weight. Since then, studies indicate that culture has several components: ways of life, art, and knowledge that varied among societies. Contemporary societies have rapidly changed due to current megatrends: globalization, digitalization, migrations, financial crisis, etc. The meanings of culture are constantly changing and adapting to the evolution of societies. This research aims to uncover culture's components as an analytical concept and how it varies for different social groups in Spain. Data comes from a pilot study conducted in Spain from May to July 2020 (and in other 8 European countries as a part of INVENT European Project) to test whether open questions concerning culture's meanings could provide meaningful information about culture. We interpret the unstructured corpus of texts with semantic network analysis to uncover the components of culture. We have identified three main components of culture as an analytical category: art, personal knowledge, and a way of life. However, the weight of these components of culture varied according to age and gender groups. We conclude that even though culture's meanings are related to the life experience, there are universal meanings of culture.

How Countries are Clustered according to Science and Technology Perceptions: A Comparative Analysis of the World Values Survey data

Dimitra Kondyli[1], Olympia Kaminioti[2]

[1]National Centre for Social Research (EKKE) Greece;
[2]National Institute of Labour and Human Resources ((NILHR) Greece

The paper focuses on comparative analysis of the countries that participated in the 7th round of the World Values Survey, focusing on the perception of technology and science. We examine whether the criteria of R&D, educational attainment and GDP at the country level are the driving force for the categorization of respondents' answers. We then use exploratory statistical clustering techniques to group the countries according to the five main questions used in the survey on the topic of technology and science. We investigate the criteria that lead to the clustering utilizing the World Values Survey. Additionally, we perform a reflective analysis on the findings, using other surveys like Eurobarometer and European Values Survey. Moreover, within selected countries, including Greece, we examine how demographic and socioeconomic variables relate to the perceptions of technology and science. The paper aims also to investigate the extent to which different countries and different social groups within countries were prepared to address the technological challenges and the required transformations brought by the pandemic of COVID-19.

#Culture: How Twitter Users in Croatia and Denmark Discuss Culture

Željka Zdravković[1], Franziska Marquart[2]

[1]University of Zadar / Institute for Social Science Ivo Pilar, Croatia; [2]University of Copenhagen, Denmark

Recent research on social media platforms provides fresh theoretical and methodological perspectives on different sociological questions (Selwyn, 2019). In this paper we focus on emerging opinion leaders and explore how they use Twitter to frame cultural issues. We do so because (1) Twitter is a medium that specifically frames user profiles across different European countries, and (2) it allows researchers to focus on specific groups and individuals that do not represent the broader population but are increasingly taking over the role of opinion-makers (Bossetta, 2018; Jungherr, 2016).

Overall, we are interested in finding out how interactions through social media expand the understanding of contemporary conceptions of culture. We will present case studies from two largely different European countries (Croatia and Denmark), in which we gathered and analyzed data related to what political, social, and cultural actors communicated on culture over the period of two months (focusing on #culture and other related combinations of hashtags). Our exploratory analysis concentrates on three research questions – (1) defining the main topics and discourses in online discussions on #culture; (2) mapping the key actors in defining the topics discussed; and (3) identifying similarities and differences between these two countries. This research was carried out within a Horizon 2020 project, 'European Inventory of Societal Values of Culture as a Basis for Inclusive Cultural Policies in the Globalizing World' (No: 870691).

Streamers and Viewers: The Interactive World of Twitch.tv

Mücahit Baykul[1], Mehmet Emin Balcı[2]

[1]Bandirma Onyedi Eylul University, Turkey; [2]Istanbul University, Sociology Department

One of the most important characteristics of youth culture is its predisposition to things related to play. Twitch.tv is the summit of everything game related and is an interactive cultural medium for the new youth. There are few researches on the cultural effects of Twitch.tv on the youth. This paper aims to know how new youth sub-cultures emerge in the virtual context of Twitch.tv. The samples of this study is comprised upon several streamers and their viewers' practices around Twitch.tv and other sites related to it. Participant observations and analytical surveys conducted with 238 participants. Intentional random sample used for the participant selection. The results of the study indicates that at Twitch.tv the streamers and the viewers interact constantly about games and the culture sphere around it and effect each other via using the chat and continue that trend by interacting in other social media sites and apps (YouTube, Instagram, Discord, Reddit, ect.). New cultural memes and toughts emerge constantly in Twitch.tv because of its dramatic character. This character constituted by the streamers and their reactive responses to new things happening in game culture. These responses by the streamers and viewers creates new cultural phenomenons which includes discussions, opinions and suggestions about games, streamers and the generic scene on Twitch.tv. What makes viewers keep coming back to site is this constant rotation between Twitch.tv and its peripheral sites and apps. The contents of these cultural phenomenons vary via different games being played, streamers being viewed and viewers participate in streams. This rotations happen in an accelerated pace and as a result new cultural phenomenons arise and go to bed on a daily basis.

Independent Bookstores: Good Taste And Aesthetics In The Cultural Consumption Experience

Mariana Oliveira Martins

ISCTE-IUL, Portugal

This paper aims to discuss the aestheticization of objects and everyday practices understood as an intensification of the aesthetic and symbolic-expressive component in the forms of appropriation of certain objects, places, and consumption practices in contemporary times. We specifically seek to understand the aesthetic consumption dynamics within the book consumption. To this end, we conducted our research in the city of Braga, a small town in northern Portugal, where we mapped the landscape of book sales and analyzed how the aesthetic and affective relationship with books and bookstores is practiced in these spaces. In a market marked by department stores and bookstores linked to big retail chains, one bookstore, in particular, stands out: the independent bookstore Centésima Página, known nationally for its beautiful store, for the cultural events it promotes, and for its special treatment of books. We sought to understand how the culture practiced in this bookstore is configured as a refined way of commercializing and consuming products, linked to strategies for marking social differences, both economic and symbolic. Based on the case study of this bookstore, we analyzed the ways in which independent booksellers and consumers articulate and consolidate new strategies of cultural and economic capitalization, the symbolic configurations of the spaces, and the way in which the phenomena of consumption and material culture generate social relations and constitute subjectivities. We sought to understand how the discourse of the aesthetic relationship with spaces and objects of consumption crystallizes in the forms of sale and consumption of books practiced in the bookstore Centésima Página. For this study, we use the concepts of distinction (Bourdieu), artistic capitalism (Lipovetsky), material culture (Featherstone), and consumer culture (Campbell).

Gatekeepers at work: Intellectualizing 'Foreign Language' TV on Netflix

Noa Lavie

The Academic College of Tel Aviv-Jaffa, Israel

Over the past half-decade, the field of global television production has been undergoing a profound change, facilitated by the success of streaming video on demand (SVOD) platforms such as Netflix, Hulu, Amazon and others. One of the characteristics of this age is the penetration of foreign language TV series (i.e., TV series in languages other than English) to the Anglo-American market through these platforms. In accordance with theories that conceptualize TV reviewers as cultural gatekeepers who take part in a process of taste distinctions, this paper wishes to shed light on the practices that TV critics in major Anglo-American news outlets use to enshrine foreign-language TV series into the well-established cannon of what is known in the past decades as 'quality TV'. Using Netflix, which is the worlds most prominent SVOD to date as a case study, this paper analyzes reviews of three Netflix foreign language TV series with different national origins ('Shtisel'/Israel, 'Money Heist'/Spain and 'Dark'/Germany) published in six major Anglo-American news outlets (The Chicago Tribune; LA Times; The New York Times; The Telegraph; The Independent; The Guardian). The analysis of these reviews shows how the discourse about the foreign language series at hand is being intellectualized in a way that makes them appeal to an imagined Anglo-American cosmopolitan high-brow audience. This paper is also important in showing how transnational flows of TV content are both expanding the Anglo-American discourse of 'quality TV' while simultaneously re-enforcing it.

RN07_T03_01 | Cultural policies and taste cultures

Rising Social Inequalities in Europe: Implications for Cultural Policy

Inga Tomic-Koludrovic[1], Predrag Cveticanin[2]

[1]Institute of Social Sciences Ivo Pilar, Croatia; [2]Faculty of the Arts, University of Niš, Serbia

Over the last thirty years, culture and the arts in Europe and the world have undergone fundamental changes. These changes are related to the impact of megatrends such as globalization, European integration, migration, rising social inequalities, and digitalization. However, cultural policies in Europe have not kept pace with these trends. In order to formulate cultural policies that would adequately respond to new social realities, it is essential to study how European citizens perceive and understand the changes caused by the megatrends.

In this paper, we focus on the impact of rising social inequalities on culture. Following Bourdieu, we study how the conceptions of culture (Bourdieu, 1984) and perceptions of the social world (Bourdieu, 1989) – in this case, perceptions of the impact of social inequalities on culture – differ depending on respondents' position in social space. Our study relies on survey data collected in nine European countries within Horizon 2020 project 'European Inventory of Societal Values of culture as a Basis for Inclusive Cultural Policies in the Globalizing World' (No: 870691), but we will exemplify this type of analysis using the cases of Croatia and Serbia.

Keywords: social inequalities, culture, megatrends, cultural policy

Exploratory Research and Cultural Policy: Towards a Bottom-up Understanding of Culture in Croatia

Mirko Petric[1], Augustin Derado[2]

[1]Institute of Social Sciences Ivo Pilar / University of Zadar, Croatia; [2]Institute of Social Sciences Ivo Pilar, Croatia

In now over thirty years that have followed the "golden age of cultural policy", decision-makers have often been criticised for social "instrumentalisation" and economic "colonisation" of culture (Scott Sørensen, 2016). Criticism has also been levelled at the current "participatory turn" in cultural policies, emphasising "active involvement" of "users" and their having more say in how public money for culture is spent. While in the former case, the replacement of self-cultivation (Bildung) with goals such as "employability" or "achieving social competence" is seen as an unacceptable degradation of humanistic ideals, in the latter case "user democracy" is feared to lead to populism. Nevertheless, it is clear that policy makers cannot formulate inclusive cultural policies without consulting their "end users": the question is how to best approach that task.

This paper presents the results of an exploratory survey on Croatian citizens' different understandings of culture, carried out within the Horizon 2020 project 'European Inventory of Societal Values of culture as a Basis for Inclusive Cultural Policies in the Globalizing World' (No: 870691). Since the study involved a limited number of respondents (170) and was based on open-ended questions, our data collection followed the logic of qualitative sampling (maximum variation and the typical case approach), and our data analysis involved two qualitative strategies (connecting and linking). The results reveal important differences (especially generational) in understanding what culture is and what role it plays in respondents' lives. Exploratory research has proved its heuristic value in a policy context that has traditionally favoured top-down solutions.

Keywords: definitions of culture, cultural policy, participatory turn, access to culture, Croatia

Taste Cultures and Taste Publics – Cultural Microcosms in Europe

Predrag Cveticanin

University of Nis, Serbia

There are multiple, often contradictory concepts of culture and understandings of culture's societal values among various social groups (demographic, socio-economic, ethnic, religious) in Europe today. These differences are due to European societies' heterogeneity, and the migration flows that further increase it. For designing inclusive cultural policies, it is necessary to understand the relationship between the varied array of concepts of culture and their relationship with culture's societal values. This paper will first identify aggregates of people who share similar conceptions of culture, similar social values, and similar cultural practices, i.e., the existing plurality of cultural microcosms in four countries of Europe (France, Spain, Denmark, and Serbia). Secondly, it will be determined if these cultural aggregates patterns systematically differ in the societies under study. Thirdly, the identified cultural microcosms will be analyzed to establish whether they share specific demographic, socio-economic, ethnic, and religious characteristics. Finally, an attempt will be made to discern the implications of our findings for the creation of pluralistic and inclusive cultural policies.

In contrast to Herbert Gans (1999 [1974]), whose attempts to identify different taste cultures and taste publics in the USA were mostly theoretical, we will use sophisticated statistical methods – Multiple Correspondence Analysis, Fuzzy Cluster Analysis, and Hierarchical Cluster Analysis - to identify and analyze these cultural microcosms. Our data come from a survey (4,800 respondents) carried out within a Horizon 2020 project, 'European Inventory of Societal Values of Culture as a Basis for Inclusive Cultural Policies in the Globalizing World' (No: 870691).

RN07_T03_02| Cultural inequalities

Culture and Child Labour, the Case of Roma in Greece.

Maria Chaita
Aristotele University of Thessaloniki, Greece

Child labour is considered to be one of the major social issues of modern world. This phenomenon is directly related to the phenomenon of school dropout, since the entry of many children into the labour market prevents them from attending school. How is the phenomenon of child labour influenced by people's or a community's culture? The concept of culture in the broadest sense of the term refers to the way of life and thinking, constituting the identifying consciousness of a group. This paper studies the cultural impact in child labour. The research was conducted in Dendropotamos of Thessaloniki and Drosero of Xanthi, where their way of life was explored. The method used to research the matter is the quality in depth interview, conducted with Key-informants, that is people who have special knowledge and relationship with the subject being studied.

The study has shown that the Roma cultural backgrounds influence the phenomenon of child labour, because of their value system, which considers that the human purpuse is to create family and ensure their well-being through work. However, their value system is connected to work and not to education. As a result children entering the labour market from a realy young age, increasing dropout rates among Roma circles. Althought, Roma's culture is not compact and static. Influenced from the modern way of living, the cultural identity of Roma is slowly changing and adapting new elements.

Experiences of Homelessness During COVID-19: Homeless Migrants in a Global Crisis

Simon Stewart

University of Portsmouth, United Kingdom

This paper relates the progress of an 18-month ESRC/UKRI-funded project, involving researchers from University of Portsmouth and University of Sussex in collaboration with St Mungo's, the homelessness charity, on migrant homelessness during the COVID-19 crisis. The paper focuses on the experiences of non-UK nationals. Many homeless migrants face multiple everyday challenges; they experience the hostility and aggression directed toward homeless people, compounded with often intense experiences of racism. A cultural miasma of fear and anxiety due to pandemic can affect such marginalised groups particularly forcefully. Moreover, concerns remain about how migrants with No Recourse to Public Funds (NRPF) can be supported in the longer-term. Drawing on cultural sociological perspectives, this paper considers the life stories of migrants in relation to their experiences of homelessness during the coronavirus crisis. It also reflects on the experiences of staff in the homeless sector as they responded to the crisis. Ultimately, the project will make recommendations for measures that can be taken across the UK and elsewhere to support migrant groups facing homelessness, during times of crisis and beyond.

280

Cultural Shifts While Riding the Global Risk

Svetlana Hristova

South-West University, Bulgaria

The pandemic crisis has heavily affected not only economies, societies and political systems worldwide; it is questioning the Western civilization in its deep ideational foundations as established and cherished for centuries since the modernity advent. The 'mobility turn' (Hannam, Scheller and Urry) is halted now, and all that has once brought satisfaction and self-esteem is causing fears and self-restrictions. Today's COVID-19 is the general rehearsal of tomorrow's life in a risk society. Beck conceived such risks as by-products of late modernity occurring around 'systemic causes' coinciding with the very motor of profit-based progress: in the long run, risks turn global, unpredictable and unescapable; sooner or later they strike those who produce or yield from them.

While trying to predict how lasting these changes will be, scientists are reproducing one of the main stances of risk society: the hyper-anxiety oriented to future. As culture's one of the most important roles is benchmark orientation, a new culture is gradually emerging – with younger generations trying to grasp the future in their hands, with new kind of solidarity, motivated by the notion of 'common bad', and new types of leadership – from below. This is a culture not just in, for and as sustainable development (Dessein et al.), but culture of sustainable development. The debates around overcoming the consequences of Covid-19 question not simply the welfare system efficiency but the capitalist logic of development. The strategic dilemma is therefore not only to establish a healthy balance between poverty and wealth (nationally and internationally), but between the profit-driven and safety-driven models of thinking and acting.

RN07_T04_01 | Covid and culture

The Memory of Pandemic Events as Strategy of Resilience in COVID 19 Times and Beyond. The Role of the Social and Media Representations

Mihaela Gavrila[1], Guido Nicolosi[2]

[1]Sapienza University of Rome, Italy; [2]University of Catania

Resilience is defined as the "capacity of a social system to proactively adapt to and recover from disturbances that are perceived within the system to fall outside the range of normal and expected disturbances"(COMFORT et al, 2010). It relies greatly on risk perception (Beck, Slovic, Giddens, Luhmann, Bauman, Sofsky and Furedi, Glassner, Robin, Castells) and the memory of catastrophes. However, if we look at the social experience of epidemics, the affected communities seem to show a tendency to develop amnesia. Nevertheless, collective memory, supported by the multiple forms of mediated representation (literature, architecture, popular fiction, legends, art, radio, television, cinema), presents multiple and evident "mnemonic traces" of these collective traumas of the past. The outbreak of the Coronavirus epidemic seems to confirm this ambivalent dimension of memory. On one hand, our societies were unprepared,

despite the fact that epidemics represents a constant in the history of humanity. On the other hand, during the others pandemic or epidemic events (the Spanish Flu, Asian Flu, SARS-COV-2, Ebolavirus Epidemic) were recurring and obsessional in media discursive frames and in institutional communication. Postulating that, social representations play a crucial role in explaining, re-shaping, and communicating on social priorities, the project focuses on how historical analogies, by associating current critical moments with past events, rely on collective memories to support the community's resilience. The final goal is to investigate the ambivalence of cultural memory of pandemics through the analysis of contemporary media narratives (Di Veroli, 2014; Weber, 2013; Frugoni, 2020; Spinney, 2017; Davis, 2020; Arnold, 2020; Gavrila 2020)and explore cultural and communicative models and tools to enhance collective memory in order to reduce social vulnerability and improve resilience.

The Italian Cultural Industry At The Time Of COVID-19. Evidences From South Italy Between Challenges And New Horizons.

281

Raffaele Savonardo, Rosanna Marino, Augusto Cocorullo, Mirella Paolillo

University of Naples Federico II, Italy

The italian cultural and creative industry has been severely affected by the social and economic repercussions of the pandemic emergency still underway. If in the past the sector was characterized by a fragmentation of the support initiatives, of the promotion and of innovation, in this contemporary phase it seems destined to an organizational drift caused by the pandemic. The contribution analyzes the current conditions of the cultural and creative industry in the South Italy, focusing on the consequences of COVID-19 and on the points of strength emerged in response to the challenges posed by the pandemic. The study concerns the various reference areas of the cultural and creative sector, including music, cinema, museum, theater, social innovation, youth startups. The study is based on a qualitative methodology, that involves 15 semi-structured interviews to the privileged witnesses. The results suggest that to overcome the pandemic crisis in the sector of cultural industry three stratecic actions need to be developed: territorial networking, digitalization, empowerment of young people. The study

is part of a broader exploratory survey, still ongoing, conducted within the Department of Social Sciences of the University of Naples Federico II.
Keywords: Cultural industry; Pandemic; Italy; Innovation; Young people.

Turning the page? Library Imaginaries in the (Post-)Covid-19 City

Marco Ciorli

University of Turin, University of Milan, NASP: Network for the Advancement of Social and Political studies

In recent years, local reading libraries have attracted extensive and interdisciplinary interest both as a place of culture and as a venue for cultural processes. In the library, the cultural sphere performs a crucial social policy function by enabling encounters between different backgrounds, providing means to understand social life, and reproducing and developing representations that enhance and expand forms of interchange and inclusion. Responding to social and cultural transformations, the "social" librarianship has embraced and discussed the emergence of various models, addressing the heterogeneity of publics, and the change of information needs, cultural consumption, and fruition of urban space. Nonetheless, such institutional processes are expressly cultural, the result of negotiated political and social representations not devoid of difficulties: support for the most vulnerable, the inevitable definition of (il)legitimate uses of the public domain, the distinction between codes of expression, the participation in regenerative processes that may respond to exclusive interests and tastes. In pandemic times, characterized by social crises, closures, and isolation, the search for new appropriate paradigms intensified. In this regard, the sociological imagination has the potential not only to provide a solid understanding of previous cultural processes and their ambivalences, but also to enhance the evaluation of promising developments.
Based on historical analyses of the field and qualitative data from Italian libraries, my research activity contributes both to the fields of sociology and library science, attempting to enrich the prediction of trends by avoiding impressionistic approaches, and offering practical and fundamental alternatives for the future of communities.

Cultural Work in a (NO) Future Institution: The Case of Russian Contemporary Art Sector

Margarita Kuleva

NRU Higher School of Economics, Russian Federation

Alongside the Coronavirus pandemic, political, economic, and ecological challenges push changes within cultural institutions to re-define themselves in the complexities of today's societies (Bishop 2013). For instance, the digitalisation of museums, that has been discussed for more than twenty years (Manovich 2019), happened in a single month, not only in advanced experimental institutions but in more traditional ones as well, thus provoking the thought that the future of the museum has already arrived (Banks 2020). Similarly, the dynamic turbulence of the pandemic, together with rapidly changing political climate, radically revitalises the conception of 'future' within cultural institutions not only in Russia, but globally: is 'future' in our conventional understanding possible without the prospect of long term planning? This turn of events only made the existing inequalities in the art industry more visible but put extra pressure and even challenges on cultural workers (Gill 2012, McRobbie 2018). The ethnographic study based on more than 50 in-depth interviews and long-term observations in large contemporary art institutions in Russia between 2014-2019 and a follow-up study organised devoted especially to cultural work during the pandemic (2020) reveals individual and institutional strategies used by the cultural workers to adapt to the (no) future paradox in the Russian art sector.

282

Legitimation Crisis and Cultural Governance: Cultural Creative Industrialization of Enninglu and Pantang Wuyue in Guangzhou Urban Renewal

Yimeng Yang

Leiden University; National Taiwan University

Taking Enninglu and Pantang Wuyue in Guangzhou, China as examples, this article examines how the legitimation crisis of urban renewal emerges in social resistance, and how the Chinese government that concerns social stability takes cultural creative industrialization as a new governance mechanism to consolidate political legitimacy. Three adjustments to governance techniques occur in the process of cultural creative industrialization: (1) revising cultural discourse to consolidate cultural legitimacy; (2) developing creative economy to stabilize performance legitimacy; (3) promoting state-led cultural public sphere to compensate for procedural legitimacy. This process temporarily alleviates contradictions and fixes the different types of political legitimation crises of urban renewal. The argument of this article includes two points: on the one hand, the cultural creative industries in Enninglu and Pantang Wuyue are not for economic prospects, but forward-looking cultural governance techniques with politically legitimizing effects. It is used to respond to the newly emerging social appeals at various stages and further promote the development of urban renewal. On the other hand, it is precisely because the cultural creative industries have been given governance responsibilities, cultural creative workers actually become policy tools for the government to respond to the demands of all parties. They are trapped by various constraints imposed by the government, developers, and residents in their creative work.

Towards More Inclusive Cultural Heritage: The Victory Day Celebrators as an Alternative Heritage Community

Agnese Karlsone, Ance Kristāla, Zane Grigoroviča

Latvian Academy of Culture, Latvia

Social groups and cultural elements accepted and safeguarded as an intangible cultural heritage offers an important insight into a society's political and social structure, but equally important is to recognize alternative heritage as a possibility to engage excluded social groups. Interpretations of cultural heritage are developing dynamically, influenced by changes in cultural, social, economic, environmental or political context (e.g., Bendix, Eggert, Peselmann, 2012). Although accepting and safeguarding cultural heritage might seem more of a political question, community as a social construct plays an especially important role, as the heritage and community are mutually constitutive. Analyzing alternative elements of intangible cultural heritage, that in public discourse can be considered as difficult (MacDonald, 2009) can be seen as a forward-looking approach to create a more inclusive future society.

The research analyzes fluid borders of cultural heritage interpretations and the role of community in maintaining it, using case study of a cultural heritage community that is not formally recognized in Latvia - celebrants of the Victory Day (May 9th). The difficulty lays in fact that in part of Latvian society's social memory this historical day signifies the beginning of the Soviet occupation. Whereas others commemorates their lost family members and victory over the Nazi forces. Thus it is possible to consider intangible cultural heritage as a process of overcoming social and historical traumas in the ethnically divided societies.

The paper is part of a research project "Community Participation in Cultural Heritage Governance: Practices, Developments and Challenges"carried out by Latvian Academy of Culture.

The Digital Book In The Public Library: What Are Librarians' perceptions Of Their Changing Roles?

Christelle Pelbois, Marie-Claude Lapointe, Jason Luckerhoff

Université du Québec à Trois-Rivières (Québec/Canada), Canada

The usage constraints associated with the digital book and the reading experience it provides explain some of the reluctance of readers to use digital books (Labrousse and Lapointe, 2021). However, digital books are very popular in Quebec public libraries, particularly because of their more or less prolonged physical closure due to the COVID19 pandemic (Syndicat national de l'édition, 2020). What are the perceptions of these library professionals regarding the influence of the digital books on their roles and the constraints or opportunities it creates in their daily lives? In the fall of 2020, we conducted a survey of about 50 librarians. Our results present a contrasting relationship to the digital book. A change in the relationship to the book as an object and a significant increase in the roles of technological mediator and digital literacy trainer are present. While libraries are described as key players in a book ecosystem undergoing profound change (Cusson, 2016) and despite the many advantages of the digital book, including its great practicality, concerns about accessibility to reading and its democratization through the digital book are highlighted, as well as the roles of libraries in this area. The negative influence of some readers' dissatisfaction with their first borrowing experience is also highlighted. Finally, librarians' concerns about their professional identity were revealed. Our results are likely to be echoed in several countries, especially considering the closure of many cultural venues in the context of a pandemic.

Info-Communication Culture and Society in the era of digital transformation: Global Control, Local Resistance

George Gantzias

Hellenic Open Univesrity, Greece

In the era of digital transformation, the info-communication society is a reality. Artificial intelligence, robot and quantum computers have challenged all cultural and social structures. According to McKinsey research (2020), building a more connected world could create substantial economic value, mostly enabled by advanced connectivity. The use case in the four commercial domains i.e. healthcare, Manufacturing, Mobility, Retail, could boost global GDP by an estimated 1.2 trillion dollar to 2 trillion dollars by 2030.

'Social distancing', 'physical distancing' and digital transformation have challenged irrevocably cultural structures and our everyday life in the Covid-19 pandemic crisis. The Covid-19 pandemic crisis and AI robots have irrevocably challenged the different cultural networks, products, services and content by creating a new 'paradigm' in the info-communication society. According to the Economist Intelligence Unit's Democracy Index, citizens experienced the biggest rollback of individual freedoms ever undertaken by governments during peacetime.

The paper examines the 'paradigm shift' is, from the detached paradigm in cultural content platforms (cultural industries or creative industries) to the unitary paradigm in digital cultural platforms, so-called the Info-communication (info-com) content paradigm. It analyses the role of cultural administrators and managers in creating new values and standards to manage digital productivity, automated decisions making mechanisms and new digital strategies in the info-communication culture. Finally, it suggests to cultural managers and administrators to develop locally oriented and globally reaching values and universal public interest principles in the info-communication globalization.

Islands and Ocean of Digitized Cultural Memory and "Machine Vision"

Maija Spurina

Latvian Academy of Culture, Latvia

It is clear that our future is and will be shaped by information technologies. Increasing digitization of social reality is supplemented by a cultural change - a spread of algorithmic thinking and machine logic. One role of future cultural sociologists would be to analyze "digital realities" and to understand logic behind them, as well as get at their cultural and social implications. The paper examines the impact of digitization on cultural memory. It is informed by the memory studies literature, most prominently Jan and Aleida Assmans and Eviatar Zerubavel, and cultural analytics of Lev Manovich. The paper explores possibilities to analyze large cultural data, specifically three digital national databases of museum collections - NMKK in Latvia, MUIS in Estonia, and FINNA in Finland – including analysis of images using a machine learning algorithm VGG19. The three mass digitization projects are aimed at a certain imaginary future of a global digital ocean that transgresses institutional and national boundaries and provides an easy access to accrued cultural memory. Do they form an ocean or are they rather distinct digitized islands? What do they encompass? Can they be bridged or aggregated? What new knowledge they open up? Is their value added only in terms of data quantity or do they provide a qualitatively new opportunities to learn something about culture and the past?

RN07_T05_02 | Festivals and audiences

International Film Festivals in Times of Covid-19 and Beyond - Comparison of Various Modes of Reactions

Aleksandra Biernacka

Polish Academy of Sciences, Poland

Covid-19 have made a huge impact on the global film industry not only because of restrictions in production of films (closing down the film sets) and in organizing the public events (like film festivals that can gather tens of thousands of viewers), but also because it coincided with the major technological and structural changes in distribution of films the whole industry have been undergoing for the last decade. Quite traditional, keen at keeping the industry's status quo securing their place and importance within the distribution process, film festivals were skeptical about using full range of public streaming possibilities offered by the new technologies. They've kept the films' presentations closed for a relatively small number of viewers able to physically access the cinema theater on site of the festival.

Covid-19 changed the situation drastically. Major festivals were forced to either cancel the event (Cannes IFF), or to move onto the net, developing a completely new form of "virtual" film festival (Locarno IFF), or another possibility - to come out with a mixed form combining the limited physical, theatrical presentations with online screenings (Venice IFF). What were the various, new forms of reactions of the major premiere film festivals worldwide? What were the effects of their different modes of engaging the viewers? And which of them seemed to be the most successful and hence are likely to become a future of the international film festivals circuit?

Comparison of particular cases of global film events will show trends that will shape international film industry as a whole providing the festivals' enormous influence and their dense net of mutual relations, resulting in copying and implementing similar tools across the world.

Audiences And Participation at Portuguese Film Festivals

Tânia Leão

Faculty of Arts and Humanities of University of Porto, Portugal

Currently, film festival studies are numerous and heterogeneous. They are, in fact, a subdiscipline with interdisciplinary characteristics. Within them we find works from history, marketing, tourism, cultural economics, gender studies, anthropology and sociology. Although there are several focuses, conceptual frameworks and methodological instruments available to study film festivals, the analysis of their social dimension is, perhaps, one of the most important aspects - and, simultaneously, one of the most devalued. In the meantime, the Covid-19 pandemic imposed changes on the normal functioning of cultural events with the generalized rules of 'social distancing'. This global happening highlighted the determining importance of the social dimension of film festivals. In its absence, participation has faded into the virtual world.

Film festivals are, in fact, social spaces where various actors or social agents circulate and interact: workers, professionals who move through the 'network' of festivals, and audiences. French sociologist Emmanuel Ethis, in his pioneering book on Cannes Film Festival (2001), demonstrated that there are different forms of participation and ways to relate in a film festival: through pre-defined roles, specific behavioral models or rituals. In this communication we propose to discuss, based on previous research on audiences of Portuguese film festivals - a master's dissertation in 2006 and a doctoral thesis in 2019 - to what extent their inform us about the the festivals' cultural projects, the cinematic culture of their participants (which the festivals contribute to promote) and even the history of Portuguese audiovisual sector.

Ethis, Emmanuel, dir. 2001. Aux marches du palais: Le festival de Cannes sous le regard des sciences sociales. Paris: La Documentation Française.

Festive Culture and its Hindrances: Women in a Traditional Festival

Rita Ribeiro, Emília Araújo

University of Minho, Portugal

Community celebrations are central to the structuring of cultures and to the rooting of identity and territory. Although festive culture has undergone major changes in sociological modernity, it is a vital feature of the sense of belonging, togetherness and communitas. And it is an important analytical operator in the study of contemporary communities. Festivities are also a space-time of tensions, micro-conflicts, imbalances and exclusions, crucial to the understanding of how the community makes the festival and the festival makes the community.

We intend to analyze the participation of women in the Bugiada e Mouriscada festival, in Sobrado (north of Portugal). One of the characteristics of this festivity is that it has persisted over the years as a male festivity, led by men, although with the active collaboration of women in all stages of preparation that do not involve public presentation. Being born a woman establishes one of the main structural limits because the festival is a stage for male engagement and in which protagonists of all performances are men, even if the festival backstage depends largely on the helpfulness, organizational authority and hard work of women in preparation activities.

In the framework of the current growth in the tourism and cultural industry, as well as the global tendency to the heritagization of traditional cultural forms, gender issues related to the preparation and the festive events are increasingly relevant. This presentation describes how women have been achieving a place at the festival, albeit marginally and subversively, and highlights some of the main challenges for the community and the future of its traditional festivity.

Cultural Pactices and Public Spaces as Places of Social and Political Interaction. An Analysis of Artivism in Barcelona and Valencia

Ricardo Klein, Joaquim Rius Ulldemolins

Department of Sociology, University of València, Spain

This communication presents and analyses cultural practices in public space based on forms of artivist participation. From this point of view, emphasis will be placed on artivist actions in the city of Barcelona, where the aim is to consolidate public space as a place of resistance to different social problems that currently arise, such as access to housing. On the other hand, we will analyse the politicisation of festive culture in Valencia, which, although it has tended to promote conservative festive-social visions in public space, there are also alternative and critical views, such as the experimental Fallas or the alternative Fallas. From these points of view, it is understood that intermediate and large cities have generated, in the social space of coexistence, a disconnection between the inhabitant of the city and his or her surroundings. Thus, the search to connect the micro-political scale of these places with their inhabitants reconfigures the sense of belonging to the city and often leads to the development of cultural practices that aim to discuss the uses and appropriations of their public spaces. In some cases, this leads to active forms of social disobedience in public space or, in contrast, to actions that perpetuate the reproduction of conservative cultural practices. The presentation will make use of secondary sources, mainly visual documents. To this end, we have an archive of images taken in situ, both of the Fallas in Valencia and artivism in Barcelona.
Keywords: Public space, cultural practices, cultural politicisation, artivism, street art

Cultural Approach to Fire. The Social Imaginary of the Forest Fire and its Cinematographic Representation.

Carmen Rodríguez-Rodríguez, Alberto Cotillo Pereira, Elvira Santiago-Gómez

UDC (Universidade da Coruña), Spain

Within the MitigACT project (PID2019-1074443RA-I00), of which we are part, an attempt is made to analyze the importance of incorporating knowledge based on experience in the prevention, management and recovery of environmental disasters. To mitigate these types of risks and develop public policies that collaborate in this regard, it is essential to achieve correct multidirectional and multidisciplinary communication between international, national and local agents that work on their prevention, breaking the top-down unidirectionality that has traditionally dominated these kinds of relationships. This paper starts from this fact to propose the objective of exploring how, from the local point of view, a type of environmental disaster with profound impact in Spain, the forest fire, is thought. For the prevention measures proposed by the authorities to be effective, it is necessary to understand the perspective of the local actors, analyzing how they understand and how they represent the forest fire. Within the Spanish territory, the specific case of Galicia is taken to carry out this approach to this social imaginary in which an attempt will be made to define and analyze the cultural construction of this phenomenon, relying on its representation in a cinematographic cultural product on this subject, the film O que arde (Oliver Laxe, 2019). Ultimately, it is about using culture to build the foundations of policies that are expected to change the relationship of the territory with this environmental disaster in the future.

Entering A Bakery – Transforming Socio-Spatial Order During The Covid-19 Pandemic

Paul Eisewicht[1], Ajit Singh[2]

[1]Technical University Dortmund, Germany; [2]Technical University Berlin, Germany

Using the empirical case of customers entering a bakery during the Covid-19 pandemic, we address the question how the pandemic affects action in everyday life and which (new) forms of action and spatial transformations emerge in the course of the practical and situated accomplishment of social and epidemiological rules. The analytical focus on everyday practices is not accidental. Everyday life proves to be fruitful insofar as the corona pandemic fundamentally changed the way of self-presentation (using masks, physical distancing), the habitualised ways of institutionalised embodied communication (shopping, queuing etc) and basically the assumptions on the undoubtedly existing lifeworld. We thus argue for a revival of everyday sociology (Goffman, Garfinkel) in order to strengthen a perspective of everyday life and the relevance of everyday phenomena for cultural analysis.

Our empirical data was collected within a collaborative and videographic research project across Germany that involved filming a bakery in a big German city over several months between the first and the second wave of the pandemic in 2020. The data were analyzed using ethnomethodological video analysis. Chosoing prototypical cases of situational order, we want to show how the pandemic manifests itself even in small everyday actions like waiting or accessing a building. Analytically, the so-called normal everyday life before the pandemic forms the methodological contrasting foil to unfold the findings. In this way, we aim to contribute to a deeper understanding of the social transformative forces of the pandemic and to connect them to a cultural sociology of everyday life.

Thinking about cultural configurations: Michels' legacy

Raffaele Federici, Cristina Montesi

Università degli Studi di Perugia, Italy

Michels' legacy is subject to innumerable interpretations and seemingly endless controversies specially in present times witnessing his rediscovery. The scientific starting point of this paper is Michels' Essay on "Intorno al problema dei rapporti tra economia e politica" which was published in his book on "Problemi di Sociologia Applicata" in 1919. In his writings Michels is sometimes elusive, but some themes do frequently persist. Our approach emphasize the innovative and evolutionary aspects of Michels's thinking on the determinants of historical becoming. Michels argues critically that all expressions of human activity can not be exclusively determined by extrinsic motivations and economic factors, but can also be equally influenced by intrinsic motivations and cultural factors. Michels offers different and suggestive examples of the influence of cultural factors on the economic growth or recession of a country; on the success/insuccess of a national industry; on the fortune/misfortune of a city; on the outbreak of a war. According to Michels historical happenings should be analyzed in the light of the form of "culture", in the light of the content of "economy", in the light of their combination and synergy which burst into the dynamism of history, in the light of the two-way correspondence between society and economy.The object of Michels' research program on political sphere is not confined to the institutional boundaries and does not coincide with the simple analysis of the forms of institutions. The tight relationship between economics and politics, theorized by Michels, in terms of an association of two interdependent spheres very difficult to separate, is also useful for understanding the current crisis of intermediate social bodies.

RN07_T07_01 | Culture: theory and concepts

Speculative Constructionism versus Speculative Realism (?): Theoretical Reflections on Notions of the Subjective

Joost Van Loon

Catholic University of Eichstätt-Ingolstadt, Germany

A Sociology "of" Culture that seeks to empirically engage with events that have not yet come to pass, is by its very nature speculative. Thankfully, it does not need to invent the wheel. In Philosophy, a renewed interest in the work of Alfred North Whitehead had already sparked a "speculative turn" in the 1990s, and the fact that this has unfolded in a highly diversified range of debates and interests, which also include specific domains of the social sciences (in particular but not exclusively STS) enables other clusters such as that of the Sociology of Culture, to latch on to find out what may translate into trajectories of theoretically informed research that are relevant to their fields of inquiry.

One particular "controversy" I would like to unpick for the purpose of developing a speculative cultural sociology is the difference in appropriation of Whitehead's work by the Belgian Philosopher of Science Isabelle Stengers and by the American philosopher, Graham Harman under the headings of "Speculative Constructionism" and "Speculative Realism. Both have drawn inspiration from and have in turn inspired the work of Bruno Latour. Rather than providing a generic synopsis of both positions, I will instead focus on their respective conceptions of "the Subjective" as that is precisely one domain where Cultural Sociology has been very active. As Cultural Sociology has had a long–standing interests in objects and artefacts, the question arises whether a speculative turn that changes our understanding of the Subjective will also radically challenge how Sociology should engage with "cultural objects", even allowing for the possibility, that we may have to completely change our analytical vocabulary.

The Anticipation of Things to Come: Culture and the Challenge of Unpredictability

Jörn Ahrens

Justus Liebig University Giessen, Germany

The directedness towards the future is a nexus of modernity. Modern societies and individuals are engaged in framing the future by calculation, or rationality. As a decisive category within modern societies, the future as that which is not present yet, is emerging as part of the present. Hence, one problem in dealing with the future and the ambivalence of modernity is its massive contingency, and unpredictability. The future as the last frontier of sociation and as final goal of social agency, remains a permanent source for disruption and hazard. Regarding the humanities and social sciences, it is astounding that, probability calculation aside, no sustainable competences have been developed for making the future accessible for social endeavors. Even more, as such cultural techniques do exist and are successfully employed already when sociation also relies on the production of cultural narratives that do not only describe the world, but also provide sources for the making of meaning. One of the most important techniques here is the capacity of film to serve as analytical medium by unfolding thought experiments about how the present condition might develop into a future with only vague indications. The enormous request for Steven Soderberghs Contagion in spring 2020 is a recent example for this capacity of film. In my presentation I will firstly discuss the ambivalence of modernity regarding its relatedness to a future that remains a factor of uncertainty. Secondly, I will emphasize film as a source for cultural imagination that offers itself as data for social research.

Cultural Classifications and Wine Worlds

David Inglis

University of Helsinki, Finland

Since the 1980s, it has been very common to understand grape wine in terms of so-called 'Old World' – primarily Europe – and 'New World' – primarily the Americas, Australasia, and South Africa. This binary classification does a lot of symbolic work. It divides the planet up into two distinct wine-making zones, while drawing attention to multiple alleged differences between them, in terms of typical styles of wine and wine making, and in terms of divergent dispositions and attitudes, among both producers and consumers of wine. Yet it is an arbitrary social classification rather than a reference to a solid, geographically rooted reality. It only really comes into play in the 1970s, once California and Australia, and then later on some other locations, start to challenge hitherto profound European hegemony. The appearance of major wine-making operations in China and some other Asian countries suggests that there could plausibly be said to exist now a new third world-region of wine making, but it is as-yet unclear which actors will have the symbolic power to define what it could be called e.g. the 'New New World'. Resurgent wine industries in west-central Eurasia, especially Georgia, make claims to the title of the 'Ancient World' of wine. This paper examines these cultural politics of naming wine Worlds, tracing the struggles over classifications, identifying the key actors involved and what is at stake in their conflicts, namely specific forms of prestige and status, and claims to global recognition. How sociology may make sense of these matters, and how it can make a distinctive contribution to these games of classification, is the central aim.

RN07_T08_01 | Culture in context

Historical Warnings for Current Debates: the Experience of Political Theatre in Weimar

Andrea Pérez Fernández

University of Barcelona, Spain

The political theatre attempts in Berlin during the Weimar Republic presented themselves as ways of drawing a class response to the totalitarianisation processes of their time. The work of Erwin Piscator and Bertolt Brecht —in collaboration with socialist artists such as George Grosz or John Heartfield— was a field of artistic innovation and theoretical reflection which key topics have survived to the present day. Starting from the assessment of Meiksins Wood, who reminds us that "there is no inverse relation between historical contextualization and 'relevance'" (2008), I propose, through primary sources documentary analysis, to identify the main issues in two directions.

290

First, the relation between artists and public. Specifically: the role that artists should play in the revolution, the debate on mass ignorance and (by extension) the means art should use in order to reach them. Second, I study the social viability of the initiative. This means answering two questions: can a theatre be made "for" a social stratum that cannot support it financially? And, as a result: what should be its relationship with the state and private institutions in a context where both are seen as enemies? This paper is not about finding closed answers, but defending that an approach that considers the historically rooted nature of those conflicts can shed light on current and future problems through the disarticulation of ideological clichés, thus contributing to a better definition of the questions on the relationship between art and politics.

Understanding Culture in Contexts of Difference: Proposing a Theoretical Model to Study Chilean Cultural Policies

Carlos Poblete-Lagos

University of Munich (Germany) - Metropolitan University of Educational Sciences (Chile), Germany

The impacts of the COVID-19 pandemic have redefined the boundaries between individual freedoms and collective rights (Lebret, 2020; Spadaro, 2020), highlighting the structural weaknesses of globalization questioned before the pandemic (Alba-Rico, 2017; Flew, 2020). A context complicated with the effects of migration, the emergence of nationalism, and the disputes around recognizing cultural differences (Bauman, 2017, Coelho, 2008).

In this context, it is a priority to review the foundations on which culture is built, disseminated, and transmitted in contemporary societies, proposing new readings around the relationships between subjects and communities, territories, and social practices.

The paper proposes a theoretical model to analyze cultural narratives from a perspective that relates processes, territories, and socio-historical contexts, articulating the substantive and adjective dimensions of culture in different layers and forms of relationship. Subsequently, the model is applied to characterize culture treatment in the Chilean Cultural Policy (Ministry of Culture, Arts, and Heritage, 2016).

The study incorporates theoretical elaborations from different authors from cultural studies (Appadurai, Bhabha, García-Canclini, Sousa Santos), sociology (Basil Bernstein, P. Bourdieu, L. Wacquant), and history (F. Braudel, P. Burke, R. Chartier) to characterize structure and dimensions of the model.

It is expected that the work will allow establishing dialogues around culture and its manifestations, facilitating a structural approach applicable to different contexts.

Drag Performers' Perspectives on the Mainstreaming of British Drag: Celebrity, Heteronormativity and Precarity

Mark McCormack[1], Liam Wignall[2]

[1]University of Roehampton, United Kingdom; [2]University of Bournemouth

Drag performance has entered mainstream British culture and is gaining unprecedented appreciation and recognition, yet no sociological accounts of this transformation exist. Using an inductive analysis of the in-depth interviews with 25 drag performers, this article develops a sociological understanding of the mainstreaming of drag. There are two clear reasons for the success of drag. First, there is a pull towards drag: it is now seen as viable career opportunity where performers receive fame rather than social stigma in a more inclusive social zeitgeist, even if the reality is more complex. Second, there is a push away from other creative and performing arts because heteronormative perspectives persist through typecasting and a continued professional stigma associated with drag. Drag performers also fear precarity and a lack of permanence related to drag's mainstreaming. In calling for a sociology of drag, future avenues for research on contemporary drag are discussed, alongside the need for the sociology of cultural and creative industries to incorporate sexuality as a subject and analytic lens.

RN07_T09_01 | Music cultures

Globalization, Hybridization and Aesthetic Cosmopolitanism in Spanish Popular Music: the Case of Los Rodríguez

Fernán del Val

UNED, Spain

Analyzing the rock band Los Rodríguez, founded in Madrid in the early 90's, allows us to delve into various dynamics of the Spanish popular musical field of that decade.

The band, formed by Spanish and Argentinian musicians, forces us to consider the impact that Latin Americans musicians have had on the Spanish pop-rock, and how these Anglophone music have been globalized and arrived to Spain, not only through the rock metropolises (USA, UK) but also through Central and South America (Cuba, Mexico, Argentina…).

In turn, Los Rodríguez were a band that emerged against the current rock trends, focused on grunge, noise, indie and garage sounds. In that context of Anglophilia, Los Rodríguez's records united the legacy of classic rock with rhythms such as rumba and milonga, developing a kind of aesthetic cosmopolitanism that authenticated rock with Latin and Spanish rhythms and sounds.

The success of Los Rodriguez could be seen as an element that connects the aims of modernity in Spain with a vindication of a national musical tradition, and reveals the conflict between vernacular tradition and cosmopolitism, understood as an adoption of foreign cultural models and practices.

Based on the analysis of his best-known album, "Sin Documentos", and interviews with members of the band and their environment, in this paper we will reflect on the musical and cultural field in the 90´s in Spain, and on the cultural significance of Los Rodríguez in that context.

The Concept of Independence to the Independent Music Scene in Fortaleza (Brazil): The Case of the Independent Band Collectives' at the Belchior Cultural Center

Pedro Menezes

University of Porto, Portugal

Fortaleza isa metropolis located in northeastern Brazil. Nowadays, he city's independent bands are joining together in collectives: sort of band of bands or guilds the bands constitute in order to support the artists and unify the strategies of their activities. These independent band collectives have organized concerts and festivals that take place at the Belchior Cultural Center (CCBel), a public arts venue founded and financially supported by the local government. To participate in CCBel's program of musical events, the collectives have to submit their applications according to public bidding notices issued by the board of the cultural center. Besides being entitled to use the premises and to benefit from the technical infrastructure and the CCBel institutional seal of approval, the independent band collectives who perform at CCBel have their professional fees paid by City Hall. Given this context, this work brings up the following questions: what does independence mean to the independent band collectives who organize their festivals at the Belchior Cultural Center? Two main elements make the question especially relevant: (1) the bands work collectively; (2) the bands are sponsored by the local government. So, what does being independent mean to a community of artists who regard themselves as independent while acting collectively and provided for by the State? To find adequate answers to these questions, this research crossed diachronic and synchronic tools: on one side, I tried to retrieve the history and the controversies about the concept of "independence" in music, from its beginning to present days (diachrony); on the other, I interviewed the bands of the collectives that perform at CCBel, as well as the directors of the institution (synchrony).

Innovation and creativity

Considerations For an Ethical Economy of Sounds and Flavours

Isabelle Darmon

University of Edinburgh, United Kingdom

'Flavour' and 'sound' are everywhere. 'Flavour' is alluring us to heightened gustatory experiences; it is ensuring us naturalness and its sustainable sourcing; it is allowing for decreases in sugar, salt and 'bad fats'; in brief it is aesthetic, hedonic, and moral. Flavour could almost be said to have eclipsed cuisine, a move which can be compared with the 'breaking free' of sound from music throughout the 20th century (Solomos 2013), with sounds becoming the bearers of 'divergent social identities, individual creativities and affordances, biodiversities and differing abilities' (Novak and Sakakeeny 2015:6). In past papers I explained how, for both sound and flavour, this move was facilitated by technology, yet was fostered by aesthetic movements (futurism, nouvelle cuisine, molecular cuisine), often in dialogue with science, as well as by new forms of consumption. On this basis, here, I explore how aesthetic practices and 'encounters' are intensely mediated by moral considerations, as sounds and flavours themselves have become moral carriers. Ethical (ascetic) practices and states of listening and savouring are studied in this new light, towards an 'ethical economy' (Kronengold 2018) of sounds and flavours. I call in Foucault's study of practices of the self but also Weber's analysis of pathways to salvation as relevant frames for making sense of such existential stances. Cultural sociological analyses of mediation, affordance, attachment and affiliation (DeNora 2000, 2003; Hennion 2007; Benzecry 2011), which are usually mobilised to make sense of how 'the material properties of the artwork afford conditions for its appropriation' (Acord and DeNora 2008: 235) are revisited on these premises.

Culinary Innovation Centers as Cultural Innovation Producers: The Case of BCC Innovation

Auxkin Galarraga Ezponda, Iñaki Martínez de Albeniz Ezpeleta

University of the Basque Country, Spain

The relationship between gastronomy and culture is an important field of study for both social scientists and gastronomic sciences. This link has been interpreted and analyzed through two main perspectives.

First, meticulous studies have been carried out on local gastronomic cultures and traditions, noting the enormous diversity of knowledge, practical skills, rituals and symbols associated with agricultural cultivation and harvests, as well the important richness in the ways of conserving, transforming, cook, share and consume food. Second, from areas such as innovation studies, the gaze has been focused on the impact and relevance of cultural factors in culinary innovation processes, entrepreneurial projects in gastronomy or in the definition of working models that prevail in the haute cuisine.

However, in our view, there could be a third perspective for the study of the relationship between gastronomy and culture. This third perspective focuses the capacity of agents and organisms involved in culinary innovation activities to generate discourses, symbols and shared beliefs fundamental for the configuration of lifestyles or forms of sociality and not only innovative products or processes. This perspective understands, in short, that those environments oriented to culinary innovation play a fundamental role in the cultural innovations of the present. From this perspective, we present the case of BBC Innovation, a Center for Research and Innovation in gastronomy field, linked to Basque Culinary Center (Faculty of Gastronomic Sciences attached to Mondragon University) highlighting the symbolic resources and discourses elaborated both for its internal articulation and for its external recognition and legitimation.

293

The Role of Creativity and Artists in the Era of Artificial Intelligence

Urszula Jarecka

Institute of Philosophy and Sociology Polish Academy of Sciences (IFIS PAN), Poland

The goal of this paper is to discuss possible changes in development of music, art and participation in cultural life in the context of technology development. Changes in culture rooted in technology will shape future societies and cultural life. Basically, technology helps in expanding the individual sphere of freedom, and improving the quality of life for individuals and societies. Progress in technology was believed to decrease the level of uncertainty in social life and in facing the natural environment problems. In such a vision crucial was reducing results of nature vehemence. However, progress in science and technology leads to increase the level of complexity of world and the networks between social phenomena.

Since the beginning of industrial revolution all societies has experienced graduate dependance from technology. Technology development creates new problems connected with unintended consequences of introducing some discoveries into social life. Especially development of Artificial Intelligence (AI) is important for life of future societies. Increasingly we observe involvement of AI technologies in both, everyday life and in artistic life. Artists uses electronic devices and AI in their work, and some questions connected with this engagement arouse. How to analize creativity of AI, and of artists who based their work on the cooperation with AI? What will be the role of artists in culture in the era of AI? Based on the qualitative research, some questions on the character of creativity, originality of art works, music pieces etc., and on the participation of audience in cultural life will be answered.

RN07_T11_01 | Cultural practices

'He May Not Be Qualified In It, But I Think He's Still Got The Knowledge': Team-doctoring In Combat Sports

Reem AlHashmi, Christopher R Matthews

Nottingham Trent University, United Kingdom

Several studies have examined the provision of medical care in a variety of competitive sport settings. These are important contributions, but the majority of this work has focused on elite sports that tend to have a group of medical health professionals as part of the team, with little attention given to sports that lack access to such services. This lack of dedicated medical support may result in athletes being more likely to engage in 'team-doctoring' – a term used to describe athletes seeking medical advice from teammates and coaches. This concept is yet to be theorised and empirically described. In this paper, we begin to define, explore and contextualise the process of team-doctoring in relation to sociocultural interactions, beliefs embedded within the combat sport subculture and the critical role it plays in shaping fighters' perceptions of health and injury. In so doing, we demonstrate that team-doctoring is the process whereby apparent medical knowledge is (mis)understood, recommended, transferred, interpreted and developed within a somewhat coherent team.

294

Consensual Injury As Cultural Practice: Addressing Legal Legacies Via Historico-Cultural Method

Alexandra Carina Grolimund

University of Essex, United Kingdom

This socio-legal study considers the relationship between consent and injurious bodily activity, as it relates to human rights discourse and activism. It examines how one case study in particular – the fallout of the UK's Operation Spanner trials and consequential limitations on sexual expression – exemplifies and sheds light on the role of activism within and around cultural practices of consensual injury, including BDSM and body modification. It considers public reactions to the negative outcome of the court trials and resulting European Court of Human Rights case for bodily autonomy and, given the recent resurrection of the accompanying legal framework as it was applied to the 2019 R v M (B) case more than a quarter-century on, how these might be reincarnated and take form in contemporary socio-legal debate, engaging both activist, political and legal narratives. By examining the fallout of the R v Brown case, charting its legal trajectory to contemporary debate, the research offers an opportunity to understand the perceptions, beliefs and motivations of key historical figures in their fight for recognition of sexual freedom.

Among the existing scholarship related to the impacts of Spanner there is a pressing need to consider sexual rights, particularly in a cultural context. Given the resurgence of the topic through recent cases, this research examines how cultural practice is narratively constrained within legal discussion, and how this might bring a reconsideration of the full array of consensual injury among more mainstream defences of cultural expression, i.e. legality of BDSM and body modification.

Stickers In Mobile Instant Messaging In Social Business Discourse In Japan

Hiromasa Tanaka

Meisei University, Japan

In spoken interaction, past research reveals that Japanese interlocutors make mutual use of synchronized non-verbal expressions, such as silence and head nodding whilst interacting. As with in written text, manga, or comic illustrations, are synchronized with verbal texts. Even in business communication, the efficacy of manga has been validated for safety training to employees in the manufacturing industry. The present study investigates the use of stickers (manga with/without texts) in mobile instant messaging (MIM) in a Japanese social business organization in which members of multiple cultural and linguistic backgrounds interact. MIM is becoming popular in Japanese business organizations because of its strength in mobile capacity and immediate responses. Stickers supplement the lack of non-verbal cues and expressiveness in MIM. This study uses the concepts of business discourse and politeness to analyze the data. Working in teams within social business organizations, the members need to develop and strengthen their relationship while they report, instruct, and acknowledge messages sent by other members. The data show that the frequent use of greetings, acknowledgement, and emotion stickers constructs team solidarity and accurate processing of the work. Further analysis of the data indicates the disciplinary effect of the MIM interaction discourse in terms of choice and use of stickers, which is particularly important for non-Japanese participants to be able to integrate into the discourse community.

RN08 | Disaster, Conflict and Social Crisis

RN08_T01_01 | Disaster Research: An Interplay of theoretical and methodological approaches (I)

Analyzing the Interplay Between Mediated and Non-mediated Communication Processes During Disasters - Development of a Methodology

Nina Blom Andersen, Jonas Mortensen

University College Copenhagen, Denmark

LINKS "Strengthening links between technologies and society for European disaster resilience" is a four-year EU Horizon 2020 funded project on disaster governance in four European countries. The project holds a multi hazard approach in its aims to investigate the use of social media crowd sourcing (SMCS) in disasters under diverse conditions. Even though SMCS has been integrated into crisis management in recent years, the effectiveness remains unclear. From this point of departure, the overall objective of LINKS is to strengthen links between technologies and society with specific focus on the disaster management professionals' inclusion of vulnerable groups in particular.

In the presentation for ESA 2021, the first part of the presentation concerns the methodological challenge of the project's distinct focus on integrating the needs of vulnerable groups in social media crowd sourcing. Vulnerability is often related to lack of integration in society and the possibility that vulnerable citizens will be forgotten and excluded as target groups with certain needs in a social media crowd sourcing strategy is probable.

The second part concerns the interplay between digital online communication processes and non mediated communication. A broad number of studies hold either a digital or a non-digital focus, but there is a lack of studies that present the interplay and relation between the two forms. There are several reasons for this, one is that it requires a comprehensive methodological design, and this second part of the presentation touches on this development.

Categories and Crisis: Definitions of Essential in the COVID-19 Pandemic

Joshuamorris Hurwitz

Stanford Graduate School of Business, United States of America

Crises are occur when risks become elevated and unmanaged, such that the organization's continued existence comes into question, requiring swift, yet ambiguous action to resolve (Pearson and Clair 1998). To overcome crises, organizational decision-makers moot possible strategies. I propose here that crisis strategies have a common structure, containing crisis-specific actions overlaid upon a mapping of activities and functions that will be maintained, restricted, and curtailed. When enacted, such strategies serve to allocate rights, resources, and risks via these features. Second, I consider how crisis solution/strategies come to be devised, suggesting that they become Latourian heterogeneous networks of actors, ideas, and concepts, rife with both inconsistencies and interdependencies. A case study of the delineation of "essential businesses" during the COVID-19 pandemic is used to illustrate the process.

Conceptualizing Complex Disasters and the Implications for Future Civil Protection and Disaster Management

Cordula Dittmer, Daniel F. Lorenz

Freie Universität Berlin, Disaster Research Unit (DRU), Germany

Research has shown that disasters are becoming increasingly complex. Decisive for this increase in complexity are the interactions of social processes on different levels. For some time, scientific discourse has differentiated between different degrees of severity and temporalities of disasters and increasingly considers complex interaction effects in so-called "compound disaster" (Wachira 1997), "consecutive disasters" (Ruiter et al. 2020), "cascading disaster" (Pescaroli et al. 2015) or NaTech/TechNa disasters (Gill et al. 2018). The interaction of natural, technical and socio-political hazards is referred to as a "complex disaster" (Funabashi et al. 2012). Among other things this means that less visible, slowly building threats to societies but also new consequences across scales are entering the field of disaster management.

The paper develops initial considerations on how complex disasters can be conceptualized sociologically and what the impacts on future disaster and crisis management might be.

The Collision of Institutional Systems

Diego Fernandez Otegui

University of Delaware, United States of America

This article intended to add clarity about the role of symbolic constructions that are used by humanitarian executives and disaster survivors to relate with one another. A total of 30 purposefully sampled decision makers were interviewed using a semi-structured questionnaire. The conversations were transcribed in full and analyzed using a deductive approach. The article undergoes an analysis of the institutional logics that are used by both collectives in the aftermath of a disaster. Data from field research trips to Mexico, Dominican Republic, Puerto Rico and Mozambique were also used. Having into consideration the limited amount of data collected, the findings of this article cannot be considered

representative of the global humanitarian community. But it provides important insights to open a new field of research that has not received enough attention yet: the role of symbolic constructions in the relationship between different collectives during international humanitarian interventions.

The research supports that disasters affect the cognitive structures of international humanitarian actors and local stakeholders alike, but in different ways. Because of this, their post-disaster institutional systems are unarguably different. Consequently, the way they perceive and interpret the new post-disaster reality is different, having important implications in the way they relate.

Return to Normality. The Reinforcement of the Symbolic Limitations in the Field of Disaster Control as a Means of its Reproduction

Sandra Maria Pfister

Johannes-Kepler-University, Austria

Disasters disrupt the taken-for-granted structures of social order, and in particular a society's way of dealing with disasters. Hence, disasters are considered to induce transformations in the space of practices of dealing with disasters – the field of disaster control. Yet, a bulk of research suggests that disasters rarely result in paradigmatic changes, but rather in temporary limited or piecemeal adaptations in line with prior institutional arrangements. Obviously, the basic principles of the field persist. This is far from self-evident. From a Bourdieusian perspective, one of the most powerful mechanism that perpetuate the established social order is the operation of symbolic power – the chance to affect the actors' perception, interpretation and attitudes towards threats

and disasters. Thus, the twofold censorship of any given field becomes the main locus of a stable reproduction of any given social order. For one thing, it sets symbolic limitations of the unspeakable, meaning that established beliefs (orthodoxy) prevail against alternative ones (heterodoxy). For another, it sets symbolic limitations of the unthinkable, meaning that taken-for-granted beliefs inform the social order and render it a naturally given fact (doxa). Thus, the disaster's transformative potential lies in the challenge of these limitations, rather than in the disastrous "event" itself. The paper illuminates the mechanisms that reinforce these symbolic limitations in the wake of disasters to contribute to a understanding of how the field order persists. Particularly, it sheds light on the strategies of the established actors in negotiating the disaster and its proper solution. To do so, it conducts a case study of a mudslide disaster in the Austrian Alps relying on method triangulation to gain in-depth-material (institutional analysis, process-produced data, interviews).

Trust and Ethics: Ambivalent Relationships and Perverse Effects in Times of Crisis

Simone D'Alessandro

University of Chieti-Pescara, Italy

How does the relationship between Ethics and Trust change in times of social, pandemic, or economic crisis? Is it possible to alter their relationship, changing the perception that social actors have of them?

Starting from the epistemological assumption that progress in the social sciences is determined by the change in the theoretical horizon produced by "a reformulation of metaphysical assumptions" (Reed and Alexander, 2009) and combining this path with the relational perspective (Donati and Archer, 2015) we will examine definitions, meanings, functions, and relationships between trust and ethics. Following the theoretical logical method, we will understand that trust and ethical behavior are ambivalent in nature and their circle can also produce dysfunctional outcomes that depend on the ability of social systems to modify collective perceptions through forms of communication, in the awareness that distrust constitutes an ineliminable and, paradoxically, preparatory element for the restoration of the trust circle. The relational circle between gift, trust, collective ethics, and personal morality does not end with distrust, but changes in a contingent way, determining perverse effects. The perverse effects cannot be defined as exceptional - as is

believed in the theory of rational choice - but recurrent because daily practices are marked by an intuitive, emotional and moralistic trust circle that prevails over logical reasoning, as ascertained by both relational theory and behavioral economics. Functionalist paradigms cannot engineer and optimize the performance of the trust.

The Role of Human Values in the Communities Responses to Environmental Crisis.

Natalia Ewa Bełdyga

Kaunas University of Technology, Lithuania

According to recently launched Human Development Report environmental crisis is a test of our uniquely human development, of our ability to come together, cooperate and adapt to a different way of sharing our planetary home (2020). As mankind has reached unprecedented tipping points, can human values become a critical factor in making us humans more resilient and responsive to natural disasters caused by this environmental crisis?

People rely upon recources provided by ecosystems, and ecosystems are influenced by people's decisions and behaviors (Jones, Shaw, Ross, Witt, Pinter 2016). Research has shown that human action is determined not only by sociodemographic and socioeconomic conditions - such as age, gender, or income - but also by values and worldviews (Posch, Höferl, Steiger, Bell, Laxmi 2019).

Based on literature review a theoretical analysis of the factors making community more resilient and responsive to natural disasters caused by environmental crisis will be performed. Also an analysis of empirical studies such as Schwartz's cross-national research and his work on basic values dimensions will be made in order to gain an understanding of how values in different cultural landscapes and settings influence and shape divergent communities responses to natural distasters such as for example earthquakes. Worthy of note are, ever more found indispensable by organizations such as United Nations, responses and attitudes towards the planet developed by indigenous communities. The output of the research will be a study of types of values being critical factors in making communities more resilient and responsive to crisis.

RN08_T02 | Disasters and Conflicts in Society

A Whole New Ballgame for Disaster and Crisis Management? The 2015/16 Refugee Crisis and the SARS-CoV-2 Pandemic

Daniel F. Lorenz, Cordula Dittmer

Freie Universität Berlin, Germany

In 2015/16, the European refugee crisis overwhelmed the response capacities of disaster and crisis management as there were hardly any established procedures on how to deal with such a crisis. The current SARS-CoV-2 pandemic shows similar weaknesses of national and international disaster and crisis management systems in several European countries, at the EU level and beyond with particular clarity.

Although both crises (or disasters?) differ fundamentally in many respects, they also have specific commonalities, since they are, among other things, long-lasting, cross-border situations beyond classic disaster scenarios and in which specific societal functional areas are disrupted and which are at the same time highly politicized. They are also both characterized by the fact that resources and capacities from disaster management were deployed in unconventional forms and by the involvement of new actors (e.g., social and welfare systems, asylum system, health system) that had not or hardly been involved in disaster and crisis management before.

The pthaper therefore analyzes differences and commonalities of both crises. Based on this analysis, the paper asks to what extent the identified commonalities are already known from decades of disaster research or represent fundamental changes in the disaster landscape and signify a whole new ballgame for disaster and crisis management but also research.

Preparing For Crises? A Case Study Of A European Crisis Training

Fabian Brand, Leonie Dendler, Gaby-Fleur Böl

German Federal Institute for Risk Assessment, Germany

In an era of globalization, organizational attempts to create resilience for crisis events are rising. A prominent instrument used in this context, increasingly also on a cross-national level, is the organization of discussion- or operation-based crisis trainings. Usually framed as an instrument to generate organizational learning and increase overall resilience, crisis trainings can be conceptualized as strategic interventions to facilitate resilience-directed institutional change.

Despite the growing prominence of crisis trainings, research so far has paid little attention to their effects. Using a case study of a cross-national crisis training, that brought together members of 14 European and national public agencies in a combined discussion- and operation-based approach, this study aims to address this gap. Drawing upon post-event survey and in-depth interviews with participants as well as observational insights, we discuss factors that were perceived as hindering or facilitating effective crisis reaction.

Preliminary findings support the value of multi-organizational crisis trainings on an individual level, especially if they combine a discussion- and operation-based approach. However, they question the extent to which crisis trainings can facilitate institutional change to increase overall, field-level resilience. This raises questions about what institutional structures may hinder resilience-directed change as well as potential paths to destruct them. While answering these questions is arguably relevant from a new institutional theory perspective, they certainly are of high importance for public sector organizations across the world.

299

Reintegration Into Civilian Life Of The Veteran Population In Ukraine After Six Years Of Conflict

Tetiana Liubyva

IREX

Since 2014 an armed conflict in Eastern Ukraine has taken place. Thousands of volunteers started their service in the Anti-Terrorist Operation zone (later – Joint Forces Operation) at the beginning of the conflict, and more joined them as members of the Armed Forces, National Guard and State Border Service. As a result, about 400,000 Ukrainian veterans have engaged in this conflict as of the beginning of 2021.

To address the existing gap in information on the current situation and needs of Ukrainian veterans IREX and KIIS administered a survey of 1,905 veterans in 2020. Special efforts were made to include in the sample sufficient numbers of female veterans and veterans residing in rural areas. An additional sample of 1,700 individuals, representative of the non-veteran population, was surveyed to assess differences between veterans and civilians on a series of critical issues.

A number of findings confirming the existence of significant challenges faced by veterans were obtained. For instance, a significant number of them reported to have suffered physical injuries or diseases while in duty that still affect their lives. Moreover, presence of mental health related issues is more frequently reported by veterans than by civilians. Social stigmatization from the side of the civil population led to harassment and discrimination episodes reported by every second surveyed veteran. Research also suggests that reintegration into civilian life of Ukrainian veterans is negatively affected by the fact that the conflict in East Ukraine is not over yet.

The WEF Nexus Under Shocks: Migration, Pandemics, And Natural Disasters – The Impact of Forced Migration in Jordan's Resources

Konstantinos Pappas, Bassel Daher, Silva Hamie, Tessa Thomas, Saumya Thomas

Texas A&M University, United States of America

The Water-Energy-Food nexus (WEF nexus) is a conceptual approach to describing and interpreting the complex and interconnected nature of global resource systems and the interactions between the natural environment and human activities.

The paper attempts to highlight the effects of migration, pandemics and infectious disease, and natural disasters on these interconnected resource systems. Comprehending the interconnections between the facets of water, energy, and food when exposed to these global shocks (which are further exacerbated by variables such as climate change) are crucial to achieve the sustainable development goals (SDGs) outlined in the 2030 Agenda for Sustainable Development.

This discussion is further specified in the case of Jordan. Jordan provides the unique perspective of a developing nation. Jordanian institutions and policies created to manage migration, water, energy, and food arguably differ from those in developed countries, as the two are functioning in different circumstances. Second, it provides the ability to examine the impact of migration on the WEF Nexus in a country with few resources. Jordan is a water-scarce country and also faces salient challenges in the realms of energy and food security.

A scenario-based framework that assesses the shocks of forced migration on WEF Nexus components, interconnections, and associated impacts on communities' resilience is presented. Moreover, the country's progress towards certain SDGs is measured using the developed framework.

The aim of this assessment framework is to become a tool for policy makers to better understand the pressures placed on the water, energy, and food industries in their countries, thus having the ability to make more informed decisions.

RN08_T03 | COVID-19: The Sociology of Resilience and Crisis

What is New? COVID-19, De-democratization and Invisible Citizenship

José Manuel Mendes

University of Coimbra, Portugal

The COVID-19 pandemic was neither unpredictable nor unforeseen and has been a real test to risk governance and to the strength and consolidation of democratic systems. Although COVID-19 is undoubtedly qualitatively distinct from other outbreaks, from a risk regulation perspective there is little new in the actual health emergency crisis, as the responses relied on governments' routine decisions with the help of agencies, expert committees and dedicated emergency rapid response mechanisms. The element of surprise and the global scale of the COVID-19 pandemic shows how difficult it is to design public policies and civil society responses based on learned lessons and past experiences.

In this paper it is proposed that in the case of COVID-19 the main structural explanatory factor was not a cycle of panic-neglect, but the different institutional configurations and the specificity of public health policies. The main argument is that the policies adopted in the COVID -19 pandemic were based on top-down approaches and expert knowledge that resulted in a de-democratization of health crisis regulation and a diminished relevance of citizenship claims and rights.

The paper will mobilize the concept of invisible citizenship, not only to produce a social autopsy of mortality rates by COVID-19, but also to understand how individuals and communities live with the pandemic and to analyse its impact on social ties, intergenerational relations and community solidarity.

Building Community Resilience During The Crisis? An Exploratory Study In The Wake Of The Pandemic

Andreas Georgiou, David Murillo

Univ. Ramon Llull, ESADE Business School, Spain

In the wake of the pandemic, established institutions and governments around the world failed to serve their citizens' needs and demonstrate systemic resilience. Resembling a dystopia that only a few could imagine, public healthcare systems almost collapsed, and the world economy was at risk. Despite this institutional void, the pandemic seemed like a wake-up call for local communities. Citizens socialized through their balconies, engaged in acts of solidarity and provided emotional support to each other. In other words, they exhibited a remarkable sense of community which runs contrary to sociological theories that emphasize the self-interested, rational and isolated way of living in the contemporary world. Therefore, we set out to gather individual thick descriptions and explore how sense of community emerged during the crisis. Our open-ended questionnaire received more than six hundred responses from individuals around the world (April, 2020), which were complemented by some follow-up qualitative interviews (May, 2020). Building upon a cognitive and social constructivist perspective, we show that sense of community emerged due to an intense sensemaking process which enabled neighbors to avoid the collapse of sensemaking, attach a social meaning to the confinement, become familiar with the neighborhood and its needs and feel that they belong and are responsible for each other. As crises continue ringing the doorbell and institutions fail to deliver, our research shows that community resilience research can benefit from examining how neighbors come together, form meaningful ties and organize during the crisis.

Decomposing Social Bonds: The Disastrous Consequences Of The Covid-19 Pandemic Through Narratives Of Three Generations of Women In Greece

Joanna Tsiganou[1], Anastasia Chalkia[2], Martha Lembesi[3]

[1]National Centre for Social Research, Greece; [2]National Kapodistrian University of Athens; [3]Centre for the Study of Crime

The covid-19 pandemic and the measures undertaken to confront it have a tremendous impact to both, societies and individuals at global level. Our proposed paper aims at deciphering the disastrous consequences of the pandemic and its regulation for the social ties linking societies together. Through narratives of three generations of women in Greece produced by means of a qualitative research conducted during the summer of 2020 (that is immediately after the first wave of lockdown imposed at pan-european level) we attempt to comprehend the means, the ways and the extend the new social circumstances have affected people's lives. Our focus on women implies the gendered aspect we wish specifically to address, since much of the research conducted already asserts the pandemic's impact on those most vulnerable, women among them. Drawing from the broad literature on what keeps societies together we focus on the micro-level of the daily experiences of women upon their re-allocation within their domus. The narratives of compulsorily detained women domiciliary, help us to comprehend more fully the impact of lockdown restrictions not only it terms of a come-back of the human bondage to traditional women's status within contemporary societies, but also in terms of decomposing broader social bonds and collective ties, as well as recomposing extremely individual traits.

Towards Research-Practice Integration in Emergency Management and Disaster Risk Reduction (DRR): Breakthroughs, Multidimensional Challenges and Future Directions

Alex Altshuler

University of Haifa, Israel

The challenge of creating and fostering research-practice integration in disaster risk reduction and emergency management is typically described as a strategic and complex vision. This presentation describes and critically analyses the Israeli effort during 2016-2020 to comprehensively promote this vision. It relates to the cultural, organizational, strategic, and other aspects of this process. The preparatory stages and the importance of inter-organizational and inter-ministerial cooperation are extensively described. The novel applied research infrastructure and the ecosystem aimed to support the research-practice synergy are depicted and analyzed in detail. Through strategic lenses, the major breakthroughs, challenges, complexities, and objectives are critically examined. Moreover, broad scientific and applied, national and international implications, and potential future directions are discussed.

Covid- 19 Pandemic And Extremisms: Dealing With A Cumulative Crisis. A Resilient Perspective

Barbara Lucini

Itstime Dipatimento Sociologia Università Cattolica Milano, Italy

The spread of the outbreak of the Covid - 19 virus in China in late 2019, which became a pandemic in early 2020, had major impacts in many ways, across all affected societies. The measures to manage the crisis and contain the spread of the virus, such as lockdowns, have had a strong impact on some social groups that have promoted various initiatives of dissent and protest. Some of these phenomena of violent tension and social conflict have been fostered and acted upon by groups of various extremist origins: in the political sphere by both the extreme right and the extreme left and again, with the advent of conspiracy theories, such as those supported by the Qanon group.

The ultimate aim of this reflection is to understand if and how crisis management models have produced behaviour of resistance and opposition to the new regulations introduced.

The methodological approach used is that of digital ethnography and the focus of the research dimensions concern risk and crisis communications.

Such a study will allow to better outline the best practices and bad practices implemented during the management of the pandemic, highlighting the multiple and contemporary perceptions and interpretations of risk by different social groups.

Finally, the contribution will promote a proposal for new ways and strategies of resilience, which may allow for a more competent and effective crisis management in view of the characteristics of the risk itself and the previous vulnerabilities of societies.

Crisis Preparedness, Cooperation, and Resilience against the Backdrop of Digitalisation

Marén Schorch

University of Siegen, Germany

This contribution draws attention to the role of crisis preparedness, cooperation, and digitalization for supporting resilience and maintaining continuity. Based on our long-term research project, we reflect on our empirical studies' insights before and during the Corona pandemic. The paper will present results from original empirical studies that triangulate data from qualitative studies with two quantitative surveys conducted in Germany between 2018 and 2020. The works focused on images of crises, continuity, and resilience, emphasizing emergency preparedness and stocking. While the studies before 2020 mostly referred to extreme short-term events (like fallouts, floods, or winter storms) or anticipated major disasters, the recent studies also include the ongoing Corona pandemic. In many respects, the prolonged crisis (or better: catastrophe) highlights, often increases existing socio-economic inequalities, the diversity concerning resources (in the sense of Bourdieu) and also underlines the omnipresence of digital technologies in our everyday life. We are going to discuss the potential of the current crisis for (long-term) changes of the awareness for vulnerabilities and dependencies (of supplies, goods, services, etc.), but also the potential for learning from experience and increasing individual's resilience through cooperation and collaboration within families, neighborhoods, local communities and beyond. Lastly, one socio-technological example supporting such partnerships and collaboration (based on our studies' results) will be presented shortly. From a broader perspective, our work strongly connects to the intertwined relationship between (social, economic, technological) change and continuity. It thereby also echoes the overall theme of this year's ESA conference.

303

Reliability of SER Tool as Measure of Resilience in Situation of Active War and Conflict: The Case of Tigray, Ethiopia

Kibrom Fekadu Berhe

Mekelle University, Ethiopia, Belgium

This research is part of a study that explores how training affects Social Economic Resilience (SER) in vulnerable communities. The training program is implemented by two interrelated Nuffic projects (funded by the Dutch Ministry of Foreign Affairs) in the Horn of Africa (Ethiopia, Somalia, Sudan, and South Sudan). The research refers to studies conducted previously in Uganda and Ethiopia. The research design (quasi-experiment) in Uganda and Ethiopia was the same and in a real-life situation. The research in Uganda was conducted among participants in a rehabilitation context (people rehabilitating from war); in Ethiopia, the participants were among Eritrean refugees in a very vulnerable situation that was not yet stabilized. In both studies, it was found that the Social Economic Resilience (SER) was a reliable tool to measure resilience. Resilience can be seen as the opposite of vulnerability and SER was defined as a characteristic of an individual and relates to the beliefs the individual has about coping with and improving their social and economic domain (Van Reisen et al., 2018; Kidane Selam, 2020). SER-tool used in both studies has three constituents: Psychological (capability, empowerment, and worriedness constructs), social (social embeddedness and trust in the system constructs), and economic (income construct). The question is whether the SER-tool remains reliable if used in a situation of active war and conflict as is currently the case in Tigray. The research question was addressed using a quasi-experiment design and research participants were selected through convenient random sampling from vulnerable communities (IDPs, and marginalized groups) of war and conflict-affected Tigray region. 10 participants were approached through a phone interview. Items constructs were used to see tool reliability and adapt it.

The Effectiveness of Self-help, Low-cost Trauma Counseling on Enhancing Social and Economic Resilience in War Affected Communities in Northern Uganda

Mia Stokmans[1], Bertha Vallejo[2,3], Mirjam Reisen. van[1], Selam Kidane[1], Zamina, M Baluka[1,4]

[1]Tilburg University, Netherlands, The; [2]University of Johannesburg, College of Business and Economics, South Africa; [3]UNU-MERIT, Maastricht, the Netherlands; [4]Equal Opportunities Commission, Kampala, Uganda

This study's main focus is on the lagged effect of a low-cost trauma understanding, support and processing techniques, the Trauma Resilience Understanding Self-help Therapy (TRUST), on social and economic resilience. This therapy is based on two important pillars: self-help to get control over the symptoms of PTSD and ownership of the program by the community. TRUST was provided to highly vulnerable women living in northern Uganda, an area where poverty and vulnerability are widely spread, due to two decades (between 1986 and 2006) of prolonged conflict between Government forces and the Lord's Resistance Army (LRA).

The study made use of a (between groups) pretest (n= 141) posttest (n=111) design, with a time lag of about seventeen months, in which the effect of TRUST is compared to the effect of social protection programs, such as regular but small amounts of cash/in kind, and no social protection program. The main research question regards vulnerable and traumatized communities in sub-Saharan Africa, Uganda, and is about the effectiveness of TRUST (compared to cash/in-kind) in enhancing social and economic resilience. The results indicate that those who received TRUST and/or social protection scored significantly higher on different components of social and economic resilience (compared to those who did not). However, the effects of TRUST are stronger (in terms of partial eta-square) than those of social protection programs (cash/in-kind).

The results suggest that TRUST is, in the long run, at least as and probably more effective in enhancing social-economic resilience as continuous financial/in-kind support is. In the paper, policy implications will be discussed.

304

RN08_T05 | Resilience in times of crises: Recent developments, concepts and approaches (II)

Building Resilience towards Forest Fires in Spain. Insights from MitigACT Project.

Elvira Santiago-Gómez, Alberto Cotillo Pereira, María del Carmen Rodríguez Rodríguez

Universidade da Coruña, Spain

Forest fires constitute one of the main environmental threats in southern European countries. In Spain, during 2019, there were a total of 10883 forest fires that burned 83963 hectares of land, these data make the country the most affected in Europe, both in number of fires and in burned area. Given the severity of the socio-economic, political and ecological damage that natural disasters –as forest fires- cause each year, the international community design action programmes for disaster risk reduction (DRR). The actual Sendai Framework (2015-2030) overcome the limitations of the traditional plans based on top-down risk management initiatives. This program recognises the need of coordinated action between local, national and international actors to understand disaster risk, to strengthen risk governance, to invest in disaster risk prevention and reduction through structural and non-structural measures, and to enhance disaster preparedness. Trying to progress in resilience to natural hazards and reach the full engagement of public and private actors into bottom-up initiatives oriented the mitigation of forest fires, the main objective of MitigACT (PID2019-1074443RA-I00) is to incorporate local knowledges, experiences and practices into DRR strategies. In this paper, we present the first results of this project, drawing form an ANT perspective we carrying out a multi-situated characterization of the concept of resilience and analyze the construction and deconstruction of the natural-cultural distinction in disaster studies.

Social Vulnerability, Damage Perception and Resilience After an Earthquake. A Lesson for the Present

Monica Musolino

CNR ITAE of Messina, University of Messina, Italy

Our analysis originates from an empirical research, conducted between 2011 and 2015 in the centers of Gibellina and Santa Ninfa (Sicily, Italy). The research is focused on the processes of material and identity reconstruction following the 1968 earthquake, through a socio-historical and constructivist approach. The comparative analysis aims to point out the similarities and differences between the reconstruction processes of the two centers. In particular we focus on the role played by the local communities and authorities correlating it with the results obtained in terms of resilience and social vulnerability. Indeed, the participation of the inhabitants to the decision-making process mediated by the action of local politicians is the core of the strategy in order to face the material and symbolic crisis and to achieve a successful reconstruction. It is interesting to notice that even the damage perception is closely linked to this capacity. In other words, the damage as well as the future risk perception are socially built, more depending on the degree of internal cohesion of the population and its ability to react to a disastrous event than to the "real" and calculable extent of the material damage itself. The self-representation of the community, considered as a result of this process, becomes a condition for the present and future resilience.

Methodology: Coherently with the constructivist approach, we used a qualitative methodology, collecting life stories from the political elite of the time and some active representatives of both communities, always within a socio-ethnographic and socio-semiotic observation.

305

Ten Years After. Changes in the Assessment of the Causes, Responsibles and the Correctness of the Red Sludge Disaster from the Point of View of Resilience

Zoltán Ferencz

Eötvös Lóránd Research Network Centre for Social Sciences., Hungary

In the planned presentation, I present the comparative results of two researches that examined people living in the settlements affected by the red sludge disaster in Hungary on October 4, 2010. The researches were conducted in 2013 and 2020 on the same sample.
The framework of the presentation is provided by the use of the concept of resilience in the communities affected by the disaster. According to the approach that integrate the results of social sciences, resilience creates a "new normality", hence resilience includes the ability to renew and reorganise a system. According to the most widely accepted interpretation, the community resilience is relying on a network embedded "adaptability" and on pre-existing resources (economic development, social capital, information and communication, and community competence) which can be activated in the event of an emergency.
In the presentation, I will show how the memory of the most sensitive issues in the affected communities has changed regarding the causes and responsibles of the disaster and the role of the helpers. How important is remembering to communities 10 years from now? Are the affected communities moving in the direction of conflict or cooperation? When someone goes through a disaster, does it become more trained or vulnerable?
The presentation shows how these changes have contributed to the resilience of the affected communities.

What Makes Crises and Resilience in Blood Supply? Results from a Case Study in South Africa

Miriam Nagels, Alina Winter, Lars Gerhold, Roman Peperhove

Free University Berlin, Germany

Blood supply systems are elementary pieces of health-related critical infrastructure. Particularly due to their dependence on blood donors they constantly interact with environmental dynamics and are directly influenced by social and societal developments. As a result of this vulnerability to external factors shortages in blood supply occur. The blood supply system in South Africa is in a particularly well-rehearsed interaction with its environment, given numerous experiences with past crises and challenges, such as epidemics or power outages. In this light, the main research question addressed in this contribution is what factors affect the resilience of the South African blood supply sector in crises and which role communication plays in this regard. Within the contribution preliminary results from a third-party funded international research project are presented. These results are based on an in-depth literature review and qualitative analysis of primary literature and interviews conducted with disaster management actors and blood services. Findings of a scenario process, which aims at identifying possible consistent courses of crises as well as dependencies on relevant influencing factors, are presented. Besides, results from the analysis of crisis communication at the interface of crisis management actors, blood services and the public are discussed, exploring communication's impact on tackling crises affecting South African blood supply. As part of the contribution, the researchers critically reflect on research methods and their role as European researchers working on a phenomenon in the global South while contributing to the discussion of crisis prevention and management in different cultural contexts.

RN08_T06 | Social Dimensions of Disaster/Crisis Preparednes and Response (I)

"Ebbs and Flows of Social Solidarity. Findings from a Polish Qualitative Longitudinal Study"

Jowita Radzińska

SWPS, Poland

It is increasingly more apparent that the COVID-19 pandemic mirrors the effects of previous public health crises on people's professional and private lives. Nonetheless, it has different implications in relation to social positioning of individuals, engendering varied social practices and responses. As an 'unsettling event' (Kilkey, Ryan 2020), it has varied implications for interpersonal relations, especially cooperation and the willingness to support each other within communities (see e.g. Carlsen et al. 2021).This paper contributes to this debate by focusing on dynamics of solidarity over one year of crisis in Poland. The data used in this work has been collected from March 2020 to April 2021 through a longitudinal qualitative research (QLR, Neale 2019): "Solidarity in Covid-19". The project was adapted to digital methods and encompassed three waves of interviews, as well as additional material from asynchronous exchanges and diaries. Research participants (n=25) are middle-class men and women ages 28 to 73.

Drawing in the analyzed data, the paper demonstrates how solidarity has had its "ebbs and flows" between the beginning of the lockdown measures in Poland (March 2020 in Poland) and the following spring. While the first period of the pandemic, especially the national quarantine, brought out supportive attitudes, the prolongment made it more difficult to mobilize, both individually and through brokerage social networks. The reasons behind solidarity/engagement being marked by intermittent accelerations and standstills are explored, with particular emphasis on how social practices in defining and experiencing solidarity have evolved. Despite the destabilizing uncertainty of the pandemic, the interviewees do not forgo solidarity, but rather manage change with "windows of opportunity". Worries connected to experiencing risk are balanced by the requirement to self-regulate and be proactive.

A Time of Disasters - What Can We Learn from Mobilization of Ultras Subculture in Croatia?

Andrej Ivan Nuredinović[1], Dino Vukušić[2]

[1]Faculty of Humanities and Social Sciences, University of Zagreb; [2]Institute of Social Sciences Ivo Pilar, Croatia

The paper chronologically presents and analyzes the social role and social status of the Ultras subculture in the context of organizing assistance amid natural disasters that hit Croatia, such as floods in 2014, fire in 2017, the earthquake that struck in 2020, and finally, the COVID- 19 pandemic. The Ultras represent the most numerous subculture on the Croatian subcultural scene and their collective engagement at the time of natural disasters and the pandemic has had a significant impact on the otherwise negative perception of this supporters' group by the media and the public. Therefore, by using the sociological theories of collective action and certain theoretical aspects from the domain of sociology of subcultures, the paper aims to demonstrate the solidarity and organized efforts of Ultras in regards to the five above-mentioned traumatic events. Within the qualitative part of the research, the researchers used an ethnographic approach by combining participant observation and a semi-structured interview with active participants, members of the supporters' group Bad Blue Boys. The quantitative part of the research was conducted through a survey on a sample of 692 inhabitants of Zagreb that was carried out immediately after the Zagreb earthquake. This paper presents the results of the aforementioned survey questionnaire, analyzed materials collected through interviews, and diary entries created while conducting the field research. The aim of combining different methodological approaches is to show what role the supporters' groups played in the eyes of the citizens in times of natural disasters and the pandemic, while also focusing on the members of the Ultras subculture and their point of view on the abovesaid events.

Women And Children First? An Analysis Of Gender Roles In The Rescue Of People Following The 2011 Lorca Earthquake

Rosario González Arias, Sandra Dema Moreno, María De Los Ángeles Alcedo Rodríguez

Universidad de Oviedo, Spain

Catastrophes, especially those on a grand scale like earthquakes, hurricanes and tsunamis, have a devastating effect which extends beyond personal or material losses and also affects social order. From this point of view, there is increasingly more scientific evidence that demonstrate the impact of disasters on gender relations. This communication is aimed at investigating this issue in the Spanish context -where scientific production remains scant- within the framework of the R&D project GENDER (Gender, Disasters and Risks), funded through the Spanish Research Agency (FEM2017-86852-P). To this end, the discussions from four focus groups were conducted in Lorca (autonomous community of Murcia, Spain) comprising people who experienced the 2011 earthquake there.

The initial results of this study demonstrate that, although, in principal, the danger should be the same, the lived experiences and reactions of men and of women faced with a catastrophic event are not always the same, as is evidenced in the discourses of the different genders. The men's accounts of the rescue and recovery actions they undertake, usually involving the use of physical strength coupled with great risk-taking, are rich in detail. Meanwhile, the accounts of women in this respect are more spartan, their protective actions usually take the form of verbal suggestions and recommendations, and, in addition to the rescue itself, entails staying with those who are rescued. These findings, on the one hand, reveal the presence of traditional gender roles in the recue of people, and, on the other, widen the notion of what rescue involves through incorporating the gender-specific actions identified.

Collective Actions for the Restoration of Monuments: Protecting Architectural Heritage against Natural Disaster in Greece

Maria Leni

Hellenic Ministry of Culture and Sports, Greece

Along with cities and local societies, cultural monuments often suffer from various types of damage, both man-made and natural. As Greece is a seismic area and has suffered from extremely destructive earthquakes over recent years, collective actions have been taken in order to develop civil and cultural heritage protection policies. Group actions for the preservation of architectural heritage after natural disasters have highlighted innovative practices. The restoration of architectural monuments has become the symbol of a society in recovery after an earthquake. Serving this purpose, government officials, public administration bodies, members of municipal and community authorities, together with active groups of citizens have contributed to the efforts to restore the architectural monuments, as a well as other aspects of their lives.

For example, the coordinated actions for the preservation of the historic center of the city of Kalamata and the restoration of its preserved buildings after the 1986 earthquake were proposed for and awarded with the Europa Nostra Award. Respectively, collective efforts and innovative conservation works were carried out on buildings of historical and architectural significance, such as the Zappeion Hall and the Panathenaic Stadium in Athens, treating the damage caused by natural deterioration and the 1996 earthquake.

Active groups of citizens, restoration and conservation experts, as well as public and municipal officials form a network that succeeded to manage and overcome earthquake crisis. The restoration of architectural monuments becomes a metaphor of a healing society and an image of the value of cooperation.

RN08_T07 | Social Dimensions of Disaster/Crisis Preparedness and Response (II)

The Reproduction Of Gender Roles In The Recovery Of Goods After The Earthquake In Lorca (Spain)

Virginia Cocina Díaz

Universidad de Oviedo, Spain

Following a catastrophe such as the earthquake in Lorca (Spain) in 2011, people endeavour to guarantee their own survival and to protect and recover their own goods and possessions. Although, in principle, it might seem that the actions of men and women in the face of a disaster do not differ, some studies have indicated that the social experience of catastrophe situations confirms, reflects, disrupts and shifts social relations and gender roles (Moser 1993, Anderson 1994, Enarson and Morrow 1998, Arenas Ferriz 2001, Kumar-Range 2001). In this paper, how gender roles operate with respect to actions taken to recover goods and possessions after this earthquake are examined. To do so, data from four focus groups of survivors conducted in Lorca eight years after the catastrophe are analysed.

The results demonstrate that men and women behave, to a great extent, in ways coherent with traditional gender roles. The comments of the women focus on explaining how they tried to save essential items— money, clothes and medication— to guarantee their and their family's immediate subsistence, behaviour in line with the female role of caring. In contrast, the men's stories revolve around the risks undertaken to gain access to their homes, barely mentioning the items they managed to rescue, as if what was important was the action of getting back to and into the home, rather than the utility of the items rescued, which could be linked to certain characteristics of masculinity such as bravery or risk taking.

Determinants Of Social Care Organisations' Abilities To Provide Help In Times Of COVID-19 Pandemic

Kristi Nero[1], Kati Orru[1], Abriel Schieffelers[2], Tor-Olav Nævestad[3], Merja Airola[4], Austeja Kazemekaityte[5], Lucia Savadori[5], Daniel De Los Rios Perez[6], Johanna Ludvigsen[3]

[1]University of Tartu, Estonia; [2]The Salvation Army, Brussels, Belgium; [3]Institute of Transport Economics, Oslo, Norway; [4]VTT Technical Research Centre of Finland Ltd, Espoo, Finland; [5]University of Trento, Trento, Italy; [6]Jönköping University, Jönköping, Sweden

The Covid-19 pandemic challenges the sustainability of the social care organisations (and those dependent on their services) when services are stopped or restricted to mitigate the spread of the virus. The aim of the study is to examine the outcomes for the social care organisations and their users in the early months (March to July 2020) of the pandemic, and the factors influencing the organisations' abilities to successfully respond to the crisis. The study focuses on the experiences of social care organisations such as residential settings, day-centres and food banks that offer services to individuals in highly precarious situations or the homeless in nine countries: Germany, Italy, Hungary, The Netherlands, Norway, Czech Republic, Finland, Lithuania, Estonia. The study is based on 29 qualitative research interviews with managers and staff at social care organisations and document analysis. The analysis demonstrates that in the context of drastic surge in demand for services, diminishing funding, and lack of crisis plans, the dedication and creative solutions by organisations' managers, organisational culture and intra - organisational cooperation were pivotal in maintaining the care provision. The study offers important insights in terms of potential strategies and the role of social service in health crises.

Organisational Practices of Managing Uncertainty and Anticipating Severe Weather Events

Jasmina Schmidt, Rebecca Lange

Freie Universität Berlin, Germany

Extreme weather events like winter storms or droughts can have a significant impact on public safety, especially when there is limited time for authorities and organisations with safety tasks to prepare for them. Communicating forecast uncertainty allows weather services to provide information about potentially severe weather at an earlier time, albeit with lower probability or precision than at a later point in time. However, this earlier communication may allow better preparation for the event. Hence, this study focuses on the handling of weather warnings and the uncertainties they entail on the side of organisations with safety tasks. This research is based on two case studies: fire brigades in Brandenburg, Germany and their practices of managing forest fire danger and the German road traffic sector in relation to weather warnings and road safety.

The emphasis here lies in factors of organisational structuration and culture, as well as in implicit and explicit knowledge in decision-making, especially in the preparatory phase of reported extreme weather events. In order to better understand how forecasting uncertainty is incorporated into organisational decisions and practices, the study follows a qualitative research approach. In our conference contribution we will present the first results of focus group discussions and semi-structured expert interviews with representatives of the organisations in question. Findings will contribute to the understanding of responses of professional recipients of weather warnings and the theoretical discussion of organisational practices in the context of weather forecasting and warning.

RN08_T08 | Comparative perspectives in socio-economic crisis

Migration: Sociocultural Conflicts of Values

Musa Yusupov

Chechen State University, Russian Federation

The modern world is characterized by a high level of migration, movement of people within the country and between countries. National and local societies are becoming more and more multi-ethnic, spaces of interaction of different cultures are being formed. This is often accompanied by tension and value conflicts. Research object: migration.
Subject: socio-cultural conflicts of values of migrants.
Purpose: to reveal the features of manifestation of the conflict of sociocultural values of migrants.
Method: Sociocultural and conflictological approaches, application of the method of comparative and logical analysis.
Result: Migration is a natural phenomenon in the development of mankind. Today it is based on various reasons, social inequality, surplus population in certain regions, natural disasters, physical security in zones of the armed conflict and others. The report highlights the main migration flows from one country to another, provides a comparative analysis of emerging relations and emerging contradictions of socio-cultural values in European countries and Russia. The presence of value contradictions within migrant groups, between migrants of different ethnic diasporas, as well as between migrants and the population of the host country is noted.
Conclusion: Migration processes are an inevitable phenomenon of social reality and represent a significant resource for the development of the economy, science and art. They demand that government bodies and civil institutions constantly improve and develop new mechanisms for harmonizing values and interests, adapting and integrating migrants into local communities. We need permanent commissions or public councils to prevent and regulate conflicts of interest and values.
Key words: migration, sociocultural values, conflict, interests, difference

The Economic "crisis" in Greece Through the Lens of Labour Mobility - Immobility of Albanian Migrants

Maria Panteleou

University of the Aegean, Greece

This presentation, using material from triennial anthropological fieldwork (2015-2017) with Albanian migrants, who live and work in Corinth since 1998, highlights how people from the same ethnic group perceive and manage differently the "crisis" and the common issue of the working hours' reduction in the Corinthian labour context. For some Albanians as archetypal "crisis" is understood the collapse of the Communist regime in Albania in the 1990s and aftereffect of national unemployment that was confronted by international migration and finding work in Greece. Therefore, the subsequent economic "crisis" in Greece is considered as a familiar precarious situation, dealt with mobilization of social, labour relations of "trust" with Greek employers who help them to move in the wider region of Corinth, acquiring additional jobs by various Greek employers. For other Albanians, the economic "crisis" in Greece is an unusual, fluid economic situation, during which Greek employers make the work, which they used to assign to Albanians, done by themselves or they assign their work to other workers, who seek lower labour payment than the Albanian workers. The presentation concludes that the economic "crisis" in Greece is being experienced differently among Albanians in Corinth, because some of them, having had built social and labour networks of "trust" with Greek employers, receive the privilege of labour mobility in the wider region of Corinthian area by increasing their income. Others, indifferent to establish relationships with Greek employers, are immobile in Corinth; expect local works from random Greek employers to emerge.

Findings On Organizational And Inter-organizational Tension Fields During The „Refugee Crisis" – What Crisis Are We Talking About?

Patricia M. Schütte[1], Jana-Andrea Frommer[2], Malte Schönefeld[1], Yannic Schulte[1]

[1]Bergische Universität Wuppertal, Germany; [2]German Police University, Germany

It has been over five years, since a major refugee movement to Europe took place. Between fall of 2015 and early summer 2016 a total of more than 745,000 people sought asylum in Germany, to cite an example (BAMF 2017). Public authorities, aid organizations, private actors, as well as citizens etc. contributed to the situation by taking over functions addressing the handling of the asylum procedure, accommodation, care and support until the decision of the procedure (about integration, or repatriation). The involved actors faced a dynamic, complex and challenging situation, often labeled as "Refugee Crisis". Retrospectively it seems that involved organizations had low capacity to evaluate the situation to draw lessons for the future as daily duties required their full attention. The research project "Security Cooperation and Migration" deals with this "gap", and aims to reconstruct and analyze the inter-organizational handling of the situation, as well as lessons learned and good practices from various perspectives based on qualitative interviews. The empirical findings point to challenges in terms of "tension fields" within and between the involved organizations, which indicate conflicts, but also learning opportunities for the future, for example based on evolving trust through participation. The main question concerning this set of issues: What kind of organizational and inter-organizational challenges can be identified and what could be learned as for other crises (e.g. COVID-19 pandemic)?
This contribution will present findings from interviews with members from police, public administration and private security to provide an explanation to the main question stated.

311

Symbolic Interaction, Power, And War. An Ethnography-inspired Analysis of the Narratives Of Unaccompanied Young Refugees With War Experiences In Institutional Care In Sweden

Goran Basic, David Wästerfors

Linnaeus University, Sweden

This study concerns young people who have experienced war, taken shelter in Sweden, and been placed in institutions. The purpose of the study is to identify and analyze power relations that contribute to the shaping of young people's identities and repertoires of action via stigmatizations and social comparisons with different reference groups. The study's empirical material includes qualitatively oriented interviews with six young people from Iraq, Syria, and Afghanistan who have experienced war followed by placement in institutional care in Sweden. Analytical findings with the following themes are presented: (1) power relations and war, (2) power relations and escape from war, and (3) power relations and post war. The study demonstrates that narratives about war, escaping war, and postwar life in Sweden construct and reconstruct an image of a series of interactive rituals that are both influenced by and influence the power dynamic between the actors. This relationship in turn creates and recreates an interplay among the stigmatizing experiences of the youths, their social comparisons, and definitions of inequality.

RN08_T09 | Crisis and Conflict in Society

Displacement of Violence in Post-Conflict Setting: The Case of Bosnia and Herzegovina

Maja Halilovic-Pastuovic

Trinity College Dublin, Ireland

The focus of the paper is the segregated education system in Bosnia and Herzegovina, and the phenomenon of 'two schools under one roof' that currently operates in the country (TSUOR). TSUOR describes a policy of ethnic segregation which was introduced by the Dayton Peace Agreement that, in 1995, officially ended almost four-year long conflict in the country. Muslim and Croat children attend classes in the same building but are physically separated into different classrooms and taught ethnically differentiated curricula. The paper investigates if more than two decades of segregated education in Bosnia have had a negative impact on security in the region by creating fertile ground for ethno-radicalisation of Bosnian youth. The paper presents current situation in Bosnia as ethnocracy, a political system in which political and social organisations are founded on ethnic belonging rather than individual choice. This paper argues that segregated education in Bosnia presents an example of post-conflict ethnocracy trap. It further argues that while actual combat may have ceased, the ethnic conflict continues via the field of education and as such contributes to community vulnerability. The paper is based on textbook and curricula analysis and interviews with educators in Bosnia.

312

Civilian Participation In Interstate War: Unfolding Voluntary Collective Action In Nagorno-Karabakh War

Hayk Smbatyan

Uppsala University, Sweden

The paper covers the results of a small-scale single-case study on civilian participation in interstate war. Looking at the case of the 2020 Nagorno-Karabakh war, I am exploring the reasons and motives why civilians volunteer for joining the armed forces during war. In this qualitative analysis of in-depth interviews with war volunteers from Armenia, I mainly rely on Elisabeth Wood's theory on insurgent collective action, additionally drawing on the observed phenomenon from the perspective of Max Weber's social action theory. Based on the results of the study, I argue that emotional and moral motives, rather than rational intentions, are what shape the decision to volunteer. Withal, the paper exhibits that Wood's theory, contingent upon relevant conceptual and contextual expansions, has a significant explanatory power even outside of its original scope conditions.

Conflict As A Catalyst For Peace? The Case Of The Conflictualisation And Pacification Of Northern Irish Society Through Its Past And Present Political Crises

Théo P. V. Leschevin[1,2]

[1]EHESS (LIER-FYT), France; [2]Maynooth University, Ireland

This presentation focuses on the Northern Irish peace process. Using ethnographical work in an area of Belfast marked by the conflict between Catholics and Protestants, we analyse how actors confront each other in order to enforce competing conceptions of what the peace process should be. For most social groups, the residents of this district maintain a 'social anachronism' by remaining attached to forms of social conflict that the rest of society, and the State group, intend to relinquish. The members of these disadvantaged communities, whilst divided on their attachment to their ethno-political community, then put forms of stigmatisation regarding

their relationship to peace and conflict to the test. How are these processes of increased reflexivity and accusations of resistance to peace characteristic of the particular social change that a 'peace process' represents? First, we show that these conflicting ideals of 'conflict' and 'peace' are expressed in the treatment of local public problems and have their origins in actors' practices. We then suggest that the unexpected evolution of certain public issues - such as juvenile suicides, street fighting, women's empowerment and sporting oppositions - and the increasing accusations of 'return to conflict' or 'imperfect peace' highlight tensions that are specific to the way modern societies attempt to regulate internal antagonisms. Finally, through a historical detour, we show how this reflexive dimension of conflict has become increasingly prevalent as Northern Ireland has experienced successive crises throughout its history, being progressively taken over by the state.

Culture Eats Conflict Moderation for Lunch

Bettina Fackelmann

University of Applied Sciences, Darmstadt, Germany

The current Covid-19 pandemic enhances existing societal conflicts (namely equal access to health services, economical and educational resources) and might only be the first of further global virus-related crises to follow (Davis, M. (2012)). Governments have the chance to integrate citizens in debates on these conflicts as to solve them more consensus-based (Howarth, C. et al. (2020)) and with innovative (OECD (February 11, 2019)), approaches.

The levels of competences to deal with conflicts, however, vary among people as recent, partly violent social and political tensions and escalations show (Rollwage M. et al. (2018) / van Prooijen, J. (2019)) especially when mirroring them against (intercultural) conflict competencies like "inter-pretive perception and judgment" and "developmental construct/no either-or attitude" (Füllenbach, B. et al. (2016)), "conflict optimism" or „balanced behavior" (Ting-Toomey, St. (2007)).

Risks of intensifying the existing conflicts could be decreased by moderating them officially and publicly. Here, again, cultural sensitivity matters for choosing suitable moderation methods and competent moderators as to be perceived as "appropriate" and "effective" (Spitzberg, B. et al. (1994)). This is especially important with regard to global conflicts, requiring region-wide or global, lasting agreements. Appropriate conflict moderation thus avoids the "violation of valued

313

rules, norms, or expectancies in given context or contexts" while "effective interaction obtains valued outcomes, objectives or goals" (Spitzberg, B. et al. (1994)).

If and how popular conflict moderation methods work in different cultural settings, will be examined by using valid

RN08_T10| Science, Technology and Disaster Studies (I)

Digital Practices of Russian Emergency Volunteers

Polina Ermolaeva, Olga Basheva

Federal Center of Theoretical and Applied Sociology of the Russian Academy of Sciences, Russian Federation

The authors' research based on the original empirical data (in-depth and expert interviews, online-survey, analysis of digital communities) provides insights on the nature, functionality, opportunities and limitations of digital technologies of Russian emergency volunteers, in particular, volunteer forest firefighters and search and rescue teams. The key areas of digital emergency volunteers work relate to (1) gathering and analysis of vast data streams in order to respond to humanitarian crises (i.e., volunteered geographic information), (2) designing of new digital platforms aimed at efficient and transparent distribution of assistance (this area engages the volunteers work among IT community), (3) mobilizing online communities to meet the needs of affected people as quick as possible. The data also shows that the emergency volunteering is divided by the level of risk to their life and wellbeing, expertise, skills set and knowledge. Along with search and rescue skills and firefighting the volunteer community are actively mastering the skills to deal with special equipment and technologies, including working with media content and SMM. Modern technologies have created new repertory of volunteer practices in emergencies and restructured the agency of volunteers in a way that they can create and lead virtual volunteering emergency platforms by themselves. The authors will also discuss the key opportunities (e.g. fast speed engagement, coordination) and shortcomings (e.g. digital divide, fake information) of the Russian digital emergency volunteers as well as their work during the COVID-19. The latter period has shown that the vast opportunities that digital technologies are introduced cannot fully compensate offline activities.

Covid-19 as a Slow Disaster: an STS Perspective as Intervention in the Management of the Pandemic.

Israel Rodriguez-Giralt

Open University of Catalonia, Spain

This talk aims to "think with" the intense adventure in which I have been involved. It tells the story of a multidisciplinary Technical Support Group (TSG) on the Catalan government's pandemic. This particular task force was aimed to contribute to "everything necessary to understand and get involved in the logic of this epidemic". This included epidemiological surveillance issues, health prevention and promotion, working at the healthcare and community level or adding risk communication and citizen involvement. For about 4 months, a multidisciplinary team of 8 people worked intensively to develop ideas, technical documents and tools for risk communication, protocols, indicators, alert plans, social support strategies for isolation and quarantine…

Ethnographically, I am interested in two interconnected processes: 1) the role and boundary-work of epidemiology throughout the pandemic, interrogating whether the pandemic is changing the field of practice and/or its academic status, particularly concerning other disciplines and medical specialities, and 2) in what way, this interpellates and intertwines with our own capacities/incapacities, as social scientists, especially as disaster scholars, to collaborate and be relevant in the midst of a pandemic. In particular, I will reflect upon the notion of "slow disaster" and how it has worked in our TSG as a boundary-concept that has had enough immutable content to maintain the integrity and facilitate communication despite being understood in different ways across various experts and publics. In this regard, the notion has become an interesting, and still intriguing, way of negotiating my expertise, as a social scientist, and mostly as "disasterologist", to intervene in the conceptual and practical articulation of the pandemic.

314

Military Conflicts and Existential Fears: a Comparative Analysis of Modern European Society

Natalia Nemirova

Saint-Petersburg University, Russian Federation

The presentation is devoted to the problems of transformation of the concept of "war" in the mass consciousness of the population of European countries and its influence on the solidarization of European society. In the context of hybrid wars, due to the development of digital technologies, war is virtualized, and as a result, ideas about it are distorted. The formation and maintenance of images of enemies in the media contributes to the growth of fears. This is a serious burden on the everyday consciousness of citizens, which was especially aggravated during the Pandemic. War refers to massive existential fears fueled by military rhetoric, constantly fueled by a sense of catastrophism and isolationism. In this report, based on secondary sociological data (Levada Center, Gallup, Pew Research Center, ESI, EDeLman and others), a comparative analysis of the fears of residents of European countries and their perceptions of war as a real threat is carried out. How do fears contribute to international polarization? How has robotization influenced the socio-political significance of war? Do real military conflicts affect the transformation of opinions in modern conditions? How has isolation during the pandemic affected the growing fears of Europeans about war? What measures should be taken to stabilize the situation? To answer these questions, several cases are analyzed: the war in Ukraine, military actions in Syria.

Dialogues of Digital Commons and Equitable Resilience: Spaceless Community Participation and Concrete Reflections on Regions

Danai Toursoglou Papalexandridou[1, 2, 3]

[1]Aristotle University of Thessaloniki, Thessaloniki, Greece; [2]URENIO Research Unit, Thessaloniki, Greece; [3]Northeastern University, Boston, MA, USA

During the first wave of 2020 pandemic, a rise in the number and popularity of commons-based initiatives was observed worldwide. In this paper I question the ways that platforms associated with urban and digital commons affect bonding, bridging and linking social capital and eventually the resilience of communities. The analysis takes place in 2 layers:
- the direct impact of the platforms on the ability of communities to bounce forward,
- the impact of such platforms on equitable policy making related to community resilience on the regional level, through ecosystem interactions.
Based on the preliminary findings, the platforms can result in both positive outcomes and negative externalities of social capital depending on their internal characteristics in terms of community, rules and data management and the way that they interact within cyberphysical ecosystems.
The paper consists of a theoretical framework and a case study.
The theoretical framework is a comparative analysis in the fields of resilience, social capital, urban and digital commons and platform ecosystems.
The case study is analysing Boston communities, towards lessons learnt for equitable resilience in Europe. An inferential statistical analysis and an analysis of within and across community interactions through social network analysis, leads to the correlation of the impact of COVID19 on Boston communities with platform participation. The results are used for a bottom-up assessment of I-RES (Integrated Resilience Enhancement Solutions) framework of Global Resilience Institute.
The paper is a valuable contribution, linking the fields of equitable resilience and the commons. It can highly support future research and projects, as many diverse types of crises, shocks and stretches are following the pandemic.

RN08_T11 | Science, Technology and Disaster Studies (II)

Crisis Communication and Informative Treatment of Forest Fires That Occurred in Galicia (Spain) in October 2017

Ariadna Rodríguez-Teijeiro, Alberto Cotillo Pereira

University of A Coruña, Spain

This proposal recognizes forest fires as a social, political, economic and environmental problem (da Silva et al., 2019) and focuses on the analysis of the media coverage granted to forest fires that occurred in Galicia (Spain) in October 15 and 16, 2017. Particularly, this proposal's objective is to examine how risk of forest fires is communicated in a local newspaper, La Voz de Galicia, that "in its public service mission must offer useful information for citizens in emergency situations" (Pereiro, Dominguez y del Campo, 2018). We start from an approach that places news as a discourse (Van Dijk, 1990) and we approach the news published during the fire period through the analysis of the interpretative frameworks that they contain (Goffman, 2006). Ultimately, this proposal tries to understand the contribution of local media to risk perception of forest fires to identify possible "gaps between scientific communication and local risk communication" (da Silva et al., 2019).

Political Use of Visual Social Media in Spain in Times of the COVID-19 Pandemic

Miguel Varela-Rodríguez

Universidad de Valladolid, Spain

This paper examines the use of COVID-19-related images in social media by major political parties in Spain between March and June 2020. Through content analysis of a sample of 985 images collected from the Instagram profiles of the parties in the Spanish Congress, the paper identifies key moments and leading visual elements and discourses that have accompanied the different phases of the response to the coronavirus. In an early phase (following the decree of a State of Alarm in March 2020), parties promoted messages of unity and encouragement, drawing on national symbols, emitting messages of hope and calling for social responsibility and collective care. Images that included messages of gratefulness to health workers were common, as were the demands for support to public services. This phase opened a window of opportunity for enhanced dialogue in Spain that would not last long. Steadily, images became more divisive, with the use of national symbols becoming more closely ascribed to certain ideologies and a higher use of memes and posters demanding change or putting blame on certain collectives, more visible with each extension of the State of Alarm. By May 2020, rallies for the removal of restrictions became commonplace in visual social media, attacks between parties were no longer the exception, and leaders (mostly male) emerged more prominently. The paper argues that such discourses have contributed to increasing the emotional and social toll of the pandemic, and furthered the perception of social division.

316

Emerging Technologies and Terrorist Threats: A Monitoring Approach

Isabel Kusche, Christian Büscher

Karlsruhe Institute of Technology, Germany

The aim to prevent extremist polarization and terrorist acts is closely linked with the notion of monitoring developments that may not be dangerous in themselves but could nevertheless foster or facilitate the emergence of threats. "Monitoring System and Transfer Platform Radicalization" (MOTRA) is a collaborative project funded by the German Civil Security Research Programme that is based on this notion. Our sub-project focuses on the monitoring of the role that new technological developments may play in the aggravation of extremist and terrorist threats on the one hand and their prevention and mitigation on the other hand. In the first part of our paper, we describe the theoretical assumptions that underlie the monitoring concept and their translation into an operational procedure. In the second part, we present results of a delphi study that asked experts at the intersection of research on technology and extremism/terrorism to evaluate how likely a number of technological developments are to help and encourage extremist and terrorist actors. We situate the study in the overall monitoring process and show how it contributes to a prioritization of technology assessments that take the possibility of misuse seriously. The overall ambition of the project is thus to contribute to more societal resilience in the face of possible political conflicts.

From Catastrophic Energy To Critical Information: Forest Fires In The Spanish Parliamentary Debate Of The 21st Century

Juan de Dios Ruano Gómez, Ariadna Rodríguez Teijeiro

Universidad de A Coruña, Spain

The Spanish Parliament (Congress of Deputies and Senate) is the main political mechanism for transforming the catastrophic energy of disasters into critical information for politics. Energy and information, catastrophes and crises will therefore be analysed in this Communication through parliamentary debates on forest fires in 21st century Spain, which have been the subject of public debate in the Spanish Parliament.

Organizational Adaptation and Structural Inertia during the Covid-19 Pandemic: The Case of Excursion Companies in Russia

Maiia Kim, Maksim Markin

HSE University, Russian Federation

The Covid-19 pandemic dramatically changed leisure practices in 2020. For instance, the tourist season started later than it usually starts. Hotels, restaurants, tour operators and other companies lost many clients in the first part of 2020. But millions of persons decided to have vacations in the summer. Most of them selected domestic over foreign destinations (Zenker and Kock, 2020). As a result, tourism industry business had to adapt the new conditions when there were many clients after the lockdown and the demand structure changed. The research studies the organizational adaptation and the structural inertia of excursion companies during the Covid-19 pandemic. Fifteen in-depth interviews were conducted with directors of excursion companies and self-employed tour guides in Russian Black Sea Coast in August 2020. The findings show that the state financial support was not enough for tourism industry business and it had to solve the problems by itself. Most of the tourists spent their savings during the lockdown and the demand on excursions decreased. Companies had to reduce the expenses and to optimize the number of tours. As people wanted to relax after the coronavirus restrictions they mostly asked for entertainment excursions. The resorts that specialized in such tours fulfilled the demand. But the structural inertia (Hannan and Freeman, 1977) of excursion companies in other places on the coast limited the organizational adaptation.

Tourism industry business had been investing in cultural and historical tours for many decades and it was not sure that entertainments would be demanded after the Covid-19 pandemic.

New Business Requirements In The Tourism Sector In Greece Due To The Pandemic – Resulting Skill Requirements

John F. Dumont[1], Olympia Kaminioti[2], Iliana Katz[1], Sofia Mitic[1]

[1]Webster University Athens, Greece; [2]National Institute of Labour and Human Resources

The sectoral and occupational structure of employment has been radically changed due to Covid-19 in the last year. Additional changes have been recorded in labour relations. Moreover, the pandemic has accelerated institutional and technological transformations at the sectoral, country and international levels. The impact of these changes has been stronger in certain sectors such as the tourism sector, due to limitations in traveling and other restrictions due to the pandemic. In this paper we focus on the new requirements brought by the pandemic in the tourism sector in Greece. Utilizing quantitative data from a survey of tourist users and qualitative data from in-depth interviews with key tourist actors, we map these new requirements for developmental change in the tourist sector in Greece during, and, especially after the pandemic. We address how the current situation leads to new opportunities and obstacles for tourist companies and skill needs for employers and employees in the tourism sector.

Welfare benefit recipients in Germany: Unemployment dynamics during the Covid-19 pandemic

Katrin Hohmeyer, Katharina Dengler, Tamara Harrer, Veronika Knize

Institute for Employment Research, Germany

The Covid-19 pandemic has been challenging social security systems such as the German welfare benefit system 'Unemployment Benefit II (UBII)', which might have changed its scope as a consequence. The article analyses the UBII entries and exits of unemployed people by individual characteristics and economic sectors as well as their participation in active labour market programmes during the Corona crisis. Using aggregate administrative data, we find that lower exit rates from unemployment drive the Corona-related change in unemployment for UBII recipients more strongly than for the average unemployed. Those most strongly affected in their employment opportunities are UBII recipients without a vocational degree underlining the importance of education. To a smaller extent yet still strongly affected are foreign and younger UBII recipients. Furthermore, the sectors accommodation & food service and temporary work agencies that normally provide employment opportunities for welfare recipients are the most affected by the Corona crisis. Considering that UBII recipients are a per se vulnerable group facing barriers to finding a job, it is likely that missing opportunities during the pandemic might further deteriorate their employment perspectives.

Experiencing and Projecting a Crisis: Households' Reactions to the First Months of the COVID-19 Outbreak in Poland

Marta Olcoń-Kubicka[1], Łukasz Posłuszny[2], Joanna Felczak[3], Paweł Kubicki[3]

[1]Institute of Philosophy and Sociology at the Polish Academy of Sciences, Poland; [2]University of Wrocław; [3]Warsaw School of Economics

How the Covid-19 related crisis has impacted the financial situation of the households? How do they try to make a living in that situation of radical change? The main goal of our presentation is to analyze households' coping strategies in a situation of the experienced or projected crisis. Our analyses are based on the diary research material obtained in the memoir contest "Everyday life in the times of coronavirus" organized in Poland in the first months of the pandemic outbreak (March-July 2020). Drawing of this biographical research material (448 diaries and memoirs) we show that restrictions on mobility and increased precautionary measures have changed households' economic and consumption practices. The limitations in the availability of goods, shopping opportunities, and services pushed diarists to initiate substitute actions based on their own resources, competencies, and local support networks. The radical change resulted in the practice of carrying out an "audit" of the household as household members engaged in a deeper reflection on their financial situation by attempting to predict and visualize the future risks. The diaries, written by people in different social and economic situations, showed to what extent household resources, understood as income, savings, living conditions, social contacts, or professional qualifications had a significant impact on the severity and perceived costs of the pandemic. We focus on two types of households: (1) those that experience immediate effects of the crisis, and (2) those who project the upcoming crisis that might affect their financial situation in the future. We show how these two categories operate in different time horizons and how the uneven impact of the crisis manifests itself in their trajectories, expectations, and coping strategies.

RN09_T01_02 | Morality and Modern Market Economy

The Moral Background of Impact Investment

Philip Balsiger, Daniel Burnier, Noé Kabouche

University of Neuchatel, Switzerland

Over the last decade, the practice of investing with the intention to generate both a social/environmental impact alongside a financial return – a practice called "impact investing" – has become increasingly common. While most studies of impact investment have analyzed how financial value and social values are brought together in investment practices, our paper is interested in analyzing the moral discourse that underpins them. Building on the "new sociology of morality" which investigates the nature, causes and consequences of people's ideas about the good and the right, we have conducted a study of the public moral opinions of this industry (on traditional investments, socially oriented investments, social enterprises, the economy in general, and political and social/environmental issues), as well as its "moral background" (Abend 2014), which is the framework that supports specific moral judgments and behaviors. What do impact investors urge traditional investors to do to be more moral? What examples and cases are cited? What "heroes" must be followed? What kinds of reasons, conceptual repertoires, methods and evidence, or metaphysical conceptions support their moral opinions? Empirically, the research on which this paper builds is a qualitative study of the impact investment ecosystem in Geneva, a major global hub of traditional and "sustainable" finance as well as international development. For this paper we analyze two data sources: a collection of publications from core impact organizations (websites and selected reports), for which we make a qualitative and quantitative content analyses; and a qualitative analysis of interviews with impact investors and intermediaries (around 30 so far). The paper promises to yield new insights into the "moral turn" of contemporary finance.

RN09_T02_01 | Theoretical developments of Economic Sociology revisited

Institutions and Innovation: A Systematic Literature Review of Major Research Fields

Paula Espinosa-Soriano, Manuel Fernández-Esquinas, José Luis Ortega

Spanish National Research Council (CSIC), Spain

Institutions are considered one of the important factors that shape innovation. Institutional arrangements are expected to determine the innovation capacities of countries, regions and to yield social outcomes. The social studies on innovation have placed institutions in a significant position of the research agenda. Theoretical approaches and empirical studies have increased substantially, resulting in a very complex multidisciplinary landscape built from sociology, economics and policy sciences, among others.

As a consequence, it is very difficult to figure out what we really know about the role of institutions on innovation. Two important gaps are the lack of consensus on the meaning of institutions, and the popularity of innovation as a catch-all concept applied to phenomena of diverse nature.

The goal of this article is to provide a review of the literature on the topic. Our research questions are: 1) what are the conceptual foundations of research traditions?; 2) how the relationships between institutions and innovations are studied?; 3) what are the major achievements?

We conducted a bibliometric analysis of the literature published in the Web of Science followed by a qualitative review of significant works. We used 806 documents to explore the knowledge base and the current research fronts. Because of their usefulness to identify social networks, we used "author co-citation analysis" and "author bibliographic coupling analysis". The preliminary results show several clusters that represent the intellectual and social map. We have found that the structure of the field is built on the different

320

conceptualizations in economics and sociology about the meaning of both institutions and innovation. In the paper we identify the research communities and analyse their contributions to the current state of knowledge.

New Sociological Thinking About Economic Forms - Max Weber's Institutionalism

Andrea Maurer

Universität Trier, Germany

In the 1980s when new economic sociology started only few attentation had been given to classical European thinking. So, for a long time economic sociologists overlooked Weber's studies on economic forms and did not see his analyses of socio-economic institutions in "Economy and Society". This presentation will provide a new perspective on Max Weber and elaborate his institutionalism as a foundation of a sociology of economy today. It is stated that we can take from him the notion that a variety of institutions could frame the economic world having different effects, due to the inherent constellations of interests. Thus, Weber's "General Economic History" and "Economy and Society" are presented as a comparative institutional perspective on economic forms and a third way of analyzing socio-economic phenomena. This allows us to present Weber's work as a sociological perspective on economic forms, as well as a foundation of economic sociology.

Political Structures and Trust in Markets: A Comparative Examination of Consumer Trust in 28 EU Member States and the Effects of Consumer Policy on Trust.

Sebastian Nessel

University of Graz, Austria

A central tenet of the New Economic Sociology is that trust is a central factor in the sound functioning of markets. Previous research has mainly used a national-scale network approach to argue that personal relations generate trust in market relations. In contrast, I argue, from a comparative perspective, that political structures influence consumer trust. First, using secondary, aggregate data on consumer trust in the 28 EU member states retrieved from the 2016 EU Scoreboard on Consumer and Retailer Attitudes toward Consumer Protection, I show how consumer trust in markets varies across the 28 EU member states. Second, I use regression models to examine the effects of varying levels of political embeddedness on consumer trust, taking legal, enforcement, associational and institutional consumer policy dimensions as a proxy. GDP per capita and market competition (Hirschman-Herfindahl Index) are included in the regressions as control variables and to test the possible effect of economic influences on consumer trust. The results support the view that it is not only personal relations that generate trust in market relations but also political structures. As the results furthermore show, it is political more than economic factors which play a role in trust generation. The findings and the argument presented in this talk echo institutional economic sociological approaches, and they add to them a trust dimension. They furthermore encourage finer-grained comparative analysis to better account for the effects of social macrostructures on trust.

The Economic Sociology of Innovation: Taking Stock – Looking Ahead

Alexander Ebner, Filippo Reale

Goethe-Universität Frankfurt, Germany

This paper argues that a distinct economic sociology of innovation aims at exploring the motives and modes of novelty-generating and -diffusing economic action. A point of departure may be provided by the diverse forms of knowledge and the degree to which they appear as property and commodities. In a similar vein, the contested logic of marketization may be explored when it comes to narratives, metrics, and other means of coping with the effects of uncertainty associated with technological innovation. Moreover, an economic sociological view on entrepreneurship may address reflexive actors, who develop distinct techno-economic goals and deploy social skills to achieve them, involving strategies for the legitimization of novelty. A corresponding perspective on the innovation efforts of firms might explore how firms proceed with innovation routines and practices, as exemplified by modes of R&D operations. As firms are set to compete within specific social structures, their embeddedness in socio-spatial networks emerges as a further key concern of the economic sociology of innovation. These inter-firm

networks might extend to research institutes, universities, government agencies and other actors from the private and public sector who are active in the generation of new knowledge and thus become constitutive parts of regional or national innovation systems. An economic sociological perspective might look at the characteristics of these systems in terms of the structures of knowing, valuating, and legitimizing which sustain the reflexive interaction and learning efforts of the involved actors. Corresponding variations in political and legal aspects of innovation inform the national and regional diversity of capitalism and their self-transformation into new paradigmatic types.

The Moralization of Economics

Georg Kanitsar

Institute for Sociology and Social Research, Vienna University of Economics and Business, Austria

The discipline of economics has a formative role in the moral configuration of market society. Yet, the moral content of economics has been dissected mainly by unveiling the implicit normative implications of its purportedly neutral assumptions. Far less attention has been devoted to figuring out what it is that the economic scholarship regards as moral and how economists conceive morality. However, it is exactly these explicit conceptions that enter economic discourse, spread as part of economic knowledge, and eventually shape the moral understandings of markets.

This article discusses the 'moralization of economics' – that is, the integration of morality into mainstream economic thought. I show that, in light of the behavioural turn, economics has rediscovered morality. I map three strands in present-day economic literature, which have theorized the moral foundations of market society, emphasized the moral limits of market expansion, and illuminated the moral consequences of market trading. The three strands are ostensibly irreconcilable with prevalent views of economic scholarship as either endorsing market solutions or neglecting morals altogether. Nevertheless, the three strands remain strongly wedded to the discipline's theoretical and methodological conventions. As a result, the 'moralization of economics' centres on a narrow and peculiar kind of morality, which is functional to the correction of market imperfections and attributed to the responsibility of rational individuals. I conclude by pointing to parallels between how economics theorizes morality and how economics supports the ideational embeddedness of market society.

Reimagining Capitalism in Times of Crises: How the Pandemic Affects Moral Market Entrepreneurs' Imaginaries of the Future

Simone Schiller-Merkens[1], Philip Balsiger[2], Lisa Suckert[3], Birthe Soppe[4,5]

[1]Witten/Herdecke University, Germany; [2]University of Neuchâtel, Switzerland; [3]Max Planck Institute for the Study of Societies, Germany; [4]University of Innsbruck, Austria; [5]University of Oslo, Norway

The current pandemic seriously affects all spheres of society, including the economy where growth has plummeted, value chains have become interrupted, unemployment has increased, and R&D investments have been put on hold. In this state of radical uncertainty, tentative questions about the long-term effects of the crisis have been raised. While some fear that the turmoil of the pandemic will reinforce or even aggravate capitalist dysfunctions like increasing inequality and environmental destruction, others hope that this crisis can "open up the future" and provide a window of opportunity to transform capitalism and bring about change toward a sustainable economic order.

Contributing to this broader question, this study focuses on a group of actors that are considered as drivers of social change and capitalist transformation: moral market entrepreneurs. Based on a qualitative analysis of semi-structured interviews and complementary document analysis for 25 entrepreneurs in the German ethical fashion market, we set out to understand how these actors imagine the future in the face of crisis. In particular, we explore a) their imaginaries of social change, i.e. how they generally project the pathway toward an alternative economic future, and b) how the current crisis affects or alters these imaginaries and figures in their ideas of a forthcoming capitalist transformation.

Our study contributes to the growing strands of literature on imagined futures in the economy and on morality in and around markets. By shedding light on how moral market entrepreneurs reimagine capitalism in the face of the pandemic and reconsider the possibility for broader social change, we highlight the contingency of imaginaries of social change and capitalist transformation.

322

The Impact Of The Financial Crisis On The Participation In Private Pensions In Germany

Ulrich Brandt, Dagmar Zanker, Dina Frommert

Deutsche Rentenversicherung Bund, Germany

In the context of the German three-pillar system of old-age security, financial markets play a significant role in securing living standards in old age. The financial crisis of 2008 has not only left its mark on the value of retirement savings, but most probably also on savings behavior. We assume in this paper, that the financial crisis has led to a loss of confidence in financial markets, and this loss of trust can be illustrated by looking at the number of newly taken out pension plans in the following years.

The paper is based on data of the LeA-study on "life courses and old-age provisions". The representative survey contains information on employment records and individual pension plans for Germans born 1957 to 1976. The analysis concentrates on so-called Riester pensions as the most dynamic private pension scheme in Germany in recent years. We estimate panel fixed-effects logit models to examine whether the financial crisis had an impact on the participation in Riester pensions. Results show that instead of a shock effect relating to the crisis years, we rather see a linear effect following the crisis. Even though it is thus difficult to pin the effect solely on the financial crisis, there is big challenge for social policy, if funded plans are needed to ensure adequate future old age incomes.

RN09_T02_02 | New Forms of Money

Fear of the Pandemic and Social Distancing as Factors Determining Faster Institutionalization of Cashlessness

Joanna Szalacha-Jarmużek

Nicolaus Copernicus University, Poland

The shock of the coronavirus pandemic has changed the way societies and economies around the world function. It has also influenced the payment behaviour of customers and firms' payment strategies (the way companies accept payments). More and more publications indicate that cash is being replaced faster and faster (because of the pandemic) by payments made with cards or smartphones around the globe. With this paper we would like to discuss sociological dimensions, specifically institutional aspects of this change.

With references to two phases of empirical studies – qualitative (IDIs) conducted with owners of small firms in June 2020 and quantitative (CATI) conducted on a representative sample of 1000 adults in July 2020 in Poland – the issue of institutionalisation of cashlessness is at the centre of this analysis and is presented as a broad social process that consists of individual and organizational actions. The paper will present how "organizational field" of cashless economy is becoming more "mature" (in terms of Maguire & Lawrence 2004 concept) during pandemic times, as it is being constructed and sustained by the institutional work made by small firms. We will present types and examples of institutional work firms made in 2020. Additionally, we will discuss these efforts in a perspective of the visible changes in payment behaviour of consumers (changes revealed in the conducted survey) that are also caused both by emotional factors (fear of the pandemic) and new social rules (social distancing) that together rationalize cashless payments.

Between Bitcoin And Post-Capitalism: Comparing Narrative Of Two Discursive Economic Communities

Ilan Talmud

University of Haifa, Israel

Between Bitcoin and Post-Capitalism: Comparing narrative of two discursive economic communities,
In this paper, based on my ethnographic and netnographic study, I compare narrative themes, stemming from two discursive economic communities; both entailing a performativity claim of future markets: the Bitcoin community and the Post-Capitalist community.
The two communities perform similar "rhetorical devices" regarding minimizing transaction costs, attributing significant value reduction to transfer and transition costs due to technological changes, and consequently dramatic eradication of traditional occupations, organization, and financial processes. Moreover, both deduce current values from futurist utopia.
The socialization of currency and financial inclusion are also joint theme. Yet the specific application proposed by the two communities is a "mirror image" of one another. Additionally, the two communities have similar problems in "marketing" their message to the wider community and their acceptability by political economic organs.
On the other hand, there are significant differences between the two in the degree of analytical primacy attributed to society, the State, the economy, the individual, and technology. Similarly, there is meaningful difference in the outlook on human agency, economic performativity, and socio-technological agecement.
The Bitcoin community suggests a single solution, depicted by a "modal" individual, who controls its monetary value by algorithmic regulation, embedded in a monetary-paralyzed State. In sharp contrast, the Post-capitalist discourse glorifies the real, living individual who is integrated in the community, struggling with the complexity of human existence by a variety of tools. This individual is portrayed as rooted in a democratic decision-making mechanism of sovereign citizens; all free from the appalling link between existence and wage, and sheltered by an active State and sustainable economy.

Violence of the Instant Loan Market in Debtors' Narratives

Ella Lillqvist, Päivi Timonen

University of Helsinki, Finland

The Finnish "instant loan" market, operating since 2005, has been criticised e.g. for lax criteria in loan approval, high interest rates and costs, as well as targeting vulnerable groups. In this paper, we argue that this kind of credit market can be understood as involving "market violence", circumstances on the market that lead to unequal life chances and below-potential health and wellbeing for certain marginalised people and groups. Market violence takes place through an assemblage of various inter-connected aspects of the market environment, including business practices, laws, social relations and affective dynamics. Previous research has shown that there is a particularly strong connection between unsecured debt and negative emotional and mental health outcomes such as anxiety and depression, but, at least provisionally, also optimism and relief. Rather than simply focusing on individuals' sentiments, we turn attention to how these intimate aspects of debt are made use of on a market level and how they work together with other aspects of the context. We analyse debtors' anonymous narratives from the discussion forum Suomi24 ("Finland24") in order to explain the nature of market violence and particularly the role of affect in it. The narratives tend to describe an initial change in life circumstances that brings about an affective state, an intense present. The digitally mediated instant loan market, where loans are quickly and easily available, can respond to the demand of this intense present, while also avoiding embarrassment related to asking for help from friends or family members. However, debtors quickly find themselves worse off, stuck in a spiral of debt.

The Gendered Construction Of Risk In Asset Accumulation For Retirement

Hayley James[1], Ariane Agunsoye[2]

[1]University College Dublin, Ireland; [2]Goldsmiths University of London, United Kingdom

Retirement provision has become increasingly financialised since the 1980s, as welfare has been replaced by measures governed by financial markets and tools. In the UK, the state pension provides minimal protection against poverty, and individuals are expected to provide for retirement by accumulating personal assets through financial products. This financialisation requires individuals to act as rational portfolio managers, negotiating the potential for risk and reward across their investments.

However, official reports suggest that 12 million people are under-saving for retirement through workplace pensions, representing approximately 38% of the working population, and there are gender disparities in terms of who saves for later life, and how much. We investigate why people are not accumulating assets for retirement as expected to understand to what extent people are able to act as responsible risk managers and examine the role of gender in determining decisions about risk in asset accumulation, based on 105 semi-structured interviews conducted across two independent studies.

The findings reveal gendered approaches to risk in asset accumulation, in terms of how men and women understood the nature of financial risk, how they felt they should response to that risk and the anticipated goal of their response. We argue that these are subjective conceptualisations based on gender norms, so neither represented the expected rational portfolio management, although men appeared to be better able to perform the expectations of the financial system. Women felt disenfranchised by a system that did not reflect their understanding of the world and were less likely to engage with asset accumulation, compounding the effect of structural inequalities such as lower salaries over the course of their lives.

RN09_T03_01 | New Markets, Digitalization and Innovation

Imaginations of Eco-digital Capitalism

Sarah Lenz

University of Hamburg, Germany

Technological progress generated by digitalization and ecological change towards more sustainabil-ity both appear to be necessary developments to which contemporary societies must respond. While these two societal processes have long coexisted, in recent years political and societal efforts were made to link the increasing importance of digital technologies with development goals aimed at sustainability. However, there are certain contradictions calling into question the compatibility of digital technologies with the goals of sustainability.

Following the collaboration between the New York City government and leading tech companies during the Corona pandemic, Naomi Klein recently diagnosed a "Screen New Deal". Digital technol-ogies - serve to not only maintain normalcy in a state of emergency, but promote imaginaries of a safer and better "permanent and highly profitable no-touch future". These technologies are then not only short-term solutions against pandemics, but allow maintaining the security of populations in the face of climate change. Some argue that all that is needed to cope with events like floods, drought, and forest fires is more accurate real-time data and predictive analytics. In such a "sus-tainable digital future" digitalisation and sustainability are to be specifically intertwined.

The paper asks what such an eco-digital capitalism looks like and to what extent digitalisation or sustainability are considered relevant. For this purpose, documents of the German government, the EU Commission and of global tech-companies are analysed. The paper aims to provide insights into how societies can imagine a "better future" that attempts to integrate both digital technologi-cal progress and the mitigation of climate change.

325

Innovation as Ideological Disruption: The Adoption of Index Funds in the U.S. Mutual Fund Industry

Nataliya Nedzhvetskaya

University of California, Berkeley, United States of America

The process of "technological disruption" in innovation has been studied extensively, but less attention has been paid to "ideological disruption", largely due to the difficulties of isolating this phenomenon for study (Schumpeter, 2008 [1942], Christensen, 1997; cf. Haveman and Rao, 1997). By studying the adoption of index funds in the U.S. mutual fund industry, exploiting a lag between private adoption of indexing strategies and public offerings of index funds, I demonstrate that innovation can be both ideological and disruptive (competence-destroying) in nature (Tushman and Anderson, 1986). I conceptualize the shift from actively managed mutual funds to index funds as a shift from an "active investment logic" to a "passive investment logic". Until the launch of the first commercial index fund in 1976, American finance had been dominated by the active investment logic that privileged "active" decision-making by investment managers.

Using a panel dataset, I find evidence that two separate investment logics existed in the mutual fund industry between 1980 and 2008. A firm's likelihood of launching an index fund increased significantly if they had already adopted tenets of the passive investment logic, such as a lower expense ratio. In addition, index funds exhibit the characteristics of a competence-destroying innovation. Firms were more likely to launch an index fund following a launch by a top industry player in the previous year, demonstrating the value of signaling. As a population, they are more likely to be launched in the first year of a firm's operation than active mutual funds.

Digital Nomads During Covid-19 Pandemic: New Ways Of Organizing Working Practices, Social Life And Travel Habits

Vincenzo Luise

University of Milan, Italy

Digital nomads are conceptualized as a specific type of digital self-entrepreneurs who escapes from standard forms of work and office routine (Thompson, 2019). Their lifestyle is constituted by two pillars (Green, 2020). On the one hand, digital nomads benefit from the proliferation of ubiquitous digital platforms which allow them to prioritize leisure considerations over employment-based locations. On the other hand, they combine adventure and global travels with mindfulness activities. Ideal places for the digital nomad's purposes are sites of tourism which offers lower living costs and work infrastructures such as coworking, incubators and cafes with Wi-Fi connection. Digital nomads aim to achieve professional, spatial, and personal freedom (Reichenberger, 2018). However, the COVID-19 pandemic has fundamentally changed the ordinary way of life (Kylili et al., 2020). The introduction of measures and practices aimed to prevent the spread of the virus (closing borders and restricted mobilities) changed the nomadic existence. This contribution investigates to what extent the COVID-19 pandemic affected the digital nomad lifestyle on three dimensions: working practices, social life and travel habits. The study is based on a digital survey launched from April to June 2020. The survey was distributed in several Facebook groups, Instagram profiles and to some organizations which offer specific support to digital nomads (travel insurance, visa applications). The 158 respondents answered the survey across over 63 countries. The study concludes that digital nomads reconfigured in unexpected and innovative ways their working practices and travel habits to better suit the coming shut-in society (Smiley, 2015).

326

Economic Rationalisation Of Environmental Policies. How Market Orientation Limits Nature Protection In The United States

Stephanie Barral

INRAE, France

Since the 1970s, environmental policies have experienced a "liberal turn" underlined by scientific, law and market dynamics that result in the rise of market-based environmental policies. Applying a Weberian sociology of rationalization to endangered species conservation banks in the United States, this paper questions such policy choices. Are market dynamics relevant to reach ecological objectives? The paper builds on data gathered between 2017 and 2020 and includes desk research, direct observation and semi-structured interviews (n = 30) with biodiversity investors, environmental consultants and bureaucrats.

First, it shows how applications of environmental law incur a restrictive definition of legal categories—the natural elements to be protected—according to a value-based hierarchy. Hence in the USA, market-based conservation policies are limited to endangered species and wetlands. Second, financing circuits and profitability factors that incentivize the participation of financial investors in the implementation of endangered species protection policies are analyzed. This reveals how only a reduced number of federally listed endangered species are attractive therefore actually protected. Exploring the tension between abstract legal principles and their material rationalization in the making of economic transactions, a Weberian approach thus highlights the limiting effects on nature protection of market dynamics.

RN09_T03_02 | Cultural Perspectives

A Feel for the Game: Economic Dispositions as Micro-Foundations of Inequality

Adam Hayes[1], Meg Bea[2]

[1]The Hebrew University, Israel; [2]University of Wisconsin-Madison, USA

People make economic decisions for themselves all the time—insular decisions that are made entirely for and by one's own self. Conceivably, the life chances and individual outcomes of those people who are more inclined to make "beneficial" economic judgments for themselves will begin to differ and diverge from those who regularly make "detrimental" ones—as the consequences from decisions like these, large and small, compound over time. In this paper we use a Bordieusian theoretical framework to understand economic dispositions that promote "beneficial" vs. "detrimental" (i.e. "irrational") economic behavior. Our empirical study looks to one's composition of economic vs. cultural capital in explaining heterogeneity in individual-level loss aversion, a canonical example of an otherwise cognitive bias in behavioral economics. In doing so, we reveal that composition of capital does, indeed, influence individual economic choice, and with striking gender differences.

327

Spatial Semiotics of a Peculiar Good: Framing Security in the Private Security Market in Istanbul

Gokhan Mulayim

Boston University, United States of America

My research looks into the processes of economization of security in the market for private security services in Istanbul by asking two interrelated questions: (1) How is security as a peculiar good translated into the economic field, and (2) how the market for private security services is organized as a field of production, dissemination, and consumption of that peculiar good? Asking both questions at once, my purpose is to look at the mutual constitution of the processes of translation and the processes of marketization. In this first installment, I explore how security as a political, social, and affective good is being framed as a market object in the first place. Drawing on two years of ethnographic fieldwork that I conducted year in Istanbul, I identify four types of actors: administrative actors, legal actors, experts, and firms, involved in the making of the institutional conditions of the private security market in Istanbul, each of whom deploys differential discourses and practices in framing security. My argument is that security is institutionally translated into the economic field through the politics among those actors and their non-overlapping discourses and practices. While this argument is certainly far from exhausting the totality of the dynamics shaping the processes of translation, it lays the institutional ground for my further pragmatic analysis of how security is framed on the everyday market encounters characterizing the field. Moreover, it gives insights into the non-economic foundations of the economy by shedding light on the institutional power dynamics that constitute the conditions of possibilities of marketizing security as political, social, and affective good.

Operationalizing Hegemony: Linking Economists' Public Discourse and Citizens' Economic Beliefs

Sinisa Hadziabdic

Max Planck Institute for the Study of Societies, Germany

The paper aims to reconsider the notion of hegemony as a way to operationalize the impact of economists' public discourse on citizens' economic beliefs. After pointing out that there is a historical trend that has increased the role of cultural hegemony as the socio-ideological glue of democratic systems, classical approaches to hegemony (Marx, Gramsci, Althusser, Laclau-Mouffe) are reviewed by showing that the emphasis has gradually shifted from material determinism to self-ruling ideological articulation. Building on the key role attributed to civil society by Gramsci, it is argued that the autonomy and organic character of the field of economists make it the perfect locus for the production and dissemination of a hegemonic economic discourse. While a large literature has theorized the performative role of the ideas that economists promote in the public sphere, the empirical evidence used to test this is almost exclusively based on ad hoc ex post reconstructions of historical events in which economic ideas are essentially used to fill explanatory gaps. To operationalize the hegemonic role of economists' ideas on citizens' economic views, it is necessary to measure these ideas by focusing on the actual content and relevance of economists' public discourse and to consider the peculiar character of economic attitudes.

328

Habitus Of The Population: A Method Of Definition And Classification

Boris Borisovich Podgorny

Southwest State University (SWSU), Russian Federation

According to P. Bourdieu, social space exists in the form of social fields, whose participants, guided by habitus, possessing capital, perform various practices. Bourdieu highlights that habitus expresses general principle, a style that manifests in all individual practices. The habitus is immutable and applies to any action.

We have developed an approach to identify habitus by combining the disposition and capitals of the actor. We have grouped the possible dispositions along the six most common areas: safekeeping, development, influence, management, fulfillment, distancing. To perform any practices, an actor belonging to one of the dispositions uses the capitals he has: economic, cultural, social, symbolic, human, administrative; political, physical. When you perform an action, habitus or subconscious understanding of how to act and what capital is most effective comes into play. To classify habituses, we conducted research series and determined the general characteristics of actions depending on the disposition and capital combination. We identified 48 groups of common characteristics of habituses. We gave each group a name that is projected in the Russian population' minds into a definite complete image. We identified more detailed characteristics in relation to the digital economy. To determine the detailed characteristics of other specific aspects of life and activity, it is necessary to conduct clarifying research, wherein the aspectual habitses will be in their focus within the framework of general habitses. The study supported by RFBR grant No. 20-011-00228 "The Russian digital economy as a social field."

RN09_T04_01 | Social Responsibility

"Just Another Asset Class". The Tough Introduction of a Performance Index for Real Estate Investments in France in the 90s

Marine Duros

EHESS, France

Today, real estate is considered the "third asset class" after stocks and bonds. This paper focuses on the emergence of this new asset class in France in the 90s, which arose through the implementation of a device aimed at comparing the performance of real estate with other financial assets: the BD2i database, developed by major French institutional investors in 1993, acquired 6 years later by the English firm Investment Property Databank (IPD). By studying the field of stakeholders, I analyze the work of requalification of real estate as a financial asset in a context of competition between the world's major financial centers.

This work is based on internal mission reports related to the implementation of BD2i, interviews with stakeholders who participated in the launch of BD2i and one of the English promoters of IPD in France. First, I analyse the institutional context in which the BD2i project emerges as part of a wider process of internationalisation of the real estate market and of financialisation of the French economy. Secondly, I review the debates surrounding the definition of the "value" of real estate assets. I attempt to describe the internal struggles between the real estate departments of insurance companies and the top management, as well as between the sponsors of IPD and BD2i. In doing so, I show how financialisation entrepreneurs progressively redefined what should be considered as the value of real estate: overcoming previous valuation methods, the mark-to-market value progressively came to dominate in the French real estate investment market.

Managerial Social Responsibility (MSR) - A New Trend in Management

Przemysław Wechta, Anna Parniewicz-Bętkowska

Adam Mickiewicz University Poznań, Poland

Corporate social responsibility (CSR) is a well-known concept. Our research focuses on the activities of managers that go beyond the boundaries of CSR. At the theoretical level, the foundations of MSR can be found in economic and sociological concepts, for example: economic chivalry (Alfred Marshall), economic disinterestedness (Talcott Parsons), social capital (Francis Fukuyama), relational work (Viviana Zelizer).

Managerial social responsibility is a concept that offers a vast research potential. The term refers to a form of economic leadership which can constitute an adequate response to further civilization challenges such as economic, social, climatic, ecological and pandemic-related issues, both locally as well as globally. Perhaps such managerial behaviors, which are rather uncommon today, will become a future norm.

A socially responsible manager is able to make use of the array of his / her qualifications and talents, as well as his / her personal economic and social capital not only to manage the enterprise but also in other areas of social life. Such attitude and action can become another phase of managerial revolution which will reshape the economic and political system in a way that allows the society as a whole to more successfully deal with the turbulence it faces.

At the empirical level, MSR is examined with the qualitative method by means of in-depth interviews with managers of large companies in Wielkopolska (Poland). This is the initial stage of the study to identify attitudes and behaviors that can be referred to as MSR, as well as the values that motivate this type of action. Part of the study is MSR website that can serve as a meeting place for academics and managers (https://www.managerialsr.com).

How to Make Sense, Conceptualize and, Study Corporate Social Responsibility (CSR): Juxtaposition of Gender Right Politics and CSR Activities in Turkey

Ilke Imer

Boğaziçi University, Turkey

How should we read corporations' attempt to integrate gender equality into their jargon and their agenda; as an intrusion of gender rights politics into the organizational field or an intrusion of market rationale into gender rights politics or both? Can we talk about politics in corporations at all? On the one hand, many corporations around the globe including Turkey allegedly try to enhance gender equality in work-life by adopting transnational codes and standards, generating certain structures and practices under the name of corporate social responsibility (CSR). On the other hand, there is a robust literature that criticizes CSR by conceptualizing it as an ideological apparatus that conceals the real intentions and destructions of corporations. By conducting a multi-sited ethnography, I intend to critically interrogate the previous system of representation but not by falling into the latter one. Thus, in this paper, first, I aim to explain why I am going to abstain to produce knowledge that will fall into the second by illustrating different conceptual frameworks in critical CSR studies and their methodological implications. Second, by portraying the context-specific consequences derived from the juxtaposition of gender right politics and CSR activities in Turkey, I aim show CSR needs to be conceptualized as a 'field of contestation' rather than an apparatus since it is a fragmented complex system that brings a multitude of diverse actors with diverse interests together. Consequently, I intend to modify hegemonic representations while examining what happens in action.

Keywords: corporate social responsibility, gender rights politics, 'field of contestation'

RN09_T04_02 | Attitudes Towards Money and Finances

The Social Ambiguity of Money. Empirical Evidence on the Multiple Usability of Money in Social Life

Klaus Kraemer, Luka Jakelja, Florian Brugger, Sebastian Nessel

University of Graz, Austria

When it comes to the question regarding for what purposes money is used, economic theory provides a functionalist answer (the quantity side of money), while a dominant sociological view focuses on culture (the quality aspects of money). However, Georg Simmel noted the paradoxical nature of money in this respect. Money brings together both quantity and quality; therefore, it simultaneously has different potentialities of its usage. In this paper, we conducted an exploratory factor analysis by using a representative sample (n = 2,000) of the Austrian population to explore the dimensions (potentialities) of money usages. We found seven factors, namely, freedom, community, status, institutional control, conflict, work-related control and household control. This range of different potentialities of money usages reveals some paradoxes. Money can be a means of freedom on the one hand and of control on the other hand. It can be used to strengthen community ties, while at the same time, it can be used to provoke conflict. Additionally, a discussion of the factors reveals the simultaneous existence of the qualitative and quantitative potentialities of the usage of money in every situation of social life.

Origins of Institutional Investors' Risk-taking Behavior: The Case of Financial Market Development in Israel

Daniel Maman

Ben-Gurion University of the Negev, Israel

Institutional investors are specialized financial organizations that manage other people's money, including insurance companies, pension funds, and mutual funds. In recent decades, their role in managing people's savings in diverse developed economics has grown dramatically. While their tendency toward risk-taking behavior has been documented, insufficient attention has been paid to the sources of this behavior. Based on the case of emerging financial markets in Israel, this paper argues that in adopting various neoliberal reforms, state agencies induced institutional investors to change their investment behavior toward greater risk-taking.

Until the early 2000s, institutional investors in Israel were marginal actors in a financial system designed to support state building, primarily investing in government bonds and bank deposits. As changing state financial interests induced market changes, they emerged as autonomous actors, diversifying their investments to also include corporate bonds, stocks, and investments in foreign financial markets. This case reveals that the risk-taking behavior of institutional investors can result from financial market building generated by state agencies, which here included changes in institutional arrangements, technological innovations, and the transformation of financial market architecture. With individuals' growing dependency on institutional investors for their financial security, greater insight into the role of state agencies in organizing competition in financial markets could help identify factors affecting their functioning in financial capitalism.

Financial Subjectivities And Attitudes To Economic Risk In Spain

Nazaret Abalde, Anastasiya Shevchenko, Rebeca Noya

Universidade da Coruña, Spain

The aim of this communication is to analyse the configuration of financial subjectivities in Spain. It is part of a series of socio-economic studies conducted into the financialisation of everyday life (Martin, 2002), a process that is present within non-financial sectors of the real economy, creating a connection between financial networks, households and individuals (Langley and Leyshon, 2012). Our work is therefore intended to analyse the emergence of financial subjectivities by exploring the points of convergence between individuals' life cycles and their financialisation processes. A qualitative methodology was used, based on semi-structured in-depth interviews. The discourse analysis, based on an analytical model of the concept of financial subjectivity, points to a lack of correspondence between the theoretical contributions concerning this concept and empirical findings. Respondents' economic behaviour was found to be only weakly financialised. A generalised lack of trust in the financial system, together with the predominance of public social welfare structures, discourage the use of financial investment as a means of protection against risk.

RN09_T05_01 | Regulation of Markets

Social Capital As An Internal Resource Of Human Development

Rim Valiakhmetov[1], Guzel Baimurzina[2]

[1]Bashkir State University, Russian Federation; [2]Federal Center of Theoretical and Applied Sociology of the Russian Academy of Sciences

Just as in nature there is a constantly changing "conveyor of currents" that circulates the interconnected deep currents of the World's oceans, it is likely that human development has its own "conveyor" of social interconnections, not always tangible and visible. We are talking about social capital as a kind of internal "conveyor" and a human development resource. In our case, it can be detected and described only by sufficient observations and special studies.

In this regard, the works of Pierre Bourdieu, Robert Putnam, James Coleman, and other researchers show us an absolute example. They examine the social capital phenomenon as immanent value of social connections and "the set of real or potential resources associated with durable networks».

It is important today not only to conceptualize social capital as an internal non-economic source of development, but also to determine the starting points for further observations and workings. The latter is also conditioned by the variety of new manifestations of social interdependencies and relationships in the changing world.

New channels and mechanisms of social communication between people, social groups, regions and countries have emerged, which significantly affect the nature of their relationships, trust, cohesion, solidarity and, ultimately, human development. Among the most significant examples in this sense is the emergence of a "digital intermediary" between the subjects of social interactions. Accordingly, the following question arises: how vulnerable is the degree of trust and sincerity between people and their communities in these conditions? It is obvious that we are talking about new research of social capital in the context of digital stage of human development.

Social Social networks and entrepreneurship: Russian speaking women entrepreneurs in Poland

Kseniya Baimurzina2

University of Warsaw, Institute of Applied Social Science, Poland

Entrepreneurship of female migrants is a pathway to economic independence and active participation in the mainstream market. Understanding the feature and role of relations of migrant entrepreneurs within migrant and non-migrant female networks is crucial for conceptualisation of women migrant agency and entrepreneurship.

Recent migration trends in Poland shows that the county undergoes transition not only into the country of immigration but also into more diverse and multicultural society. In 2020 major groups of new residents constitute Ukrainians and Belarusians, women migrants compose almost a half of the migrant population. But still not much is known about women migrants' perspective on entrepreneurship and development path from enclave to mainstream market.

In the paper I analyse how woman migrant entrepreneurs achieve agency trough feminine social networks. The analyses refers to the sociological perspective of women migrant agency and focus on the interrelation of social ties that women entrepreneurs maintain within and out of the migrant network in aim to develop their venture.

I would like to present the results of the research conducted during the period July-September 2020. The study was based on eleven in-depth interviews with Russian-speaking women migrant entrepreneurs, who develops their career in the "beauty" sector in Warsaw. Following individual stories I find out how do female migrants develop their entrepreneurial path starting services in private apartment and finally establishing own beauty salons.

The research of women migrant entrepreneurship contribute to understanding of women agency and its impact on social changes on the mainstream society.

Quality Matters on Markets: The Use of Screwcaps on Fine Wines

Malte Doehne

University of Zurich, Switzerland

What part - if any - does quality have in shaping market outcomes? This paper addresses this question through a socioeconomic lense. Quality is treated as an abstract property of products that explains markups on prices that buyers will pay for otherwise comparable goods. Differences in quality sustain market niches whose appeal to producers varies. The ordering of producers by quality and its implications for profitability set in place the quality order of production. The model yields testable predictions for the locus of quality-related innovation. An analysis of the bottle closures used on 52,880 German premium wines by 1,028 winemakers in three winemaking regimes (commercial, cooperative, elite) supports the general claim that quality matters and a specific claim as to how quality matters.

RN09_T05_02 | Markets and State Politics

<div style="text-align: right">333</div>

The Institutional Logic of Development: The Evidences from Transformation of Land Policies in Taiwan

Ssu-Chin Peng

National Cheng-Chi University Taiwan, Taiwan

This article argues that the institutional logic behind the land redistribution policies of the late 1950s to the 1980s, which are crucial aspects in understanding Taiwanese modernization. The previous land reform in 1953 was a useful policy tool for the Taiwanese government to channel the rural production surplus for industrial development. Since then, the industrial sector's gross production value significantly exceeded its agricultural counterparts. Therefore, redistributing land to meet industrial and farming purposes became a critical issue for the Taiwanese government after the late 1950s. However, the scholars often neglected such redistribution processes and ignored the agricultural role

in transforming the state into a modernized one. This article reveals the connections between land policy transformations and the institutional logic of development. This article applies the integrated method from Skocpol's policy center framework, institutionalism, and the variable center methodology from historical sociology to understand officials' institutional logic of redistribution. This article focuses on four essential variables in the above research frameworks to analyze and further understand the processes: state capacity, actor, power, and idea. The data mainly came from governmental archives. The preliminary results of the 1960s show that the central government is the primary arbiter for resolving land acquisition conflicts between Taiwan's industrial and agricultural sectors. However, the previous reform of 1953 limited the central government's capacity for repurposing land usage. Moreover, motivated actors with their own agendas tried to intervene in the direction of the reform. Their influences are related to the power relationship with the central officials. Hence, although the officials solved the dispute temporarily, the results opened further conflicts till nowadays.

Two Trends in Russian Agriculture: Macro-trend of Holdingization and Micro-trend of Farmers' Cooperation

Irina Trotsuk

Center for Agrarian Studies, RANEPA, Russian Federation

Since 2000, the transformation of Russia's food system has led to a concentration of capital and power among relatively few players, which mirrors broader trends in the global food system. The Russian industrial agricultural model has evolved into large-scale, vertically integrated agribusinesses that are linked to international trade and global markets, and have brought greater food security and strengthened regional economies in Russia. However, there are two 'poles' in the sociological study of rural Russia – quantitative (mainly statistical) and qualitative (field research). The first 'pole' prevails and proves the macro-trend of holdingization, but such macro-sociological descriptions are not sufficient for understanding the everyday social-economic practices in the countryside. Thus, our rural case studies revealed an increase in the local differentiation of rural areas since the late 2010s, which did not eliminate the general pessimistic mood but led to the development of a new

rural family-entrepreneurial stratum. All Russian rural entrepreneurs face the same problems (abandoned production facilities and dilapidated social infrastructure, expensive loans and harsh tax and administrative pressure 'from above', etc.). Nevertheless, rural entrepreneurs ensure a kind of a symbiosis of formal and informal local cooperative practices, and some development of sustainable agriculture (eco-villages that produce food for self-consumption; farmers that modify equipment to local conditions and use biological growth stimulants to replace chemical fertilizers; many rural households still operate subsidiary agriculture, mostly for self-consumption rather than for commercial sales, etc.).

"Project Management Practices In Agriculture In Portugal- Review With A Sociological Perspective"

Francisca Carvalheira, Carlos Alberto da Silva, Tatiana Filipa Silva Mestre

Universidade de Évora, Portugal

This work was initially undertaken with the intent to analyze the project management practices in the agricultural sector in Portugal. Three questions were defined: Q1. What are the adoption of project management practices profiles in agricultural projects in Portugal? Q2. What is the impact of the use of project management practices in the perception of success of agricultural projects? Q3. What is the influence of the use of public funds in the adoption of project management practices?

After a literature review, a quantitative methodological approach was defined in order to answer the three questions. Then the data was collected, through questionnaires, and processed.

It was concluded that the project management practices are still not widely used, in agriculture, in Portugal. It was not possible to establish statistically relevant models to relate the use of tools and project management methodologies to the success of agricultural projects in Portugal. And it was not possible to attribute to the use of co-financing in the projects influence on the adoption of project management practices in agriculture in Portugal.

By analyzing data from the 110 questionnaires from the initial study, in a sociological perspective, it was possible to identify that cofounded projects in agriculture are not the drive for the adoption of project management practices in agriculture, in Portugal. Moreover farmers

report that these projects are too bureaucratic and they need more training in these matters.

The Privatization of Market Regulation. The case of Quality Standards in the Agri-food sector

Carlos de Castro Pericacho[1], Andrés Pedreño[2], Elena Gadea[2], Miguel Ángel Sánchez[2]

[1]Autonomous University of Madrid, Spain; [2]University of Murcia, Spain

Private quality standards have gained enormous relevance in the organization and regulation of economic practices at a global level since the 2000s and have become a new model of market regulation based on a hybridization of public and private (Ponte et al, 2011; Bair, 2017; Meyer and Phillips, 2017).
In the agri-food sector, big retailers have promoted the application of quality standards relying on the creation of an institutional structure (Loconto and Busch, 2010) in which public and private institutions intertwine to establish standards and to organize and supervise the certification and accreditation process.
This communication maintains that the increase in the power of big retailers is based on the design and control of this institutional structure. Based on a large number of interviews conducted with the main public and private actors linked to the agri-food sector in the Region of Murcia (Spain), this communication will first describe the operation of the institutional structure of private standards, as well as the heterogeneous set of actors (auditors, accreditors, quality consultants) that have emerged to participate in the process of design and of evaluation of standards.
Second, the communication will describe how the entrepreneuralization of the standards development process is the key question in the institutional structure of private standards. Finally, in the conclusions, we will reflect on the way in which private standards have allowed big retailers to increase their power in the agri-food sector in Murcia.

RN09_T06_01 | Alternative Forms of Organisation and Consumption

Bloody Commodities: An Empirical Analysis Of Varying European Frameworks (Dis)allowing Individual Support For Paid Blood Or Plasma Donation

Sam Gorleer, Lesley Hustinx

Ghent University, Belgium

335

Many have objected the payment of blood donors, expressing moral opposition toward monetary transactions for blood and believing that donation should remain outside of the commercial sphere. Driven by the idea that unpaid donations appeal to the altruistic tendencies among donor populations, scholars have also empirically pursued Titmuss's famous argument that payment might crowd out the altruistic motivation to donate, eventually leading to a decrease in the overall blood supply. Despite recent evidence for this Crowding Out Theory based on experimental designs (e.g. Mellström & Johannesson, 2008), we argue that experiments insufficiently capture the societal dynamics that drive different attitudes toward donor payment and willingness to donate. Inspired by Healy's seminal work on 'blood collection regimes', we argue that the attitudes surrounding blood donation should be understood in terms of the institutional context in which they appear. In this paper, we therefore aim to explain the large cross-national variance in the acceptance of cash payment for blood (or plasma) donation. Based on Eurobarometer data from 2014, we find that the acceptance for cash payment varies cross-nationally between the range of 2% to 39% (N countries = 28; N individuals = 27 868). Our multilevel analyses suggest that the varying attitudes toward cash payment are associated with national measures of development and trust after controlling for individual-level determinants. We conclude that the acceptance of paid donation, and its association with willingness to donate, should be understood in terms of

the underlying social relationships between the citizen, state and national health system.

Alternative forms of organizing during Covid-19: The case of Alternative Food Initiatives in the UK

Maria Daskalaki[1], Natasha Gjorevska[2]

[1]University of Southampton, United Kingdom;
[2]University of Roehampton, United Kingdom

Several analysts have already started writing about the need for a radical social transformation that will counteract the effects of Covid-19 pandemic: a re-assessment of how we organize both socially and economically (e.g. Klein, 2020), a collective formation of a new system of relations built around values of affective connectivity, care and solidarity. Drawing from prior work on prefigurative organising (Boggs, 1977; Daskalaki, 2018; Parker et al., 2014; Swain, 2019) and wide scale food system transformation (Blay-Palmer et al., 2016), this paper discusses Alternative Food Iinitiatives (AFIs), and their role as vital agents in building sustainable, post-pandemic, non-capitalist futures. It has been argued that 'while mobilization of values (in this case concerned with post-capitalist futures) is a necessary spark for action [...], the reproduction and sustenance of the value of the priceless, and non-hierarchical forms of sociality and humane living must be continuously performed and reiterated through practice' (Daskalaki et al., 2018: 1759-80). Alternatives are enabled by direct community engagement and collective action based upon the principles of participatory democracy, solidarity and reciprocity (Parker et al., 2014). However, empirical work on the 'value tensions' that economic alternatives face in response to challenges (Mitzinneck & Besharov, 2019) remains largely scarce. We try to inform this area of research through a qualitative study of 35 AFIs (food coops, allotments, community gardens, local food banks) in the UK, presenting evidence on the tensions and potentialities these initiatives experience in their attempt to build alternative socio-economic relations during the pandemic.

Economic Diversity and Alterity in Local Food Economic Strategies

Denise Misleh

The university of Manchester, UK

Local food has become the most prominent alternative to conventional food systems and its socio-ecological challenges. Although the transformative potential of local and alternative food networks has been widely addressed, it still remains controversial and requires further conceptualisation. In Polanyian parlance, local food is simultaneously on both sides of a double movement. First, it has been considered as a form of re-embedding the economy; as a reaction from society to protect itself from markets destructive forces and secondly as process of marketization that deepens and extend market relations and commodification to other spheres of life. The argument of this paper is that this oppositional evaluation of local food is based on faulty understanding of economic relations which tend to separate market relations from cultural, moral and social dimensions. It is argued that alternatives emerge from within the hegemonic capitalist system, and hence they contain capitalist elements of organising the economy vis a vis alternative forms. Therefore, a more complex and concrete analysis of local food economic strategies is needed.

The paper proposes to analyse people's strategies involved in localising food by interrogating the role of different agri-food imaginaries in shaping economic strategies. It shows that in three local food economies in north England, a particular strategy become dominant supported on different agri-food imaginaries; some based on purely economic values while others move towards multidimensional concerns of social justice. In all three cases local food strategies develop through markets but only one strategy is based on commodification. In the other two cases, markets are either being mixed with planned and coordinated economic models or are considerately being limited by the presence of non-market relations.

336

Food Support Provision as a Field

Filippo Oncini

University of Manchester, UK

In the United Kingdom food charities are increasingly required to alleviate hunger and food insecurity, and even more so after the disruption of Covid19. In Greater Manchester (GM) alone more than 200 organizations operate everyday to provide food parcels or cooked meals to people. The increasing attention towards food poverty and food aid use has been paralled by a growth in the scientific literature that employs survey data, interviews and ethnographic insights to unveil causes and consequences of food aid use. Despite the abundance of literature however, the pheonomenon of charitable supply of food is still undertheorised, and attention is often solely devoted to food banks, thus neglecting the many other food support providers operating in the sector. In this paper, I build on field theory to shed light on the dynamics and the cooperative/competitive relationship that characterise the field of food support provision (FSP) in Greater Manchester. Making use of a mutual recognition network extracted from Twitter and on 40 semi-structured interviews with FSP directors, spokespersons and stakeholders gathered immediately after the first Covid19 wave, I illustrate the overal structural properties, the hierarchies and the symbolic boundaries of the field, and eventually discuss how such a theorisation permits to better accounts for its institutionalisation and the problems this poses for the construction of a more generous welfare state.

RN09_T06_02 | Democracy, Cooperation and Consumption

The Challenges of Cooperation in Illegal Markets: The Case of the Cannabis Street Dealing in the City of Geneva.

Loïc Pignolo

University of Geneva, Institute of Sociological Research, Switzerland

In illegal markets, making transaction is a challenging issue for actors of the supply and demand sides. Indeed, as a result of breaking the law, they cannot count on the State's support for the enforcement of contracts, and also face the risk of being arrested and prosecuted (Beckert and Wehinger, 2013). Based on a sociological study of the cannabis street dealing in Geneva (Switzerland), this presentation aims to shed light on the way market actors deal with these two issues. More precisely, I carried out qualitative fieldwork – mostly interviews with street dealers and consumers – in a neighborhood of Geneva's urban center well-known for opened and highly visible drug transactions. Based on these data, I will show that market actors are able to cooperate due to the learning and following of informal codes which enable them to appear as trustworthy – although they rarely know each other – and to avoid being arrested despite the visibility of the sales. While most transactions occur peacefully thanks to these codes, conflicts between actors and police arrests may occur anytime. Thus, cooperation in this illegal market is better understood as an ever-going process under tension. Overall, this presentation seeks to contribute to a better theoretical understanding of the functioning of illegal markets, an area still little explored by economic sociologists (Aspers, 2011; Beckert and Dewey, 2017).

Paid Work as a Universal Social Norm? Comparing Perception of Work as a Moral Obligation across Generations and Economic Contexts

Daniel Gerbery

Comenius University in Bratislava, Faculty of Arts, Slovak Republic

Centrality of work in our lives has belonged to the key themes of sociological thinking for a long period. The fundamental changes in the labour markets, induced by the technological advances, increasing inequality and ongoing deregulation, put the centrality of work into question. However, so far, a world without work remains rather an ambiguous theoretical concept and not an inevitable future.

In this context, the paper addresses the question whether paid work represents a universal social norm. It employs the age-period-cohort models in order to explore whether perception of work as moral obligation varies by birth cohort (generational membership), age, and time period (historical socio-economic context).The aim is to disentangle the three time effects, as they represent different social phenomena and have different implications. We will try to find the answers to the following questions: Do the younger generations differ from older generations in terms of the perception of work as moral obligation? And do the different socio-economic conditions play the role?

In addition, attention will be paid to the effects of the key socio-economic determinants at the individual level (class, education) in order to grasp existing inequalities in perception of paid work.

The papers draws on data from four waves of the European Values Study from 1991, 1999, 2008, and 2017. The analysis focuses only on one country – Slovakia. The reason behind is that interpretation of (expected) differences among generations and historical contexts requires detailed knowledge of the key social and economic ideas that formed socialization of the different cohorts, as well as the socio-economic conditions in the given periods.

RN09_T07_01 | Forms of adaptation to the pandemic crisis II

Explaining Attitudes Towards Quarantine Measures in Ukraine

Alberto Veira-Ramos[1], Tetiana Liubyva[2]

[1]Universidad Carlos III de Madrid, Spain; [2]Institute of Sociology of National Academy of Sciences of Ukraine

During COVID-19 pandemic governments have faced the dilemma of finding a balance between measures to protect the health of citizens and easing as much as possible the effects of such measures on the economy. As a result, a growing divide between citizens in favor of maintaining strict quarantine restrictions and those in favor of ending them takes place in European societies, including Ukraine.

Items related to the COVID-19 pandemic were included in the last biennial survey of the Institute of Sociology of National Academy of Sciences of Ukraine, implemented from September-October 2020. When Ukrainians were asked about restrictions associated with the quarantine, up to 22% were in favor of severe restrictive measures and 22% in favor to stop them. The majority, 43%, supported the softening of the quarantine combined with the continuation of some restrictions.

Our presentation provides a profile of Ukrainians who are in favor and who oppose strict quarantine measures. For instance, students and retired are more in favor of strict measures and the unemployed are the most in favor of ending the restrictions. One out of four interviewees that oppose quarantine measures is unemployed. Those in favor of strict quarantine measures are employed in telecommunications and information sectors and in the public administration. Those employed in agriculture, construction and accommodation sectors are most in favor of ending with the restrictions. The most striking divide between Ukrainians derives from employment status: 23% of employees favor strict measures, while only 10% of employers and 7% of self-employed support them.

Is COVID-19 creating a new paradigm for the future of Global Disaster Management?

Sharon Mabel Sánchez-Silva Baltazar, José Luis Condom Bosch

University of Barcelona, Spain

The Coronavirus pandemic has revealed the level of resilience in the countries and their real adherence to supranational actors such as the WHO. In order to identify the nature of the pandemic and the social interactions performed at the individual, international and supranational levels, the event has been analyzed through normal accidents theory perspective. Through a combined methodology applied to Spain, Italy and Sweden: a chronology of official governmental and supranational response, a journalistic chronology of public response in the Spanish media, a causal modelling and behavioral models of linear regression (ESS 2018) have been made. Results show that countries with mostly materialistic values have higher epidemiological indicators and that the lack of international cooperation partially reflects the levels of trust, transparency or satisfaction shown by citizens. The study suggests that there is a need to reduce social complexity, retaking the idea of the world as a unit of analysis, to define possible transversal guidelines for international cooperation based on the coupling degree of systems and traceability of potential interactions. Also, the need to broaden the analysis of value systems and epidemiological incidence in all affected countries to identify potential public measures with the aim of reducing health vulnerability based social behaviors. In addition, a development of new values measuring variables is suggested, in order to respond to the current international cooperation context requirements through behavioral models of citizen opinions that may help national and supranational actors build social adherence to them. This is my first sociological approach with intentions of further development and methodological improvement.

How the COVID-19 Pandemic Has Affected Micro and Small Entrepreneurs: Findings from a Qualitative Study

Maria Nawojczyk, Joanna Pyrkosz-Pacyna, Lidia Synowiec-Jaje

AGH University of Science and Technology, Poland

In early 2020, entrepreneurs worldwide faced a pandemic that influenced all of their operations. Many businesses closed due to governmental restrictions, lost customers, or lost investors. Small businesses are among those who suffered the most damage due to a lack of substantial financial reserves, staff shortages, and limited expertise. Simultaneously, they are not sufficiently represented in entrepreneurial crisis literature. At the pandemic's outbreak (March 2020), we conducted in-depth interviews with 20 micro and small business owners from different industries in Poland. The interviews were repeated three months later. The study aims to investigate how business owners are dealing with the pandemic. We focus on three levels of analysis: the business owner, the company, and the external environment. We found that a combination of two potentially contradicting characteristics, namely composure and the propensity to act, is crucial. Analyzing the company level, we discovered that the current crisis has exposed the importance of social relations within (e.g., with employees) and outside of (e.g., with clients) the company. These social relations are vital for both personal and professional reactions to the crisis. We also found that to introduce changes as a reaction to new business opportunities that the crisis revealed, one needs to pave the way with a preparatory contemplation of the idea. Our study contributes to the literature by providing insight into an entrepreneurial crisis that is considered both an event and a process. We believe that this distinction could be useful in future research on this topic. Additionally, given the scarcity of research and its vast importance for the economy, we wish to highlight the importance of including MSEs in entrepreneurship crisis research.

RN09_T07_02 | Case Studies – New Methodology in Economic Sociology

Family Firms And Business Families: Preliminary Findings And An Agenda For A Cross-Cultural Research Perspective

Tobias Koellner

Witten/Herdecke University, Germany

To date, family business received little attention in economic sociology and we still need a better understanding of how family firms and business families operate in different cultural contexts and how the family influences economic decision-making. Therefore, this proposal aims to highlight the role of the family behind the company. In so doing, I take a comparative perspective, taking into account the specific cultural and historical context. The starting point for this is the work of Sylvia Yanagisako, who understands "capitalist action as culturally produced and, therefore, always infused with cultural meaning and value" (Yanagisako 2002: 6). From this it becomes clear that culture and capitalism produce each other, so that "a model of culture and capitalism as mutually constituted processes..." is needed (ibid.).

Drawing on Yanagisako's findings, the central aim of the presentation is to understand how certain motives, practices and strategies are produced in daily economic activity, and how they shape the family firm and the business family. To this end, material is presented that is based on ethnographic field studies in European Russia and Japan. Based on the empirical material, approaches for a comparative perspective will be presented and discussed aiming to move beyond the dichotomous juxtapositions that can be found, for example, in the works of Geert Hofstede. Furthermore, it is not my intention to 'orientalize' economic activity or to develop any form of 'Asian capitalism' but to emphasize similarities and differences in more detail.

Yanagisako, S. J. 2002. Producing Culture and Capital: Family Firms in Italy. Princeton, NJ: Princeton University Press.

The Rise of Small Craft Breweries in Belgium: What a Socio-historical Analysis Can Teach Us about the Role of the State in the Structuring of Markets

Pauline Delperdange, Marc Zune

Université catholique de Louvain, Belgium

The recent rise in the number of small artisanal breweries in several countries can be seen as an emblematic case of the resurgence of craft in modern economies. These new realities have aroused great interest from researchers who have tried to understand the emergence of relocated activities inspired by a culture of craftsmanship.

In Belgium, the development of small breweries is more progressive than in other countries, but it follows a phase of significant economic concentration (Poelmans & Swinnen, 2018). These new breweries share common understandings and norms about production, and differentiate themselves from an industrial model.

However, the newness of these oppositions remains to be explored. By adopting a processual approach inspired by Abbott's work (2016), our aim is to re-locate the contemporary period within a long historical period marked by reconfigurations of these activities.

We identify four configurations, each characterised by the precarious domination of a production model, from the mid-19th century with a phase of early industrialisation, characterised by the breakthrough of bottom fermentation in a context of traditional production in many small breweries. Following Fligstein's political approach to markets (1992), we consider these successive evolutions in relation to changes in the legislative framework, particularly in terms of tax and subsidies policies, which make possible and facilitate certain production models, their productivity and profitability. We rely on a socio-historical analysis, based on the examination of archives and documentary sources and, for the recent period, on a survey by in-depth interviews with privileged observers.

"Title Case" The Low Water Crisis on the Rhine 2018

Florence Rudolf[1], Murielle Ory[1], Amadou Coulibaly[2]

[1]Amup, UR 7309, Insa Strasbourg, France; [2]CSIP, Icube, Insa Strasbourg, France

The severity of the low water crisis of 2018 has played a warning role in the world of inland navigation. The near-total immobilisation of the sector has therefore overcome a certain wait-and-see attitude of the stakeholders. In 2019, the Interreg Clim'Ability Design project has banked on the association between investigative methods specific to the social sciences and inventive design methods specific to the engineering sciences.

Our communication aims to analyse and relate a research experience that combines in-depth interviews and the TRIZ inventive design method. The interviews provide an account of how stakeholders understand the situations in which they find themselves; the issues they encounter and the room for manoeuvre available to them. To this first stage of the research, was added the time for a concerted search for solutions using the TRIZ method. This method is presented as a reasoning assisted by processors, databases/patents and "good practices". It consists of consulting various stakeholders on the basis of the identification of a "source" or "key" problem that they propose to solve.

The combination of these approaches allow to verify how systems of standards work to identify shared solutions. The TRIZ method is configured to take into consideration different environmental and ecological elements when solving the "source" problem, which offers researchers the possibility of observing and better understanding the reception of these elements by economic players on the Rhine and the role they play in this concerted search for solutions.

Understanding the Entrepreneurial Phenomenon: the Importance of Collective Perceptions

Sofía Louise Martínez-Martínez

University of Malaga, Spain

The creation of new products, services, processes or business models is necessary and crucial for the advancement of society. The entrepreneurial phenomenon encompasses these actions, and, at the same time, it is also defined by the people who drive and develop these initiatives, as well as by the context in which the activities evolve and consolidate. The study of entrepreneurship has mostly been approached from an economic perspective. However, in order to understand the phenomenon as a whole, it is necessary to apply a sociological perspective, that allows to understand the cultural factors and the collective perceptions of the context that surrounds entrepreneurship.

Through a quantitative methodology, this study explains the factors that influence collective perceptions of entrepreneurship. Primary data is used, collected in the framework of the Global Entrepreneurship Monitor, a world benchmark in the analysis of entrepreneurial dynamics. The results show that collective perceptions are largely explained by structural factors. In addition, aspects such as previous entrepreneurial experiences, episodes of business failure or the development of intrapreneurial activities favor the entrepreneurial predisposition of society. This study is novel in that it focuses on explaining collective perceptions of entrepreneurship, complementing the existing literature which normally considers this aspect mainly as an independent variable. From a practical point of view, the research also has numerous implications. Its conclusions contribute to improve the design and implementation of policies and programmes that promote entrepreneurship placing more value on social reality and context.

RN09_T08_01 | Human and Social Capital and Inequality

The Role of Private Capital Markets in Escalating Inequality

Donna Carmichael

London School of Economics, United Kingdom

The last thirty years have seen extraordinary growth in private capital markets, including asset classes such as private equity, venture capital, and hedge funds. Global private AUM (Assets Under Management) has grown at a compound annual rate of 10.2% over the last ten years, hitting a record high of almost US $11 trillion in 2019. Despite the pandemic, global private market AUM is expected to grow by almost $6.5 trillion in next five years to 2025, as yield-hungry investors continue to shift capital from public markets in search of better performance, while avoiding the cumbersome regulatory and reporting requirements imposed on public market participants. In fact, 2018 marked the first year that investors ploughed more capital into private markets than the public markets, prompting suggestions that this represents one of the most profound shifts in the capital markets since the 19th century.

The rise of finance as the dominant engine of the global economy has become a primary driver of escalating levels of economic inequality. Financial capitalism contributes to increases in income disparity as the benefits of rentier capitalism accumulate disproportionately in the hands of economic elites, who are increasingly channelling capital into private markets. Stock markets have reached dizzying heights over the last year, in spite of the pandemic-induced economic upheaval, benefiting those with the capital to invest in public equities. Less examined, however, has been the increasing role of private capital in elites' wealth accumulation, particularly during the current economic crisis. This presentation will discuss the under-examined role of private capital in escalating inequality, and how the coronavirus crisis exemplifies capital accumulation through exploiting economic disruption.

Debts of Care: The Social Support of Formerly Incarcerated People With Serious Mental Illnesses

Tommaso Bardelli

New York University, United States of America

How do people who are structurally marginalized negotiate their relationships with family and friends who support them given that they are often unable to reciprocate the support they receive from them – including loans, gifts, and other forms of material assistance? And how do members of their social networks make decisions about the extent and duration of support they are willing to extend to them? Existing research on how people make and respond to requests for assistance from members of their social networks suggests that givers and receivers engage in complex negotiations around these requests. Receivers have to establish the sincerity of their requests and the urgency of their needs. Givers, on the other hand, carefully draw boundaries around deserving versus undeserving recipients of their support. In her work on social capital activation among Black and Latin-x service workers in California, for instance, Sandra S. Smith (2005) shows how jobholders were more likely to make referrals for jobseekers whom they perceived as personally responsible and highly motivated.

This article draws on qualitative research with 32 people with Serious Mental Illnesses (SMIs) and histories of incarceration in the city of New Haven, Connecticut, to examine how "hyper-marginalized" people in the United States manage their supportive relationships. We document our participants' strategies to establish their reputation as honorable requestors, even though most of them were in a condition of perpetual indebtedness vis-à-vis friends and family. We also reconstruct the dilemmas faced by those who supported them, and how the receiver's condition of structural oppression makes it trickier for the giver to define the limit of his/her obligation to assist.

A Study Of (Trans)national Capital: A Sociological Analysis On How Transnationalism Shapes Social Class In The 21st Century Britain

Marta Pagnini

London School of Economics and Political Science, United Kingdom

Since the publication of Piketty's (2013) Capital in the Twenty-First Century, the academic debate on economic inequality and the rise in the top 1% share of wealth and income distribution has seen an unprecedented revival. More specifically, in the sociological literature, an increasing number of publications focuses on elite studies (see: Friedman et al., 2021; Savage, 2021).

Drawing on the sociology of elites and social capital literature, my research focuses on the relationship between economic globalisation and elite formation in 21st century Britain.

The project aims to recreate a statistical model of social class at the top of the British social pyramid to investigate how the social structure changes from the early 2000s until present times. My aim is to analyse transformations of the elite constellation during key moments in recent economic history, such as the 2008 financial crisis, Brexit referendum in 2016, and the COVID pandemic, with a distinctive focus on the role of the aristocracy and corporate elites in reproducing social and economic inequalities.

In particular, I am drawing on the Court Circular dataset (https://www.royal.uk/court-circular), which records on a daily basis the past engagement of the British Royal Family from the 19th century until present times. In particular, I investigate changes in the nature of the clusters of individuals (e.g. Celebrities, Cultural elites, Media etc…) surrounding the Royal Family on a 20 years time period. Based on the Court Circular data, I also analyse the evolution of the Royal Family's social networks in terms of geographical expansion, gender, race, and class dynamics.

RN09_T08_02 | Wealth and Inequality

Strategies Of Capital Accumulation In Times Of Land Scarcity. A Field Perspective On Social Housing Construction In Vienna.

Carina Altreiter, Katharina Litschauer

Vienna University of Economics and Business, Austria

The city of Vienna is known for its large de-commodified (social) housing stock. Since 2004, the task of social housing construction was left entirely to limited-profit housing associations (LPHAs). More recently, Vienna experiences a sharp increase in land prices, putting pressure on the construction of affordable social housing (e.g. Kadi 2015). The city government tries to cope with this challenge by drawing on its well-established land banking fund and distributing highly demanded building plots to LPHAs via a competitive tenure procedure ('developer competition').

Against this background, the paper explores the structure of relations between LPHAs operating in Vienna to highlight how recent challenges and state interventions affect established market configurations. Applying a field perspective (e.g. Bourdieu 1998; Schmidt-Wellenburg/Lebaron 2018) we identify the dominant forms of capital (economic, cultural and social) that structure the field of social housing construction and shape relations between LPHAs. Results from multi-correspondence analysis reveal heterogeneous combinations of different forms of capital configurations, which indicate LPHAs positioning in the field. The positions evoke different strategies of capital accumulation and for gaining access to scare land. Tightening market conditions especially force medium-sized LPHAs to develop new strategies. They are either highly dependent on competitive tenure procedures or become subsidiaries of larger LPHAs. In contrast, small LPHAs both lack economic and cultural capital limiting their possibilities to participate in the market, while large companies can draw on their capital stock, reducing market constraints.

Intergenerational Wealth Transmission And Access To Homeownership And Mortgage Debt: An Institutional Framework

Or Cohen Raviv[1], Thomas Hinz[2]

[1]University of Konstanz, Germany; [2]The Department of Sociology Cluster of Excellence "The Politics of Inequality" at the University of Konstanz

Homeownership is the main source of wealth accumulation for most families in most advanced economies. Intergenerational wealth transmission (IWT) from parents to children can play a significant role in determining offspring's access to homeownership and mortgage loans, specifically when children are at a family-forming age. This study investigates the association between IWT and homeownership and mortgage debt within and between European countries and explore to what extent economic and governmental institutions moderate this relationship. Data was drawn from the Household Finance and Consumption Survey (HFCS) 2013 and 2017 (European Central Bank). We found that the probability of homeownership with and without mortgage debt is higher for those who had benefited from IWT than for those who had not among all countries included in the analysis. At the same time, where governmental housing regulations promote homeownership, IWT is insignificant for access to homeownership with mortgage. The same was found regarding housing financial institutions that are relatively more generous. However, when housing is less affordable, IWT matters for access to homeownership with mortgage. We conclude that governmental and financial institutions are meaningful mechanisms in reducing homeownership inequality and, therefore, wealth inequality through intervention in the housing market.

Income Distribution and income trajectories of Finnish Cohorts born 1920–1983 during the Welfare State Expansion and Retrenchment 1970–2018

Esa Karonen, Hannu Lehti, Jani Erola, Susan Kuivalainen, Pasi Moisio

University of Turku, Finland

In this paper we study generational income inequality in Finland, following the cohorts born in 1920-1983 over their adult life course in the period 1970–2018. We are especially interested in the birth-cohort-specific variation in the period-specific income distribution. This variation can be considered as a proxy for the generational inequality in a society. By decomposing this variance, drawn from a series of random effects models, we test the role of four different factors that potentially contribute to generational inequalities: socioeconomic changes in the educational and occupational composition of society, employment, family demographic changes, and social transfers as part of total incomes.

We study income inequality between generations over the period 1970-2018. We utilize income and other socioeconomic data from the total population register dataset based on longitudinal census data of Statistics Finland. The total population data allow us to compare the position of the birth cohorts born 1920-1983 during the period 1970–2018 and it includes over 5,000,000 cases. We use hierarchical random effect growth curve models and variance decomposition.

The income trajectories over the life course show that the cohorts born in the 1940s and 1950s both began and ended their adult life courses higher in the income distribution than the cohorts born before or after them. This is the case especially for women. We further decompose the life-course variation in the income trajectories of different birth cohorts according to various sociodemographic factors using random effect models. The results suggest that around one fifth of the income inequality experienced during the period covered can be attributed to cohort differences. Most of these differences relate to cohort differences in occupational class structure and employment.

RN09_T09_01 | Money - Miscellaneous

The Transformations of Money and Its Importance for Individual Subjectivities

Rebeca Noya Rodríguez, Matilde Massó Lago

University of Coruña, Spain

This paper analyses how money and means of payment are being transformed, what are the actors and processes involved in such transformation and what are their social consequences in terms of attitudes towards money, consumption and indebtedness.

The transformations of money are intrinsically related to complex dynamics. On the one hand, the development of multiple instruments subjected to innovation in ICT; on the other, issues of political relevance linked to the relationship between the territory, the state and monetary sovereignty, as well as the social processes related to the confidence in the economic system and the conflicting interests between the agents involved in the issuance of the means of payment.

We have conducted a qualitative approach based on semi-structured interviews with individuals and actors involved in the process of monetary innovation. We have analyzed individual feelings and attitudes towards different payment methods and people's confidence in commercial banking. Provisional results show the identification of different monetary uses according to age, income and gender. Instrumental attitudes prevail among young people versus conservative attitudes towards savings and new financial products, which prevail among older people. In addition, we have identified different models of managing monetary expenses according to income levels

The Materiality of the Point-of-Sale Credit Assessments

M. Fatih Karakaya

Istanbul University, Turkey

Debt books of shoppers, sales forms of department stores, and POS terminals are those market devices that enable the seller to assess the creditworthiness and the credit limit of the buyer. The material aspects of these market devices do matter in the assessment processes. Debt book of shoppers records the routine shopping of customers. Hence, a rhythmic evaluation process leads seller to trust the customer on credit. It also determines a certain limit and restructuring terms for the credit. Sales form of a department store makes a buyer answer definite questions that are weighted instantly to decide whether sell the product on credit or not. Hence, a clinical evaluation process leads seller to trust on the customer on credit. POS terminal calls the server of Credit Card Company to receive authorization for the credit sale. Hence, an algorithmic evaluation process leads seller in couple of seconds to trust on his sale on a credit card. Based on interviews with relevant parties of credit sale transactions and published materials as well as literary works, this paper aims to open the black box of point-of-sale credit assessment processes by analysing the materiality of the market devices that enable credit assessment. Bridging the historical figurational analysis of Norbert Elias, and in situ encounter analysis of Erving Goffman with the emphasis on non-human actants of Actor Network Theory, the paper seeks for an alternative explanation to deconstruct the grand narrative of the loss of trust in modern society.

345

The Commercial Credit and the Financial Sociology.

Evangelos Prontzas, Virginia-Anastasia Fournari

Panteion University of Social and Political Sciences, Greece

This proposal addresses the role of credit policy, its procedures, who participate in the market, and generate knowledge about financial instruments. The sociological interest in the content is based on the initial identification of at least one bank trading mechanism that constitutes values (the "environment" of banking credit) and the final question for the analysis of the "social processes behind value formation". The dynamics, which are developed in this context, formulate in time-specific ways of behavior where each element of the system does not only influence the other but to a large extent every element determines the behavior. The transition to the issue of credit function is the sociological analysis of the mediating role of commercial banks. The credit framework is evolving and monitoring the conditions for growth and change in transactions. The appearance of the "credit officer" is a special technique based on its ability to evaluate and judge the borrower's ability to repay the loan. The productive future of a national economy is linked to the business team that decides, according to incentives, on investments. The relationship of social groups with investment incentives is identified with the problem of "investment activity of society" and the problems of entrepreneurship. Management modernization is a concept that reflects the policy within the commercial bank. The concept is linked to the central development goal of "social production", ie the long-term and responsible utilization of social resources, resulting in the maximization of added value. This is a more general and long-standing issue that differs between countries. Its difference negatively affects the economic position of a country compared to countries that have "developed social production systems".

What If The Mean Is Not The Message? Causes Of Effect Heterogeneity Of Research And Development Subsidies

Seweryn Krupnik

Jagiellonian University, Poland

Research and development (R&D) subsidies on average increase R&D expenditure. However, an increase is not observed for each beneficiary. Previous research has established only some causes of this heterogeneity.

The aim of this study is to contribute to the understanding of the causes of heterogeneity of R&D subsidies among the beneficiaries. The central question in this study asks what configurations of conditions explain lack of increase of R&D expenditure and high increase of R&D expenditure. Moreover, what mechanisms account for the lack of effect for some beneficiaries.

The article describes the results of impact evaluation of the 'Fast Track' – implemented in Poland measure 1.1.1 of Operational Programme Smart Growth. 36 cases were included in Qualitative Comparative Analysis (QCA) model. The model combined multi-value, crisp and fuzzy sets. Conditions were saturated by diverse sources of data: monitoring, survey and in-depth interviews. A process tracing was applied as a complementary method. As a result of the analysis configurations of conditions leading to lack of effect and high effect were identified. They include size of the beneficiary, reception of public support before applying for subsidy, high budget of the subsidy and expenditures on R&D in two years before applying for subsidy. Moreover, the study provided evidence for two hypothesised mechanisms leading to lack of the effect: measurement error and crowding out of private expenditure.

346

RN09_T10_01| Attitudes towards Inequality

Robin Hood Or The Sheriff Of Nottingham? A Cross-national, Micro-level Analysis Of The Relationship Between Economic Inequality And Support For Redistributive Policies

Carolien Van Ham, Alex Lehr

Radboud University, Netherlands, The

While economic inequality is generally increasing, support for redistributive policies does not quite appear to follow suit. In particular the apparent limited support for redistribution among low-income earners in highly unequal societies appears puzzling based on standard self-interest theory. A potential solution for this puzzle may be found in a principle-agent approach to support for redistributive policies, wherein individuals (i.e., principals) take into account not only their potential gains from such policies but rather also their expectations about the efficacy and equity of the governments (i.e., agents) implementing these policies. We therefore analyze the interplay between macro and microlevel economic inequality, support for redistributive policies, and individuals' political attitudes, in particular their political trust and support for democracy and autocracy. We deduce a micro-, macro- and cross level interaction hypothesis from these theoretical arguments. These hypotheses are tested by estimating a series of multilevel regression models using data form all waves and countries included in the World Values Studies. Our findings clarify to what extent political attitudes are able to explain the relationship between economic inequality and support for redistribution.

Beyond Financial Strain: Explaining the Relationship of Labour Market Marginalization and Civic Participation through Values and Social Identity

Carlotta Giustozzi

Goethe University Frankfurt, Germany

The paper examines the consequences of labour market marginalisation for civic participation. As previous literature suggests little effects of economic factors, the analysis explores the validity of two competing sociological approaches. The dominant status model predicts a positive relation of stable labour market integration and civic participation based on social status, resources, contacts, and motivation. Competing approaches stress the importance of social identity for shaping capabilities and opportunities to engage in civic life. Identity can be influenced by privilege or discriminatory experiences and expressed through individual values.

Results from multilevel linear probability models based on SOEP data from 1990 – 2017 challenge dominant status theory as full-time employment shows consistent negative effects on civic participation and financial strain fails to explain any of the effects. Overall, the effects of labour market experiences do intensify when accumulated suggesting it takes time for changes in the labour market to unfold their impact on social practices supporting the hypothesis of the relevance of social roles. Furthermore, findings reveal the impact of social roles for shaping involvement in civic life. On the one hand, it is primarily the accumulation of unemployment, which negatively affects civic participation. On the other hand, strong family and friendship values can function as a source of support and belonging improving participation for all independently of their labour market experiences. Additionally, strong values around work and self-realization increase resilience to labour market marginalization and encourage participation of individuals with unemployment experiences.

347

How Does Our Society Look Like? Unemployment Experience and Perception of Social Structure

Miloslav Bahna

Institute for Sociology, Slovak Adademy of Sciences, Slovak Republic

Research suggests that experiences of (long term) unemployment within a family have various adverse effects on education chances, employment opportunities or political trust. We try to establish if experiencing unemployment has an impact on the general views on social structure. We argue that long term unemployment can be seen by those who experience it as a systemic failure which undermines the meritocratic legitimization of social structure. Using data from the ISSP Social Inequality module, we model factors explaining how people see the structure of their society on the example of the two ex-Czechoslovak countries. Both post-communist societies share the beginning of the transformation to a free market economy in 1989 but are divided by very different socio-economic impacts of the transformation process. The expectation is that a long history of chronically high unemployment will divide perceptions in Slovakia from those in the Czech Republic which had a much more favorable unemployment situation. When comparing views on the social structure in both countries, people in Slovakia see their society as extremely polarized between a small elite at the top and a great mass of people at the bottom far more frequently then respondents in the Czech Republic. However, people who see their own position in the social structure as low tend to define their society as extremely polarized in both countries. At the same time those with experiences of unemployment identify their positions within the Slovak society as lower than respondents without such experience. The connection between unemployment experience and views on social structure is therefore indirect with subjective identification of one's position within the society acting as an intermediate variable.

Welfare And Well-being Of Young Adults During The Corona Crisis

Juliane Achatz, Dr. Bernhard Christoph

Institute for Employment Research IAB, Germany

Recent research on the Covid-19 pandemic shows that adverse effects on worker's employment situation are highly unequal for different groups. This paper focuses on young adults in Germany who are at the beginning of their working life. Young persons have limited work experience and often start their career in insecure forms of employment such as part time or fixed term employment. Therefore, compared to older age cohorts, we would expect young adults to be at a higher risk for experiencing a loss of employment and income during the course of the pandemic. Moreover, such a decline in perceived job as well as income security might also negatively affect the younger person's subjective well-being - even among those whose individual employment situation has not changed yet.

In this study, we examine the evolution of crisis-related job loss, modification of working hours, and income loss and their impact on feelings of anxiety and compare these results for workers of different age groups. We use a new and unique dataset, the High Frequency Person Panel Survey "Life and Employment in Times of Corona". For these data, persons living in Germany that either were employed or were drawing on welfare benefits (Unemployment Benefit II) were interviewed repeatedly in short intervals since the occurrence of Covid-19 (one month in the beginning, two months later on). Therefore, the data allow following the individual situation of respondents over the course of the pandemic.

RN10_T01_01 | Aspiration, Choice and Selection 1

All Degrees Are Equal, but Some Degrees Are More Equal Than Others – a Cross-country Analysis of European Students' Views on the Value of Their Degree

Achala Gupta[1], Rachel Brooks[2]

[1]Southampton Education School, University of Southampton, UK; [2]University of Surrey, United Kingdom

Drawing on 54 focus group discussions conducted with 295 undergraduate students across six European countries (Denmark, England, Germany, Ireland, Poland and Spain), we examine participants' understandings about the value of their higher education degree, situating these within the discourse of students' aspirations. We pay specific attention to the plasticine models they made within the focus groups, which helped to make tangible some of their more abstract ideas. In our analysis, we explore the extent to which students' responses were patterned by the place and subject of study. We found that the majority of our respondents tended to believe strongly that the institution one attended and the subject one studied had a significant influence on employment destinations. For example, students' perceptions about the likely impact of institution on their employment aspirations were not confined to only those in countries with strongly vertically-differentiated systems, where one might expect the rewards of HE to be more variable. However specific ways in which these views were shared varied across and within nation-states. For example, while Danish students referred to institutional differences by 'university of applied sciences' vs 'traditional universities', their English and Irish counterparts differentiated between older and newer institutions, believing that transitions into professional employment would be much easier from the former. Our comparative approach allows us to tease out these intricate patterns across the continent, and contribute to debates about the degree of convergence of higher education students' perspectives and experiences across the European Higher Education Area.

Aspiration Paradoxes Among Spanish Young People in Marginalised Neighbourhoods

Abel Beremenyi

Central European University, Democracy Institute, HU

The concept of 'aspiration paradoxes' (Stahl 2018) describes that although working-class youth recognize that post-compulsory education would increase their power in society, however, accumulating that form of power makes them uncomfortable. In marginalized conditions, the conflict between values instilled within the local community and the neoliberal prerogatives transmitted by the school (competitiveness, economic rationality, meritocracy) is made evident. The 'aspirational discourse' is fostered in parallel with the budget cuts, thus reinforcing the young people's responsibility, or that of their community, for the success or failure of education and work. The paradox is manifested in the negotiation between the doxic logic of aspiration and the habitual logic (Zipin, Sellar, Brennan, & Gale, 2015); between the one that conforms to the normatively desired future, and the one that is guided by the historically informed and organised-organising structures of the Bourdieusian habitus. This paper focuses on the Spanish Roma young (18-30) peoples' career aspirations and school-to-work transition plans. Through a 'patchwork ethnography' (Günel, Varma, & Watanabe, 2020) carried out during the months of COVID-19 (2020), I collected 23 interviews with Roma young women and men (btw 17-24 years old) and 21 with municipality civil servants and high school teachers. Starting from the premise that the 'ability to aspire' is not uniformly distributed in any society (Appadurai 2004), I analyze 1) the process of elaboration and negotiation of the Roma young people's training and career aspirations; 2) institutional and community support for this process and 3) its alignment with broader socio-economic structures.

Influencing Factors of Study Path in Higher Education

Gabriella Pusztai, Anett Hrabéczy, Cintia Csók

University of Debrecen, Hungary

The expansion of higher education led to an increase in the number of dropouts, and even the transition to the Bologna system did not eliminate the high dropout rate (Vossensteyn 2015, Wolter et al. 2014). The causes of dropout do not necessarily arise during university studies, but their elimination is an unsolved problem of higher education (Pusztai 2018). In our presentation, we attempt to answer the question of what factors influence students' academic progress in addition to socioeconomic status. For our analysis, we used a database of questionnaires for students from five countries (PERSIST 2019, N = 2199). According to our hypothesis, career aspirations can be identified as independent factors in addition to socioeconomic status. During the study, we identified three groups of students through cluster analysis (standard, delaying and corrective), and the period before entering higher education was examined along these groups. Based on our data, demographic and social background, the high school performance, factors influencing career choice, and characteristics of the chosen field of study show a correlation with the academic progress of the students. Our findings may contribute to the development of more effective dropout prevention for students entering higher education. This presentation is supported by the ÚNKP-20-3 New National Excellence Program of the Ministry for Innovation and Technology from the source of the National Research, Development and Innovation Fund.

Classed Choices: Young People's Rationalities for Choosing Post-16 Educational Tracks

Aina Tarabini, Alejandro Montes, Judith Jacovkis

Autonomous University of Barcelona, Spain

The sociological literature has repeatedly highlighted the socially situated nature of educational choices (Ball et al, 2000) and the importance of analysing them as a result of complex processes of negotiation between opportunity structures and social actors' frameworks of meaning (Evans, 2007). The segmentation of education systems into different tracks is one of the main factors explaining the processes of social reproduction through educational choices (Seghers, et al, 2019). The aim of this presentation is to examine the relationship between educational tracks and social class, focusing on the reasoning behind the choices made by young people. The analysis is conducted in Barcelona (Spain), where education is organised in a comprehensive structure in lower-secondary education and segmented in two different tracks, the academic and the professional, in the upper-secondary. The Spanish system is also based on a sub-protective transition regime (Walther, 2006), a limited history of VET and high numbers of school leavers. The analysis employs a mixed-method design based on a survey of 1,318 students in the first year of upper secondary education and 38 in-depth interviews with middle-class and working-class students from both tracks. The results explore the differences and similarities in young people's discourses when explaining their choices as more or less naturalised processes or as guided by future options. The meanings and realisations that both processes acquire among young people of different social classes help to further understand the nexus between choice, tracks and the (re)production of social inequality.

Pandemic Perspectives 1

Strengths and Weaknesses of the (Online) Debate as a Strategy for Acquiring Cultural Capital and Democratic Competences in Young University Students in Times of COVID.

Francisco Javier Jiménez-Loaisa[1], Pablo de-Gracia-Soriano[2], María Jiménez-Delgado3, Diana Jareño-Ruiz[4]

[1]Universidad de Alicante, Spain; [2]Universidad Complutense de Madrid, Spain; [3]Universidad de Alicante, Spain; [4]Universidad de Alicante, Spain

For decades, the sociology of education and educational research have shown the centrality of language, communication skills and, ultimately, cultural capital as explanatory variables of educational inequality, in terms of success or failure. However, despite the evidence found during decades of educational research, the specific processes through which students acquire these competencies and increase their cultural capital have not been sufficiently investigated. Therefore, this research explores the strengths and weaknesses of the online debate to achieve these objectives. For this purpose, ten debate sessions have been organized within the framework of a degree subject, evaluating its impact on students through a pre and post questionnaire. The main results show the ambivalence of the debate as a teaching tool: although it does not seem an adequate tool to increase students' knowledge of the curricular content, it does seem an adequate tool to acquire certain competencies and values and develop their cultural capital.

Czech teenagers' Reflections of the School Lockdown

Helena Kubátová, Miroslav Dopita, David Fiedor

Palacký University Olomouc, Czech Republic

The aim of the paper is to present how Czech teenagers in compulsory education perceive their teaching during the school lockdown period. First, the contribution addresses the situational context of education in the Czech Republic March 2020 to June 2021 by examining data on distance education provided by the Czech School Inspectorate. Second, it presents the Czech Republic's results of the questionnaire survey in the population of 11-, 13-, and 15-year-old schoolchildren conducted in June 2020 within a Health Behavior in School-Aged Children (HBSC) study. Schools were randomly selected from the database of the Ministry of Education, Youth and Sports. The response rate at school level was 61.5%. Two research questions underlie the data analysis. (1) How did the Czech teenagers in compulsory education perceive the consequences of school lockdown in terms of social contacts and of the time occupied by the school? The focus here is the perception of loneliness and the frequency of social contacts. (2) What are the educational conditions of the Czech teenagers in compulsory education during the school lockdown? The conditions were subdivided into family and school conditions. Within family conditions, both material (workplace, electronic equipment, the nature of housing) and intangible conditions i.e. help with school assignments and family atmosphere (feeling of crampedness, quarrels, joint leisure activities). Within the school conditions, online access to education and the level of contentment with the scope of assigned tasks were surveyed.

351

The Life of University Students In Italy During Covid-19

Giuseppe Monteduro[1], Sara Nanetti[2], Davide Ruggieri[4], Michele Bertani[3], Matteo Moscatelli[2], Fabio Ferrucci[1]

[1]University of Molise, Italy; [2]Catholic University of the Sacred Heart of Milan, Italy; [3]University of Verona, Italy; [4]University of Bologna, Italy

The regulatory constraints deriving from the Covid-19 outbreak have changed the university students daily lifes, with a primary impact on the educational sphere, mainly as a consequences of the quick switch from traditional to online learning; this new scenario affected other important students life' dimensions (peer relationships, student-faculty relationships, etc).

The effects of these changes were investigated through a national online survey (from April to June 2020), to which over 16,000 students replied. The survey investigated several thematic areas: education, inequality and social capital, as well as psychological and social well-being. The areas were questioned in relation to the structural elements according to the theoretical approach of relational sociology.

The main results of the survey present a student population significantly differentiated by: socio-economic status, digital devices, social capital and social participation.

Several students define the University as a "place of life", in which two important dimensions are interconnected: the instrumental ones (university education) and the individual ones, referring to the opportunity to promote human capital, facilitate employability and improve quality of life and the fulfillment of dreams and aspirations.

For other students, the university represents a weak place, almost a transit space: the sense of belonging is weak.

This research cleary describe an unexpected transition phase for Italian Universities and their students, focusing on the different aspects related to pre and post pandemic scenario, which helps to reconfigure the upcoming one, as well as showing how we are probably facing a new era for universities and students life.

Potentially Losing Your Safe Space: The Impact of Covid-19 On Young Queer Students Within Education

EJ-Francis Caris-Hamer

University of Essex, United Kingdom

It has been more than twelve months since the UK became engulfed in a global pandemic due to Covid-19, with rises in infection leading to two national lockdowns. The media has exposed to the world the resulting impact of the closures on inequality amongst school children according to class, ethnicity and mental health. Yet, such exposure seldom identified the impact that Covid-19 has had on other vulnerable pupils such as those who are part of the Queer community, especially when, according to the government and public as a whole, schools are expected to be considered a safe space for vulnerable children. Many of these students are doubly vulnerable within a Covid-19 context, as Covid-19 has hampered any existing or further attempts at Queer inclusion within education. This paper draws upon interviews conducted with 40 secondary school teachers who are essential to support and maintaining inclusion for students during the first lockdown. The interviews were conducted with teachers across England, to explore the impact Covid-19 has had on the student Queer community. My findings expose, not only the disparity of Queer inclusion in schools but how Covid-19 has become a barrier to maintaining Queer inclusion by further silencing Queer voices within educational settings. More importantly, it considers strategies that teachers and schools can adopt to ensure Queer inclusion, to ensure the positive wellbeing of all students is maintained in schools during an ongoing pandemic.

Policies to Combat Educational Inequalities in Turkey: From the Precariousness of Measures to the Medicalization of School Failure in the Neoliberal Era

Metin Cevizci

Acıbadem Üniversitesi, Turkey

Implemented in the 1960s, The Equal Opportunities Policies in Education in Turkey have followed two different paths since the early 2000s under the influence of the intensification of neoliberal policies. On the one hand, the new public management in education provides the political domain with projects and partnerships that result in restricted and temporary arrangements that are deprived of regular evaluation for lack of available data. On the other hand, the recognition of dyslexia and hyperactivity as disabilities within the school contributes to the construction of school failure as a medico-psychological issue. Mobilizing an analysis of regulatory and official documents and a field survey carried out between 2018-2020 on the experiences of school stakeholders in the management of school failure, this communication aims to discuss the way in which educational inequalities are represented and supported by these policies. Based on a liberal conception of equality, project-based policies target specific individuals and aim to manage the social consequences of educational inequalities rather than prevent them. In the absence of permanent arrangements that would take into account the social dimension of school failure, the educational difficulties arising from sociocultural factors risk slipping into the field of special education. The image of an inefficient school built by these policies, which prove to be ineffective, reinforces the individualization and externalization of the definition and management of educational inequalities which in turn lead to the deresponsabilization of the political and educational fields.

Moving Towards a Students' Leading Role in Learning Communities.

Ignacia Palma Salinas

University of Barcelona, Spain

Inclusion and overcoming structural inequalities are some of the most important challenges in education. They imply for educational research to take a role in the analysis of the practices that are contributing to them. Historically, the schools have been characterized for adult-centric relationships that make the students' learning process dependent of adult figures and place them as passive subjects of their educational experience. Hence the importance of going through more democratic schools and placing students as relevant actors in their pedagogical processes.

In this context emerges the project Learning Communities, which proposes a social and cultural change of schools to move forward social cohesion. The schools that become Learning Communities have shown improvements in their academic results, coexistence, the inclusion of cultural minorities, and in the motivation and self-esteem of their students (Elboj Saso & Oliver Pérez, 2003; R. Flecha, 2009; De Gràcia & Elboj, 2005; Ramis-Salas, 2015). Based on a dialogical educational model, those results are achieved by increasing the social interactions between students and adults and between them and the community.

In a highly segregated education as is the Chilean one, Learning Communities represent an alternative to move towards inclusion. The paper focuses on an ongoing qualitative research about students' participation and how Learning Communities are contributing to change the adult-centric dynamic in schools placing the students as the protagonists.

353

Interactions in Interactive Groups: volunteers' role.

Sandra López Fernández, María del Carmen Sánchez Pérez, Juan García López

Universidad de Castilla La Mancha, Spain

It has been already proven that Interactive Groups improve the educational success. In this paper, the focus is on the volunteers´ role. Through a communicative methodology, information gathered with focus groups, interviews and data analysis, provide evidence on the relevance of volunteers´ participation when developing Successful Educational Activities. This case study deepens in the academic improvement in Language and Mathematics performance of four Learning Communities Schools in Spain, analyzing to what extent interactions provided by volunteers in the classroom can be hindering academic developments. Their diversity and intensity were considered. Also, that the activities comply with the dialogic learning principles. It will be concluded that those rich interactions foster the students´ educational success in the schools studied, highlighting the important role of community involvement in children´s educative process.

Epistemology of Surveillance: Knowledge Production as a Hidden Marker of Racist Academia:

Sarab Yunes Abu-Rabia-Queder

Ben-Gurion University of the Negev, Israel

The current paper explores the hidden racialized mechanisms of surveillance in the field of knowledge production experienced among Palestinian researchers in Israeli academia. The study relies on interviews with 15 researchers (7 females, 8 males) mostly from humanities and social science faculties in Israel. The paper shows that Israeli academic gatekeepers are not only interested in maintaining the racial hierarchy between Jewish-Israeli and Palestinian researchers but aims to control them as colonized subjects who do not violates\threatens the Zionists' ideology in their studies, which is a fundamental part of the Israeli academic essence. Being Palestinian-indigenous citizens of Israel, they suffer from the intersection between living and studying colonialism. Like other indigenous researchers in the world, Palestinian researchers perceive their academic mission as part of a

wider mission aimed at voicing Palestinian colonized experience. However, this critical knowledge production threatens the colonial power structure that Israeli academia is part of.

The hidden process of delegitimizing critical knowledge production of anti-colonial scholarship is conducted through various mechanisms of disciplining Palestinian researchers, such as labeling them as biased or political. The fear of the Palestinian researchers from not receiving a tenure serves as another hidden method that drives them to self-policing and monitoring their writing.

Unpacking these invisible mechanisms challenges the definition of academic freedom and reveals its limitation in a settler-colonial state.

RN10_T02_01 | Aspiration, Choice and Selection 2

Why Do Healthcare Assistants Want to Be Nurses? How the First Two Years of Vocational Education Contributes to Increasing the Aspiration for Higher Education

Asgeir Skålholt, Elisabeth Hovdhaugen

NIFU, Norway

In Norwegian vocational upper secondary education, the general structure is two years of schooling and two years of apprenticeship to acquire a qualification. But students who originally started a vocational programme can choose to get the general academic qualification required for higher education access, by taking a supplementary ('make-up') year after completion of the first two years of vocational education. Through the use of registry data, this article shows an increase over time in the share of students starting a vocational programme and completing it by taking the make-up year to get their academic qualification. Additional, survey data indicate that there is an increase in the proportion of students planning to take higher education from the first to the second year of upper secondary vocational education. This tendency, however, is greater among students planning to become health care assistants than in any

other vocational programme. By using survey data combined with extensive qualitative data, we show that the increased aspiration for higher education can be explained by student's experience during their two first year in upper secondary. Hence, the change in aspiration, from starting on a vocational path to entering an academic path may partly be formed by school experiences. Further, the paper also questions to what extent the teachers in vocational health care programmes function as role models. The background of these teachers are primarily as educated nurses, hence, they hold an academic qualification, which might contribute to influence the continued educational choices of students.

Job Ambitions Among Students With Immigrant Background In Contrasting Labor Market Contexts

Thea Bertnes Strømme[1], Berit Lødding[2]

[1]Oslo Metropolitan University, Norway; [2]NIFU

Neither cultural capital in Bourdieu's sense nor more economically oriented class analyses can explain the over-representation of non-white ethnic minorities in higher education across western societies.' Immigrant optimism' or 'immigrant drive' are concepts capturing young peoples' internalization of immigrant parents' social aspirations.

Anticipating consequences of the COVID-19 pandemic, this article seeks to investigate the shaping of aspirations among young people with immigrant backgrounds in very different economic and labor market contexts: Barcelona in Spain and Bergen in Norway by 2014, six years after the great recession in 2008, which affected the two countries' economies to very different degrees. Youth unemployment was severe after the recession in Spain, whereas Norway was hardly affected. The differences are likely to aggravate by the recent recession caused by the pandemic.

The results indicate that the thesis of immigrant drive is partly confirmed for Bergen, but most clearly among young people of East European origin. In Barcelona, by contrast, the young people with immigrant backgrounds have lower educational aspirations than their fellow students of native origin. However, the degree of segregation between schools impacts on the aspirations in Barcelona; students at schools with high proportions with immigrant backgrounds tend to have lower aspirations. The findings encourage sensitivity to context when assuming the existence of immigrant drive and

highlights the importance of young people's observations and confirmations of anticipated job prospects as well as segregation.

Peripheries Within The City: The Role Of Place/space In Shaping Youth Educational Choices And Transitions

Judith Jacovkis, Aina Tarabini, Alejandro Montes

Universitat Autònoma de Barcelona, Spain

Educational and youth research is attributing growing importance to geography in their analyses, but there is still a need to reinforce the spatial understandings of young people's lives (Farrugia, 2015; Raffo, 2011). Educational choices and transitions are socially embedded processes, from which young people's agency is always bound and informed by the social dimensions of inequality (Tarabini and Ingram, 2018). Consequently, this agency is also space/place configured.

The objective of this presentation is to develop a critical reflection on the role of geography and particularly of the place/space equation in shaping youth educational choices and transitions. Specifically, we explore the relationship between urban mobility and educational transitions, and we investigate the reasons for selecting a particular upper-secondary school. For doing so, we first identify the general patterns of mobility and the reasons provided for different types of youth. Then we focus on the experiences, logic and meanings of the peripheral youth. The analysis is based on 68 in-depth interviews with upper-secondary students in Barcelona and focuses particularly on young people living in two of the most impoverished urban peripheries of the city, understanding peripheries as a core part of their habitus and, thus, a central element in explaining their educational transitions and choices by instilling a sense of (dis) entitlement, (lack of) belonging and (dis) possession, in Wacquant's terms (1993).

The results demonstrate the importance of spatialising the analysis of educational transitions and to conceptually and empirically reinforce the notion of urban peripheries as a core element of youth identities.

Explaining Students' Religious Attitudes: the Role of Schools' Religious Diversity and Multicultural Teaching in Different Belgian Policy Contexts

Charlotte Maene[1], Jochem Thijs[2], Peter Stevens[1]

[1]Ghent University, Belgium; [2]Utrecht University, Netherlands

This study examines how secondary school students perceive different (non-) religious groups. Very few studies in this area consider how students' attitudes are informed by contextual differences in school policies and differences in their religious affiliations. We investigate the role of multicultural teacher culture, schools' religious diversity as well as their specific association with the religious attitudes of students from different (non-) religious groups. In addition, we explore how these relationships differ between two different regional policy contexts (Francophone and Flemish education in Belgium). The analysis of a quantitative SIS-dataset involving 3789 students selected from 62 Belgian secondary schools showed that; a) students' organize their religious attitudes hierarchically, b) the effect of multicultural teaching on students' religious attitudes is rather limited and c) that Non-believing students respond differently to schools' religious diversity than religious students. Implications of these results for future research are discussed.

RN10_T02_02 | International Persectives 1

Teaches and Cultural Diversity in Primary Classrooms in Spain

Sergio Andrés Cabello, Jhoana Chinchurreta Santamaría

University of La Rioja, Spain

Attention tocultural diversity at school is one of the main challengesof the educational system, which also intersects with other socioeconomic variables. In a country like Spain, which went from having a very small foreign-origin student body at the end of the 20th century, to exceeding 10% in many regions in the following two decades, has meant a transformation in every sense. This communication addresses the assessment of the situation and training of teachers in Primary Education centers (0-6 years) to address cultural diversity. Through a survey of 1,700 schools throughout Spain and ethnographies in twenty centers, within the project Cultural diversity at school: discourses, policies and practices (CSO2017-84872 -R), under the State Research, Development and Innovation Program Focusing on Social Challenges. Ministry of Economy, Industry and Competitivenes, it is found how teachers do not feel sufficiently trained for this purpose, that there are needs in that sense that are not covered, and that it is through daily practice that they learn, to a large extent, to attend and work on cultural diversity.

356

Hanging in the Balance. Participatory Action Research with Young School Drop-Outs

Teresa Wintersteller, Veronika Wöhrer, Mariam Malik, Shenja Danz

University of Vienna, Austria

In our presentation, we describe findings from a participatory research project with young school drop-outs from Austria. We address connections and tensions between individual educational biographies and the structural conditions of the educational system and the labour market. Based on concerns, goals and aspirations of these young people we analyse intersectional disadvantaging factors, that are sometimes met by uncertainty, by active resistance or by rethinking educational pathways by the young people.

In Austria, young people are obliged to complete their education until they reach the age of 18. If they do not find a place at school or vocational training, they have to participate in measures aimed at improving their (social) skills and increasing their employability. Many young people who take part in these measures come from educationally disadvantaged households, are confronted with language barriers due to migration histories, face psychological or family problems. The young people experience their limited scope of action in systems that have difficulties including them – a situation that becomes increasingly critical in times of Covid-19. How these concerns are articulated by the youths themselves will be illustrated with videos and visual representations of young researchers between the age of 15 to 21 who participated in the Horizon 2020 research project "CoAct – Co-designing Citizen Social Science for Collective Action" (funded by the European Commission).

Inequality At The Top: An Exploration of Cross-national Differences in Inequality of Opportunities of Graduation at Bachelor and Master Level

Luis Ortiz, Carlos Palomo

Universitat Pompeu Fabra, Spain

Although recent expansion of higher education has highlighted the distinction between graduate and postgraduate education, not much research has been carried out so far comparing the inequality of educational opportunities at these two levels of education. Even less attention has been paid to national factors possibly moderating such inequality; in particular, to the role played by income inequality and financial support to higher education. Resorting to individual-level data drawn from PIAAC and ESS and country-level data drawn from different sources (OECD, UIS and Harry Garritzmann's typology of national regimes of higher-education finance), we explore the moderating effect of educational expansion, vocational orientation, income inequality and financial support on inequality by social origin in graduation at bachelor and master level. We apply a two-stage approach to our data, estimating first the difference between the marginal effect of having a high- versus low-educated father on the probability of graduating at bachelor and master degree in each country, turning then these contrasts into the dependent variable at the second level of analysis and finally, by means of weighted-least linear regressions, referring these country-level differences to each national-level independent variable. We find that social origin has a statistically significant effect on graduation at both graduate and postgraduate level, although to a lesser extent at this latter level than at the former one. We also find that income inequality and regimes of higher-education finance are more salient than either educational expansion or vocational orientation in moderating the effect of social origin in getting a university degree. Such ranking of national-level factors, though, does not moderate the effect of social origin in graduation at master versus bachelor level.

357

Obstacles, Achievements, And Collaboration In Swedish High School Work With Students Consuming Alcohol And Narcotics: Accounts Of Teachers, Nurses, And School Counsellors

Sophia Yakhlef[1], Goran Basic[2]

[1]Kristianstad University, Sweden; [2]Linnaeus University, Sweden

As shown in previous studies, teachers report that there is a growing need for teacher training regarding alcohol and drug abuse among adolescents, and that many teachers feel uncomfortable with the role of being both teachers and "social workers". Previous research also indicates that children and youth with good school results and good schooling situations face a lower risk of experiencing social problems as young adults. In this on-going ethnographic study based on observations and field interviews we focus on the experiences of teachers, school nurses, and school counsellors regarding collaborative efforts in cases with young pupils with alcohol and drug abuse. Drawing on an ethnomethodological and symbolic interactionism perspective, we focus on the accounts of school staff who face pupils with these problems. We are mainly interested in 1) the organizational efforts and measures taken to enabling the schooling situation of the pupils, as well as 2) the emotional toll it has on the staff involved. We also focus on collaboration difficulties regarding schools, parents, social workers, as well as other welfare institutions. The preliminary findings suggest that there are various conflicting demands regarding the work tasks and emotional commitment of the school staff; on the one hand to ensure a good educational environment for all pupils, and on the other hand to provide emotional support to the students affected by these problems.

RN10_T02_03 | Specialist Perspectives 1

Conductorless Orchestras and Dialogical Learning

Danilo Martins de Castro Chaib[1,2]

[1]University College Dublin, Ireland; [2]Escola de Música de Brasília, Brazil

This present study presents the core of my doctoral research of whether the learning in conductorless orchestras can be defined as a form of dialogical learning (Flecha & Soler, 2013). The literature review first locates the orchestra historically and the influence incorporated from capitalist society; then, depicts how the myth of static leadership is represented by the figure of the conductor; and, finally, indicates the learning aspects that are present in the orchestra as a workplace and how the figure of the conductor interferes with the learning process of the musician's work. Orchestral musicians react in many ways to this interference. I focused in one specific reaction–playing without a conductor. From the Emancipatory Paradigm's point of view (Baker, Lynch et al, 2009), I observed and participated as a cellist in rehearsals and concerts with four conductorless orchestras (Persimfans from Russia, Orpheus from the USA, BandArt from Spain and OrquestraRio from Brazil), and have interviewed, conversed and recorded narratives with musicians, staff members, composers and guest musicians. Moreover, I have reflexions of some experiences done by myself trying to organize a conductorless orchestra in 2015, and from others in 2017-2020. Although there is a significant evidence of dialogical learning in conductorless orchestras, many elements are identified as being inherited from conductor-led orchestras. However, advances of egalitarian practices have been noted. The practice of conductorless orchestras can contribute to overcome a system based in inequality. Conductorless orchestras can serve history as a musical-organic intellectual entity (Gramsci, 1935) as in Mondagron and others workers' self-directed enterprises (Wolff, 2012; Soler, 2017) to help overcome the hegemonic system.

358

Does The Effect Of Conscientiousness On Academic Achievement Vary With Determinants Of Social Inequality?

Dennis Föste-Eggers[1], Marit Kristine List[2], Fabian T. C. Schmidt[3]

[1]German Centre for Higher Education Research and Science Studies (DZHW), Germany; [2]DIPF | Leibniz Institute for Research and Information in Education, Germany; [3]University of Hamburg, Germany

Intersectionality describes social inequality on the basis of various interrelated factors (e.g. migration status and social origin). This approach goes beyond a multidimensionally defined construct of inequality by making the linkages of its dimensions visible. In the field of educational research, there are already findings on multiplicative effects that can be attributed to an intersectionality persepective: For higher education, Lörz's (2019) findings suggest that immigrant youth from non-academic homes are less likely to complete their studies.

The aim of this study is to investigate whether the effect of conscientiousness on academic achievement varies with determinants of social inequality (immigrant background and parental educational level). We focus on conscientiousness because it is one of the most important factors influencing academic achievement outside the domain of cognitive factors (Poropat, 2009).

We use data from the 2008 cohort of a German panel study with three measurement points (Heine et al., 2017). The data make it possible to investigate the effects of the Big Five personality traits on the (perceived) achievement in university over a span of five years. Our sample consists of N=3.084 participants.

The results of our linear regression model indicate a differential effect of conscientiousness on academic achievement when interaction effects of social background variables are accounted for. The expected positive correlation between conscientiousness and academic achievement is not evident for adolescents with an immigrant background who come from non-academic households. Although the results require replication, they nevertheless show the intricacies of the differential influences of socio-emotional factors in the educational context. The findings can be further discussed with regard to possible implications for the field of intersectionality research in education.

Rethinking Education: A Sociological Reflection Through The Writings Of Jiddu Krishnamurti

Komal Yadav

Jawaharlal Nehru University, India, India

Education in our times demand more attention. The crisis, we hit by COVID-19 pandemic is not only affects our lives throughout the world but also the whole education system. Many studies came forward, which reflect on possibilities of online education, decreasing children attention, not able to have access to internet so on. This, on the one hand, widen the inequalities in the already hierarchical society, on the other hand, it affects the educational possibilities which exist in the society. Amdist all this, the question which we didn't discussed is education itself- what is education? Does education has any relationship with one's life or is it just clearing the exams, getting degrees. The pandemic has unsettled everything. But then, acedemic bureaucrats far from rethinking education at this moment of existential turmoil, have failed to see beyond the technical approach-legitimising online education. At this point, we need to rethink the very purpose of education, when death is statistics, fear is all pervading, modernity has proved its hollowness, and the notion of 'productivity' has lost its meaning. To understand these, This paper will focus on the writtings and educational thought of Jiddu Krishnamurti. Jiddu Krishnamurti is is an Indian thinker, philosopher, who reflected extensively on Education and on life. With the deep engagement with his writing, thoughts and sociological understanding of education, this paper will look for alternative sociological knowledge in the context of education. This paper will also discuss the researchers ethnographic experience at one of Krishnamurti foundation school- Rajghat Basant School, Banaras, India.

359

Renewing Pedagogy: PBL as a Space for Young People's Educational Citizenship

Eunice Macedo[1], Elsa Teixeira[2], Alexandra Carvalho[3], Helena C. Araújo[4]

[1]Universidade do Porto, Faculdade de Psicologia e de Ciências da Educação, Centro de Investigação e Intervenção EducativasPortugal; [2]Universidade do Porto, Faculdade de Psicologia e de Ciências da Educação, Centro de Investigação e Intervenção Educativas; [3]Universidade do Porto, Faculdade de Psicologia e de Ciências da Educação, Centro de Investigação e Intervenção Educativas; [4]Universidade do Porto, Faculdade de Psicologia e de Ciências da Educação, Centro de Investigação e Intervenção Educativas

This presentation focuses on the way Problem-Based Learning (PBL) sets young people at the center of the pedagogical relationship, by creating spaces for the enactment of their educational citizenship (Macedo & Araújo, 2014; Macedo, 2018), referring to the rights to: i) expression and recognition of their own voice, ii) reflection and action over their life contexts; iii) participation in the definition and construction of knowledge. This comes in line with the competences for the XXI century, autonomy, critical thinking, creativity, and media and digital literacy included.

The goal of PBL (Ayala, Messing & Toro, 2011) is not to solve a problem, but to implement a learning intention. Students work together on a problem: organize ideas, collect information, define the nature of the problem, define learning goals and propose possible forms of action. PBL highlighs the relational construction of knowledge.

The research took place during 2019/20 and has a qualitative interpretivist approach. Under this polyphonic view, this presentation is based on the analysis of 21 teachers' individual reflexive reports about the implementation of PBL in 5 educational institutions (EI) with 120 students, and researchers' fieldnotes on 23 PBL online sessions with three classes of 10th graders, during the pandemic confinement. Community feedback was collected by an online questionnaire (35 respondents); three (online and face-to-face) evaluation meetings (69 students), and three online evaluation meetings with 12 teachers.

Results show that PBL fostered teachers' reflection about their own pedagogical practices. It also enabled young people's participation and autonomy in task management and in the search for solutions, as well as the improvement of media and digital literacy.

RN10_T02_04 | Social Inequality, Inclusion, Participation and Internationalisation 2

Covid-19 Outbreak and Deepening Inequalities in Education: The Case of Muş Alparslan University

Ayşe Nur Leblebicier

Muş Alparslan University, Turkey

Due to the Covid-19 pandemic, education is one of the institutions that has been most affected by the Covid-19 outbreak. In parallel with the transition to distance education to ensure the sustainability of education, discussions about the reproduction and legitimation of inequality in education have increased rapidly. A number of factors - such as the availability of digital devices, access to the internet, and physical environment - are important for an efficient education. However, these factors are incomplete and insufficient for some disadvantaged students. Therefore, while there are students who continue their education without any problems, the students who face cultural, geographical, socio-economic obstacles to access classes deepens the inequality in education. This study is based on qualitative research principles and was carried out with students of Muş Alparslan University. In this respect, a total of 13 students were interviewed using the snowball sampling. The main purpose of the study is to determine the negative conditions and barriers that affect the access of disadvantaged students who have problems in accessing classes. As a result of the study, it is seen that one of the most important problems faced by students is the insufficiency of digital devices and lack of infrastructure. Moreover, some of the factors that prevent students from effective learning in the classes are: the lack of private study areas at home, the mechanisms related to the dominant gender roles in the society (namely patriarchy), the inability to stay away from familial problems due to living with the family, and the lack of motivation.

Key Words: digital inequality, opportunity inequality, education, pandemic

Schools as Learning Communities Creating Safe Environments and Educational Success During The Global COVID-19 Pandemic

Adriana Aubert, Ane López de Aguileta

Universidad de Barcelona, Spain

Learning Communities (LC) is a project based on Successful Educational Actions (SEAs) which have showed to give the best results worldwide, highlighting two key factors for learning: interactions and community participation.

We present here the success of those schools that before the COVID-19 pandemic were already functioning as LC, in recreating SEAs and not leave any child unattended. We analyse the case of the Santiago Apostol College of Valencia (Spain), included as a case of success in the European Toolkit for Schools (www.schooleducationgateway.eu), and which has more than 80% of students at risk of social exclusion (95.92% without a computer at home).

The community network that they had already built broke the Matthew Effect analysed by Merton, that has been deeply accentuated in the last year due to the coronavirus lockdown. For example, the access to technology was achieved thanks to donations and work of associations with which they were previously collaborating. In addition, this schools "opened doors" to create healthy and safe contexts during the confinement, implementing online actions such as: dialogic workspaces (DW) with students, teachers, and volunteers; dialogic gatherings (DG) with students; and dynamization of social networks with preventive messages and the creation of a sense of community (SN) (Roca, et al. 2020)*.

In conclusion, the joint work of teachers, families, and the community to promote evidence-based actions, enabled the creation of a safe environment and ensured the continuity of a quality education for all, even during a pandemic.

How To Overcome Situations Of Violence In Schools ?: Lines Of Action Framed In Learning Communities

María Belén Troya

Universidad de Barcelona, Ecuador

Worldwide, gender inequality and violence are problems that seriously affect today's society and that, on the other hand, are used as obstacles to achieve a quality education that breaks the circles of poverty. In this sense, Learning Communities is an educational model that seeks integral transformation and that has been shown to reverse problems of exclusion and inequality, inside and outside the classroom. Taking as a premise that education is a decisive element when it comes to reproducing patterns and roles or transforming reality, the research take as a case study a Ecuadorian school in process of transformation into a Learning Community, with three objectives: 1) break the circle of re-victimization and stigma that continues to affect the entire educational community, 2) establish lines of action to generate a context free of violence 3) ensure that these lines of action become a national and international contribution, not only for those educational centers that go through similar scenarios, but mainly to prevent these situations. To achieve the project's objectives, the critical communicative methodology (CCM) will be used because it contributes to overcoming situations of inequality, promoting the inclusion of the least favored social groups.

361

Higher Education Reform and Higher Education Management in the Czech Republic – Stakeholder and Interest Analysis

Dušan Lužný, Dana Bilíková

Palackého University, Czech Republic

The paper analyses the failing attempt at higher education reform of the first decade of the new millennium. The paper points out the original OECD recommendations and Higher Education White Paper Bill, and compares them to the final proposed amendment to the existing Higher Education Act. The analysis centres on the different approaches and interests of the stakeholders, namely universities, ministries, the government, and the team behind the reform. The aim of the reform was to boost the international competitiveness of Czech universities and to modernize their rigid mode of operation. Another goal was to open higher education to socially disadvantaged groups. The objectives were a priority for all the stakeholders, and yet the reform failed and the outcome was but a resigned compromise of all the parties involved. The paper identifies several key moments which sabotaged the official reform efforts. This is followed by an analysis of controversial proposals which transformed the fundamental reform into a mere amendment. The article also briefly discusses reform-based measures which were successfully implemented in the operation of universities. Finally, it highlights elements of the reform plan which were put into effect without the backing of the official (politically supported) reform. The study identifies the neoliberal rationale for this attempt at reform.

RN10_T03_01 | Aspiration, Choice and Selection 3

Educational Aspirations and Negotiations of Working Class Mothers in a Poor Neighbourhood

Sriti Ganguly

OP Jindal Global University, India

Working class mothers have been stigmatized for not doing or not being able to do the "right" kind of parenting which results in undesirable peer influence on their children, their low educational attainments and drop outs and subsequent "failure". This is consistent with the neoliberal logic that blame the poor families for the conditions they find themselves in rather than critique the larger structural inequalities that perpetuate advantages for some and disadvantages for others. Stories of indifference and ignorance of working classes especially with respect to education are not uncommon. However, the researcher's own fieldwork in a poor neighbourhood of Delhi challenged the assumptions about working class mothers. It was observed that the mothers were much more closely involved with schooling activities and daily lives of their children. It not only revealed and reinforced the arguments given by different scholars that parenting is often gendered, it also showed how mothers in urban poor households, contrary to popular perceptions, were aspirational and juggling between domestic responsibilities and paid employment to support their children's school routines and activities. These mothers relied on their own past to draw a different vision of the future for their children. Narratives of women about their daughter's education especially showed how they rebelled against the norms and gender roles in general and those set by their own communities. Based on an ethnographic work, this proposed paper will discuss the educational aspirations of the marginalized, working class mothers living in a squatter settlement of South Delhi and the everyday activities and negotiations they undertake to support their children's education.

Turning Uncertainty into Efforts: the Meritocracy of Effort in Selective Examinations

Siyu Li

Université de Lille/ENS, France

The meritocracy and reified evaluation (by grades or scores) breeds inequality. However, selective exams, the embodiment of both, are perceived positively and invested with enthusiasm in a great number of countries. The selection by exams is characterized by actual inequalities behind the formal equality of opportunity. The degree to perceive and thus to endure those inequalities varies across countries and shapes the attitude toward the selective exams. Why do some societies give more credit to selection by exams and endure better resulting social inequalities? Focusing on the case of the Gaokao, the Chinese National College Entrance Examination (NCEE), my research addresses this question by focusing on the ways by which test takers interpret numeric scores that contribute to the calculability of the future.

This research based on 12 months' ethnographic observation in two high schools in Beijing; 149 repeated interviews with students preparing for the Gaokao.

The hierarchy of schools structures students' investment in preparing for the exam, by shaping their expectations of social status. The quantified results constitute a symbolic capital (Bourdieu 2010; Lamont 2002), according to which a society allots a "credit of notoriety" to individuals (Dubois, Durand, & Winkin, 2013). This "credit" forces students, especially those in elite schools, to "make an effort" not only in their preparation for the Gaokao, but also for future social status expectations. The whole family is often mobilized by the credit by investing economically in the cultivation of in-school competence and the out-school "quality (sushi)". This pattern demonstrates the school hierarchy's efficiency in managing individual expectations and in creating market that attract personal investments in education.

Looking at the Future from the Periphery of the System: Low-ability Grouping and Educational Expectations

Manuel Tomás Valdés

Universidad Complutense de Madrid, Spain

Scholars often distinguish between tracked and comprehensive education when analysing educational expectations. Track placement in stratified educational systems is informative for students when forming educational expectations net of academic ability. In turn, the undifferentiated curriculum in comprehensive systems contributes to higher and somewhat unrealistic expectations to a later age. However, this distinction between tracked and comprehensive education is insufficient to analyse adequately many educational systems. For instance, Spain is a comprehensive system that nonetheless has progressively incorporated some low-ability grouping programs aimed at struggling students. In this work, I intend to study the effect of these programs on the educational expectations about post-compulsory education.

363

Using the 2018 PISA dataset and Entropy Balancing to balance confounders and interpret causally the results, I observe that the position in the Spanish educational system exerts a substantial effect on their educational expectations net of academic ability. Furthermore, the rich information available in PISA allows to distinguish two types of treatments (adaptations of the general curriculum and pre-vocational programs) and four types of educational expectations (vertical and horizontal expectations about Upper Secondary and Tertiary Education). On the one hand, I observe that adaptations of the general curriculum mainly conditioned horizontal expectations (academic vs vocational education). On the other hand, pre-vocational programs exerted stronger effects and also shortened the educational plans of participants. Finally, I also report that results differ by sex, socioeconomic background, and migrant status. Policy-makers should take these results into consideration in order to extend or limit this kind of practices to manage underachievement in an undifferentiated curriculum.

RN10_T03_02 | Gender and Education 1

Impact of Covid-19 Pandemic on Education and Experiences of Students in Turkey: Social Inequality, Constraints and Gender

Aylin Çakıroğlu Çevik

TED University, Turkey

Even though Covid-19 is a health problem, it has played an important role that will cause changes and rearrangements in many social, economic and political fields. Education as one of the intersections of those is the field where the pandemic has most noticeably created changes, i.e. closure of schools, shifting to online/remote education. In Turkey, all educational facilities from primary schools to universities were closed on March 16, and online education was launched on March 23, 2020. These advancements have created a new environment (i.e. computer-based learning, digital class) and different experiences than as usual for the students in Turkey. This study aims (1) to explore how the experiences and perceptions of the students (over the age of 18) differ, and based on these differences, (2) to figure out the social inequalities among students by gender. These issues will be examined through the use of data based on a Tubitak project where the mixed method is used (for quantitative data N=955; for qualitative data N=40). According to the findings, students (ages 18-30) generally agree remote education is not effective as much as face-to-face education. Moreover, there is a significant difference between students to access online education by regions, i.e. technical problems vs psychological problems. By gender, due to remote education and returning to the hometown, woman students are supposed to meet the domestic tasks, which constraints "student identity" and access to education.

Masculine Restrictions, Emotional Restrictions And Covid-19 Restrictions: Considerations For Adolescent Males In Schools

Brendan Kwiatkowski

University of Edinburgh, United Kingdom

The concern over adolescent males' mental health in schools has only intensified as the Covid-19 pandemic has led to unparalleled interruptions to their academic, daily, and social lives. While much research links males' adherence to restrictive norms of masculinity to increased negative social-emotional outcomes, little, if any research isolates a single norm of masculinity and compares those who adhere the least to that norm with those who adhere to it the most. For this research 170 adolescent males, ages 17-19 from a public school district in Canada, were screened for their adherence to a specific masculine norm: emotional restriction. The ten participants with the relatively lowest levels of emotional restriction and the ten participants with the relatively highest levels of emotional restriction were interviewed regarding their masculinities and school experiences. Interviews were conducted three weeks into the initial school lock-downs due to Covid-19 and offer unique insights as participants' personal and academic worlds were in a state of uncertainty and flux. This paper primarily discusses seven of the themes that emerged and their implications for schooling during a time of Covid-19 restrictions: facing masculine pressures, the importance of emotional safe havens, conscious diminishing of own emotions, aloneness, the importance of the relationship with dad, school foremost as a social playground, and school as a site and source for stress and distress. These particular themes are selected for their relevance for adolescent male students' mental health and are also the themes most subject to variability caused by Covid-19 restrictions.

Schools against gender violence: overcoming Second Order Sexual Harasment (SOSH)

Ane López de Aguileta[1], Gisela Redondo-Sama[2]

[1]Universidad de Barcelona, Spain; [2]Universidad de Deusto, Spain

There is a wide array of sociological research about sexual violence in schools, but we have now a quite new challenge. The modification of the Catalan law 05/2008 has meant a legislation innovation on Second Order Sexual Harassment (SOSH) all over the world. SOSH is defined by this law as the physical or psychological violence against those who stand up for sexual harassment victims. This way, the law protects the ones who defend the victims in order to put an end to sexual harassment, as scientific research had already demanded. Regarding education, it is crucial that all the school community knows the SOSH concept to tackle it and to create violence-free educational spaces. In this vein, this paper presents an analysis of the social impact of different proposals in different schools. Some of them put the emphasis on talking about the SOSH concept, whereas others also included actions against SOSH. The results show that speaking about SOSH and not taking actions against it does not improve the situation and, in some cases, it even was counterproductive. However, in the schools where, besides speaking, the emphasis was posed on promoting actions, a better response for first and second order victims of sexual harassment was seen. This study contributes to the eradication of sexual violence in schools, as tackling SOSH is an essential requirement to overcome sexual harassment.

Does Gender-Norm Transgression Allow To Take Distance From Occupational Gender Stereotypes? A Study Of Upper-Secondary School Students In Switzerland

Dinah Gross

University of Lausanne, Switzerland

Occupational choices are still often determined by stereotypes about which kinds of occupations are adequate to one's own sex; indeed, gender stereotypes are one of the representational tools available to young people in order to project themselves into their future occupational life. Following such stereotypes, men may prioritize prestige, power and earnings in their occupational aspirations, while women may attribute more importance to their family life than to their work. However, not everyone adheres to these stereotypes. We hypothesize that young people who transgress gender-related norms in other aspects of their life, or who belong to a sexual minority, may dissociate themselves from these stereotypes.

Regression analyses on a sample of 490 upper-secondary vocational school students in Geneva, Switzerland, show that while male and female students generally tend to adhere to the above-mentioned stereotypes, LGB men and men who study in a female-dominated field adhere less to norms of prestige, power and high earnings. However, LGB women and women who study in a male-dominated field show no difference to other women in their adherence to these norms. LGB men and men who study in a female-dominated field attribute less importance to family than other men. When relative values given to family and work are compared, studying in a field in which one's own gender is in minority leads respondents to distanciate themselves from the norm associated with their gender, but being LGB does not have any effect.

Pandemic Perspectives 2

Suspended Futures? Building Life Projects In Times Of Crisis : The Case Of University Students From Rio de Janeiro's Outskirts

Elis De Aquino

Freie Universitat Berlin, Germany

The Brazilian university student profile has changed. The significant investments and public policies in education between 2003 and 2015 have increased the chances for more black and indigenous people, individuals from a poor background, and inhabitants of the peripheries and less central regions of Brazil, to access university, a space that was previously exclusive to the national elites. The country's economic growth and the reduction of inequalities observed in the same period fertilized the ground where aspirations of social mobility on the part of "non-heirs" were born. However, the "Brazilian dream" seems to take the form of a nightmare. Hit by multiple crises (economic, political, health, social, etc.) intensified in the second half of the 21st century and worsening since the election of Jair Bolsonaro in 2018, Brazil is experiencing a moment of many uncertainties (Gomes, 2020). Furthermore, the Covid-19 has added another layer of inequalities to the nation's fragile situation. The followed cuts and dismantling of public policies threaten the possibilities of a future with more social equity. Based on this scenario, I investigate to what extent the intermittency of policies, with changes in governments and agendas, impact the projects of future of young university students from Baixada Fluminense, a region considered peripheral in Rio de Janeiro, where I conduct my doctoral research. Based on in-depth interviews conducted with twelve undergraduate students, I analyze to what extent their aspirations built in a political and economic conjuncture until then more favorable, are cooled in an unfavorable context, or if the access to education and information provides the emergence of strategies and anticipations to deal with the increasingly uncertain future.

Consequences of School Lockdown and Deepening Social and Economic Inequalities in Early Primary School Education in Turkey

Ece Cihan Ertem

University of Vienna, Austria

COVID-19 pandemic has been a life-changing experience for people, societies, countries, and education is one of the most affected areas during the pandemic. Early primary school years which is a more attentive process vis a vis the acquisition of basic skills such as reading and writing requires one-to-one teacher contact. However, in some countries, primary school education has been raptured and children needed to stay at home for months. This research focuses on Turkey where school lockdown has been quite long compared to EU countries and where there have already been regional inequalities that deepened during the pandemic. Therefore, this research has chosen Turkey as a case study and will include an (online) fieldwork to explore the effects of the Covid-19 pandemic on first, second, and third graders in primary schools who have been mostly at homes being deprived of the actual contact of their teachers. This research aims to scrutinize the perceptions of parents and teachers in addition to their adaptation strategies and solutions to changing conditions. This study will include 40 semi-structured in-depth and focus-group interviews with parents and teachers by having 20 participants in each group. Even though there are some works on the intersection of pandemic and education in Turkey, the early primary school period (first three years) have not been emphasized in many of them, thus this research aims to fill in this gap in the literature with the data focusing on the response of teachers and parents to Covid-19 pandemic and deepening regional inequalities due to this difficult period.

Schooling In The Time Of COVID 19 Lockdown In Italy: Some Empirical Findings

Filomena Riccardi

Universita' degli studi della Campania "L.Vanvitelli"

Meeting the needs of a changing world and growing social disparities in the schools, research must now focus on the educational needs in the newly fragmented global societies (Touraine, 2015). In the present era of Coronavirus lockdown, a school psychological and didactic support for the most vulnerable adolescents and pupils urges more than ever. Since the emergence of Covid 19 pandemic, in the Italian public schools, the most vulnerable pupils result to be the disabled and children or adolescents living in foster care who are often migrants but not only. The present contribution aims at presenting some findings of an ongoing empirical research based on the methods of in depth interviews and participant obeservation implemented in some Italian public schools with a high concentration of migrant students in the city capital of Roma (Laurentino district) dealing everyday with adolescents and children in foster care. Pupils in foster care's school dropouts have increased in the last months and to explain this we should consider two categories: the pupils' emotions and the space they live in. Emotions profoundly influence cognitive strategies of learning and resulting achievement (Pekrun, 2008). The category of space is here intended as a "meeting place" (Massey 1991) where the actors' articulation of identity and values develops (Sheppard, 2002). This "relational" approach to "space" derives from Simmel's concept of "Wechselwirkung" which considers the category of "space" an interaction between the concrete 'spatial form' and the 'social form' that includes "impulse, psycholgical state, emotional states" (Simmel, 1908/2009; Bianchi F., 2019).

COVID-19 and the Recreation of Social Injustices: Issues of Learning and Belonging Among Syrian Refugee Students in London

Jumana Al-Waeli

UCL Institute of Education, United Kingdom

The paper uses Nancy Fraser's lens of social justice to explore the experiences of learning and the perceptions of belonging, among a group of 6 London based, Syrian refugee students, during the time of COVID-19 pandemic and school closures.

The study maintains that issues of social justice and concerns around belonging to school were significantly exacerbated by the pandemic, causing severe negative impacts on the learning of the Syrian, secondary school, students and adding more adversity to their already disrupted lives.

Using transcripts from an extended narrative study, the students explained how they received little to no online learning during the whole period of the first UK lockdown and school closure. This was attributed to stances of misrecognition, including low teacher expectations, prejudice, and fixed presumptions; maldistribution of different types of resources; and lack of representation, signified by the absence of channels of effective and meaningful communication between the school on the one hand, and the students and their parents on the other hand.

These factors were at the heart of the students' testimonies and were seen to gravely hinder their learning, as well as their sense of belonging to school, and their long-term adaptation.

Additionally, the paper highlights the participants' feelings of despair and disappointment; loss of hope and motivation; concerns about their 'lost futures'; and the critical implications of all these issues on their overall wellbeing. It also represents how some of these students adapted their own strategies to learn in light of the lack of meaningful and equal school support.

For Whom Do Schools Support Student's ICT Skills? A Multilevel Approach On How School ICT Environments Influence Family Background Differences

Renae Sze Ming Loh, Gerbert Kraaykamp, Margriet van Hek

[1]Radboud Social and Cultural Research, Department of Sociology, Interuniversity Centre for Social Science Theory and Methodology, Radboud University

Recent research illustrates how social background differences in student ICT skills have bearing on social inequalities in educational performance. It is, however, less clear if school ICT environments enlarge or reduce these differences. We therefore question whether schools can compensate for a student's less advantageous family background, or facilitate accumulation processes that are prominent in enlarging existing differences. We employ notions from social mobility and social reproduction to derive two sets of hypotheses. Following social mobility arguments, school ICT environments might compensate for a lack of ICT skills especially among low-SES students, and in doing so, mitigate educational performance gaps. Following social reproduction arguments, school ICT environments might nurture the accumulation of ICT skills among high-SES students, and through this, widen educational performance gaps. We conceptualise rich school ICT environments in terms of their ICT infrastructure, ICT innovativeness and teaching staff's ICT capacity. These features indicate structural, cultural and capability-based aspects of school resources. To identify the general impact of school ICT environments on students' ICT skills and Math performance, we utilise comprehensive data from PISA 2018 of 108,688 students from 6201 schools across 23 countries. In our analyses we apply multilevel fixed effects models to deal with the data structure of students nested in school in various countries.

Beyond Re-Educational Rhetoric: Possibilities And Limitations Of University Education In Prison

Gerardo Pastore[1], Ivana Acocella[2], Andrea Borghini1, Vincenzo Scalia[3]

[1]University of Pisa; [2]University of Florence; [3]University of Winchester

This paper focuses on university education in prison as a strategic tool for building social inclusion. Using qualitative methods, it examines an Italian experience in this area. Being arrested produces a biographical and above all a relational break in the life course of the person who is suddenly deprived of his/her freedom. Moreover, "devices for disciplining bodies" together with logics of reward or punishment extend the relationships of dependency and control. Even the many practices of orientation (to work, training, study, cultural activities, etc.) included in the paths of penitentiary treatment risk being configured as instruments of social control, selection, and reproduction of stereotypes about prisoners.

However, in the interstices of a suspended time, dominated by material and symbolic forms of control, some activities seem to emerge as a strong element of novelty: this is the case, for example, of the encounter between university and prison, which indeed allows us to question the gap between prison and society, as well as stereotypes about prisoners, ex-prisoners, and prisons themselves. Nonetheless, in an ordinary condition of subjection to discipline aimed at the remissive acceptance of their inferiority, inmates can encode the possibility of studying as a "benefit" rather than a guaranteed right. Hence, the risk is to reduce the capacity of transformation and regeneration of these interactive spaces. Therefore, the research intends to investigate the importance and value of university education in prisons to develop a critical sociological understanding of the penitentiary from the convicts' perspective, beyond any rhetoric about their re-education.

Becoming an Academic Craftsperson – Transformations of Habitus and Identity in Higher Education

Katrin Lehner[1], Hans Stefan Moritsch[1], Anna Wanka[2]

[1]New Design University St. Pölten, Austria; [2]Goethe-University Frankfurt, Germany

Educational attainment is still heavily determined by family backgrounds. Speaking with Bourdieu, the inheritance of economic, social and cultural capital, and the thereby resulting lack of 'habitual fit' between individuals and educational institutions are decisive for the reproduction of educational inequalities.

In this paper we outline the case study of an Austrian design university in which students of different origins and qualifications study Manual & Material Culture. Based on a mixed-methods design, we combine quantitative data from a representative survey with biographic-narrative interviews with students and alumni from contrastive social and educational backgrounds. By exploring how milieu borders are transcended, cultural capital is acquired and diverse competencies are exchanged and internalized, we ask how habitus and identity are transformed in the course of studying.

Results show that processes of habitus and identity transformations are non-linear and sometimes contradictory. For example, coming from a non-academic background is not a disadvantage per se, but can be an asset in certain study situations. At the examined university, students from non-academic milieus showed competences and skills that students from academic milieus did not. This indicates how didactic formats can allow the permeability of milieus and indicate how milieu borders can be crossed. However, our data also reveals how the Covid-19 pandemic has challenged teaching formats and consequently affected studying particularly for students from non-academic backgrounds.

Concluding, we discuss how these results can enrich the debate about educational justice, the reproduction of social inequalities, and a re-evaluation of practical and theoretical competences in academic education.

Teaching Feminist Knowledge In Times Of Social Emergence: University Students and Teachers Speak.

Lorea Romero Gutiérrez

University of Cantabria, Spain

The crisis derived from the COVID-19 pandemic has highlighted the essential but largely invisible work of caring broached by feminisms, both academic and activist. Sex and gender analysis have been pointed out as fundamental in the response to the health and social crisis (Oertelt-Prigionem 2020; Instituto de la Mujer, 2020). On this matter, Women's, Feminist and Gender studies constitute a research area with a broad, deep, and rigorous scientific production that has incorporated new questions, perspectives, themes, and methodologies, also during the current pandemic (e.g., the project Solidarity and Care by The Sociological Review). However, their implementation in university teaching and their introduction at the pre-university level have been limited (e.g., Ballarín Domingo, 2017, García Lastra, 2017, Verge, Ferrer-Fons and Gonzalez, 2018, among others). The research presented aim to explore the ideas, experiences, and perceptions of the university community about the interest and limits of feminist knowledge in curricula. The methodology used is a case study of a Spanish regional university, involved in gender equality initiatives, and it has been conducted throw qualitative methods: focus groups with students and in-depth interviews with feminist or gendered sensitive scholars. This research has been conducted in a new and different scenario to previous research on the field (above cited), with a higher inequality awareness within Spanish society (after the 2018 feminist strike) and the fragility and uncertainty situation derived from the pandemic.

RN10_T04_01 | Aspiration, Choice and Selection 4 – International Case Studies

School Choice And The Production Of Global Middle Class(ness): Reflections From An International School In Delhi, India

Bianca Daw

Jawaharlal Nehru University, India

This paper seeks to examine why Indian parents are choosing international schools for their children and whether such schooling aids the production/reproduction of global middle class(ness). The research found that most of the informants for this study (parents) did not have a strong rationale in choosing international schooling for their children and some of the reasons provided by them do resonate with studies conducted at international levels. However, one among the many prominent factors influencing their choice seemed to be a dissatisfaction with the Indian local system of education be it schooling or higher education.

The paper therefore, attempts to inquire whether such a choice gets merely reduced to an indicator of status symbol which constitutes being/becoming globally mobile or whether, they have been altered amid global uncertainties. Hence, it precisely aims to understand how Indian parents make their choice of an international school for their children; what they seek to demand/attain by enrolling their children in such a school; and, how school choice (in this case international schooling) has become a medium to produce or reproduce global middle class aspirations in the wake of neoliberalism and globalization as well as in advance stages of the same that have ushered in anxieties and greater risk via a global Pandemic.

These aspects will be addressed in finer detail through this paper in order to centrally argue that choice-making in the case of international schooling is related to one's

class belongingness and in this case - constituents of the global upper middle class in the Indian context are the beneficiaries as well as benefactors of this model of schooling.

Educational Privileges During Pandemic – Experiences of the Applicants to the Early Selective Grammar Schools During the Covid-19 Lockdown in Hungary

Eszter Berényi

ELTE University Budapest, HUngary, Hungary

The Covid pandemic has affected the educational sector in most societies first and foremost by widening the gap between the advantageous and disadvantageous school populations (e.g. Van Lancker – Parolin (2020). However the problem is far more complex than just "disadvantaged children left behind".

This paper scrutinizes the educational carrier of an advantageous group of the Hungarian society: families with children who wish to apply to the "Early Selective Grammar Schools" (ESGS) in an educational context turned upside down by the Covid-19 pandemic.

In Hungary traditional elementary schools run from the 1st to the 8th grades and most secondary schools start from the 9th grade. However, these ESGS offer for the 10-15% of the population, instead of the traditional 4-year-long secondary schools, 6 or 8-year-long tracks. Families with high level of social and cultural capital are always overrepresented among the applicants.

The presentation analyses the findings of a mixed method (survey and interviews with applicants' parents) research, scrutinizing the choices and decisions these applicants make and take during the preparation for the exams. The effect of the Covid-19 pandemic on their educational trajectories and well-being will also be under scrutiny – both during the total lockdown of the schools in spring 2020 and during the partial lockdown and various forms of hybrid education in the school year 2020/21.

Main findings include the problems deriving from the unavailability of shadow education used heavily in "normal" years; problems of work-life balance of the parents; elevated level of tension and anxiety within the family; and how the peer-group socializing function of the school is missed by the families.

370

A Capacity to Aspire as a Collective Project: Transition of Socially Excluded Children to High Schools in Czechia

Karel Cada

Prague University of Economics and Business, Czech Republic

Based upon official data on segregated schools, we identified inequalities in the transition from lower-secondary to upper-secondary education, and we used qualitative data from interviews with teachers, school representatives, children and parents to explain the roots of these inequalities.

The paper is focused on the aspirations of socially excluded children as the usual explanatory factor for their failures in the transition to upper-secondary education. In contrast to prevailing Czech public discourse, the paper does not see these aspirations as a product of family background but rather as a cultural artefact stemming from different logics, including the social environment and institutional culture at schools.

The paper draws on Appadurai's claim that aspiration is a collective cultural capacity, not just an individual motivation, and Gale and Parker's four overlapping concept-clusters explaining aspiration (social imaginary, taste, desire and navigational capacity).

Data from schools indicate a high number of pupils who do not apply for any secondary school in segregated schools with high concentrations of Roma. They are significantly less likely to apply for academic tracks and significantly more likely to apply to schools preparing them for unqualified jobs. The interviews conducted with teachers and representatives of the schools revealed that the teachers' perception of identities of Roma pupils are stereotypical and heavily biologized.

The paper describes low aspirations not only as a result of their family backgrounds but also as a product of a racialised school environment and risk-avoiding school culture.

"I Want to Become Someone Recognised": Descendants of Pakistani and Moroccan Immigrants Facing the Transition to Post-compulsory Education

Martí Manzano Moliner

Universitat Autònoma de Barcelona, Spain

Transitions to post-compulsory education are a key process in the educational trajectories of young people, especially in comprehensive contexts such as the Catalan, where post-compulsory tracks are the first division of educational pathways between vocational training and baccalaureate.

The distribution of students between vocational training and the baccalaureate is not independent of their positions in the social structure. As numerous studies show, students with a migrant background, boys and working-class background are over-represented in vocational education, while natives, girls and middle-class students have a relatively higher presence in the academic pathway.

In order to open the "black box" to explain these differences with an approach from the migratory and ethnic axes of inequality, we analyse how descendants of immigrants navigate to post-compulsory education: 17 sons and daughters of Pakistani and Moroccan migrants attending two public schools in a Barcelona neighbourhood with high levels of school and urban segregation were accompanied throughout their transition to post-compulsory education. Methodologically, the research is based on a sequential succession of 50 semi-structured and photo elicited interviews along the end of compulsory and the beginning of post-compulsory education.

Results focus on how these young people negotiate educational orientations, family expectations and the influence of peer groups on their identities and aspirations over the transition. Is identified an aspirational construction that is strongly linked to the family migration project and to identities in constant negotiation between what young people identify as "here" (represented by the school institution) and "there" (represented by the family).

RN10_T04_02 | Grade Retention and Drop-out

Does Grade Retention Produce Cynical Citizens?: A Cross-National Multilevel Analysis On The Effects Of Being Retained On Civic Atitudes

Timo Van Canegem, Mieke Van Houtte, Jannick Demanet

University Ghent, Belgium

This article studies the association between grade retention and civic attitudes in secondary education. School curricula often stress creating a sense of community among students, since this is believed to be a backbone of democratic societies. At the same time, schools use grade retention as a differentiation mechanism in order to sort students based on their perceived capacities. As such, there appears to be a tension field between actively promoting social cohesion and giving certain groups of students a fundamentally different treatment. Therefore, retainees are expected to hold more cynic civic attitudes. Furthermore, based on the reference group theory (Richer, 1976), contextual effects on both the school level and the national level are expected. We expect retainees to be more cynic in contexts with less retainees, because they are more at risk of being stigmatized or isolated. Moreover, we expect both retainees and promoted students to be more cynical in environments with a high amount of retainees, because of a spill-over effect in which cynic retainees increase the cynicism of non retainees. Cross-national multilevel analyses on the PISA-2018 data set were conducted in order to test the aforementioned hypotheses. Preliminary results confirm that retainees have a more cynic world view. As expected, this cynicism increases when retainees are surrounded by a low amount of other retainees on both school and educational system level. Unexpectedly, however, there seems to be no spill-over effect from retainees to non-retainees, since students in schools with a high retention composition have a significantly less cynic world view.

Typologies of Early School Leaving: Dissatisfaction with the Choice and Educational Disengagement

Alejandro Montes, Judith Jacovkis, Aina Tarabini

Autonomous University of Barcelona, Spain

Since the mid-1990s, early school leaving (ESL) has become one of the central issues on the European educational agenda (Smyth and Hattam, 2001; Tarabini and Jacovkis, 2020). This phenomenon has gained a central relevance since it not only limits the life opportunities of ESLers, but also questions the very foundations of the educational systems as guarantors of the right to education for all. Numerous contributions have analysed the causes and identified the main factors leading to ESL at the individual, family, school and systemic levels (NESSE, 2010). The diversity and heterogeneity of the ESLers highlight the need to continue providing evidence that allows to understand ESL processes from the students' subjective perspective. The aim of this presentation is to identify different typologies of ESLers according to the moment they have drop out the educational system, the educational trajectories they have experienced and the subjective reasons they attribute to their early school leaving. The analysis is based on 30 in-depth interviews with ESLers in Barcelona and provides an in-depth analysis of their educational trajectories and experiences as well as of the systemic, institutional and relational factors behind these trajectories. The results demonstrate the (co)existence of two major ESL profiles: those who leave education by dissatisfaction with their upper-secondary choice; and those leaving education for experiencing a strong school disengagement during lower secondary education. The analysis contributes to a better understanding of the processes leading to ESL and identifies the need of different policy actions to tackle an intrinsically heterogeneous phenomenon.

Students' Social and Academic Integration in Higher Education during the COVID-19 Emergency Remote Education Period in Austria

Katharina Resch

University of Vienna, Austria

The lack of social and academic integration of students in higher education institutions can be a major cause of student dropout. This applies even more to the emergency remote education necessitated by COVID19, wherein no face-to-face interaction between students and staff was allowed in Austria and social and academic integration was at risk. Supporting student integration has generally been an important educational objective of higher education, for adequate student integration is associated with higher performance. Based on Tinto's integration theory (1975), this paper analyzes the effects of the COVID19 pandemic on students' social and academic integration. Students from the largest university in Austria were asked to complete an online survey during the first home-learning period in early 2020. In total, 640 students filled out items pertaining to academic and social integration before and during the home learning period. Results indicate that social integration and academic integration decreased significantly during the 14-week lockdown period. The level of perceived support during home learning was positively associated with the levels of social and academic integration. Furthermore, while the students' age was a predictor for higher academic integration, however, it was not a predictor for social integration among peer students. Academic and social integration during COVID19 was significantly linked with student satisfaction in various studies. This study has important implications for future home learning periods, suggesting how higher education institutions could prepare for longer disruptions of university attendance and how they could leverage student integration.

The Effects of Disadvantageous Parental Origins, Early Home Leaving, and Early Parenthood on Secondary Education Attainment in Finland

Niko Eskelinen[1,2], Johanna Kallio[1], Timo M. Kauppinen[2]

[1]University of Turku | Finnish Institute of Health and Welfare, Finland; [2]Finnish Institute for Health and Welfare

Level of educational attainment is a key factor in determining an individual's adult social position (Hout & DiPrete, 2006). Low education, measured by lack of post compulsory degree, increases the possibility of confronting various social problems, such as poverty, unemployment, exclusion from the labor market and early retirement (Bäckman et al., 2015; Brekke, 2014). Further, having only completed compulsory education is a strong determinant of welfare dependency in young adulthood (Ilmakunnas & Moisio, 2019).

We analyze how a disadvantaged parental origin, measured by social assistance receipt, unemployment, and low education, together with critical life-course events—namely early home leaving and early parenthood—are associated with the probability of a person completing secondary education by the age of 30. Special attention is devoted to whether the early home leaving or becoming a parent at a young age reinforces the effect of a disadvantaged family background on educational attainment. In addition, gender differences related to these questions are examined.

For our analysis, we use high-quality register-based data from Statistics Finland. Data cover 25 per cent sample of persons born in Finland between 1980–1986 including information on their biological parents and siblings born in the same period. Data clustered according to families are analyzed with sibling methods using random effect linear probability models.

Results show that disadvantaged parental origin, early home leaving, and early parenthood are negatively associated with the probability of completing secondary education. Findings suggest that early home leaving is more detrimental for men and early parenthood for women. We also conclude that maternal education can act as a protective factor against negative effects of early home leaving and becoming a parent at young age.

Perceptions, Beliefs and Constructions of Vulnerability

School Networks Of Positive Relationships, Attitudes Against Violence, And Prevention Of Relational Bullying In Victim, Bystander, And Aggressor Agents

Tatiana Íñiguez-Berrozpe, Carmen Elboj-Saso, Diana Valero-Errazu

Universidad de Zaragoza, Spain

Despite prevention campaigns, school violence continues to be widespread on a global scale. Within this type of violence, relational bullying appears to be the most common phenomenon both internationally and in the Spanish case, where one in four adolescents admits to having carried out this kind of humiliation at some point on their peers, and one third admit to having been a victim. Participation therein may be preceded by a socialization that makes young people prone to violence. Due to this, positive relationships, paired with the rejection of any belief that advocates the tolerance of violence, are factors that play a significant role in preventing relational bullying among adolescents. In this study we analyse how the relationships of students with their peers, the educational community, and their families, as well as their attitudes to school violence, influences becoming a relational bullying victim, a bystander, or an aggressor in a sample of 4,273 Spanish high school students, using Structural Equation Modelling. We applied multi-group analysis, separating girls (n=2,022) from boys (n=2,038). The results show that positive relationships serve as a protective factor against participation in situations of aggression and exert a significant influence on the acquisition of transformative attitudes toward violence. Such attitudes, in turn, significantly help prevent bullying. Slight differences were found between boys and girls: mainly in terms of the influence of relationships at school on attitudes toward violence, and the influence of attitudes toward violence on becoming a bullying aggressor, both scoring higher in girls.

Validation Of A Social Vulnerability Scale To Assess The Impact Of Socio Educational Programmes

Irene Cussó-Parcerisas, Jordi Longás Mayayo, Jordi Riera Romaní

Facultat de Psicologia, Ciències de l'Educació i de l'Esport Blanquerna Universitat Ramon Llull (FPCEEB-URL), Spain

This study aims to design and validate a multidimensional instrument that allows establishing a numerical scale to measure the social vulnerability of families with children that participate in socio-educational programmes. This measure is necessary to promote rigour in the family social diagnosis and actions plans made by the professionals, as well as to make longitudinal studies to evaluate the effectiveness of such programmes.

The validation of this scale is still under development. Regarding the design of the scale, firstly, we carried out a systematic literature review about the topic, that was followed by 2 expert's validation groups that included a total of 28 experts in the social action field, who determined the dimensions and indicators to measure social vulnerability. Secondly, the social vulnerability scale was tested by 26 social workers using 5 case studies to validate the content of the scale. In this paper, we will present the results obtained in the design phase.

Further steps to validate the scale will be the following: we expect to carry out two psychometric statistical studies: a pilot study with 600 families and a confirmatory psychometric study with 1200 families, in which the proposed scale will be applied to families that participate in the social programme CaixaProinfancia, led by la Caixa Foundation, that attends families at poverty and social exclusion risk across Spain. This final phase will allow to know the effectiveness of the developed social vulnerability scale and its utility in socio-educational programmes, such as the one mentioned above.

Acknowledging the Teacher's Care Work and Its Relevance for Social Justice in Fragile and Vulnerable Times

Ana María Rio Poncela[1], Lorea Romero Gutiérrez1, David Didier Bermúdez Rochas[2], Marta Estellés Frade[3]

[1]University of Cantabria, Spain; [2]Autonomous University of Madrid; [3]The University of Auckland

The crisis derived from the COVID-19 pandemic and consequent lockdowns has spotlighted fundamental questions for the sociology of education regarding the social functions of school and the several socioeconomic gaps among students and schools (Bonal and González, 2021; Tarabini, 2020). Between these two issues, the digital and economic gap has attracted the social, research and agencies' attention (OCDE, 2020; Save the Children, 2020; UNESCO, 2020), relegating fear and hope inequalities (De Sousa Santos, 2009) among students. In this sense, the care work provided by teachers, essential to ensure the function of the school as an instrument for social justice (Tarabini, 2020), has hardly been analysed (Bahn, Cohen & van der Meulen Rodgers, 2020; Morgade, 2020). In an attempt to recognise this work, the research presented examines how teachers have cared about their students and navigated the challenges posed by the pandemic. For this purpose, in-depth interviews have been conducted with teachers that worked at different educational levels, from early childhood education through to adult education. The findings are focussed on the care work provided to students during the lockdown, the cost of this care work and the supports and barriers experienced. Despite decades of feminist studies showing the value of care work and the role of teachers, mostly females, in this regard, the teachers interviewed show the lack of recognition of teacher's care work during this pandemic.

Perceptions of Future Teachers of Primary and Secondary Education Towards Muslim People in Spain

Wilfrid Antonio Martínez-Sánchez[1], Maria Jiménez-Delgado[1], Cristian Soler-Roca[1], Diana Jareño-Ruiz[1], Pablo de-Gracia-Soriano[1,2]

[1]University of Alicante, Spain; [2]Complutense University of Madrid

The social problem of prejudice and discrimination towards certain ethnic and religious minorities is an acknowledged reality in European societies, including Spain, with the Muslim population in Europe being one of the most stigmatized. Aware that educational institutions have a fundamental role in the development of citizenship competences to form a more democratic, fair and inclusive society, the aim of this study is to identify the beliefs, attitudes and opinions towards Muslims of future teachers of primary and secondary education in Spain. The research design corresponds to the quantitative methodology based on the production of primary data through a survey. The sample consisted of 721 students from the University of Alicante studying for a University Degree in Primary Education Teaching and a Postgraduate in Secondary Education. The main results indicate that future teachers perceive that Muslims have difficulties integrating into Spanish society, that young Muslims have few job and educational opportunities, and that there is a divided opinion about the contribution they make to the enrichment of Spanish society. It was found that future teachers in Spain have a great lack of knowledge about Islam and a more negative than positive perception of Muslim people. This highlights the importance of improving teachers' initial training on religious diversity so that teachers can, in return, educate students for a democratic society and respectful of plurality.

The State Just Makes Everything More Difficult For The Deaf": Barriers To Inclusion In Education And The Labour Market In Russia

Nikita Bolshakov

HSE University, Russian Federation

Youth transitions into employment across the industrialised world have come to be characterised by greater insecurity and precariousness in recent decades, as young people (especially young people with disabilities) navigate a greater range of choices and risks both in education and work, and do so without the social guarantees. This research explores the changing shape of transitions from education to employment amongst deaf and hard-of-hearing (DHOH) youth in Russia and adopts a mixed-methods approach, combining a quantitative survey with in-depth, biographical interviews.

The study showed, that the pathways of DHOH youth are characterised not by an expansion of choice, but by an ever-decreasing set of possibilities that gradually narrowed their horizons for action to a vanishing point. Central to this narrowing of choice is the ongoing salience of the medical model of disability, which, despite the apparent shift towards a social model with the Educational Reform of 2012 in Russia, continues to manifest itself in narrow prescriptions of what DHOH youth can and cannot do. While an enabling ethos clearly underpins the attempt to foster an inclusive approach, the lack of resources to realise this ethos means that the education system remains a disabling institution. Moving into the labour market, DHOH youth are then often confronted with disabling attitudes that further narrow their prospects, again with de jure rights de facto not held up.

"Formal Education and Lifelong Learning: Social Profiles, Practices and Dispositions of the Portuguese Population with Low Levels of Schooling."

Vanessa Carvalho da Silva[1,2], Patrícia Ávila[1,2]

[1]Iscte, Portugal; [2]CIES, Iscte

Characterized by their metamorphosis [Beck, 2017], current Western societies, impregnated with information and structured by knowledge, pose multiple challenges to institutions and individuals, at various levels, from economic to educational. People are required constant learning and adaptation - lifelong and lifewide - but the skills and dispositions that enable them are unequally distributed, resulting in the increase of the social exclusion of the population that remains at the margins of these processes (Enguita, 2007; Costa, Machado and Ávila, 2007).

In Portugal, not having completed a level of education can represent a significant barrier to returning to the formal education system (Valente, 2014). Studies on adults' participation in lifelong learning [LLL] activities (Aníbal and Ávila, 2019; Alves,2010) have confirmed the presence of an unequal relation marked by the Mateus effect: those with fewer qualifications have been the ones who access it less.

This communication proposal results from a research that intends to extend the knowledge about the Portuguese low educated population that has remained outside formal education, despite the national policies on adult education and training of the last 20 years.

The mapping of the phenomenon, carried out through secondary analysis of 'microdata' from the Adult Education Survey (INE, 2016), revealed that we are facing a diverse group, of expressive size and transversal presence in Portuguese society. By mobilising social characterisation indicators, we sought to capture its diversity by identifying type profiles, portraying practices and dispositions on LLL, contributing to the production of sociological knowledge on this phenomenon.

Steps to overcome the pseudo-theory of Meaningful Learning in Latin America through evidence-based teacher training

Alfonso Rodríguez-Oramas, Lena de Botton

University of Barcelona, Spain

In recent years, the international scientific community has warned of the spread of various educational pseudo-theories and myths about learning that decrease the effectiveness of teaching and contribute to perpetuate social inequalities. However, this has not prevented those hoaxes from becoming popular in teacher education programs around the world, perpetuating educational practices that lack any scientific bases. One of those pseudo-theories is that of Meaningful Learning, developed by David Ausubel in the late 1960s and popularized in Spain and Latin America from the 1990s. Its best-known premise states that "The most important single factor influencing learning is what the learner already knows ". Based on this idea, streaming practices such as ability grouping, segregation from the regular classroom and individualized curriculums proliferated. Various international reference authors in education as well as numerous scientific publications warn of the worsening of educational results when those practices are used, as well as the lack of scientific basis of the theory on which they are based. To discuss the extension of the meaningful learning theory in Latin-America, this communication presents preliminary data from an ongoing investigation. First, results of a survey of Latin-American teachers are presented that identify the presence of this theory and related practices in their professional education. Second, voices of Latin-American teachers who participated in a pedagogical training in which they learned about evidence-based alternatives such as the Dialogic Learning theory and the Successful Educational Actions are presented.

Schools adopting and recontextualizing the International Baccalaureate Program: a comparative analysis in a Southern European setting

Marta Curran[1], Javier Rujas[1], Alba Castejón[2]

[1]Universidad Complutense de Madrid, Spain; [2]Universitat Autònoma de Barcelona

The internationalization of education (IE) has intensified worldwide in the last decades. The growth of the International Baccalaureate (IB) is part of this global trend. Nonetheless, the IB, and IE in general, takes different forms depending on national and local contexts. Although the expansion of the IB has been studied at the global level and for certain national contexts, its scope and reasons can also vary within the same country, especially in decentralized countries like Spain. This paper explores the expansion of the IB in Madrid, paying attention to the national and international influences that have contributed to shape this trend as well as to the 'logics of action' (Van Zanten, 2009) underlying the schools' adoption of the IB program.

This paper draws on interviews with education policymakers, government advisors, and other education stakeholders, headteachers and IB tutors. Likewise, policy briefings, press releases, and legal documents were analysed. Our initial findings show schools' motivations for adopting the IB program are related to 'situated factors' -their settings, histories and intake-, but also to local and national policies and regulations. In fact, the IB Program may contribute to the reconfiguration of the education system, generating different academic pathways in terms of prestige and opportunities. This paper contributes to a better understanding of the dynamics of school competition in upper secondary education and how these dynamics shape young people's educational opportunities.

RN10_T05_01 | Contextual Factors in Education 1

Does the School Context Really Matter for Teacher Burnout? Review of Existing Multilevel Teacher Burnout Research and Results from the Teaching and Learning International Survey 2018 in the Flemish and French-Speaking Community of Belgium.

Filip Van Droogenbroeck, Bram Spruyt

Vrije Universiteit Brussel, Sociology Department, Belgium

It is widely believed that the school context plays a crucial role in teacher burnout. That claim, however, is more often stated as a fact than as the outcome of empirical research. Against that background, we (1) critically review existing empirical multilevel studies on teacher burnout and (2) use data from the Teaching And Learning International Survey (TALIS) 2018 to assess the school-level variance and its correlates in emotional exhaustion, cynical depersonalization, and personal accomplishment in 2300 primary (183 schools) and 2700 lower secondary (190 schools) teachers in the Flemish-speaking Community of Belgium, and 2135 lower secondary (120 schools) teachers in the French-speaking Community of Belgium. Our results reveal that (1) conceptual confusion exists surrounding school-context variables and that most studies apply single-level analyses, and (2) that not only in past research but also in new high quality multilevel data the between-school variance in teacher burnout is small. Implications for educational policy and teacher burnout research are discussed.

Transition From Primary To Secondary Education: An Analysis Of Factors Involved From Teachers´ perspective

María Carmen Sánchez Pérez, Mercedes Ávila Francés, Andrea Bueno Baquero

Universidad de Castilla-La Mancha, Spain

Primary to Secondary Education transition is a critical moment in students' life. Many changes occur when pupils pass to Secondary Education and they need to be prepared. Teachers play a key role in this transition process since they can highly determine students' career. Because of that, the main objective of this piece of research is identifying and analysing the factors that facilitate or hinder this process from the teachers' perspective. For that, an instrumental and collective case study has been designed. Data and opinions from tutors, headmasters, management teams and High School counsellors have been recorded applying two techniques: interviews and discussion groups. Using Atlas ti. 7 from a quantitative approximation, data has been analysed creating codes that help us to classify and connect the factors that hinder or facilitate the transition. The research highlights that students and teachers are not uniquely responsible for this process. School organization and culture give also important information to know High School's life close up. For that reason, this piece of research has made a Habermasian distinction between the concepts "system" and "Life World" to understand the transition process and analyse these situations that happen simultaneously. Results give us a great view to act and improve this important moment in students' life. Determining the attitudes and actions that facilitate the transition to Secondary Education can make this process successful. Hence, the importance to consider them and act.

Social Inequality And School Guidance. An Analysis Of School Choice And Teacher Guidance Counseling

Giuliana Parente

Sapienza University of Rome, Italy

Participation in second and third grade education has gradually increased in developed countries, thus ceasing to be an experience limited to the elites; however, education can still be conceived as an asset and a privilege unevenly distributed and capable of reproducing social inequality. A "new" inequality emerges, no longer linked to overall access to the educational system, but to results and opportunities to pursue studies up to the highest educational levels. The transitions that occur between school levels, therefore, can be conceived as a moment in which social selection takes place (Boudon, 1973), thus representing a decisive step in students' school careers and, more generally, in their lives. The study of educational transitions, therefore, represents a privileged moment of observation to understand the processes of production and reproduction of social and educational inequalities (Tarabini, Ingram, 2018). At the school level, important questions are increasingly discussed about the social fate of pupils from disadvantaged backgrounds, especially in reference to the formulation of the guidance council, for which recent research (Pitzalis, 2012; Romito, 2019) demonstrates a functional distortion that discourages the enrollment in high school paths of pupils with lower social status.The study analyzes guidance counseling in reference to the school choice of 139 students from five schools selected through a reasoned choice sampling procedure. Students were administered two questionnaires to understand how teachers' guidance advice influenced their choices. The results of the logistic regression analysis conducted demonstrate the confirmatory effect of guidance counseling on students' choices. Guidance counseling reinforces class conditioning and prevents students of working-class backgrounds from orienting themselves towards schools that allow access to university and, in essence, facilitate their social mobility.

Exploring Teachers' Dilemmas And Opportunities In Developing A More Hybridised Curricula

Jo Trowsdale[1], Richard Davies[2]

[1]University of Warwick, United Kingdom; [2]University of Central Lancashire

Recent changes in English education have increased the curricula freedom available to schools. These reforms unwind the last twenty years of teachers' primary focus on pedagogy to achieve prescribed learning outcomes and, understood through a Bourdieusian (1977) lens, mark a change in the field of school education. The Imagineerium projects (2014-2019), which reflect characteristics of a community of practice (Lave and Wenger, 1991), explored new possibilities for children's learning, utilising art-making as an educational site to hybridise 'science' and 'arts'. It showed positive subject specific learning outcomes in science and the arts and development of broader learning behaviours. The model attracted interest from senior leaders. Teachers involved in the project, however, found it difficult to conceive of developing Imagineerium-like curricula in schools.

This conflict between teachers' professional habitus and the desire to transform the field of schooling gave rise to Teach-Make, a professional development programme enabling teachers to question their taken-for-granted, habituated ways of thinking and acting. This questioning opened up opportunities to explore new ways of developing curricula in/for the primary classroom. Teach-Make seeks a fluid professional habitus attuned to the emerging new field of schooling in England.

Drawing on interviews with primary school teachers and school leaders, we discuss both the perceived barriers to realising this vision in English Schools, and the potential perceived value of such a change. We explore how teachers are responding to the first phase of Teach-Make: as they recognise the dilemma of doing what they judge to be best for their pupils' development, yet still want to hold on to their usual ways of meeting the curriculum requirements.

The Promotion of Scientific Self-Literacy through Scientific Dialogic Gatherings

Marta Font Palomar, Mimar Ramis Salas, Susana Leon Jimenez

Universitat de Barcelona, Spain

"On the internet, there is a lot of information, and you have to know how to search for accurate information". This is how one of the participants in Scientific Dialogic Gatherings (SDG) speaks about one of its benefits. Adults between 55 and 70 years of age are taking part in an educational practice that brings together researchers and participants in an egalitarian dialogue that gives response to a social demand for science to become more responsible and have a greater effect on society (Buslón, Gairal, León, Padrós, Reale (2020). Scientific literacy is one of today's societal preoccupations: promoting a more and better-informed citizenry to tackle the current challenges of a globalized world with overwhelming amounts of available information. SDG is developed at an urban adult school in Spain, and is providing a space shared between scientists and lay people of low socioeconomic status and low educational level. Together, they facilitate scientific self-literacy that encourages people to learn about the latest scientific breakthroughs on different issues which are relevant for them, like health-related topics. SDG is thus part of a rapidly growing movement that seeks to democratize expert knowledge. Our presentation will introduce this educational practice, the theoretical framework grounding it, the methodology used and the important social impact associated to it, that is: the extent to what SDG helps lay people to make better decisions about today's challenging issues.
Buslón, N., Gairal, R., León, S., Padrós, M., & Reale, E. (2020). The Scientific Self-Literacy of Ordinary People: Scientific Dialogic Gatherings. Qualitative Inquiry, 26(8-9), 977-982.

The Role of Slovakian Study Agencies in International Student Mobility of Slovak Students studying abroad

Maria Bystrianska

Institute for Sociology, Slovak Academy of Science, Slovak Republic

The important part of student international mobility represents students studying abroad to obtain a university degree. The university often uses services of intermediaries who help them attract international students. At present, intermediary agencies for tertiary educational programmes abroad are important actors in active university policy in countries with developed international student migration. The agencies operate differently in various destinations and many of Slovak students also leave to study abroad with their assistance. Who are the students who use the services of such agencies? In Slovakia, this phenomenon has not been investigated yet. Our current research examines the function and importance of these agents in relation to the number of foreign students in different foreign regions and universities, possibly also their orientation to certain university departments. For most universities, agents play an important role in international student recruitment. This work complements existing research on the role of the agent in higher education mobility. In our research, we focused on intermediary agencies operating in Slovakia. Through semi-structured interviews with the leaders of the most important agencies in Slovakia, we are uncovering the characteristics of clients of these agencies from their perspectives. We are mapping how the agencies approach their clients, how they influence their decision to study abroad at specific universities. According to our findings, the work of these intermediaries has a significant impact on the volume and goals of students who go to study abroad. Some characteristics of such students leaving Slovakia are changing across the time.

Lifelong Learning in Uncertain Times: Modalities, Practices and Challenges. Real-time Reflections

Luísa Silva Delgado[1], Patrícia Durães Ávila[2], Vanessa Carvalho da Silva[2], Joana Duarte Correia[2]

[1]Instituto Politécnico de Santarém - Escola Superior de Educação, Portugal; [2]ISCTE - Instituto Universitário de Lisboa

Lifelong Learning - as a paradigm that holds within itself the idea that learning processes must and can develop throughout life and in multiple contexts (formal, non-formal and others) - carries with it the idea of that education throughout life is a key variable for economic, social and cultural development, as well as for adapting and responding to the multiple challenges that are territorially posed to communities, and particularly individuals. Moreover, the analysis of local, regional and national realities takes an essential role, since it implies a sociological look at privileged ecosystems of resources, supply modalities, agents, actors and practices. This communication aims to present an action-research project under development in the municipality of Cascais (located in the Metropolitan Region of Lisbon, Portugal), whose first objective is to map educational opportunities (formal, non-formal or other) aimed at adults and, secondly, to design an intervention plan that mobilizes resources and territorial synergies, and is appropriate to the needs of the public. Due to the timeliness of the execution, the study of the consequences of the pandemic crisis associated with COVID-19 in the implementation of ongoing and planned educational offers constitutes an unexpected but mandatory analysis dimension associated with the project, inviting the analysis of possible new practices and "new ways of doing it" that may constitute new opportunities for access and frequency of educational offers for the adult population.
Keywords: Lifelong Learning, Adult Education and Training, Social Inequalities, covid-19

Inequity in Internationalization: A Qualitative Analysis of Students' Social Markers and their Role in Participation in Internationalization Activities

Marthe Joanne Schippers, Christof van Mol

Tilburg University, The Netherlands

Over the past two decades, a growing body of research has highlighted social selectivity issues in access to international student mobility. As a response, over the past decade, higher education institutions increasingly started to offer a broader set of internationalization activities to their students, including internationalization at home activities. The rationale to do so is often informed by institutional strategies aiming to provide 'comprehensive internationalization', 'inclusive internationalization' or 'internationalization for all'. Surprisingly, however, the international higher education literature focuses predominantly on the outcomes of internationalization activities rather than who is participating. Nevertheless, the scarce empirical evidence that exists suggests that inclusive internationalization strategies do not automatically lead to social inclusion. Today, the mechanisms that explain why social inequalities persist in access to internationalization at home activities remain unknown. Consequently, in this paper we empirically investigate the mechanisms explaining participation/non-participation in internationalization activities (at home and abroad) of students at a Dutch university, with a specific focus on different social groups that are underrepresented in traditional internationalization activities – i.e. study abroad. Through 7 focus groups and 14 in-depth interviews with students, this case-study provides exploratory evidence on the role social markers such as socio-economic status, migration background and gender play in the decision-making process to participate in internationalisation activities among a diverse set of student profiles. This study is of primary importance to both scientists and practitioners, as it bridges the gap between research and practice, allowing to formulate tangible policy recommendations for daily practice.

RN10_T05_03 | Segregation, Choice and Enrolment

One Way or Another: An Optimal Matching Analysis of Students' Educational Trajectories Throughout Upper- and Post-secondary Education and the Impact of Tracking and Engagement

Isis Vandelannote, Jannick Demanet

Ghent university, Belgium

Educational attainment is the result of sequential educational decisions, hence, understanding educational attainment requires understanding students' decision-making, and social disparities therein, throughout their educational career. Drawing from rational choice theory, social disparities in students' educational decision-making result from cost-benefit analyses and risk-avoidance strategies. Additionally, following life-course research, we acknowledge that students actively shape their trajectories within the bounds of social structure, by investigating the long-term effects of students' engagement as a proxy for human agency, as well as its potential for overcoming socioeconomic disadvantages. Using data from 965 Flemish students, optimal matching analyses identified seven distinct clusters, or pathways, throughout upper-secondary and post-secondary education. While clusters largely followed the tracked structure of the Flemish educational system, there was considerable within-track heterogeneity. Most remarkably four distinct pathways were found for academic track students. Moreover, multinomial regression analyses demonstrated that even among the relatively privileged academic track students, socioeconomic background determined the choice between university or non-university education, as well as to how successful one is in higher education. Lastly, lower engagement was associated with a decreased likelihood of following traditional academic pathways. A small, but positive, moderation effect was found between social background and cognitive engagement, which indicates that engagement is a potential buffer against the negative impact of having a less privileged socioeconomic background. Our findings challenge the efficiency of the academic track as it seemingly fails its primary goal – preparing students for higher education. Policy-makers may want to rethink guidance strategies so that students are better prepared for their post-secondary careers.

Track Prejudice In Belgian Secondary Schools: Examining The Influence Of Social-psychological And Structural School Features

Lorenz Dekeyser, Mieke Van Houtte, Charlotte Maene, Peter Stevens

Ghent University, Belgium

While considerable educational research has established objective and subjective status differences between tracks and focused on the influence of ability grouping on students' educational and broader outcomes, there is virtually no research that explains variability in students' prejudices towards educational tracks. Tracking is the organizational structure of educational systems that groups students in various curricula based on their ability. In Belgium the academic track prepares students for higher education, the technical track consists of general and technical-theoretical courses, and the vocational track focuses on training students for a craft and is oriented towards the labor market. Society generally values higher education oriented tracks higher. This study relies on theoretical insights from social psychology, ethnic and school effects research to develop hypotheses about the influence of individual- and school-level features on students' track prejudice. Drawing on data from the School, Identity and Society Survey, involving 4,500 adolescents from 64 Belgian schools, using multilevel modelling (HLM6), this study demonstrates the relevance of social identity theory and social norms in students judging tracks, since the academic and technical track students evaluate tracks in accordance to the societal norm. Additionally, it shows that chauvinistic attitudes negatively impact the opinion towards groups 'lower' in the status hierarchy, whereas patriotic ingroup attitudes have a positive influence on students' opinions of technical and vocational track students. Cross-track friendships are associated with more positive attitudes towards other tracks, as was hypothesized. Implications of this study for future research and policy will be discussed.

382

Luxembourg Perspectives on Pre-Service Teacher Motivation: What Factors Influence the Choice of Becoming a Teacher, Perseverance and Success?

Salvador Rivas, Débora Poncelet, Alain Reeff, Gilbert Busana

University of Luxembourg, Luxembourg

In 2016, UNESCO estimated that 24.4 million primary school teachers and another 44.4 million secondary school teachers were needed to provide every child in the world access to education. Widespread teacher shortages have led researchers to investigate what motivates candidates to become teachers and to remain in the profession (see for example Watt et al., 2012). Luxembourg is no exception, in 2019 for example, the government wanted to hire 320 new teachers at the fundamental school level; however, only 63 graduates from the country's main teacher training programme at the University of Luxembourg took the required state exam to join the teaching ranks. The country needs 300 to 400 new fundamental schoolteachers per year to keep up with population growth.

To help address this need, we draw on 10 years of admissions data (exam performance and noncognitive indicators) collected from candidates seeking entry to the University of Luxembourg's teacher training programme. Our study investigates the major correlates, similarities and differences, between candidates that never-registered, i.e., candidates that after being admitted never start the programme; drop-outs, i.e., students that start but never finish; and of course, those that persist until completion. While circumstances may differ between these types of candidates, the first two nevertheless took-up the place that someone else who could have finished and possibly become a teacher. In light of the pressing need for more teachers, this study identifies important factors associated with showing up and staying in the programme until the end. Policy implications are described and discussed.

The Political Approach To Treatment Of Diversity At School: The Case Of The Autonomous Communities Of Cantabria, Asturias, Galicia And Extremadura (Spain).

Marta García-Lastra[1], José M. Osoro[2]

[1]University of Cantabria, Spain; [2]University of Cantabria, Spain

This paper has been developed following the partial reports carried out at the Spanish state level in the R+D project "Cultural Diversity in Schools": Discourses, Policies and Practices. Financed by the Ministry of Economy, Industry and Competitiveness (CSO 2017-84872-R). Along the first stage of this project, an exhaustive analysis of intercultural education has been carried out throughout the Spanish territory, resulting in different reports from the autonomous communities. In this case, we will focus our communication on the communities of Cantabria, Castilla León, Asturias, Galicia and Extremadura, the five communities with a lower percentage of foreign population and therefore fewer immigrant students in their classrooms. We investigate how each community attends to culturally diverse students (immigrant or ethnic minority students).

We must remember that we are moving in the field of human rights, democratically agreed values and how the conditions are provided to make them possible. Not forgetting this macro perspective, the analysis includes how communities raise the cultural project and how it is reflected in the official curriculum in the form of practices that are determined by an image of children and schools. In this perspective we move from one macro approach to a more concrete vision that tries to define what, who and how schools articulate this process.

Research will allow us to observe how decisions are made about student learning, what educational practices are designed, how evaluation processes are articulated and/or what alternatives we give to key discourses.

School Enjoyment During The Transition To Lower Secondary School

Alyssa Laureen Grecu[1], Saikat Ghosh[2]

[1]TU Dortmund University, Germany; [2]Leibniz Institute for Educational Trajectories, Germany

Besides performance-related outcomes, students´ well-being and overall socio-emotional, and mental state are important educational aims. Over the last decade, students´ affective and cognitive attitudes towards school have attracted widespread scientific interest. However, the concept of school enjoyment has been studied subordinate to well-being or achievement.

School enjoyment captures a student´s emotional connection to school. Low levels of school enjoyment are described as school dissatisfaction often characterized by anxiety and boredom. Moreover, the extent of school enjoyment is associated with a student´s integration and motivation in the school context. Given the relevance of students´ attitudes towards school for their educational performance, this study aims to provide insights into the development of school dissatisfaction.

Using data from the National Educational Panel Study (NEPS), this study investigates the prevalence and developmental patterns of school dissatisfaction from grade 4 in primary school to grade 6 in secondary school in the highly stratified German educational system. Additionally, the importance of individual factors and the school environment for the development of school dissatisfaction was assessed. Analysis followed a two-step procedure: Investigating the degree of alienation from learning, Fixed Effects Models were computed. Track-specific developments were analyzed by Group-Specific Growth Curve Models.

Preliminary results indicate that school enjoyment increases from grade 4 to 5, but decreases in grade 6. Furthermore, the importance of school factors, namely school track belonging, became evident. The paper closes by discussing whether the relevance of school factors for the development of school enjoyment is distinctive to stratified educational systems.

The "Fast And Dubious" Research On Higher Education During Covid-19 Pandemic: Where Did Sociology Go?

Elena Stoykova, Antoaneta Getova

Sofia University "St. Kliment Ohridski", Bulgaria

The phenomenon of poor research is not new. What is new - in the case of research on Higher education during Covid-19 pandemic - is its unprecedented acceleration and amplification. The stakeholders, mostly scientists themselves, wanted to know what was going on and they wanted to know it as soon as possible. For less than a year, hundreds of researches were conducted and thousands of results were produced. These extraordinary circumstances created the confidence that we could all be social scientists now as long as we are producing results about the social world - eligible enough to be published in academic journals and to inform policy recommendations.

The aim of this paper is to investigate the reliability and the validity of these results in reference to the sociological standards and requirements for conducting such research including but not limited to the statistical reliability, the research methods, the data collection instruments and so on and last but not least were there social scientists involved. The objects of our content analysis are more than 250 research papers published all over the world in different languages dedicated to the topic: COVID 19 and Higher Education. The results of analysis seek to answer the important question: what is at stake for Sociology in this process.

"Now It's My Time For The Computer" Competition For Resources Within The Household During The Covid Pandemic And Distance Learning.

Karol Leszczyński, Jacek Kurzępa

University of Zielona Góra, Poland

Last year, with the increase in the number of infected with Covid'19, many countries, including Poland, decided to close schools and start online education. In addition to schools, restrictions on the economy were introduced, companies have decided to start remote work regardless of state regulations.

In this situation, many families have experienced the problem of using a computer, because usually in Poland, there are fewer computers than family members in households. This led to competition for computer time between children, who needed a computer for distance learning, and parents who needed it to work from home. The main objective of our two-stage qualitative and quantitative research (n=10,000) was to determine the short-term and long-term effects of competition for a computer as a work or study tool, especially in less wealthy families with many children.

In the paper, we will present ways of dealing with this problem and evaluating whether it is more important to invest in the future (children) or to provide the basic living conditions (parents' income).

We also want to present the psychosocial problems in families resulting from dealing with this type of conflict and the threats they may bring in the future.

As part of the research, we conduct a survey with students, parents, teachers and school psychologists, as well as a series of IDI and FGI interviews in the same groups. We also analyzed the media coverage about the conflicts during the lockdown. We expect that our results will present the problem of competition for limited resources necessary to achieve basic life goals, and we will illustrate class disparities in access to education and well-paid jobs, which the pandemic will exacerbate.

Left Adrift: Pandemic Crisis And Educational Inequalities In Portugal

João Sebastião[1], Luís Capucha[1], Eva Gonçalves[1], Rita Capucha[1], Luísa Delgado[1,2]

[1]ISCTE- Instituto Universitário de Lisboa, Portugal;
[2]Escola Superior de Educação de Santarém, Portugal

This paper aims to analyse the impacts of the pandemic crisis on the Portuguese education system and the policies taken to address them. The fast development of the health crisis caused by Covid-19, posed the need for rapid adaptations to home confinement in order to ensure the continuation of the schooling process. In Portugal, as in many other countries, the adoption of educational solutions based on digital platforms were the alternative, articulated with a public TV home-schooling programme. Because of the restrictive budgetary policies, focused on reducing the public deficit, the Portuguese education system faced this new context clearly underfunded and under-equipped, with limitations in the available resources. The course of the three pandemic waves, particularly during the two school closure periods, showed not only the limitations of resources, but also the lack of interest to promote educational policies able to restrict some of its' most negative effects. Some groups, such as children with disabilities, children with specific educational needs, or children of immigrants, were particularly unprotected and left without any educational support, or any consideration for their living conditions or family educational resources. The selective character of the Portuguese system was also highlighted by the maintenance of standardised evaluation processes, ignoring the evident difficulties of families with lower economic and cultural resources, in order to counterbalance the reduction or suspension of the educational compensation programmes. In conclusion, we can state the ineffective policy measures to the clear worsening of social inequalities in the access to education.

385

RN10_T06_02 | ICT in Education

Teaching And Learning In The Digital Culture – Preliminary Results From A Video Study Comparing Instruction Employing Print-Based Books And Enhanced Ebooks

Uta Hauck-Thum[1], Gerleigner Susanne[2], Fabian Franz[1], Veronika Eichmann[2], Jana Heinz2

[1]Ludwig-Maximilians-Universität, Germany; [2]German Youth Institute, Germany

While children are growing up in an almost entirely digitalized world, ICT in German education has been implemented reluctantly. Thus, the Covid-19-Pandemic hit German schools particularly hard and intensified the already strong correlation between students' socio-economic background and their success at school. However, the pandemic also forced teachers to instantly employ ICT for distance teaching. Thus, the pandemic has created room to re-imagine education allied with the digital culture we already live in.

The following research question guides our presentation: How do media (print-based books and enhanced eBooks) influence reading literacies, motivation and participation in reading and literature classes in elementary school with regard to students' socio-economic background?

In answering this research question, we will present results from a research project comparing 12 third-grade classes. In eight of these classes, students learn in a student-focused and collaborative setting, four with print-based books and four with enhanced eBooks. Four classes without any treatment are our control group. The effects are analysed using a mixed-methods approach, including quantitative standardized surveys and measurement and qualitative analyses of students' interactions in class via videography and audio recordings. At the ESA conference in Barcelona, we will present results and experiences from a shortened pre-test with two classes and a focus on videography.

Though initial results indicate differences and similarities in learning with print-based books and enhanced eBooks in the digital culture, the largest effects stem from instruction designs that enable children's creative and self-regulated learning.

School as Service Operation Model Changing Stakeholder Agency

Jussi Okkonen

Tampere University, Finland

In school the stakeholders have different roles and their agency is related to somewhat established roles. In 2020 a shift to online school and massive utilisation of digital learning envinments chnaged the landscape dramatically. DLEs provide more flexible opportunities for learning, but only if sufficient infrastructure and support for students are provided. School was altered to a service model, i.e.process that utlilised spatial dispersion and also asynchoronous workig. Quite dramatic change to previous idea of a school as place to gain learning outcomes. Under some circumstances, DLEs may have a negative impact on learning outcomes, yet for resilience digital operation model

The way to a flexible, inclusive, and sustainable school as service involves using a hybrid model of digital and physical learning environments. The digitalisation of schools is about taking the leverage of technology and adopting high-end solutions in parallel to those available in real life. Parents and guardians are key to the success of remote learning in many ways. Teachers should consider the limited time resources and increased stress parents experience and acknowledge that it may require extra effort for many parents to familiarise themselves with a situation that differs dramatically from their own experiences of attending school. Children and young people are the most important stakeholders in the school context. Students who do not have the skills to participate and lack the skills to understand the dynamics within digital learning environments can be easily excluded from learning. Shift to school as service requires different agency, enhanced digital literacy and extensive input by external stakeholders.

The Digital Transformation of Egyptian Secondary Education: A Critique of Technological Reason

Hany Zayed

University of Illinois at Urbana Champaign, United States of America

Egypt's educational reform has historically been punctuated by socio-economic and socio-political junctures. Since late 2018, Egypt has been implementing an audacious reform program that involves the digital transformation of public secondary schooling. This program includes the distribution of educational tablets, the development of e-learning platforms and e-examination systems, the introduction of smartboards in classes, and the wiring of public schools. Following the Covid-19 school closures in March 2020, this digitization program was massively accelerated with scale, speed and depth unprecedented in Egyptian history.

This research seeks to understand digital transformations and educational change within a critical moment of disruption and uncertainty. Moving away from celebratory techno-optimistic rhetoric and idealized visions of positive technological transformations, this research examines the messy realities of technologies of learning in Egyptian secondary public education. This includes examining how digital technologies restructure education and schooling, change cultures of learning, alter socio-educational relations, instigate resistance and adaptation, perpetuate inequalities, and act as transformative social forces. Deploying relational and digital ethnographies, this research uses in-depth interviews, oral histories, observations, content analysis, in addition to novel digital social research.

This project uses the unique case of a middle-income country engaged in creative, swift and vast digital transformations akin to advanced industrial nations to elucidate socio-educational changes. Its critical questions, distinctive access, empirical richness, methodological innovations and theoretical insights provide a timely intervention that is theoretically significant (as it informs socio-educational research), and practically valuable (as it informs other spatial and temporal contexts) with both individual and institutional consequences

Digitizing and Datafying Education During the Coronavirus Pandemic Crisis. Implications for Learning, Policy and Governance

Maria Ranieri[1], Gianna Cappello[2]

[1]University of Florence, Italy; [2]University of Palermo, Italy

As the Covid-19 pandemic still troubles governments worldwide, numerous commentators have focused their attention on the high-tech industry's involvement in several fields (education and health care in primis), linking it to a longer privatization process, deregulation and reorganization of the public sector. Decades of outsourcing and budget cuts, justified by a dominant political discourse against governments inefficiecy, have significantly hampered public institutions' ability to provide essential services adequately. This situation has been nourished by a narrative of innovation that, while celebrating the role of the private sector as the driver of technological innovation, creates a powerful self-fulfilling prophecy: the vacuum left over by inefficient states is occupied by high-tech corporations offering their expertise to address problems that governments are failing to solve. Furthermore, the pandemic crisis has made apparent how it is increasingly difficult to untangle the link between philanthropy and capitalism, charitable efforts and profit goals. Finally, we need to see how this industry-led digitalization and datafication of society – in act well before the outbreak of the pandemic crisis – is changing the very nature of public policies.

This contribution focuses on how these developments reverberate in education, arguing that they are also the result of broader changes in the field over the past ten years or so. It is not only a question of digitizing education, we now need to see how it is also being datafied through various forms of machine learning and organizational analytics, and how this is going to affect education theories, policies, and governance.

RN10_T06_03 | Contextual Factors in Education 2

Ethnic School Segregation Processes and Family Typologies on School Choice for Migrant Families

Carlos Lubián[1], Delia Langa-Rosado[2]

[1]University of Pablo de Olavide (Seville), Spain; [2]University of Jaén, Spain

We present the results of an empirical study that addresses the phenomenon of ethnic school segregation from the perspective of migrant families in their discursive practices of school choice. We conclude that three factors -territorial, institutional framework and family choice- are involved in segregation as an interconnected process explained by the influence of different agents.

Through a socio-spatial methodological approach that contextualizes practices and biographical trajectories of 40 migrant families, we elaborate three typologies of school choice strategies (linked to the ideal-types of families) that depend on the intersection of class and ethnic factors, together with other factors that are innovative according to the migrant condition, such as the migration project and ethnic capital.

From a conception of migrant families as strategic agents far removed from the stereotype of lower classes with low educational aspirations, the typologies show family responses that confront or integrate in the education field with institutional factors of attraction (from specialized schools) and repulsion (from schools concerned to preserve the socio-economic and cultural homogeneity of their students).

The need to establish new typologies derives from a heterogeneous profile in the family configurations of our interviewees, where the migratory status confers the particularity of situating the discourses in contexts of high mobility. We consider that these characteristics require new or revised categorizations in this respect, in accordance with a changing context and continuous readaptation.

Mapping the Opportunities of Attending Bilingual Schools in Spain: Evidences from a Case Study.

Alberto Álvarez-Sotomayor[1], Juan Miguel Gómez-Espino[2], Ricardo Barbieri[1]

[1]University of Córdoba, Spain; [2]University Pablo de Olavide, Spain

Due to the relevance that learning English has acquired in globally connected societies, Spanish-English bilingual education programmes have spread widely in Spain in recent years, receiving significant resources by the governments of all autonomous communities. This large expansion has led to an incipient academic discussion about the effects of this educational policy; a discussion in which equity and school segregation implications are still quite absent. This study aims to contribute to filling this gap by analyzing how primary schools enrolled in this type of programme ('bilingual schools') are distributed across three variables: the type of school (public, subsidized private or private), the average income of the census section in which the school is located, and school's catchment area. We take the twelve cities with more than 100,000 inhabitants in Andalusia (the most populated Spanish region) as case study. We map and analyze the distribution of all the primary schools in them (n=810) by using the Q-GIS geographic software. Data show that 'bilingual schools' are highly unequally distributed across the three analyzed variables. Bilingual schools are much more frequent among subsidized private and private schools, they are mainly concentrated in middle and upper-middle class neighbourhoods, and they are unevenly spread across the different catchment areas. As a consequence, the odds of attending a 'bilingual school' seem to be clearly affected by students' social origin. The implications in terms of both the opportunities of learning English as a second language by social class and school segregation are discussed.

School and Residential Segregation at the Inter-municipal Level. The Case of Catalonia.

Roger Martinez[1], Isaac Gonzàlez Balletbó1, Ricard Benito Pérez[2]

[1]Universitat Oberta de Catalunya, Spain; [2]Universitat Autònoma de Barcelona, Spain

In the Spanish context, research on the relationship between school and residential segregation is scarce. Unlike what happens in contexts with residentially assigned schools, which generates a logic of residential choice and segregation linked to educational opportunities, in normative contexts such as the Spanish, where residence plays a minor role, the supra-municipal impacts of the link between school and residential segregation has been mainly neglected by researchers. This paper addresses two aspects on which this lack of information is notorious: the differences between municipalities' school composition and the flows between residents and schools of neighboring municipalities. Both aspects are key to understanding school segregation in all its complexity.

First, school and residential segregation between municipalities will be measured at the county, provincial and Catalan levels. To do so, the population object of analysis will be students of foreign origin in pre-primary education and primary school (ages 3-11), using the data at a municipal level of the Continuous Register, from the Education Department and of the School Dissimilarity Indexes published by the Catalan Ombudsman. Second, and also using statistical information from these same two sources, mobility of students between municipalities will be analysed in order to understand how this affects the final configuration of school segregation in the territory. Our hypothesis is that school segregation decreases when we analyse it circumscribed to intra-municipal level, for some of it happens at an supra-municipal level to which academic research has not paid enough attention.

What Does Research Says About Participation Inequalities Among MOOC Users? Results From A Systematic Literature Review.

Ioannis Zafras, Apostolos Kostas

University of the Aegean, Greece

The rise of Open Educational Resources movement during the last two decades paved the way for online education to become more equally accessible and limited the access gap for underprivileged students. This study examines the factors influencing the participation of MOOC learners in these courses. Thus, it focuses on the above research questions:
• Are the socio-economic and demographic factors of a MOOC learner related to the participation in an online course and its completion?
• Do the educational/geographic characteristics of MOOC learners affect their self-regulating abilities, as found in the literature?
• What are the main reasons/motives to enrol in a MOOC course?
The data are derived through a systematic literature review related to MOOC participants as presented in the literature for the years 2009-2019. A literature search strategy was employed with the final selection resulting in 56 papers. This process includes the formulation of search terms in scientific databases and search limitations and results in 8 academic databases employed using a PRISMA flow diagram. Participation inequalities in MOOCs persist; in overall, women participate less in science and programming courses than men. Most of MOOC users are already employed and highly skilled. Users from wealthier neighbourhoods with higher socio-economic status were more likely to attend a MOOC, while users with more educated parents are twice as likely to participate than other students.
This study attempts to shed light to the allegedly free and open digital education trend showcasing that structural inequalities in distance education remain.
*MOOC= Massive Open Online Course.

"I don't know why, but I wouldn't classify myself as a European": Qualitative Exploration of Young People's Perceptions of Europe

Eleni Stamou, Anton Popov, Ebru Soytemel

Aston University, United Kingdom

The paper offers an empirical exploration of young people's perceptions of Europe and 'Europeanness' in education and beyond. It draws on a set of semi-structured interviews with secondary school pupils in England, which were carried out as part of the international project CHIEF (Cultural Heritage and Identities of Europe's Future). The research was conducted during the aftermath of the EU referendum, in a period marked by political division and fierce public debate regarding the role and future of the UK in the union. Our analytical focus is on young people's engagement with the making of the symbolic boundaries of "Europe" and their positioning within these. We therefore examine young people's discursive constructions of Europe and European identity and explore if and how these relate to their views and position on the EU referendum and their articulations of self-identity and belonging. We consider the findings firstly, in relation to the features and contexts of formal education and secondly, in relation to key characteristics of the 'Europeanisation' project more generally.

Social inequalities in dropout from higher education – Denmark and Norway

Håvard Helland[1], Jens-Peter Thomsen[2], Thea Strømme[1]

[1]Oslo Metropolitan University, Norway; [2]VIVE - Det Nationale Forsknings- og Analysecenter for Velfærd

The article examines social class gaps in higher education dropout in Denmark and Norway, and how dropout rates varies between fields of study and type of institution.
We use administrative data from public registers on the entire population of students in higher education in both countries (from Statistics Denmark and Statistics Norway). We include all that have enrolled in a higher education
Preliminary findings show that there are clear connections between social background and persistence in higher education in Norway and Denmark, and that there are important variations both between type of institutions attended and fields of study. In the professional degrees at university colleges the social differences in non-completion is negligible in both countries. At university degrees at the BA-level in humanities, social and natural science, on the other hand, students with highly educated parents more often graduate.
Moreover, while the differences in the level of drop-out in Denmark and Norway is staggering, the patterns of social inequality are quite similar, even if the social disparities are somewhat larger in Norway, also between fields. When it comes to transferring to other educational fields, we find in both countries that students with highly educated parents transfer from university colleges into universities, whereas the students whose parents do not have any higher education tend to transfer in the opposite direction (i.e. from universities to university colleges).
Theoretically, we combine Tinto's theory with theories of social reproduction of educational inequality.

390

Individual Success, Collective Failure? The Process and Consequences of Educational Mobility for First-in-family Roma Graduates in Hungary

Judit Durst[1], Ábel Bereményi[2]

[1]Institute for Minority Studies, Centre for Social Sciences (CSS), Hungary; [2]Central European University

Public dialogue about social mobility in many countries has recently been dominated by the myth of meritocracy, using a neo-liberal vocabulary of aspiration and choice, considering mobility as an individual project of self-advancement by moving up in social hierarchy. In this discourse social mobility is the new panacea against wider historic and social ills and the answer to the increased classed and racialized inequalities. In recent years, however, many studies have demonstrated rising and cemented inequalities, that were only exacerbated by the advent of the global Covid-19 pandemic.

This paper aims to challenge the widespread public and political discourse about the myth of meritocracy by exploring the exact processes and consequences of education-driven social mobility, through analyzing the personal experiences of 72, first-in-family college educated Roma in Hungary. The participants of our study come from socially disadvantaged family background and achieved a degree, "against the odds" as underrepresented minority in higher education. We argue that among them, the most common upward mobility trajectory, contrary to the common belief of assimilation, is their distinctive minority mobility path which leads to their selective acculturation into the majority society. This distinctive incorporation is close to what the academic scholarship calls the 'minority culture of mobility'.

Through identifying the main elements of our respondents' distinct mobility trajectory, we argue, however, that these elements do not serve the purpose of their economic mobility as the original concepts (Neckerman et al. 1999) posits, but to mitigate the price of changing social class and to make sense of their individual success at the conjuncture of their ethnic community's (of background) collective failure.

Community Engagement of Underrepresented College Students: Ultra-Orthodox Students in Israel as Social Change Agents

Zvika Orr[1], Edith Blit-Cohen[2], Maya Vardi[1], Bina Be'eri[1,2], Daphna Golan-Agnon[2]

[1]Jerusalem College of Technology, Israel; [2]The Hebrew University of Jerusalem, Israel

The research on community engagement of college students from minority groups is underdeveloped. It has often adopted an essentialist and oversimplified approach that has homogenized various underrepresented student groups. This article contributes to bridge this gap by examining community engagement programs involving students from the Jewish ultra-Orthodox society in Israel, a minority group that is clearly underrepresented in the higher education system in Israel. Based on mixed methods that include a survey and in-depth interviews, the article analyzes the characteristics of ultra-Orthodox students' social activism and how ultra-Orthodox students experience their community engagement and perceive its effects on them personally and on their communities. The findings suggest that by enrolling in academic studies, ultra-Orthodox students cross social and cultural boundaries, and often this choice is delegitimized in their community. However, the students' ability to contribute to their communities through the academic framework helps legitimize their decision to pursue an academic education. Hence, the students' community engagement helps reinforce the academicization of the ultra-Orthodox society in general. Finally, the article discusses practical dilemmas that stem from the cultural adaptations and segregation in the volunteer frameworks. This case study proposes that volunteer students from minority underrepresented groups can bridge between the Academy and their communities, serving as agents of knowledge and change in their communities. There is a need for a policy to promote the participation of underrepresented students in college-based community engagement programs. Such a policy will help increase the representation, reduce the dropout phenomenon, and enhance students' experience.

Transitions To Secondary Education And Family-School Detachment

Carlos Alonso-Carmona

University of Almería, Spain

The aim of this study is to address how families from different social backgrounds manage child transition to secondary school. We hypothesized that this transition affects their involvement strategies differentially by social class. The research is based on the longitudinal analysis of in-depth interviews with parents and ethnographic observation in the secondary schools their children go to. Parents were first interviewed in 2016, from September to October, and most of them were interviewed again in 2018, from May to June. Altogether, thirty in-depth interviews were carried out. Ethnographic observation was made in teachers' meetings and parents-teacher meetings.

Results show three different models of transition to secondary school in regards to parental involvement. The first model is characterised by a decrease in direct surveillance and support, while maintaining high expectations and constant conversations with children about school. It is typically found in parents of high-achievers, regardless of social class. The second model is characterised by a progressive loss of control over children schooling, together with a decrease in expectations and a growing sense of helplessness and resignation. It is found in working-class families where children are badly underperforming. The third model is characterised by strong practices of surveillance and constant support with schoolwork, together with stable expectations. It is found in middle and upper-class families with low-achieving children.

The Classroom Conflict Kaleidoscope

Elizabeth Marie Olsson

University of Gothenburg, Sweden

Classrooms are a conflict-prone context (Olsson, 2020; Valente & Lourenço, 2020), where teacher-student interactions yield a plethora of disputes over proper conduct (Godwin et al., 2016; Weinstein, Tomlinson-Clarke, & Curran, 2004), the allocation of time and resources (Jackson, 1968/1990), social justice (Agarwal, Epstein, Oppenheim, Oyler, & Sonu, 2010), and appropriate means of problem handling (Coleman & Deutsch, 2001; Hakvoort & Olsson, 2014). Teachers cite classroom conflict— defined as social interactions where at least one actor believes that their needs, interests, and desires are blocked, and perceives another actor as either causing that block or preventing its resolution— as a significant source of stress and burnout (Chang, 2009; Greene, 2014; Jennings & Greenberg, 2009).

Classroom conflict also has adverse effects on students who complain about the stress and anxiety they experience when they participate in (Spivak, 2016) and observe conflict (Hendrickx, Mainhard, Boor-Klip, Cillessen, & Brekelmans, 2016). Arguably, these situations have the most deleterious impact on students considered "disruptive" or "problematic" by their teachers and peers (Greene, 2014). These students are frequently at the center of social disputes and often believe they are wrongfully blamed when conflict occurs (Greene, 2014).

This paper integrates existing literature on classroom conflict with empirical material—including 174 participant observations and 87 follow-up interviews with teachers and students in four primary school classes— collected during the 2017-2018 school year. In doing so, the author rotates a metaphorical kaleidoscope to see how teachers, students with special needs, student bystanders, and "regular" students, view the same conflict. Thus, the paper elucidates the polychromic contours of actor perspectives and sheds new insight into the relational accomplishment of classroom conflict.

392

What is the Ideal Age? Unfolding the School Entry-Age Effect in the German Elementary School Context

Saikat Ghosh, Lydia Kleine

Leibniz Institute for Educational Trajectroies, Germany

The school entry age effect on children's later performance is a long-debated topic without any convergence. Discussions are further extended to the time dimension of the entry-age effect if there is any. Studies in this regard are mostly concentrated on examining the entry age effect on children's cognitive achievements, whereas concepts such as school enjoyment have been largely overlooked even though children´s integration and motivation in the school context are also considered important.

This study, based on the NEPS Starting Cohort 2 (Elementary school), investigates the effect of school entry age on children's school enjoyment and willingness to make efforts in their everyday school life. Cross-section analyses at different time points and panel analysis using dynamic panel models were deployed to investigate the existence of the entry-age effect and its persistence over time. Overall, the study illustrates a "fading away" effect of school entry age. Findings from the cross-section analysis show the existence of the entry-age effect both in grade 1 and grade 4 with the effect size diminishing at grade 4. Finding from the panel analysis also confirms that there was a positive but diminishing entry-age effect overtime on children's willingness to make efforts and school enjoyment.

Keywords: entry-age, effect, school enjoyment, willingness to make efforts, Germany.

Mindset as a Potential Link Between Family Background And High School Achievement in Norway

Elin Svensen

University of Stavanger, Norway

The link between students' family background and school achievement is well documented. Recent literature also investigates how social and emotional skills and mindsets relate to education outcomes. By combining theory from psychology (mindset) and sociology (Bourdieu), I examine how mindsets, whether students believe that intellectual abilities are fixed or capable of growth, relate to family background and achievement in Norway. My research questions are: 1) What is the relationship between mindset and family background when students enter high school? 2) Is the level of fixed mindset linked to achievement after the first year of high school? 3) What are the inter-relationships between family background, performance from middle school, and mindset in predicting high school achievement? Survey data from 4,786 first year public high school students in Norway was matched with registry data on parents' socio-economic background and students' performance from middle and high school. In multilevel regression I find that students with a university-educated mother have lower levels of fixed mindset when entering high school even controlled for grades in middle school. Higher level of fixed mindset when students enter high school relates to lower achievement after the first year, and this relationship is not moderated by family background. In structural equation modeling I find a significant positive indirect effect of mothers' education via grades from middle school on high school achievement and a negative indirect effect mediated by level of fixed mindset. The results suggest that the relationship between family background and achievement in high school is mediated not only via performance from middle school, but also through the presumably more malleable beliefs about the nature of intelligence.

The Glass Floor of the Service Class. The case of Britain

Gosta Esping-Andersen, Luca Giangregorio

Universitat Pompeu Fabra

Exploiting the large sample size of the Understanding Society data, we identify with much greater precision than was previously possible the high-end of the service class, and the degree to which it succeeds in protecting its less talented offspring from downward social mobility. The 'glass floor' imagery denotes the fact that it is very difficult to pinpoint the actual mechanisms at work. To identify skills, we focus primarily on cognitive abilities but also on personality traits (the 'big-5). Our study presents a systematic comparison between men and women, and we include additionally a comparison across two cohorts. We focus primarily on income but to facilitate comparability we include parallel analyses of class mobility. Our analyses find very clear and significant 'glass floor' effects; the low-ability offspring of service class parents are indeed comparatively speaking far more protected from downward social mobility. And even if they do move down, they enjoy a significant income advantage compared to others at the same level. However, contrary to expectations and to findings from previous research, we fail to identify any strong and systematic gender biases as regards downward social mobility patterns. Our cohort comparisons suggest a pattern of over-time stability.

Inevitability and Multi-dimensional Character of Social Justice Perspective Towards Higher Education

Pepka Boyadjieva, Petya Ilieva-Trichkova

Institute of Philosophy and Sociology, Bulgarian Academy of Sciences, Bulgaria

Studies show that although expansion and massification of higher education have led to widened access to higher education for students of lower social background, this is still not enough to significantly reduce inequalities in access to higher education. The Covid-19 crisis and the digital divide have sharpened these inequalities. Against this background, the paper draws attention to the crucial importance of the social justice perspective for understanding participation in higher education and its potential to influence individuals and societies.

Theoretically, the paper builds on insights from the Sen's capability approach, Rawls' understanding of social justice as fairness and Fraser's three-dimensional model of social justice. We argue that social justice regarding participation in higher education has a multi-dimensional character and consider the inclusion and fairness, social justice for whom, social justice where, and social justice to what as the most prominent dimensions of social justice.

Empirically, the paper relies on data from the European Social Survey, Labour Force Survey, EUROSTUDENT Survey, and the Bulgarian University Ranking System. Using correlation and multi-level regression analyses we analyse: a) the inclusion and fairness aspects of social justice for social groups of low and high social background; b) the 'access to what' aspect of social justice, i.e., the involvement of students from different social background in higher educational fields, which differ in their social prestige. Our analysis demonstrates that higher education system could be fair without being inclusive and that there is a significant association between students' social background and field of study.

Teachers as Disorder-Spotters: (In)decisiveness in assigning a Child's Hyperactivity, Impulsivity and/or Inattention to ADHD as the underlying Cause

Emma Degroote[1], Marie-Christine Brault[2], Mieke Van Houtte[1]

[1]Ghent University, Belgium; [2]University of Québec in Chicoutimi, Canada

Their unique observational position in the classroom allows teachers to take on an informal role as disorder-spotter. By means of focus groups in four Flemish elementary schools, this study investigates teachers' decisiveness in assigning a child's hyperactivity, impulsivity and/or inattention to Attention-Deficit/Hyperactivity Disorder (ADHD) as the underlying cause. Results show that, when teachers talked about specific children who exhibited hyperactivity, impulsivity and/or inattention, they were, more often than not, decisive in their observation that ADHD was or was not the underlying cause of the child's behaviors. However, several child-related factors caused teachers to be indecisive whether ADHD was indeed at the base of a specific child's hyperactivity, impulsivity and/or inattention.

Negotiating Changing Structure of Educational Opportunity: Working-Class Students' Experiences Across Generations

Kaidong Yu

The University of Manchester, United Kingdom

Extensive research has focused on the working-class experience of higher education (HE) in the current period of expansion, but there is less attention on working-class transitions to HE when the participation rate was much lower. This paper sets out to examine the key moments in the history of expansion of educational opportunities in the UK, to understand how different generations of working-class students managed to access HE. Based on 22 life-story interviews with working-class students, the study highlights how the changing dynamics of the structure of compulsory education have shaped working-class students views of HE. Exploring the changing structure of opportunity, and how this has shaped working-class students sense of social position is key to understanding the uneven pattern of working-class pathways to HE across generations. It is evident that different types of secondary school experience affected working-class pathways to university with the nature of the school environment and social relations shaping various expectations over time. This article concludes that the contextualised educational opportunity structure plays a crucial role in how working-class students attended university.

RN10_T07_03 | Social Resources and Supports in Education 1

Developing a Serious Game as a Tool for Rebuilding Social Ties in Education

395

Agata Magdalena Żak[1], Urszula Anna Szczepankowska-Bednarek[1], Gabriela Bednarek[2]

[1]Warsaw University of Technology, Poland; [2]University of Warsaw, Poland

The authors aim to use serious games in the participative process of solving social and environmental problems in a smart city as well as in the development of a (geo)information society. Which is related to trying to solve real problems. This is an approach that has been gaining popularity in recent years among researchers and game developers, along with the development of projects such as "Games for change" initiative (supporting games that deal with current social problems).
The games are adapted to the age group of players. Create a place for discussion and dialogue, strengthening the activity of its users in the field of creating a civil society and social ties.
In "post-pandemic" times, it can prove crucial in the process of rebuilding relationships. The pandemic not only changed the way people function in the public space also brought the risk of further social isolation.

By using gamification methods, one might be tempted to enhance the activity of participatory users in creating visions for shaping space and social ties.

On the other hand, in our tests, we use the concept of the humanistic coefficient, introduced by Florian Znaniecki, to examine, among others cultural facts. This approach allows for creation of an open civil society. As a next step, the methods described should be tested in the field of higher education, as this will allow students to be more involved in solving scientific research problems. The authors of this game conduct research in Latvia and Estonia.

Designing Online Materials for Teaching Computational Social Science. Lessons Learned from the ACTISS Project.

Katarzyna Abramczuk, Anna Baczko-Dombi, Agata Komendant-Brodowska

Faculty of Sociology, University of Warsaw, Poland

Due to COVID-10 online teaching became reality of many academic teachers. We were lucky enough to start leading an educational project cofunded by the ERASMUS PLUS program, before the pandemic started. The project became a journey of discovery of the online teaching world in general as well as of the requirements that are specific to our field – computational social science. In this presentation we want to share some lessons we have learned as well as show examples of some teaching materials we have prepared and will soon make publicly available.

ACTISS is an educational project whose objective is to develop a massive open online course that introduces key concepts and methods of computational social sciences in an easily accessible manner. Computational social science (CSS) is developing rapidly as a paradigm allowing for the causal computer modelling of behavioural processes, ranging from processes within the individual to society at large, hence providing an interdisciplinary approach to the social sciences. However, teaching computation to social sciences students is difficult due to high levels of mathematics anxiety experienced by them. In the project we are trying to figure out how to overcome this anxiety and translate our offline teaching experience into an online format which has its own demands. We want to share with you some details of this process. We will be talking about planning, keep-it-simple rule, length of the materials, language precision,

preparing exercises and visual components. We will also show some examples of ready educational resources.

Correlation Between Academic Competence, Behaviour Problems and Socioeconomic Status – a Geographical View

Katinka Bacskai

University of Debrecen, Hungary

Much research proves that there is a correlation between SES and school performance. One explanation of it is that students from low SES families have lower cultural capital, and because of this they cannot really satisfy the school requirements. This correlation is not equally strong in every country. According to the PISA results of Hungary this correlation is huge: almost 60% of the school performance can be explained by the family background. The behaviour of students could be relating to the family background as well if the cultural fit is not fulfilled. Special educational needs can cause low academic competence and behavioural problems as well (Dodge et al. 1994., Barbarin, & Jean-Baptiste, 2013, Korous 2018, etc.).

Our presentation wants to analyse this problem in a geographical (socio-ecological) view. We aggregated the rate of the children with special educational needs and academic and behavioural problems in Hungarian micro-regions, and we compared it with the economic developments of these micro-regions. There are micro-regions where social problems strengthen behavioural ones, in contrast with other micro-regions where this effect is not observable. Based on this difference we can set up a typology. In urban regions this correlation is stronger between academic and behavioural problems of the students on ISCED Levels 1 and 2, contrary to rural regions where this correlation is weaker. The most problematic micro-regions are near the southwestern and eastern border of the country.

Relationship Between Social Origin and the Start of University Studies: A comparison among Spain and Chile

Beatriz Jarpa Sandoval[1], Cristian Segura Carrillo[2]

[1]Universidad de Barcelona, Spain; [2]Universidad Autónoma de Barcelona

The main objective of the following research is to carry out a comparative analysis between Spain and Chile, based on the educational performance of parents whose children start university education.

There is evidence that indicates that the role of the educational system is key to social mobility and higher education is the level which may contribute most to this mobility, since it has direct implications for origin inequality (Herrera, 2001; Benavides, 2004), the role of educational system is key to social mobility (Herrera, 2001; Benavides, 2004).Several studies on access to higher education show that social origin is a central element in predicting the possibility of success in completing a professional career (Langa, 2005; Rahona, 2005; Torrents, 2015). Although the democratization of university access has gradually reduced the effect of differences in origin and the choice of career is not only determined by family factors, but would be the result of a balance between personal preferences and social determinants (Troiano and Elías, 2013, cited in Torrents, 2015).

The results reveal that there are differences in access to university, depending on the occupational and educational level of the parents (determinants of origin inequality). In addition, the choice of graduate coursework by first-year students at universities in Chile and Spain is directly related to this social origin. Students of low socioeconomic status predominate in Humanities and Social Sciences majors. On the other hand, those from higher socioeconomic backgrounds choose disciplines related to Medicine, Sciences and Engineering, which provide a higher "social status".

RN10_T08_01 | Contextual Factors in Education 3

Do Rankings Affect Universities' Financial Sustainability? – Financial Vulnerability To Rankings And Elite Status As A Positional Good

Roxana-Diana Baltaru[1], Radu Manac[2], Miruna Ivan[2]

[1]University of Warwick, United Kingdom; [2]University of Essex

University rankings have consolidated the imaginary of a level playing field between competing universities, particularly in higher education (HE) systems regulated along market lines. Drawing on social stratification theory, we argue that rankings exacerbate rather than alleviate resource inequalities between universities with historically consolidated reputations (elite universities) and all other universities (non-elite universities). We test this argument empirically by assessing the role of elite status in moderating the effect of rankings on universities' financial sustainability. Using a nationally representative longitudinal dataset with yearly organisational data on 131 UK universities from 2008 to 2017, we find that the rank a university occupies in league tables is consequential for all universities except elite universities, controlling for year fixed effects, previous level of financial sustainability, and institutional level differences. The findings document universities' financial vulnerability to rankings in quasi-markets of higher education and the reinforcement of elite status as a positional good.

Diagnostic And Referral Processes In School

Edurne de Juan

University of Basque Country, Spain

This work problematizes the processes of developing diagnostics and referrals at the schools. In recent decades, diagnostic theories and therapeutic models have become a common solution for students that does not progress properly. In this research we wonder how students "cases" arrive in diagnostic teams and what are the referral criteria used by teachers.

Considering that psychological and psychiatric derivation generates new institutional mechanisms of school segregation, studying the criteria of referral of teachers, is especially interesting.

Using Foucault's contributions, the relationship between knowledge, power and subject will be problematized. Understanding power as a producer of knowledge and as an instance that seeks to naturalize these knowledges. Psychiatric diagnosis, in that sense, is based on a type of scientific knowledge that is particular to our tim and society, a new hegemocic technology, which creates new devices to analyze, classify and normalize discourses.

In this work, we will discuss the implications of culture and the socio-cultural and political context and how it influences the transfiguration of pathologies. In this sence, the body is considered simultaneously a political and cultural product, the result of natural and cultural processes, and is solidly anchored to a specific historical moment.

Implementing Formative Assessments as a Compulsory Part of the Curriculum

Eleni Koutsogeorgou, Syed Rizvi

London School of Science & Technology (LSST), United Kingdom

The aim of this paper is to demonstrate a plan for implementing formative assessments as a compulsory part of an undergraduate course in Public Health in the United Kingdom. Similar processes could be followed by other courses and educational institutions.

The plan includes aspects and challenges in terms of learning and teaching for both learners and instructors for implementing formative assessments as a compulsory part of the curriculum. Due to the increase of online processes in education as a result of adjustment to the Covid-19 regulations for social distancing, formative assessments have a key role for maintaining a high-level active learning and engagement of students, along with enhancement of performance rates, particularly during online and distant learning and teaching. However, with the shift to online learning and teaching came also gaps, performance issues, and difficulties, both for learners and instructors, whilst being required to rapidly transform traditional classroom lectures to online or blended e-learning practices, which meet learners' needs. The plan includes an overview of these challenges and how formative assessments can contribute to overcome them, as well as the main processes at administrative, institutional, and teaching-team levels required in order to implement formative assessments as compulsory at course level. Additionally, actions and performance indicators are discussed along with any anticipated obstacles and timeframe for the implementation of such a plan.

The implementation of formative assessment as compulsory part of the curriculum could potentially enhance academic performance outcomes, while benefiting learners from peer feedback and lecturer feedforward before the submission of summative assessments.

Vocational Education and Training 1

The Influence of Technological Change on the Participation in Employer-provided Continuing Training - Courses A Longitudinal Analysis of Firms in Germany

Myriam Baum, Felix Lukowski

Federal Institut for Vocational Education and Training (BIBB), Germany

Continuing training is a crucial instrument to prepare employees for changing work requirements caused by technological change. The paper examines, whether the technological change – measured by the introduction of new information and communication technologies (ICT) – has an influence on the participation of employees in employer-provided continuing training courses and, whether the effect differs for employees in the primary and secondary labour market. The analysis draws on two central theoretical approaches: (1) The configuration approach, in which external changes lead to an internal pressure for continuing training, and (2) the segmentation approach, in which different labour markets lead to unequal continuing training access. This leads to the two hypotheses that (1) technical change leads to a rise in training participation and, that (2) technical change only positively affects the training participation of employees in the primary labour market. We estimate fixed-effects models using longitudinal data from the BIBB Training Panel, a yearly representative survey of firms based in Germany. It focuses on firms' vocational training activities and qualification demands. The results show that in firms with introduction of new ICT more employees participate in continuing training courses compared to firms not introducing ICT. We observe this positive influence of ICT introduction on continuing training only for employees in the primary labour market, while employees in the secondary labour market do not participate more. However, this group is the most endangered by technological substitution tendencies. Therefore, further research and policies need to focus more on the training participation of those employees.

The Relationship between General Skills, Upper-Secondary VET Programmes and Wage Scarring after Unemployment?

Miriam Grønning[1], Irene Kriesi[1], Stefan Sacchi[2]

[1]Swiss Federal Institute for Vocational Education and Training; [2]University of Bern

The global Covid-19 pandemic is accompanied by an economic recession and steeply rising unemployment. Previous research has shown that unemployment incidents often lead to earning losses at re-employment that are more pronounced for low educated than highly educated workers. A possible explanation is that highly educated workers have more general skills, which are transferable, while less educated workers have more specific skills, which are less transferable between jobs and occupations. However, existing studies do not take into account the heterogeneity of skill acquisition within education levels. Training occupations at upper-secondary and study fields at tertiary level differ greatly regarding the amount of general and specific skills they impart. Using the former, most common type of education in Switzerland as an example, we therefore investigate whether different types of general skills (i.e. digital literacy skills and communication skills) imparted during training moderate the effect of unemployment on income. Theoretically, we draw upon human capital theory, which argues that general skills are more transferable and depreciate more slowly than specific skills. Because workers with general skills can retain their productivity level after unemployment, they will have less severe earnings losses. Our analysis is based on a sample of employees with upper secondary vocational education and training combined with objective skill measures derived from occupation-specific training curricula. We address causality issues, including potential selection and endogeneity problems, by combining a matching method with an endogenous treatment effects model. The results show that some general skills can attenuate the negative consequences of unemployment.

The Role of Hosting Organisations in Italian School-work Experience Programs

Noemi Novello, Alessandra Decataldo, Brunella Fiore

University of Milano-Bicocca, Italy

To effectively address young adults difficulties in the transition from secondary school to tertiary education or the labour market and improve their career orientation, since 2005 Italy adopted school-work experience (SWE) programs as a part of their scholastic curriculum. SWE is a pedagogical approach that aims to improve on-the-job experience, which is useful for promoting adolescents' employability and strengthening the connection between learning contents and the labour market's demands. In particular, Law 107/2015 provides that SWE programs are mandatory for all students in the last three years of high school, to increase job opportunities and student orientation skills. More recently, Law 145/2018 renamed these programs "Paths for Transversal Skills and Orientation" (PTSO) by re-modulating the minimum overall duration and the resources assigned to schools and by providing guidelines, with a focus on transversal skills and orientation. Such objectives are even more complex to achieve given the plurality of stakeholders involved in the design and implementation of PTSOs within and outside educational institutions.

This contribution shows the preliminary exploratory phase of a study on host organisations for SWE programs and, more recently, PTSOs. In depth interviews to privileged witnesses in host organisations were conducted to investigate their point of view on SWE and PTSO programs. The study outlines the SWE and PTSO programs activation scenario in Italy and it later focuses on the realised preliminary research on organisations, showing, trough the support of interview excerpts, a reflection upon relevant themes regarding on-the-job experiences.

Social and Educational Intervention with Vulnerable NEET Young People in Pandemic Times: Opportunities, Risks and Challenges

Lia Pappámikail[1], Tatiana Ferreira[1], Maria Manuel Vieira[2]

[1]Higher School of Education of the Polytechnic Institute of Santarém, Portugal; [2]Institute of Social Sciences of the University of Lisbon, Portugal

In contemporary western societies, there is a process of fragmentation of the formal school systems (Barrère and Delvaux, 2017). Nevertheless, school attendance remains mandatory during youth, while learning becomes a lasting company "throughout the life course".

In fact, "places and processes of non-school education" have proliferated, which translate into an "universe of educational and training possibilities" (Palhares, 2008: 115) available to young people. The social economy (Sousa and Kovács, 2014) and its institutions have assumed a particular role in reconfiguring "deteriorated identities" (Goffman, 1982) due to the effects of the school judgement, thus emerging as places for reversing vulnerabilities (namely, those arising from formal education). They do so by frequently adopting an individualized approach to vulnerable young people, supported on flexible proximity work logics (Breviglieri, Pattaroni & Stavo-Debauge, 2003), which is a particularly endangered practice nowadays as many institutions were forced to abandon, more or less permanently, face-to-face work, as long periods of lockdown were imposed in many European countries due to the COVID-19 pandemic crisis.

Based on two case studies developed in 2019, from contrasting territorial contexts (urban and rural) in Portugal, collected within a project aimed to identify, next to a diverse set of social economy institutions, good practices in the field of youth employability aimed specially at young people in NEET conditions, we will explore processes of reconfiguration of the educational and training field beyond the formal educational system, while discussing the main risks and challenges the pandemic period has brought to this sector.

Transitional Inequality Offset: Educational Expansion and Inequality of Educational Opportunity in European Countries

Tomáš Katrňák, Barbora Hubatková

Masaryk University, Faculty of Social Studies, Czech Republic

Educational expansion has been taking place in European countries since 2000. The proportion of university-educated people is growing and the average education level is increasing. We address the relationship between this recent educational expansion and the inequality of educational opportunity (IEO) given by educational origin. We analyse the European Social Survey (ESS) data from 20 European countries over five rounds (2002, 2006, 2010, 2014, and 2018). Our analysis is restricted to age group 25-34. We use a multilevel sequential logit (MLSL) model for three educational transitions delimited by four International Standard Classification of Education (ISCED97) categories. We apply MLSL model for the decomposition of IEO in completed education in both the educational origin effects on passing the transitions and the structural effects (weights) connected with transitions. Our results show that IEO is maintained in educational transitions by an offset mechanism. The weight of each transition takes over the role of the educational origin effect on passing the transition and vice versa. Educational expansion changes primarily the ratio of these two effects. This holds true until one of the transitions becomes mostly universal. After that, its contribution to IEO in completed education begins to diminish.

Government Intervention, Media Discourse and the Intersectionality of Attitudes to the COVID-19 Pandemic in Poland

Anna Odrowaz-Coates, Anna Perkowska-Klejman

Maria Grzegorzewska University, Poland

Our presentation is based on an empirical study carried out in Poland in 5 rounds of research linked to milestone changes in public policy, introduced by the government during the COVID-19 pandemic in 2020. We measured people's reactions to the pandemic and how they were linked to media discourse based on government decisions. We focussed on attitudes, declared behaviours and the level of trust towards both government agencies and the media. The survey was distributed online, for a limited time at each round of study, and over 2500 records were gathered. Whilst the selection of participants was coincidental, and therefore not representative of the whole population, the sample size and the diversity of respondents allowed us to draw credible conclusions. The outcomes confirm that the social and psychological effects of the pandemic are diversified by different social groups. The intersectionality included independent variables such as age and gender, but was found more profoundly linked to inequality in educational attainment, employment status and income, highlighting not only different opinions but critical disparities in wellbeing and significant welfare gaps based on social class.

Psychological Capital in Educational Context: Lifelong Learning and Beyond Hope

Mei-Ling Lin

National Open University, Taiwan R.O.C., Taiwan

The world of work is constantly changing whereby innovation and challenges requires oneself to be competitive. Although, human capital and social capital are vital to the success, psychological capital (PsyCap) has been proposed as a new complementary concept that remains in success. Research proves that hope is a good predictor of subjective well-being. Promoting academic PsyCap helps achieve academic success. The author attempts to draw parallels to consider the construct of PsyCap that can predict educational success, and substantiates the assumptions in light of results of survey "Psychological Perspectives on Perceived Hope" and highlights the significant relationships between hope, PsyCap and other relevant variables that impact educational and future life success. These dynamics of hope, meaning in life and well-being needs further empirical clarification. The purpose of this paper is to present the local results, especially the assessment of the social and psychological aspects of hope in relation to well-being. Accordingly, the paper has three aims: Firstly, what is the role of the demographic structure of the samples in enabling social change (optimism and enthusiasm, happy life years, self-efficacy) and hope of life (well-being, basic human needs, life satisfaction)? Secondly, what are the predictability of social change and hope of life? Thirdly, what are the correlation of social change and hope of life? These research questions capture broader social and psychological debates about the topics of lifelong learning, social exclusion, well-being, hope and psychological capital, and they also assist us to progress the discussions around the hope for a good life. SPSS (t-test, ANOVA, multiple regression analysis, canonical correlation analysis) was utilized to gather descriptive statistics.
Keywords: lifelong learning, social exclusion, well-being, hope, psychological capital

The Future of Higher Education After the COVID-19 Pandemic

Ildikó Hrubos

Corvinus University of Budapest, Hungary

The coronavirus crises arrived exactly when higher education was feverishly involved in the renewal of learning and teaching worldwide, in the background of which were mainly the challenges (pressures and opportunities) generated by digitalisation. The pandemic made it unavoidable to introduce learning and teaching without personal encounters, and "immediately". This unexpected and extraordinary situation, on the one hand, demanded instant action, and on the other hand, it also resulted in the interest of researchers, since – it can be stated that – an opportunity of a "natural experiment" arose.
Meanwhile ethical questions arose regarding the subject, the need to think in the long term. In general, the content of these characteristically was not to call attention to completely new norms suggested, they rather suggest that in the given emergency well-known human and social values should be enforced more consistently. The list includes such values as moderation in exercising power, solidarity, scientific integrity, honesty in disseminating information, equal treatment, flexibility and credibility.
The question of the existence of higher education (and mostly universities) in the European and global arena sharply rises again. It is already apparent that higher education is in fact capable of reacting quickly, and to the serious challenge it responded not only by defense and fighting for survival, but also with the development of explicitly new concepts, for which courage, risk taking, and imaginative thinking is required.

RN10_T09_01 | Vocational Education and Training 2

Finnish Vocational Students' Social Networks And The Vocational Education's Reform

Jenni Lahtinen[1], Tarja Tolonen[2], Ville Pöysä[3]

[1]Finnish Youth Research Network, Finland; [2]University of Helsinki; 3University of Eastern Finland

Finnish upper secondary vocational education has faced major financial and organizational changes in recent years. The new legislation went into effect in 2018 and since then vocational education was connected more strongly in the context of neoliberal ideologies of individual competitiveness, students' self-management and entrepreneurial mindset. Simultaneously, the national funding of vocational education has decreased by 23 percent per student between 2013-2017.

Vocational education is in the focal point of many political wishes and expectations. In addition to produce labour force, it is an important mean for integrating young people into the labour market and wider society. We see that there might be a conflict between education's reform and political wishes as reform emphasized individualistic orientation that might not increase student's sense of belonging to their communities either. In the presentation, we will discuss the vocational students' different social networks in the light of vocational education's reform. We are interested in what kind of social ties and networks vocational students' have inside the educational institutions and further, in relations to their families and friends. We also explore how these relationships have developed in time during the vocational education, and how these relationships are able to support their chosen educational paths.

In this presentation, we rely on qualitative data of longitudinal interviews with 17 young people (6 women and 11 men). They come from different parts of Finland: six from Southern Finland, Helsinki region, three from Northern Oulu region and seven from a village from Eastern Finland. All participants have taken part in longitudinal Youth in Time research project.

The different models of Dual Vocational Education and Training in Spain: are they effective against youth unemployment?

Daniel Barrientos Sánchez

Universidad Autónoma Barcelona, Spain

Dual Vocational Education and Training arises in Spain within the European policies about employment and training for young people, particularly based on the German model. However, the lack of an indepth legislation, the high level of unemployment and the poor resources, caused by the economic crisis, or the low role played by the Administration, has led to a limited model. Every Autonomous Community, productive sector, high school or company, has implemented their owns solutions for each limitation, developing different models in Spain. This situation does not allow us to conclude that Dual VET improves the school-to-work transition only by itself, but rather there are some conditions that must be fulfilled in its implementation to achieve the positive effects aimed. This presentation shows the results of several interviews to social actors who design and implement Dual VET and a questionnaire to 460 apprentices in Catalunya, to analyse the different perspectives about the development and possibilities of the model.

403

Same Degree, Different Opportunities? Educational and Social Background Effects on Overeducation in Germany

Ana Santiago Vela

Federal Institute for Vocational Education and Training BIBB, Germany

This article examines whether educational mismatch, measured as overeducation, vary (1) across different educational backgrounds (considering both level and field), (2) across different social backgrounds and (3) by social background among workers with the same educational background. Even though the supply of workers with higher education has grown over time due to the educational expansion in Germany, the country is still characterised by a strongly developed vocational education and training system, whose standards are based on labour market requirements. There is, however, a significant proportion of overeducated workers. This analysis uses rich information on educational and employment background as well as workplaces' skills requirements from the BIBB/BAuA Employment Survey 2018, a representative survey of more than 20,000 workers in Germany. The results suggest that higher educational levels (compared to vocational education and training) are associated with higher overeducation, implying that the supply of high-educated workers exceeds the offer of adequate jobs on the German labour market. The field of education determines the risk of overeducation as well: whereas health, education, engineering, and ICT make for lower risk, the services field induces higher risk. The results also indicate that social background, measured by the parents' occupational status via the Erikson-Goldthorpe-Portocarero-(EGP)-Schema, indirectly but also directly influences overeducation risk. The direct effect of social background on overeducation holds, over and above the effect of the own educational background. Given the strong persistence of overeducation, this article emphasises the relevance of analysing educational mismatches with regard to social inequalities on the labour market.

Decisions Under Uncertainty: Do VET Graduates Make Informed Choices Regarding Higher Education?

Aranya Sritharan, Ladina Rageth

ETH Zürich, Switzerland

Higher education (HE) has gained relevance for young adults over the last decades. Stratified education systems offer different types of HE, and hence are complex to understand for prospective HE students, which makes it relevant for them to be adequately informed about different HE offers.

The study at hand is a case study focusing on Swiss VET graduates who have chosen either university education or professional education and training (PET) for higher education. We analyse how misinformation and uncertainty about HE affect young people's choice for different HE programmes. We use cross-sectional data to analyse their information level in terms of not only their subjective assessment of their information level but also their knowledge about HE graduate wages and eligibility for HE programmes. The existing literature uses either information on costs and benefits, or information on the education system to see whether they affect the choice for or against HE. This paper contributes to the existing body by applying three different approaches to measure information, and analyses the choice between equivalent types of HE. Using a probit model, we estimate the impact of subjective assessment, misinformation, and uncertainty on the likelihood of VET graduates choosing PET over university, conditional on a rich set of control variables. Our findings show that VET graduates' information levels differ depending on the HE programme and that this information level does play a role in their HE choice.

RN10_T09_02 | Gender and Education 2

The Intersection of Gender Inequality and Income Inequality in Access to Higher Education, and the Possible Consequences of the Pandemic. Evidence from a Spanish University

Sara-María González-Betancor, María-Eugenia Cardenal, Octavio Díaz-Santana

Universidad de Las Palmas de Gran Canaria, Spain

The paper discusses the intersection of family income and gender of first year students at the undergraduate, master's and doctoral levels at the University of Las Palmas de Gran Canaria, in Spain, for the 2018/2019 academic year. Our research reveals that women, who are majority in undergraduate courses, come from households with a lower income than men. In the transition to master's and doctoral degrees, however, the income of women's households escalates, equating and even overcoming men's income. The data therefore indicate an economic selection, but also a possible adjustment of preferences, since women students with lower incomes access the master's and doctoral levels in lesser proportion than men with the same economic position. The COVID-19 pandemic may exacerbate the inequalities identified. Digitalization of higher education and the implementation of hybrid systems is a major and, probably, perdurable consequence of the pandemic. The associated costs for the students can have a deterrent effect for lower-income women, limiting their access to undergraduate studies, and further excluding them from master's and doctoral studies.

Gender and Epistemic Equality in Higher Education Curricula and Pedagogy: Developing Understanding Through Interdisciplinary and International Collaboration

Tamsin Hinton-Smith

University of Sussex, United Kingdom

Increasing equality of education is vital to achieving wider social development goals, addressing inequalities between as well as within global populations. Central to this is not only access to education, but attention to epistemic inequalities in the presentation of knowledge through curricula and pedagogies. Here we discuss insights from an international project (India, Kazakhstan, Morocco, Nigeria, United Kingdom) focusing on how gender literacy as both topic and approach is included or absent from higher education teaching across social science, science and humanities disciplines.

This British Academy Humanities and Social Sciences Tackling Global Challenges funded project, 'Gender on the higher education learning agenda internationally: Co-constructing foundations for equitable futures' set out to foster development of understanding and knowledge-sharing across disciplinary and international boundaries through a collaboration of feminist academics representing expertise in sociology, education, climate change, chemistry and creative writing. Across diverse disciplines, reified canons of knowledge that remain stubbornly connected to founding fathers (Braidotti, 2013), with gender focus still often constrained to peripheral optional 'specialism.'

Through surveys and interviews with students and staff, we explore experiences of gender inclusions and exclusions, identifying areas of good practice alongside imperatives for new approaches for HE curricula and pedagogy of the future. While our central focus here has been gender, we have been guided in this by an intersectional approach (Crenshaw) that recognises the indelible links between feminist and decolonial understandings (Maldonado-Torres et al. 2017; Ali 2009) around constructions of knowledge and how these are (re)produced in higher education curricula and pedagogies.

405

He's Up To No Good, Or Is He? Teacher Efficacy, Gender Stereotypes And Teachability Perceptions In A School Context

Lennart Van Eycken, Mieke Van Houtte

Ghent University, Belgium

Despite the reasonably amount of studies concerning teacher efficacy, little is known about the association between schools' student composition and teacher efficacy, taking into account teachers' perceptions and teaching style, but also teachers' gender. Teachers with positive perceptions about their students are more likely to experience high feelings of efficacy. However, gender issues are often overlooked in teacher efficacy studies, while research suggests that gender stereotypes may colour teachers' perceptions. Teachers' perceptions of boys and girls are often a product of their own gender stereotypes, and gender gaps are in part socially constructed. Moreover, studies indicate that the influence of teacher perceptions on teachers' feelings of efficacy might differ between male and female teachers. Since the combination of gender and teacher perceptions is often approached using only the teachers' expectations in mathematics, this study tries to investigate a more generalised influence of gender stereotypes and teachability perceptions – a specific expression of teachers' expectation – on three dimensions of teacher efficacy, while taking into account the teachers' gender and schools' gender composition. These three dimensions are teacher efficacy in instructional strategies, classroom management and student engagement. Multilevel analysis was carried out on data of 1247 teachers gathered in 59 schools (2012-2013). Preliminary results show that male teachers score lower on teacher efficacy in instructional strategies and classroom management, however, this negative effect seems to be partly explained through gender stereotypes, taking into account schools' gender composition. Teachers perceiving their students as teachable feel more efficacious in all dimensions.

The Reconciliation of Femininity and Academic Achievements Within Chinese Educational Context

Yijie Wang

University of Glasgow, United Kingdom

Female students who pursue high academic achievement have been widely portrayed to be under constant pressure to negotiate their accomplishments and their femininities. Some have proposed that within Asian educational contexts, this pressure may be alleviated by a series of factors (i.e., school disciplines that are intended to achieve "de-gendering" effects). Semi-structured interviews were conducted with 14 Chinese young women who have achieved relative academic success. In doing so, this study seeks to explore the extent to which female students experience conflicts between academic pursuits and desired femininity within Chinese educational contexts. This study reveals two major findings. First, there is a general absence of perceived pressure to reconcile educational achievements and femininity among Chinese participants. This is associated with the fact that participants predominantly define their identity in relation to the schooling and grading aspect of their life. Its gender and femininity aspects are secondary, especially at the early stage of schooling. This indicates a certain degree of emancipation from femininity norms, catalysed by educational demands. Conversely, the absence of perceived pressure may not necessarily harbour any radical subversion. Another critical finding reveals that once the participants reach the age and stage at which they realise that performing certain feminine styles may supplement their education-related efforts, they become inclined to fully commit to performing them. This study contributes to the current understanding of femininity and academic achievements by illustrating how boundaries can and cannot be pushed or negotiated within a specific context.

Pandemic Perspectives 3

Covid-19 And Education: "Pandora's Box" And / Or A Chance To Return To The Ideals Of The Enlightenment Era

Nemanja D Radovanovic

Faculty of Philosophy, University of Pristina with temporary headquarters in Kosovska Mitrovica, Serbia

The Covid-19 pandemic shook the world of education like an earthquake, destroying many things, but also leaving a chance for a new kind of development. The closure of schools around the world and the transition to distance learning has stirred the spirits in the world of education, but also some in the world of management and technology. Traditional teaching based on teachers standing in front of students who should listen carefully has been a problem for a long time when the results of this style of education are taken into account, as evidenced by the results of PISA testing, but also the dissatisfaction and lack of motivation of students and teachers. Do new technologies, various off-line and on-line platforms have the potential to substantially recompose young people's attitude towards education and bring us closer to long-set goals such as personality autonomy, ethics, creativity, empathy that are needed today than ever before? The changes caused by the Covid-19 pandemic are leading to the establishment of new relationships between education, management and technology. In this context, is it justified to think about the "Pandora's box" effect, and in what direction can this effect develop in a social system based on neoliberal capitalism? On the other hand, is this catastrophe a chance to refresh Enlightenment era ideals, with new tools, and prepare for the jobs of the future?

"Continue To Get Up Just Like When You Had Lessons". First-year Medical Students' Socialization In France In The Context Of The Covid-19 Pandemic

Agnès van Zanten[1,2,3], Christophe Birolini[4,3], Audrey Chamboredon[3], Léon Marbach[3], Alice Olivier[5,2]

[1]CNRS; [2]Sciences Po, OSC; [3]Sciences Po, LIEPP; [4]Université de Paris, Cerlis (UMR 8070 CNRS); [5]Université de Lille, Clersé, Inspé Lille-HDF

Drawing on an ongoing study of the socialization that students undergo in the first year of medical studies, this presentation will focus on processes concerning students' 'time management' and management of their wellbeing. We have studied these during the pandemic in a French university through observations and interviews conducted online with members of the administration and student tutors as well as with a group of 40 students. We will discuss how the volume and types of messages that students have received in these domains as well as their own interpretations of them might have been altered by the sanitary situation. We will argue that these processes are important because French medical students' in addition to learning to cope with an enormous workload (Becker et al., 1961) must also deal with the stress generated by the existence of an end-of-year competitive exam determining whether they can pursue their studies and in which medical field. Furthermore, by learning how to manage their bodies and minds, to calculate to what extent and how to "invest" in learning, to decide what is important, and to work under conditions of urgency, students also form social visions of their future professional activity (Merton, 1957) and social status as a professional elite (Darmon, 2013; Miller, 2011).

The Impact of Lockdown on the Learning Gap: Family and School Divisions in Times of Crisis

Sheila González Motos, Xavier Bonal Sarró

Autonomous University of Barcelona, Spain

The lockdown of schools in Spain to confront the effects of COVID-19 caused an enormous impact at both societal and educational levels. Schools and families had to react rapidly to a new teaching and learning scenario without the benefit of previous planning or government guidelines. In this context, some schools were better able to adapt to the new circumstances than others. Likewise, the structure and size of families' economic, social and cultural capital produced significant differences in the learning opportunities for children from different backgrounds. This article assesses the impact of the school lockdown on the learning gap between children from different social backgrounds in Catalonia. Based on 35,419 responses to an online survey administered between 26–30 March 2020 to families with children aged between 3 and 18, the authors' analysis shows that learning opportunities varied significantly. Middle-class families were able to maintain higher standards of education quality in a critical context, while children from socially disadvantaged families had few learning opportunities both in terms of time and learning experiences (schoolwork and maintenance of after-school activities). Results differed by type of school (public/private) where students were enrolled, family economic, social and cultural capital, and family living conditions. In the final part of the article, the authors highlight the importance of the role of the school in ensuring learning opportunities for children from low socioeconomic backgrounds, and they discuss some policy implications of their findings.

Implementation Of Distance Education In Primary School During The First Lockdown In Greece: Parents' Views

Theodoros Thanos, Dimitrios Dimitriou, Apostolos Katsikas, Anna Douvali

University of Ioannina, Greece

In order to tackle the covid-19 disease, which was caused by the coronavirus SARS-coV-2, it was decided to impose a lockdown. Under these circumstances, schools closed and distance education was implemented (March-May 2020). This was an unprecedented situation for the educational community especially in primary and secondary education and studying it is particularly interesting. In the present study, which is part of a larger study, the views of parents of primary school students regarding the implementation of distance education during school closure are examined. The sample of the research consisted of 1,014 parents of primary school students. A questionnaire, which included open-ended and closed-ended questions, was used as a means of data collection. According to the survey results, one third of parents (33.2%) believe that the implementation of distance education was timely. The difficulties that they encountered during the implementation of distance education concerned the slow Internet connection (42.2%) and the reluctance of children to participate (25.8%). Regarding the children, the parents reported that they missed their friends (76.3%), their extracurricular activities (63.8%), school and their teachers (57.4%). Parents believe that distance education was useful at the time when it was implemented (64.5%), but only 36.2% of them mentioned they were "quite" or "very" satisfied with the implementation of distance education.

Students' Perceptions Of Quality In The Norwegian Kindergarten Teacher Education

Solveig Marie Borgund

Western Norway University of Applied Sciences, Norway

This article aims to describe students' perceptions of quality on the Norwegian Kindergarten teacher education. Quality in higher education (HE) has been on both the political and professional agendas for years worldwide. However, there has been a change in what is included in the concept quality. In the past, quality referred to input- or process-quality. Nowadays, quality often refers to results (Stensaker & Prøitz, 2015). Frølich, Gulbrandsen & Stensaker (2015) point out that in Norway, HE's development has moved towards increased use of national guidelines and standardization when organizing study programs.

With the Norwegian kindergarten teacher education reformation in 2012, a national curriculum regulation and national guidelines were laid down. The policy process's focus leading to this was to create a modernized education of high quality (Rammeflu,2011). A significant part of the Norwegian HE system is the students' voices. Over the last years, Studiebarometeret (the student survey) has been given an important position in evaluating and assessing higher education.

This article aims to look at how students in the kindergarten teacher education perceive and interpret quality in their education. Through qualitative interviews with students from 4 different campuses, the students' voices form the data material. The material will be analyzed through Harvey & Green's (1993) theoretical framework on quality in higher education. The framework provides five categories: Quality as the exceptional, quality as perfection, Quality as fitness for purpose, Quality as value for money, and Quality as transformation. Preliminary findings show that students find that quality is closely linked to motivation on the one hand and to clear structure on the other hand.

Individual and School factors Affecting Student Wellbeing – Results of a Systematic Review

Krisztián Széll

Eötvös Loránd University Faculty of Education and Psychology, Institute of Education, Hungary

The children's general wellbeing affects the physical, mental health, development, and behaviour of the children as well as it can also be positively related to learning and school performance. That is why it is very important to identify the factors that determine the wellbeing of students and to have as much knowledge and empirical results at our disposal about the factors correlating and affecting student wellbeing. In the last decade, there has been growing research interest in children's wellbeing. Several empirical research results have also emerged on individual and school factors affecting student wellbeing, the systematic summary of which, the synthesis of accumulated research results, can deepen our knowledge of teaching-learning processes and educational effectiveness and equity. The presentation discusses findings of a systematic literature review that is based on the previously accumulated results of student wellbeing research. The main purpose of the review is to summarise the empirical research results and to identify individual and school factors that affect student wellbeing. Another goal is to present the conceptual diversity of student wellbeing, to explore its most important dimensions, indicators, and measurement options. The review is conducted in the databases of EBSCO, Web of Science, ScienceDirect, ProQuest with different keywords and is based on pre-defined inclusion and exclusion criteria (e.g. quantitative studies in English from 2010–2020, elementary school students). The preliminary results show that besides individual characteristics and family background, the schools and school-level factors can also greatly influence the wellbeing of their students. The research is supported by the ÚNKP-20-4 New National Excellence Program of the Ministry for Innovation and Technology from the source of the National Research, Development and Innovation Fund.

Polish Medical Students' Exposure to the Pharmaceutical Industry. Why do the Informal, Hidden, and Null Curricula Matter in the Process of Physicians' Socialization?

Marta Makowska

Warsaw University of Life Sciences, Poland

Socialization to the medical profession is the process whereby certain values and attitudes to the profession are internalized, including those relating to the pharmaceutical industry. Students are influenced not only by the formal curriculum, but also by the hidden curriculum (practice and culture), informal curriculum (interaction with others), and null curriculum (the omission of consideration of certain issues). In my talk I will describe the findings of nine focus group sessions conducted with medical students (second year and upwards) at three Polish medical universities (in Gdansk, Warsaw, and Krakow).

I will discuss quotations from students' discussions illustrating pharmaceutical companies' presence in their educational environment (specifically, in informal, hidden and null curricula). Polish medical students do not consider themselves to be the main target of marketing, but they think it reaches them nevertheless. They are surrounded by various small objects supplied by pharmaceutical companies, and take part in various events organized or sponsored by the industry. Their teachers constitute role models and often have industry connections, some teachers encouraging students to participate in meetings, implicitly teaching students that cooperation brings privileges. Discussions about the industry's impact on doctors or about laws regulating cooperation with the industry rarely (if ever) occur during students' formal education. Exposure to such a culture makes students begin to see cooperation with the industry as natural, and the benefits it confers as a doctor's privilege.

Students' perceptions on Primary to Secondary school transition.

Andrea Bueno Baquero, Mercedes Ávila Francés, María del Carmen Sánchez Pérez

University of Castilla-La Mancha, Spain

Students need to face many changes in the transition from Primary to Secondary Education: higher requirement levels, longer timetables, new relationship networks, less personalised treatment, etc. These changes are accompanied by a critical moment in students' life, adolescence stage, turning this process into a challenge. Students are the protagonists of this process, so considering their opinions and feelings is decisive to determine the factors that affect transition. Following a qualitative methodology, students' data have been recorded using questionnaires, interviews and discussion groups to provide a deeper view of participants' attitudes and experiences. Students' data is decisive to examine the factors involved in this process, distinguishing between facilitating and hindering factors. Joint work developed by schools and high schools is a key point to improve the transition process, focusing on students' well-being. Knowing students' experiences by first hand is the first step to act and promote a positive and effective transition for every student.

Do Children Perform Better in Religious Schools? Evidence From Population Data

Deni Mazrekaj, Christiaan Monden

University of Oxford, United Kingdom

Religious schools enjoy a high academic reputation among parents in many societies. Previous studies that assessed the effect of religious schools were conducted in countries where religious schools are private or where they charge fees and set admission criteria. As a result, the effect of religious schooling could not be separated from the effect of private schooling and selection. We contribute to the literature by using Dutch data that include the entire population of children born between 1998 and 2007. In the Netherlands, both public and religious schools are publicly funded, schooling is free of

charge and admission is independent of the child's religious or ideological character. Using a range of models including fixed effects models, coarsened exact matching, and treatment effect bounds, we compare school outcomes of children in religious versus public schools. Our results indicate that children in religious schools outperform children in public schools in primary education. The benefits of religious schooling were largest for children in Orthodox Protestant, Islamic and Hindu schools, which mostly attract children from a disadvantaged socioeconomic background. However, the influence of religious schooling fades out by the end of secondary education.

"New Regulatory Framework for Private Subsidized Schools in Chile 2014-2020: reshaping market- oriented Education?"

Juan Antonio Carrasco

Universidad Autónoma de Barcelona, Spain

Chilean experience of educational reform has been a well-known case of market-oriented framework for school provision by universal funding scheme to demand through vouchers sustained over the last four decades. Put into perspective, Chilean cumulative reform experience is characterized by a radical expansion of markets mechanism and particularly by subsidized private school sector. A no desired but very expected effects in the long term have been an extreme social segregation of the educational system –between schools but also within school-, crisis of public education and unequal access to educational opportunities for students by their socioeconomic status. Explore if educational policies that promote the expansion of private provision - what are the mechanisms that are specific for this purpose - and if, ultimately, these educational policies have contributed to the improvement of quality and social equity is at the center of public interest for Chile and Latin America. The purpose of this work is to understand how new institutional arrangements interacts with the logic of action of private subsidized schools within a high competitive educational market and how schools decoded these news regulatory settings in their everyday life practices and meanings. For this purpose, this research project subscribes mixed methods and contemplate two steps. The first section is a quantitative study, by using statistical analyses to describe how privatization has shaping four specifics educational markets and identified what it means that private subsidized schools respond to a more challenging regulatory context. A second qualitative phase, contemplate a multiple case study approach around a more extended schools trajectory in order to understand in deep its micro-politics and particular route toward a redefinition of their position in an educational market.

Transparency and Obscurity in Human Rights Education – a XXI century Case Study

Sérgio Xavier

Centre for Social Studies - University of Coimbra, Portugal

"Transparency" is a popular topic in the field of Education. Existing research mostly explores the teaching practice, generating emerging concepts such as "TiLT - Transparency in Learning and Teaching" (Winkelmes, et al., 2019) and assessment models such as "TAPE - Transparency of Assessment in Practice Education" (Stone, 2018).

The sociological exploration of "transparency" often relates with the activity of governments and organisations, particularly with the conditions they build for wide accountability. Usual conceptual associations include democracy, governance, and civil society.

Attempts to articulate both disciplines are diverse. Institutional research often focuses in intergovernmental or international cooperation in "quality education" (UNESCO, 2016), improving public trust in the education systems (Council of Europe & European Union, 2017), or institutional stability and efficiency (Jongbloed, et al., 2018). Academic research often concerns with improving academic results, featuring rarer incursions into the critique of globalized transparency models (Wallenius, et al., 2018) or obscurantist practices of "transparency".

This study explores this blinder angle of Sociology of Education research, taking the case study of a human rights education programme created in the Lisbon metropolitan area in 2015 by a major Portuguese local government. The study comprises 34 interviews to people with different practical and political experiences in the programme: learners, educators, officers, and decision-makers. A second analysis element is a timeline of research obstacles found along the study. The results illustrate the praxis of transparency and obscurity at institutional level, in relation with the wider aims of Democracy and Human Rights Education in the XXI century.

411

Intersectional Interference in Digital Literacy

Elisabeth Anna Guenther, Fares Kayali

University of Vienna, Austria

Digital literacy, the competence to not only be able to use tools but to understand and, in the sense of the term computational empowerment (Dindler et al. 2020, Tissenbaum et al. 2017) even design them, is of increasing importance for education (EC 2007, Conrads et al. 2017). While due to the pandemic more people have been forced to use digital tools, this does not necessarily indicate that all have been empowered to do so in a critical way. This means, the challenge of really implementing digital literacy is still existing. More is needed to empower children in their use of digital tools (Ivari 2020). In addition to that, the last year has shown there is a digital divide, not just between so called digital natives and digital immigrants but due to socio-economic background, gender, and area of living, amongst others (UNESCO 2020; Lev-On et al. 2020). Altogether, it appears as if there is an intersectional interference in digital literacy, meaning that social dynamics associated with gender, race, class, disability and other social markers influence the way children are empowered in their use of digital tools.

In order to better grasp the potential shortfalls of existing concepts and gaps in research we conduct a systematic literature review on intersectional interference in digital literacy. The aim is to further develop our understanding of digital literacy, its relation to empowerment and to highlight potential pitfalls in this endeavour.

RN10_T10_03 | Social Resources and Supports in Education 2

Transforming Education in Jalisco (Mexico) Through Community Participation: the Case of a School as Learning Community.

Teresa Morla-Folch[1], Alfonso Rodríguez-Oramas[2]

[1]University Rovira i Virgili, Spain; [2]University of Barcelona, Spain

The lack of access to quality education and the persistent achievement gap across socio-economic groups are a concern worldwide. Thus, the search for inclusive and effective educational practices that ensure a sustainable future for all has become a priority (UN, 2019). In this vein, a growing body of international research has shown that the schools that become Learning Communities (LC), i.e., schools that widely engage the community in decision-making processes and implement evidence-based practices called Successful Educational Actions (AEE), effectively improve their academic results and coexistence, even in the most disadvantaged educational contexts. Such is the case of a primary school located in a deprived neighbourhood in Guadalajara, Mexico, which became a LC in 2016 with the objective of overcoming school failure. The data presented in this paper, which draw from the comparative analysis of the school results between 2015 and 2021 as well as from in-depth interviews with school staff, family members and students, show that the implementation of SEA led to a drastic improvement in school performance and reduction of conflicts. What is more, data collected in early 2021 show that despite the social distancing measures due to the COVID-19 pandemic the school has managed to maintain a relatively high participation of family members in decision-making processes through mixed committees. In sum, these results add up to the body of evidence that points to the LC model as an effective tool to improve school performance, reduce social inequalities and promote social inclusion even during the current pandemic.

412

Understanding Educational Inequalities and Opportunities During the Covid-19 Pandemic: the Case of the Cieszyn Silesia Region in Polish-Czech Borderland

Berenika Dyczek[1], Marcin Starnawski[2]

[1]University of Wroclaw, Poland; [2]University of Lower Silesia, Poland

The paper discusses the role of symbolic and economic capitals in generating and mitigating social inequalities among secondary-education students during the COVID-19 pandemic. Combining Bourdieu's framework (economy of symbolic goods) with Znaniecki's interpretive approach (humanistic coefficient) we will analyse students' educational capacities and cultural competences, social and economic resources, and the reflexive understanding of these factors by people involved in education. Our data comes from students, school staff and administration, and parents. Firstly, we will look at students' perception of obstacles to and opportunities of successful distant learning, and how they see family life, peer-group dynamics and relations with teachers as relevant factors. Secondly, input from parents will highlight their perception of schools' capability and their own efforts in helping children. Lastly, we will explore teachers' and school administration's perspectives on their own institutions and educational policies. An online survey on a sample of students in secondary schools will provide quantitative data. In-depth interviews will provide qualitative data from teachers, school administration and parents. The population is from Cieszyn Silesia – a region of southern Poland near Czechia. We will discuss the regions' historical and religious specificity (borderland location and influence of Protestantism) in creating social networks and symbolic sphere helpful in overcoming educational gaps. Our underlying assumption is that lived experiences and definitions of the situation require exploration as much as objectivised symbolic and economic factors in order to grasp inequalities and mitigation strategies in educational settings and learning environments.
KEYWORDS: capitals, distant learning, school system, students' experiences

Student Counseling Today: Future Implications of Carl Roger's Phenomenology for Education

Sona Balasanyan[1,2]

[1]Yerevan State University, Armenia; [2]CRRC-Armenia

The future of universities and education at large has attracted sociological attention since digital education became influential for teaching and learning in knowledge societies. On the other hand, especially after the Covid-19 outbreak, an increasing evidence suggests that student's mental health has suffered due to the impact of online teaching and learning over lockdown. The paper discusses this issue in reference to student counseling - how and in what ways this can serve the student's contemporary needs. It uses Carl Roger's phenomenology and theory of personality to sociologically reflect on student counseling in times of increasing digitalization of education and uncertainty for career planning. It shows that some of important career counseling features as pointed by Carl Rogers have to be considered by universities to better serve the needs of their student communities.

413

RN11 | Sociology of Emotions

RN11_T01_01 | Theorizing emotions

Ressentiment: A Complex Emotion or an Emotional Mechanism?

Mikko Salmela[1], Tereza Capelos[2]

[1]University of Helsinki, Finland; [2]University of Birmingham, UK

Ressentiment has been identified behind support of right-wing populism and extremism as well as Islamic radicalism. The function of ressentiment is to carry out two parallel transvaluations: a devaluation of a desired yet unattainable object, and a revaluation of the self from a loser into noble, pious, and superior. Ressentiment starts from negative emotions and feelings targeting the vulnerable self, whose repression triggers the transvaluation, and gives rise to other-directed negative emotions that are shared with the like-minded. However, there are several open questions about ressentiment. (1) Is it a complex emotion (TenHouten 2018; Demertzis 2020), or rather an emotional mechanism (Salmela & von Scheve 2017)? (2) What emotions constitute or drive ressentiment; and what emotions are its outcomes? (3) What psychological processes can be identitied in ressentiment; and (4) What is the role of social sharing in ressentiment. We outline a theory of ressentiment that integrates three traditions: the philosophical scholarship of ressentiment by Nietzsche (1884) and Scheler (1915) with its contemporary proponents in philosophy and sociology (Demertzis 2020; TenHouten 2018; Aeschbach 2017; Elster 1999) that highlights envy as the driver of ressentiment; the sociological approach of Scheff (1994) and Turner (2007) that focuses on the repression and transmutation of shame and its social consequences; and psychoanalytic scholarship on defences (Kohut 1984; Laing 1969; Klein 1958). We argue that envy, shame, and inefficacious anger, with associated feelings of inferiority and impotence are drivers of ressentiment, understood as an emotional mechanism that employs several, partially idiosyncratic defences in the transvaluation of the self and its values, whereas resentment, indignation, and hatred, reinforced by social sharing, are its outcomes.

Emotional Disability Studies - A Case For Comprehensive Engagement

Yvonne Wechuli

University of Cologne, Germany, Germany

The proposed paper presents preliminary results of my PhD project that seeks to suggest fruitful theoretical concepts and a common language on emotion and affect for the field of Disability Studies, drawing on the Sociology of Emotions as well as Affect Studies.

The emotional repertoire of the non-disabled imaginary (Hughes 2012) focuses on non-disabled people's feelings in their socio-cultural context. Unpacking this repertoire, disability stands for something else, be it vulnerability (ibid.), an exemption from neoliberal (self-)exploitation (Puar 2017) or a reassurance to be positioned on the "normal" side of binary identity categories (Garland-Thomson 2017) – and thus elicits a whole range of different emotions like abjection, contempt or pity.

I call this repertoire's consequences disabling affect. Informed by the emotional repertoire of the non-disabled imaginary, disabled people face violent threats and material exclusion (Burch 2018), their own feelings are subject to medicalisation when they are misunderstood as direct effects of impairment (Fish 2018) and they have to relentlessly perform emotion work (Hochschild 2012[1983]). for the sake of others to comply with feeling rules (ibid), which puts a burden on them or even blame (Liddiard 2018).

Lastly, different feeling strategies in an ableist society are promoted to tackle disabling affect. These strategies oscillate between Cripping (McRuer 2006)– deliberately enacting pride of disability as resisting harmful social norms – and Reclaiming – acknowledging hurtful "authentic" emotions connected to the disability experience (Watermeyer 2014).

I advocate for a comprehensive engagement with emotionality in a field where, so far, discourses on emotional topics are scattered.

414

Storytelling, Boundaries and Emotions: The Narrative Genre Foundations of Inclusionary and Exclusionary 'Structures of Feeling'

Özgür Özvatan

Humboldt University of Berlin, Germany

A variety of strands offer explanations for the sources of individual and collective feelings. In general, narrativity is widely associated with the (re)production of feelings. This basically follows the existing 'narrative identity' literature, communities are held together by a shared narrative which romantically connects the past, present and the future of a given community and generates associated feelings. These shared narratives transform sometimes, however, there is little research on the social mechanisms that underlie reconfigurations of feelings attached to subjects, hero/ines and boundary-making. In this paper, I thus ask how, and by what, feelings of emotional attachments and detachments to communities are driven.

To respond to this question, I present a novel approach which, rooted in cultural sociology, weds Habermas' communicative action theory with Frye's narrative genre theory to explain the mechanisms that generate 'structures of feelings'. This novel approach builds on the assumption that it is through the act of crafting stories that emotionalizing subjectivities and boundaries arise, and that these stories emerge in four narrative forms (genres) in western societies: romance, comedy, tragedy and irony. These four narrative genres (pre)configure the way collectives feel about 'us' and 'Others' through their distinct plot movements. Some genres—romance and comedy—create strong feelings of emotional attachment to an omniscient/triumphant hero/ine in the wake of a happy ending, these feelings fix boundaries vis-à-vis perpetrating 'Others'. Other genres—tragedy and irony—generate feelings of emotional detachment from a failing hero/ine which blur boundaries towards the inclusion of 'new' and/or 'othered' perspectives.

Emotional Imperatives of Late Modern Society and their Possible Social Consequences

Olga Simonova

National Research University - Higher School of Economic, Russian Federation

The purpose of this paper is to examine the main "imperatives" of contemporary emotional culture, which may provide special research optics for a deeper understanding of late modern society. The paper begins with a definition of emotional culture and based on the body of works in the sociology of emotions and identifies dominant emotional norms and their corresponding perceptions, which have the character of imperatives in people's everyday experience and serve as an extension of social values. These emotional imperatives include a rational control over emotions, compulsive desire to be and look happy, avoiding negative feelings, individual guilt from any failure in social life, a grievance that takes the form of righteous indignation, and others. These "imperatives" are in some respect contradictory, reflecting different aspects of life, but generally subject to the logic of late modern society, and can have important unobvious social consequences such as broken social ties, «chronic" feelings of depression and frustration, tiredness, bad moods, increased anxiety and fears and many other unobvious consequences, such as the emergence of new forms of solidarity. As a result of global events and the resulting social crises, these imperatives may change, thereby allowing us to track how people's lived experiences are changing. The list of emotional imperatives anyway is not full as well as their description, but through the outlined emotional imperatives the author attempts to describe theoretically contemporary cultural configurations of lived experience through leading emotional norms.

415

RN11_T01_02 | Emotions in the Pandemic (1)

Nostalgia in Times of Crisis

Katharina Scherke

University of Graz, Austria

The paper will discuss the uprise of nostalgic practices during times of crises using different examples from the current pandemic situation. The capacity of nostalgia to be a coping mechanism in times of (individual) crisis was shown in different psychological experimental settings (e.g. by Tim Wildschut et al). People under stressful circumstances rely on social bonds for intimacy and protection. If there are deficiencies in social connectedness people look for compensatory mechanisms. By activating memories on former events, especially social activities and one's own role in these activities with other people, people can re-establish a feeling of connectedness even when they are at the current moment in a lonely position. The rising need for this kind of coping mechanism in our globalized ever changing world has already been discussed by literary scholars like Dennis Walder or Svetlana Boym, who described the up-rise of interest in nostalgic dealings with the past in literature and the arts as a feature of our time. One could expect that during the current pandemic situation - with its physical distancing practices - the need for this kind of coping mechanism is especially high. From a sociological point of view the embedding of individual feelings of nostalgia (and of practices leading to nostalgia) in a collective climate of crisis is of special interest.

Family Relationships During Strict Confinement: Mixed Emotions and Feelings

Fracisco Javier Aroca Cifuentes

Universidad de Castilla-La Mancha, Spain

This paper delves into family relationships during the strict confinement caused by Covid-19, specifically of university students and their families in the region of Castilla-La Mancha, Spain. In this scenario of hostility and fear, the following research question should be asked: How has confinement influenced the relationships between family members? To answer this question, a qualitative approach is designed, using the in-depth interview (N = 17) as the most appropriate tool due to the degree of intimacy and flexibility it offers.

First, we pay attention to nuclear families who have experienced confinement in the same home. This phenomenon has been an opportunity to spend time with the family and this can serve to strengthen emotional ties. Although on the other hand, in cases where there is no relevant emotional connection or the relationships between some members are not very good, it can suppose a problem in the correct development of coexistence. On this the degree of frustration produced by being limited to the freedom of movement to one's own home and the feeling of uncertainty associated with the pandemic situation affects negativily. On the other hand, the division of household chores can also become a reason for discussion and confrontation in many cases. Second, we analyze relationships with other members of the family, who do not usually live together: grandmothers and grandfathers. These are the oldest profiles, more sensitive to the problems produced by Covid-19 and who also suffer from the digital gap.

Keywords: Family, feelings, confinement, Covid-19.

Farewell in Corona Times. To Say Good Bye to Dying Next of Kin in Times of Restrictions

Cathrin Wasshede, Sofia Björk

University of Gothenburg, Sweden

In our society, great importance is attached to being able to say goodbye to our loved ones when they are dying. The covid-19 pandemic not only causes more deaths but also create barriers to being present in the death process. In a study conducted in 2020, nine people whose next of kin died during covid-19 restrictions were interviewed. The aim of the article is to make visible norms and ideas about final farewells and identify how the interviewees handle their emotions when deviating from or fulfilling these norms. Physical and emotional presence at the deathbed are prominent ideals of how a farewell should take place, both to support the dying person and for relatives to feel involved. The interviewees who have lived up to these ideals express pride and gratitude, while those who have not been able to do so express anxiety, guilt, helplessness and pain. To deal with their emotions they try to establish trust both in the necessity of the covid-19 restrictions and in the staff that worked with their deceased relatives.

"When life stays at home." Emotions and Their Management within Families during the First, Second and Third Lockdown in Austria

Karin Scaria-Braunstein, Sabine A. Haring

University of Graz, Austria

The Corona crisis is upsetting the order of everyday life and our routines. People are confronted with unprecedented challenges. In particular, the politically imposed lockdowns are causing life to shift homewards. Gainful employment, childcare and nursing care, housework and leisure time, all areas of life take place at home and have to be reorganized completely in many cases. Often, the boundaries between work and leisure blur. It is a great challenge for families and family cohesion. Due to these circumstances people deal with a variety of stresses.

During the Corona crisis we surveyed people in Austria during two phases of the crisis: at the beginning of the Corona crisis in the first lockdown (March/April 2020) and in the autumn/winter of 2020, when the second and third lockdowns were imposed.
We are interested in the stresses and reliefs people feel during these lockdown phases of the crisis and which emotions correspond to them. We focus on the circumstances of life and the subjective perceptions of the respondents. We analyse the emotions mentioned in connection with stresses and the emotions people associate with relieving factors. In doing so, we assume that emotion management must be used to regulate the frequently ambivalent emotional states resulting from the crisis situation. Hence, knowing about the interplay between positive and negative emotions is crucial. We observe, if temporary emotional norms emerge in this setting of crisis, and furthermore look into the emotions that arise in the changed everyday life and how they are negotiated and negotiated in the families.

RN11_T02_01 | Political sociology of emotions

Political Interest as Political Emotion

Nicolas Demertzis

National and Kapodistrian University of Athens, Greece

For eighty years political interest was treated as a basic variable to estimate people's involvement in politics. Together with political efficacy, in the political culture research it has been assessed as a psychological predisposition to be included in the individual orientations towards the components of the political system. Although Almond and Verba differentiated psychological orientations into cognitive, affective and evaluative, in the main, political sociologists opted to subsume political interest under the diffuse category of psychological predispositions without any further qualification. During the 1990s a number of scholars defined it as curiosity about political affairs; that was a step heading towards concretization of the concept. However, curiosity was understood more in terms of cognition than emotion. The vagueness of the concept has been also due to the dual meaning of 'interest' itself: it refers to advantages and profits, and the will of someone to take a share in them; besides, it refers to caring about something, to be curious about some phenomenon. Taking into account that curiosity has long

ago been registered as primary emotion, from a (political) sociology of emotions point of view, this paper offers an alternative but no less supplementary understanding of political interest as a political emotion. Political emotions are viewed as lasting affective predispositions supported reciprocally by the political and social norms of a given society, playing a key role in the constitution of its political culture and the authoritative allocation of resources (Demertzis 2014: 227–228).

Emotions and Politics: About Emotional Capital and Emotional Work

Nina Hossain

Philipps-Universität Marburg, Germany

Looking at political developments, it is easy to emphasize the high relevance of emotions in the field of politics. More and more citizens express their political discontent in an emotional manner (e.g. COVID-19 deniers), to whom politicians respond again emotionally. In fact, my empirical data proves the integral part of emotions in political work. During my dissertation, I have conducted interviews with members of the German Parliament to highlight the role of emotional capital.

It has turned out that politicians have a high degree of "political capital" (Bourdieu) which is closely interwoven with "emotional capital" (Illouz). Here, the emotional capital has a strategic character: Politicians are aware of the central importance of emotions within their work, so they not only prepare themselves in terms of content, but also 'emotionally'. To be more precise, politicians have a "toolbox" that is filled with different emotions. Depending on their needs, they use specific emotions that correspond to both their gender and their political department. In contrast to Illouz or Penz/ Sauer, politicians specifically and consciously acquire emotional capital, which they use especially in their "emotional work" (Hochschild). By using specific emotions politicians try to win political battles or electoral votes.

In my speech I would like to take a closer look at the emotional capital from a gender perspective and present the different methods of emotional work in the political field. Finally, I would like to demonstrate the interrelation between them.

Europe's shame: exploring shaming dynamics at the European Parliament (EP)

Rosa M. Sanchez Salgado

University of Amsterdam, Netherlands, The

Previous research on the role of emotions in the European Parliament (EP) has shown that shaming is common currency in a few policy areas, particularly migration and asylum (Sanchez Salgado, 2020). This article aims to analyse how shame has been perceived and how shaming strategies have been used in the European Parliament over a long-time period (1999-2014). This analysis uncovers thus the darkest side of EU policies, including those moments where the EU was perceived to have performed poorly with respect to socially prescribed standards or norms (Brader and Markus 2013). This paper discusses first how the perception and strategic usages of shame has differed per policy area and evolved over time. Secondly the attention will be turned to shaming dynamics. To which extent have shaming strategies trying to influence behaviour been successful? Has shame contributed to informal policing and to the maintaining of group norms? Have the so-called 'shameful events' been ignored or debunked? Or alternatively, to which extent have events that presumably caused pain, hurt and loss been acknowledged leading to reparation and political action? Has shame played a relevant role helping bringing together the European nation as a felt community? This paper combines an Atlas-ti content analysis with an in-depth analysis of the use of shame by EU policy-makers at the European Parliament from 1999 to 2014. Data analysed includes European Parliamentary Debates and policy documents available for this period.

Emotions in Decision-making Cooperation — A Re-reading of Interaction Data

Juha-Matti Kalervo Klemelä

University of Turku, Finland

The study presented conducts an emotion-centred re-reading of decision-making cooperation data. The data consists of interviews and surveys of politicians and office-holders in Finnish municipal government. Originally, on the basis of the data, a framework model of decision-making cooperation between the two groups was constructed. The model is based on the 'categorical trinity' of motives-means-opportunities as the bases of successful cooperation. The description and explanation within this model is based mainly on normative and rational factors. Observed emotions in the interaction process are now explicitly located inside the cooperation framework.

The emotional re-reading of the decision-making cooperation data has several aims which are realised to different degrees. These include the following: 1) to decipher the places in the interaction framework model where emotions are spontaneously reported, and to record their value (positive/negative) and force; 2) to see what the locations, values and forces of the emotions are for the actors who generally experience their action and interaction in the municipal government as successful, in relation to those who see their action and interaction as less successful; 3) to make some assessment of the minimum amount of emotions that can, besides rational and normative reasons, be used to describe and explain interaction in the studied local government context; and, 4) to create some basis for more systematically studying, both qualitatively and quantitatively, the meaning and place of emotions in local intra-government decision-making cooperation.

RN11_T02_02 | Emotions in the Pandemic (2)

Pandemic Narratives: Emotional Attitudes and Political Choices in Italy During the Covid-19 Emergency

Alessandro Pratesi, Angela Perulli

University of Florence (ITALY), Italy

419

The COVID-19 pandemic is having a strong impact on our lives, emotional attitudes and political choices. More than twenty years ago, Marcus (2000) highlighted how political sciences have been largely dominated by cognitive accounts and by a neat division and opposition between emotion and reason. Social and political scientists have recently managed to make up for the missed opportunities, and several scholars have discussed and illustrated, from different perspectives, the key role that emotions play on political attitudes and behaviour. Yet findings connecting the pandemic and people emotional attitudes in light of political choices taken at the Governmental level remain inconsistent and in need of further development (Amat et al., 2020; Bol et al, 2020; Grossman et al., 2020; Harell, 2020; Leininger and Shaub, 2020; Reny and Barreto, 2020).

This paper contributes to current debates on these issues by focusing on the complex emotional scenario characterising Italy during the Covid-19 emergency. What kind of emotional attitudes prevail in Italy during the pandemic? How do such emotional attitudes affect and are affected by political choices? Why? What type of broader narratives do they contribute to create and consolidate? What are or may be the potential long-term implications of such narratives? Drawing on a discourse and visual analysis of different types of media and communication channels, this paper aims to address some of these questions. A focus on the Italian case study—whose Government crisis in the middle of the pandemic undoubtedly represents an exception in the international scenario—can add relevant insights in the complex and ambivalent relationships between emotions and politics.

Impact of the Pandemic Covid-19 on the Well-being of Portuguese University Students.

Cristina Cunha Mocetão, Rosa Conde, Catarina Nadais

Instituto de Sociologia, Portugal; ISAG-EBS, Portugal

The confinement imposed by Covid-19, constitutes the biggest real laboratory on the human capacity to adapt (or not) to societal contexts. The emotion scale is a construct that contains cognitive assessments of positive emotions as well as their negative experiences. Much research has shown that emotions develop throughout life, and that emotions decrease with age (Littman-Ovadia & Russo-Netzer, 2019). It has also been found that positive emotions increase with age, and for example that older people feel less anger, less anxiety. The purpose of the investigation was to understand the emotional state of the respondents during the confinement period, as well as changes and implications of this new reality for Portuguese university students. We used a sample of 525 answers. Our results show that during the confinement period, our respondents were modernly happy and a little irritated. We also found that there is a significant correlation between the gender of the respondents and the following emotional states: Feeling distressed, alarmed, distressed, scared, anxious, aggressive, and sad. It was found that the variable household composition has a significant and negative impact on the following emotional states: feeling afflicted, distressed, apprehensive, concerned, content. In turn, it was found that the household has a significant and positive impact. In short, one of the conclusions of this study was to verify that the emotional states in the period of confinement are manifested differently between gender and the composition of the household. The study will make it possible to understand the impact of the pandemic on young people's well-being and for parents, social scientists to help them better cope with the post-confinement period and similar situations in the future.

What Do We Really Need? Rationality And Emotions In Consumption Habits During COVID-19 Crisis

Anastasiya Shevchenko, Matilde Massó Lago

University of A Coruña, Spain

Since the beginning of the pandemic, lifestyle habits have been seriously altered by lockdown and the imposition of social distancing. This transference of social life and social relations to the mainly domestic sphere is linked to a series of transformations of consumption habits and structure, what some scholars call consumption of panic (Shunya and Teramoto, 2020). This notion can be characterized by fear and uncertainness, while rationality is in the background.

This communication analyses some of the most important dimensions linked to individual and household consumption and the emotions linked to them in the context of the COVID pandemic. More specifically, we have proposed an operativization of the notion of emotional consumption based on the analysis of three key dimensions, these are the notions of necessity, scarcity and desire that have been redefined in the consumption pandemic.

We have developed a qualitative analysis based on semi structured interviews. Provisional results show that consumption is strongly embedded in an intense emotional ground. This is affecting not only in-person consumption but also online purchases. This led us to redefine the dimensions mentioned above in a logic that questions the dominant model of explanation based on the concept of instrumental rationality used by mainstream economic approaches to explain the individuals' consumption habits.

RN11_T03_01 | Emotion and populism

From Specific Worries to Generalized Anger: The Emotional Dynamics of Right-Wing Political Populism

Christian von Scheve[1], Christoph Nguyen[1], Mikko Salmela[2,3]

[1]Freie Universität Berlin, Germany; [2]University of Helsinki, Finland; [3]University of Copenhagen, Denmark

Right-wing populist parties have transformed the political landscape across many advanced, democratic economies. Their continued strength has been linked to an increasing sense of both economic and cultural insecurity, driven by the conjunction of economic deregulation, globalization, and increased socio-cultural competition. However, socioeconomic factors alone do not fully capture the dynamics of populist activation and support. In this chapter, we argue that emotional processes are a fundamental component that underpin support for right-wing populist parties. We argue that one ignored mechanism of "ressentiment" explains how support for right-wing populists can transform specific and targeted negative emotions, such as insecurity and worries, into generalized anger and resentment. We furthermore propose that this generalized anger not only creates a new political identity of shared grievance, it also furthers political polarization and leads to further strengthening of a newly found right-wing populist lifeworld. We test our propositions using representative, longitudinal data from the German Socio-Economic Panel and cross-lagged regression models that predict voting for the German right-wing party Alternative für Deutschland (AfD).

Individual Resentment, Collective Envy: Ethos of right-wing populism in central Anatolia

Ceren Deniz

Max Planck Institute for Social Anthropology, Germany

Research in the American heartland reveals that resentment and anger are shared sentiments among Trump voters against regional inequalities and perceived threat to their social fabric. While rural-urban divide and political polarization fuel similar sentiments among right-wing supporters in Erdoğan's Turkey, the socio-political context that these sentiments are rooted and their affect is mediated remain underexplored in the Turkish case. My ethnographic research among AKP-voting businessmen in central Anatolia, Çorum, addresses this particular gap and aims to show how the intimate experiences resonate in the political sphere. In my paper, I trace recurring expressions of resentment, suffering and ambition in Anatolian businessmen's narratives in their family and work histories. My findings suggest that these sentiments are most frequently vocalised by respondents as a reaction to demeaning experiences of wage-labour and to oppressive encounters with hegemonic masculinity. Navigating through hegemonic class and gender ideologies trying to secure their future, offspring and status, 'success' in these men's lives crystalizes in their achieved reputation and honour in their local communities. Synchronously, they construct their own 'other' who constantly threatens the hardly achieved reputation and well-being, expressed in the Anatolian vernacular as 'collective envy.' Collective envy keeps the narrative of suffering and resentment alive, feeds into the nationalist exceptionalism that forms the ethos that guides people's view of themselves in the world as to others, and transcends the local community. Consolidation of Erdoğan's right-wing populism occurs with an appeal to this particular ethos mediated by the affect of collective envy.

Angry Populists or Concerned Citizens? How Linguistic Emotion Ascriptions Shape Affective, Cognitive, and Behavioural Responses to Political Outgroups

Philipp Wunderlich, Christoph Nguyen, Christian von Scheve

Freie Universität Berlin, Germany

Emotion expressions of outgroup members inform judgements and prompt affective responses in observers. Thus, they can effectively shape intergroup relations. However, in the context of social and political conflicts emotions are not always directly observed in face-to-face interactions. Instead, they are frequently linguistically ascribed to particular actors or groups. Examples of such emotion ascriptions are found, among others, in media reports and political campaign messaging. To this point, not much is known about the specific effects that linguistic ascriptions of discrete emotions to outgroups can have on intergroup relations. With this pre-registered study, we contribute to bridging this gap by analysing the effects of ascriptions of two discrete emotions, namely anger and fear, to a political outgroup. Both anger and fear are frequently evoked in connection with and ascribed to political groups, especially right-wing populist actors. We conduct an online survey experiment in a sample of the German general population (N = 3000) in which we manipulate the emotions ascribed to right-wing populist outgroups using brief vignettes. We are specifically interested in resulting changes in intergroup emotions, stereotype content, and action tendencies, as all of these are central building blocks of intergroup relations.

Othering Negative Emotions - Emotion Discourse in the Esoteric Right Wing 'Anastasia' Movement

Manuela Beyer

Technical University Chemnitz, Germany

The Anastasia movement claims to centre around spiritual and ecological aims, but empirical investigations disclose the movement's entanglement with far-right political actors and its promotion of right wing political attitudes, such as pronounced antisemitism, sexism and homophobia (Infosekta 2016; Rosga 2018). Started in Russia in the 1990s, the movement's ideological foundations lie in the fictional novels of Wladimir Megre and their female protagonist 'Anastasia'. Movement proponents advocate and aim to settle in self-subsistant so called 'family estates' in rural areas.

Anastasia strikingly connects seemingly disparate discursive frames such as nature protection, peace and harmony on the one hand with right wing narratives and conspiracy theories on the other hand. Based on an analysis of actors' discursive strategies, I argue that emotion discourse plays a crucial role in connecting structures of meaning stressing spirituality with those implicitly referring to right wing political aims. Framing liberal or left-wing critics of the movement as acting based on negative emotions such as hate, anger or fear is central to Anastasia's emotion discourse. At the same time, Anastasia actors stage themselves as peaceful, harmless victims of political correctness who are oriented towards positive emotions. These discursive strategies, centering around processes of 'othering' negative emotions, crucially contribute to disguising right wing narratives and goals as 'unpolitical' visions of an idyllic world for everybody. The presented findings may also illuminate the role of emotion discourse in alliances of spiritual hippies with right wing extremists that have recently been observed in demonstrations against government anti-corona measures.

RN11_T03_02 | Uncertainty and hope about the future

Hope in a Threatening Future. An Emotion-sociological Approach to Hope

Åsa Wettergren

University of Gothenburg, Sweden

The purpose of this paper is to theorize hope from an emotion-sociological perspective, emphasizing its interactional, social, and collective dynamics. According to McGeer (2004) hope arises when our own agency appears limited. I consider hope as an emotion as well as a compound of multiple interacting emotions that spur and direct hope. Such supportive emotions (e.g. Lantz 2019) can be fear, despair, aggression, grief, sympathy and love. As argued by Barbalet (1998) emotions can be analysed in terms of sources, objects and outcomes. I suggest that supportive emotions tie hope to different sources and objects. Analysing how collective cognitive re-framing (emotion management) achieves these ties between emotion, source and object is crucial to understand hope's outcomes and impacts on individual and collective action. Drawing on Terpe's (2017) work on negative hopes, I propose a model where the action orientation of hope is passive or active, and the social level of hope is individual or collective, resulting in different emotional compounds and actions. The model shows some sources and objects of hope generate fear and aggression or grief and love respectively. In combination with passive or active action orientations at the collective or individual level, the result is different types of hope and different outcomes. The model is illustrated by preliminary findings from an ongoing research project studying the Transition Network and the Collapsologists, notably the collective emotion management called 'inner transition' and 'positive deep adaptation'.

Future Emotion of Action Readiness—Accelerating Climate Transition

Prins Marcus Valiant Lantz

Copenhagen Business School, Denmark

Curiosity and farsightedness are indeed formidable weapons during crises, but the question of how organizational actors decide to take action in due time when the future is unpredictably foggy continues to challenge the transition towards a livable zero-emission future. In essence, emotion constitutes reason to take action, and therefore, the article investigates the interplay between strategic (future) goals and the felt need to take action now by focusing on the temporality of emotion—how emotions evolve over and in time to provide an "affective knowledge; a knowledge that moves people to feel and act.".

Empirically, the article draws on a longitudinal study within the sustainability department of a large multinational firm and presents a rhetorical analysis of how appeals to taking climate action are situated in between organizational plausibility and sustainable desirability.

Theoretically, the article advances the concept of a 'temporality of emotion', by combining the nascent concept of 'temporal translation' within organization studies with a sociological understanding of emotion as a link between structure and agency. Hereby, it furthers our understanding of how emotions interact and evolve as an ongoing negotiated organizing of temporality that constitutes compelling reasons to act in the present.

423

Unsettling Futures: Climate Change, Emotions and Mothering

Mary Holmes[1], Kris Natalier[2], Carla Pascoe Leahy[3]

[1]University of Edinburgh, United Kingdom; [2]Flinders University, Australia; [3]University of Melbourne, Australia

To unsettle is to loosen both people and norms from steady or place-based foundations. To unsettle can mean disrupting normative expectations, for example that reproduction, family intimacies, bodily connection and well-being are best nurtured by staying put, staying together and 'settling down'. To feel unsettled is considered a cause for mourning, for pity. It is to feel ungrounded, at sea, uncertain, anxious. However, there may be both good and bad emotional consequences attached to unsettling norms around the intimate reproduction of and caring for bodies? Might unsettling feel exciting, adventurous, hopeful, curious? What is the potential of unsettling for social and political change? In the context of climate change new forms of unsettling arise. Climate change is making people mobile, often whether they like it or not. It is also unsettling people's connection to the future and for some women, it is severing their links to a future in which they settle down and have a family. We explore the emotionally reflexive processes by which they come to these decisions by analysing the testimonies on 'Conceivable Future', a women-led network of Americans bringing awareness to the threat climate change poses to reproductive justice. Are their emotionally reflexive processes driven by anxiety, fear and grief or by hopes for a deep future for the planet that is less human-centred?

Ecological Emotions And An Ethics Of Care For Eco-Social Change

Lena Maria Schlegel

Ludwig-Maximilians University Munich, Germany

Contemporary societies are confronted with multiple socio-ecological crises: climate disaster, mass extinction and the COVID-19 pandemic alike highlight a fundamental ill in our (western) relationship with nature. In spite vast scientific knowledge and technological innovations available today, individual as well as collective responses to environmental problems remain insufficient to facilitate transformative change. Instead, troubling emotions and existential insecurities harbored by these crises seem to foster cognitive dissonance and socially enacted denial. I argue that what´s lacking from current engagement with socio-ecological problems is sociological imagination for alternative ways of living with and relating to others, including the nonhuman world. Instead of approaching socio-ecological problems from the dualist understanding of nature prevalent in western societies today, I argue that we need to ground ecosocial change in an idea of multispecies coexistence. In order to better understand the motives behind environmental inaction and identify potential for change, I conceptualise human-nature relations as relationships of care and analyse eco-social change as a matter of finding ethically appropriate ways of dealing with conflicting caring needs. Combining a New Materialist relational ontology with an ethics of care, I argue, as humans are constituted through their relationships with nature, practicing responsible relationships with nature is key for eco-social change. Responsible care thereby requires 1) practices of care, 2) affective (cognitive and emotional) care, and c) ethico-political engagement with conflicting caring needs (cf. Puig de la Bellacasa 2017). In this paper I focus on the role of troubling emotions for ecological (in-)action.

RN11_T04_01 | Emotion and nationalism

Incar-Nations: Emotional States and Embodied Nations under Covid-19

Jonathan G. Heaney

Queen's University Belfast, Ireland

Recent work in the political sociology of emotions (Berezin, 2002; Holmes, 2004; Demertzis, 2013, 2020; Heaney, 2019; Heaney & Flam, 2013) has begun to take the relationship between the nation-state and emotion much more seriously. Indeed, this relationship has been thrown into more sharp relief under Covid-19 where, far from the 'decline' narratives of just a few years ago, state power, and its intersections with nationalism, and emotion have become perhaps the defining features of the current political conjuncture. The pandemic reasserts and makes visible the extent and reach of state power, and the fundamentals of what the state/citizen relation is founded upon: the sacrifice of liberty for the promise of protection. The crisis simplifies the dominant emotional regimes operating within the nation-state, and shows how both the 'left hand' (caring, giving) and the 'right hand' (punishing, taking) of the state works on and through the emotions in a time of crisis. In this paper I wish to reflect on this 'emotional state' and show how a more embodied conception of nationalism can help us to understand the emotional basis of state power and state legitimacy. This perspective aims to combine key insights from the sociology of emotions, cognitive sociology, and the sociology of embodiment, whilst also accounting for the key role of the (emotional) state in the attempt to (de)legitimize specific versions of nationness within the polity. The case of Ireland and the Irish State's response to the Covid-19 pandemic will be used to illuminate key points.

Deep Story of Right-Wing Afrikaner. Understanding the Nexus of History, Emotions and Morality

Manuel Dieterich

University of Tuebingen, Germany

In my contribution, I use an empirical example from my ongoing ethnographic research in Johannesburg to point out the relevance of the temporal dimension (historical rootedness) of emotions and moral evaluations. In doing so, I draw on the concept of the deep story to capture the complex entanglement of history, emotions, morality and current worldviews. This concept, originally developed by Arlie Hochschild, refers to a collectively shared narrative that links history to the present and thereby legitimizes a particular worldview and accompanying sets of emotions and their management. For an interpretive sociology in particular, it is important to see emotions of right-wingers not only as negative or morally problematic, but to understand where these emotions and thus the current worldviews come from. By reconstructing the deep story, such a deeper understanding can be achieved, and based on this, it is hoped that the political debate will become less confrontational and more understanding.

Empirically, I reconstruct the deep story of white right-wing Afrikaner from Mindalore in Johannesburg. Their historical narrative, which I encountered in conversations, is very strongly emotionalized and moralized. They describe Afrikaner history in South Africa as an ongoing struggle for survival, first of settlers against nature, then in various wars and finally economically in the 1930s. The apartheid state (1948-90s) appears as the guarantor of the Afrikaners' survival and self-assertion, which is why its delegitimisation through the democratic transformation in the 1990s is problematic for them. As 'moral losers' of history, old fears regarding the struggle for survival become more relevant again and express themselves in fears of economic deprivation, the loss of cultural identity and political irrelevance due to minority status.

Emotional Narratives and National Symbolism: Neo-Ottomanist Construction of National Days in Turkey

Haktan Ural

Ankara University, Turkey

This research aims at understanding the transforming discourses of national identity, particularly focusing on the case of Turkey. Using the rhetoric of constructing 'new Turkey', the JDP government in Turkey has put into practice a novel mode of identity politics, seeking to redefine the Turkish identity as a religiously conservative nationality that exalts its Ottoman past. By taking this political and cultural transformation as a point of departure, this research investigates cultural politics of emotions enmeshed in national symbolism. To do so, I specifically examine transformations of national days as a particular technology of symbolism. Specifically, I examine the celebration of Istanbul's conquest by Ottoman forces in 1453. I draw upon media texts as a heuristic to illustrate the symbolism of national identity, in which contesting definitions of Turkish identity are created, maintained and negotiated. Scrutinizing the ways that national days are claimed or disclaimed, reinvented or contested through media texts, I suggest that media discourses are not only a regime of knowledge that marks the symbolic boundaries of national identity. I instead build upon Ahmed's (2004) views on "emotionality of texts" and argue that discursive practices are laden with diverse emotional registers that produce the boundaries and meanings of nation (Ahmed, 2005). Discursive constructions of national identities are thus regimes of truth that are also moulded by affective orientations towards the nation. Viewing through this lens, remembering the national past is deeply linked to affective dispositions towards the past; what is remembered as national and how it is remembered cannot be dissociated from the emotional narratives.

The Functions and Disfunctions of Shame in Turkey, as it's Processed in the Books of Manners Published During The Early Republican Period

Tülin Ural

Mimar Sinan Fine Arts University, Turkey

Elias mentions the rise in the threshold of shame during the civilizing process. Shame gradually secularized and begins to be absorbed in the daily and worldly life. Of course, this was a process closely linked to sexuality and gender, precisely because of its bodily essence. Whether you read from Elias or Foucault, from the East or the West, shame is like the code name for civilization.

A similar process is experienced in the Ottoman Empire throughout the Westernization age that started in the second half of the 19th century. It continued in the first years of the republic too, where the westernization attempt both assumes a new character and gains momentum. In this presentation, I will analyze how the civilization process is fashioned in Turkey, by tracking the possible forms that shame took in the books manners. How did these books, which carried the tension of entering the halo of another civilization and the enthusiasm for a new life at the same time, deal with shame? Who was expected to be ashamed and of what? Or, on the contrary, what embarrassments were denied, excluded? How should shame be expressed? After all, why should one be ashamed? We will try to look for answers to these and similar questions by decoding the main meanings constructed around this critical emotion, focusing particularly on the body and the gender dimensions and reaching out to the actual effects of this climate of shame in today's Turkey.

RN11_T04_02 | Life course, family and intergenerational relationships

'So Much Better'? Investigating Single Mothers' Agency Through The Paradoxes of Their Post-Separation Feelings

Béatrice Bouillon

Paris-Dauphine PSL, France

My PhD research is concerned with single mothers' perception and negotiation of social, and especially gender, inequalities. This paper is based on life interviews I conducted with thirty French mothers of various age, class, race and residential area, who separated from their children's father and are now their primary caretakers.

Single mothering remains primarily constructed in terms of deficits, in relation to two central norms: women can only be accomplished in (heterosexual) couples, and children should grow up in two-parents families. Within such a problematization, a 'good' single mother may only feel sadness, devastation and loss about separating from her children's father. The mothers I interviewed did mention such feelings, but they rather emphasized having felt 'relief', 'peace', 'freedom', thereby challenging the main narratives representing them as mere victims lacking agency. I want to explore the collective and political implications of these seemingly individual emotions.

Interviewees mentioned having felt 'so much better' as a surprise: they expected to feel overwhelmed, lonely and helpless, but 'came to realize' how little their daily limitations actually were and how much time, space and/or enjoyment became available to them. Formulating such a 'realization' while having to face de facto deteriorated conditions of life exposes how quitting direct dependency upon men can be experienced through feelings, in a cultural context that conceals this aspect of single mothering. I therefore argue that single mothers' feelings towards their separation can be approached as ordinary ways of experiencing their agency outside of relations of direct gender dependence. If emotions are a key way through which power relations operate, they may also be one through which subordinated subjects can disrupt them in ordinary ways.

Vicarious parenting

Alison Marie Fixsen, Damien Ridge, Cerys Evans

University of Westminster, United Kingdom

Practitioners working with disturbed and neglected children and young people face many practical and personal challenges, including intense emotion work and secondary trauma reactions. Despite the literature supporting the view that mental health professionals experience secondary trauma in its various forms, limitations remain in the broader literature in terms of conceptual clarity and an understanding of the consequences of working with clients who have been traumatized. An under-explored area is the practitioner requirement to negotiate with children's parents and to process feelings towards both parents and children. We used an inductive, qualitative method (Charmaz, 2005) to collect and analyse data from semi-structured interviews with female professionals worked with challenged and neglected children and young people in different capacities. While participants spoke positively about their vocation and satisfaction gained from acting as an agent of change in young peoples' lives, they also related highly intense emotional work and traumatic accounts, using powerful metaphors to convey the impact of hearing and processing stories, indicating vicarious trauma effects and a strong parental invocation in therapists, including maternal feelings toward some children ("vicarious parenting."). Some parents were cast as potentially harming a child and obstructing the professional's work. Our paper fleshes out vicarious parenting as a particular form of countertransference and offers it up as a concept for investigation in other relational areas such as education. In terms of future policy, our study highlights the need for greater recognition of the intense emotion work performed by practitioners working with disturbed and neglected children and young people, and the need for specific training concerning parental roles and more frequent supervision for newly inducted staff if burnout is to be avoided.

Transformations of 'Resonance': Affective Choreographies Throughout Life Course Transitions

Anna Wanka[1], Luisa Bischoff[1], Annette Franke[2]

[1]Goethe-University Frankfurt, Germany; [2]Protestant University of Applied Sciences Ludwigsburg, Germany

In his "Sociology of Our Relationship to the World" (2019), Hartmut Rosa introduces the concept of resonance as the fundamental mode individuals relate and find themselves in the world. He argues that the great crises of modern society have resulted in alienation from the world, where resonance represents an affirmative self-world-relationship.

In this paper we want to link the concept of resonance to ruptures in individual life courses. Focusing on the transition to retirement we ask how affective experiences of resonance are being transformed. Based on a reflexive mixed-methods design, the contribution combines quantitative panel data (German Ageing Survey) with a qualitative longitudinal study.

Results show that the transition to retirement entails a phase of disaffection (lack of resonance) at the end of one's working life, followed by a liminal phase in which people search for intensified experiences of resonance, and consume respective offers ranging from therapy to wellness, as well other products and services of reification. This desire for resonance, however, tends to be beyond intentional management

We come to the conclusion that life course transitions entail affective choreographies of experiences of resonance, dissonance and alienation that emerge in (transformations of) everyday practices. In an outlook, we discuss how life course research and a sociology of emotions could be fruitfully combined, but also highlight the fields' methodological challenges especially the operationalisation of resonance implications.

Understanding Loneliness: Narratives of Young and Middle-aged Adults in Lithuania

Margarita Gedvilaitė-Kordušienė, Gražina Rapolienė, Joana Butėnaitė, Vaida Tretjakova

The Institute of Sociology of the Lithuanian Centre for Social Sciences

The indicators of loneliness place Lithuania on the top among the countries of the European Union. This experience is common not only among more researched older population, but has also become an epidemic among young and middle age adults (Swader 2018). In academic literature loneliness is usually defined as an unpleasant experience due to the mismatch between the number and quality of desired and actual social relations (Perlman & Peplau 1984), delineating social and emotional loneliness (Weiss 1973). A study of K. Dahlberg (2007) revealed associations of involuntary loneliness with lacking feelings of inclusion, belonging and participation. Paradoxically, people can feel lonely despite rich social contacts or not feel lonely while being socially excluded. Considering that "loneliness" in academic and public discussions covers a wide range of conceptions, this study aims to reveal the variety of subjective interpretations of loneliness.

The study is based on 45 narrative interviews with young and middle-age (18-59) adults experiencing loneliness. The interviews were conducted in December 2020 – February 2021. The research is funded by the Research Council of Lithuania (LMTLT), agreement No S-LIP-20-23.

The results reveal that subjective interpretations of loneliness are multi-layered and complex. The mostly expressed dimension of loneliness is inter-personal, emphasizing not the quantity, but the quality of relationships. Loneliness manifests itself as a lack of connection (interpersonal and with oneself), sense of being misunderstood, ignored or sense of exclusion. Other loneliness defining dimensions consist of work-related, cultural/local, religious and creativity arguments.

RN11_T05_01 | Emotions in postcommunist Eastern Europe

Between Loss, Resentment and Resilience: Narratives of Post-Communist Transformation in Lithuania

Jogile Ulinskaite

Vilnius University, Lithuania

Lately, the backsliding of democracy and the challenge of populism has become a widely debated topic in CEE. Part of the success of populist politicians is related to the fact that recent historical events still evoke emotional experiences in society. The post-communist transformation has led not only to feelings of enthusiasm, excitement, and euphoria (Trnka, 2012) but also triggered scepticism, anxiety or even caused cultural trauma in the society (Sztompka, 2000, 2004). Memories of the post-communist transformation affect citizens' political attitudes up until today (Ramonaitė, 2014). Considering that emotional narratives are powerful tools for mobilizing voters and supporters, we need to understand how people narrate their experiences of the transformation. In this paper, I aim to reveal emotional stories as told by Lithuanians regarding the post-communist transformation. To do that I analyse oral history interviews conducted in Lithuania. The analysis uncovers complex and manifold emotional memories regarding the post-communist transformation period. Informants spoke about feelings of anger and resentment related to sudden changes in their immediate social environment. Others recalled experiences of grief, feelings of emptiness and disappointment as a response to ongoing processes in their surroundings. Some others talked about an intense period and about difficult changes with a successful ending. As a result, several types of emotional narratives, involving different sets of emotions, are presented.

Deep Transformations: Emotional Experiences after the Post-Communist Change

Monika Verbalyte

Europe-University Flensburg, Germany

Authoritarian and populist leaders recreate emotional narratives of history because they provide powerful tools to mobilize voters. Regimes in Poland and Hungary are good examples for this, however, also higher support for AfD in East Germany indicates that appeals of this party resonate better with transformation experience. However, we still know very little about how the change of political regime influences on societal emotional climate and individual experiences. The objective of this contribution is therefore twofold: 1) to find the possible theoretical framing of these processes; and 2) to test their feasibility empirically.

First, I will provide theoretical opportunities to define deep transformations: 1) as change of emotion regime (Reddy) from totalitarian to democratic possibly in the direction of informalization (Elias, Wouters); 2) as cultural trauma (Alexander, Sztompka) leading to experiences of grief, depression with sometimes long-term consequences of felt helplessness and ressentiment (Demertzis, Salmela); 3) as phases of social movement: enthusiastic political action and emotional fatigue later (Jasper, Goodwin).

Second, I will try to find out what kind of conceptualization and emotions are reflected in human experiences. For that, I will conduct a secondary analysis of interview material collected in former GDR in 1993-4 by Helena Flam for her book "Mosaic of Fair". It investigated how fears of the totalitarian regime were managed by the people before the 1990s, but since interviews were constructed as biographic narratives, they also provide details on the other aspects of respondents' lives and emotional experiences, not rarely regarding political regime and transformation.

429

Strategies of Expressing Personal Sadness vs Modernization and Politization of Death: The Case of Soviet Lithuania

Nerija Putinaitė

Vilnius University, Lithuania

Meaning, rituals and even feelings regarding death have cultural and social roots (Van Brussel and Carpentier, 2014). The approach of the history of emotions (Reddy 2001) allows speaking about emotional regimes related to death that are approved and supported by the society or even constructed and implemented by the political regimes.

In the Soviet Union politics of death constituted a part of the state's political religion. The fact of death was reduced to the medical fact, and the meaning of death was based on the concept of "social immortality" (Malysheva, 2019). The state modernized the cemeteries and controlled the erection of gravestones, and created new rituals related to death. The sadness and mourning about the dead were depersonalized. The public practices of mourning and sadness were constructed according to socially and politically relevant hierarchy of the dead.

Personal feelings towards the dead and personal forms of expression of sadness were pushed to the margins of exemplar practices. However, personalized attitude towards death persisted and eventually impacted forms of the political control of death. In the field of politics of death there emerged a hybrid shape of death, which combined personal sadness and mourning with the political and social expropriation of death.

The presentation explores the persistence of personal sadness in the context of politically controlled death by analyzing two types of materials: mournful messages on bands on funereal wreaths, and erection of personalized gravestones. The examples are taken from the death practices in Soviet Lithuania in 1965-1989.

Layers of Exclusion. Tracing Sentiments of Social Misrecognition in Biographical Narratives of the Post-1989 Period

Till Hilmar

Bremen University, Germany

A mounting social science literature demonstrates that experiences of social exclusion, and the sentiments of misrecognition that they regularly generate, have profound effects on individuals and society. They shape deeply held beliefs, affect social and political trust, and make people more likely to support authoritarian political movements. In my contribution, I examine how emotions of exclusion are articulated in biographical memories of the post-1989 period in two formerly socialist societies (East Germany and the Czech Republic). The turbulent transformation provides a framework that is rich in dynamics of social inclusion and exclusion. Analyzing 67 semi-structured interviews with respondents who experienced the rupture of 1989 as young adults, I focus on how episodic memories of misrecognition and social exclusion specifically of the early 1990s are narrated. Drawing on a cultural sociological analysis as well as concepts from relational sociology, my analysis demonstrates that key experiences in the sphere of work as well as in the sphere of intimate relations (especially friendship ties) are closely interrelated when it comes to narrative accounts of emotions of exclusion and (failed) expectations of recognition. Comparing two transformation frameworks also allows me to examine more systematically how broader (and to some extent, collectively shared) scripts about the meaning of this period enter peoples' memories of individual misrecognition in the past.

Keywords: post-communist transformation, recognition, relational sociology

Breaking up is Hard to Do: Negotiating Feeling Rules In Youth Breakup Cultures

Raquel Boso Perez, Ruth Lewis, Kirstin Mitchell

University of Glasgow, United Kingdom

Heartbreak, relief, grief, and other emotions characteristic of breakups are often experienced as private and individual; yet these feelings are also socially patterned. Young people often have little knowledge or experience with which to navigate this complex process of disentanglement. Breakups can therefore become prominent sites where unhealthy relationship dynamics manifest. LGBT youth, who face a lack of prescribed relationship norms and minority stress, may experience added challenges when breaking up.

Focus groups were held to explore the social construction of breakup cultures among a sexually and gender diverse sample of 28 young people aged 15-24 recruited via youth groups in Scotland. Thematic analysis focused on elucidating the 'feeling rules' (Hochschild,1979) governing young people's emotional rights and responsibilities during the breakup process.

Breakups are structured by multiple 'rules of disengagement' including that: one should be appropriately distressed during a breakup; that one should not cause unnecessary hurt to one's ex-partner; and that one should no longer be in love with their ex. The negotiation and contestation of these rules demands 'emotion work' with (ex)partners and peers. Factors such as initiating the breakup or one's social membership, in particular gender and sexual orientation, shaped the rules of disengagement. A focus on emotion additionally highlighted tensions regarding the role of violence in youth breakup cultures, which was posited as both an exception and sanction to breaching the rules of disengagement. Understanding breakup cultures is imperative given the importance of young adulthood to the formation of a person's values, behaviours, and interpersonal skills.

Overwhelmed by the Future- Young People Facing Uncertain Futures

Natàlia Cantó-Milà[1], Mariona Moncunill-Piñas[1], Swen Seebach[2]

[1]Universitat Oberta de Catalunya, Spain; [2]Universitat Abat Oliba, CEU, Spain

In this paper we present the final results of our research on the imaginaries of the future of the young. In the course of this research we have worked with teenagers who have shared with us their views on the future, allowing us to gain an understanding of their shared imaginaries of the future, their shared discourses and also taken-for-granted assumptions. Resulting from our data analysis, we have been working with three different scenarios of the future: probable futures, desired futures and unwanted futures. These scenarios, which we have mapped through our data analysis, show how young people narrate their futures highlighting their possibilities of agency in their individual decisions, plans and expectations (or those related ot their circle of intimates), while they hardly consider any agency at all when it comes to collective processes. At the same time, though, they do not reflect on the interrelations and mutual dependencies existing between the individual level (on which they feel capable of action) and the collective level (which is referred to in passive voice). In this paper we will explore and discuss these results, particularly exploring the feeling of being overwhelmed by the projections, narratives and anticipations of the future.

Classed emotions among 15-year-old Girls in Norway

Kathrine Skoland, Brita Gjerstad, Hulda Mjøll Gunnarsdottir

University of Stavanger, Norway

The media in Norway tell stories of how young people, especially young girls, are depressed, anxious, and stressed as they struggle to become perfect in a range of social areas. These issues are rarely seen as related to structural inequality, power relations and social class, which contributes to undermine the relevance of such factors for understanding young people's emotions and identity and, further, their development towards a good life. Statistics on educational choices among 15-year-olds

431

in Norway tell a different story about the presence of social class in these young peoples' lives. These choices are closely related to both gender and class: 15-year-old girls from families with smaller resources are steered towards gender-typical, low-status, caring-for-others occupations ("Healthcare, childhood and youth development") (Reisel, 2014; Reisel, Hegna, & Imdorf, 2015). Thus, our research question is how educational choices among 15-year-old girls in Norway might be linked to apparent class- and gender related emotions and perceptions of everyday life. Through analysis of 6169 female 10th graders this paper will identify class differences between a variety of indicators on young girls' self-reported level of well-being. Our findings show that there are class differences, not in psychological and psych-social factors such as depression, anxiety, or pressure, but rather in emotions connected to self-value and self-efficacy. Our findings thus relate to a body of research on how individual identities are classed identities and how working-class women are struggling, not for perfection, but against unjustifiable judgment. This struggle entails both class- and gender related expectations and emotions.

RN11_T06_01 | Civil society, activism and collective emotions

Evoking, Realizing and Silencing Diversity Affective Dynamics in Civil Society Organizations

Yvonne Albrecht, Serhat Karakayali

Humboldt University Berlin, Germany

Organizations which deal with the institutionalization of diversity are often facing inertia. In this regard, the dispute over the change of normative patterns and institutional rules can be carried out in democratic organizations within the formal arenas provided by the organization. According to Alexander (2017) actors need to emotionally dramatize injustices for successfully making their demands. Dramatization leads to heightened tension and anticipation. The aesthetic "tool" of framing and heightening experience is employed in particular situations for the purpose of creating critical moments. For investigating these aspects of affective dramatization in organizations, we will present empirical

data from our current research project "ZOMiDi" which researches how different civil society organizations in Germany deal with aspects of diversity and migration. In our subproject at the Berlin Institute for Integration and Migration Research (BIM) at the Humboldt-University we investigate the trade union "ver.di". Our material from the federal congress of the organization in 2019 allows first insights in the questions of how and with what affective ramifications diversity is evoked, realized, or silenced in organizational settings and which affects do processes of diversifying institutions arouse in all actors involved (see also Warstat and Dilger). Aspects of the manner of emotionalizing injustice play an important role in the support of such demands received from the organizational electorate: Attributing the "cause(s)" of such injustices and evoking empathy seems to receive more substantial support than blaming the organization. As expression of internal resistance, members also can mobilize emotional responses (such as emotional threat) to ward off such criticisms, e.g. by announcing to withdraw their identification with the organization

Emotions of Protest in Physician's Mobilizations During the Pandemic in Turkey

432

Deniz Günce Demirhisar

IFEA (Institut d'études anatoliennes) & EHESS (Ecole des hautes études en sciences sociales)

Since the beginning of the Covid-19 crisis, physician's professional organizations played a key role in the opposition to government's public health policies. The Turkish Medical Association (TMA) with his 100 000 members (88% of the practitioners), provided alternative statistics to official numbers of covid19 cases, offered expertise in epidemiology through independent media, and insisted on the unsatisfactory work conditions of medical professionals. Moreover they mobilized as an important social actor by denouncing numerous impacts of health policies on social life as a whole. The narratives of their protests are framed both by scientific expertise and legitimacy, and by the expression of a wide range of emotions, moods and affects from grief and anger to exhaustion. This paper analyses the entanglement of the scientific discourse with the emotions of protest in order to shed light to the function of affective framing in mobilizations for an alternative future in a non-democratic context. Despite their focus on health policies, the grievances of the medical doctors address as well major political issues such as social inequalities, democracy and ecological crisis. The data stems from in

depth interviews with TMA members, the analysis of their online publications and their social media activity. Through this case study, with a lens of sociology of emotions, I show how the health crisis led professionals to sustain and widen their political commitment and the ways in which they envision the future.

The Transformations of Activism in the Internet and Identity Age: the Emergence of Fat Activism in Brazil

Natalia Rangel, Marcia Mazon

Federal University of Santa Catarina, Brazil

This paper aims to analyze comparatively socio-cultural and political aspects that influenced the emergence of fat activism in Brazil and the United States. While in the United States the second wave of feminism and the hippie movement influenced the constitution of a fat anti-capitalist activism of indignation with the markets (pharmaceutical, food/diet and fashion industries, among others), in Brazil, despite the North American influence, fat activism from its beginning develops distinct characteristics such as main communication via the internet and the influence of the plus size fashion industry as an "emodity", having its emergence in the 2000s. Thus resulting in the mobilization of different emotions and political actions. To this end, data from previous field research about fat activism in Brazil are used, in addition to bibliographic research on the historical contexts and fields related to the mentioned activisms, such as science (health) and markets. The relationship among fat activisms in these countries, emotions and the market is understood based on the concepts of "hostile worlds", "nothing but" and "connected lives" by Viviana Zelizer, Deborah Lupton's idea of self-entrepreneurship in neoliberal societies and the attribution of meaning from therapeutic narratives according to Eva Illouz.

Ireland's Moral Revolution: Critical Events and Collective Emotions

Lisa Smyth

Queen's University Belfast, United Kingdom

What role have collective emotions played in Ireland's transformation from a conservative, deeply gendered society in the 1970s to one which is now often regarded as a beacon of individual liberty? What does this mean for the possibility of social solidarity? This paper addresses the transformation in Ireland's 'habits of the heart' (Bellah et al., 1996), by examining shifting collective emotions. The significance of collective expressions of shame and solidarity are traced, as they underpinned the form and direction of major moral conflicts, from abortion access and equal marriage to religion in schools. The focus is on critical moments in Ireland's moral politics across five decades, as struggles for a broad-based, democratically oriented solidarity played out against more conservative, patriarchal, and ethno-nationally exclusive alternatives. Relying on critical theory, the paper develops an original treatment of social change through the collective emotions provoked by critical public events. This approach illuminates the tensions and complexities embedded in late capitalist forms of individualism, as they shape attitudes to gender, sexuality, reproduction, and family life, as well as generalized attitudes of compassion, belonging and obligations of mutual support. Attention focuses on the significance of emotions for expectations of collective life and solidarity across differences and divisions.

433

RN11_T06_02 | Emotions on the internet and the media

The Cognitive Construction of Emotion Concepts in White Supremacy Culture : the Influence of Controlling Images in Western tv Series

Julien Quesne

Université du Québec à Montréal (UQAM), Canada

Through a cognitivo-constructivist perspective, I will discuss the effects of the white supremacist culture (Leonardo, 2004) on the social and cognitive construction of dominant groups' concepts of emotion. Overall, I will highlight the epistemic compatibilities between Barrett's theory of constructed emotion (2017) and decolonial and feminist approaches of emotions (Ahmed, 2004) in order to analyze the latter as political tools of the coloniality of power (Quijano, 2007). In this context, the symbolic space of serial fictions does not escape the relations of domination that structure the social world. More concretely, I will report on the emotional experiences lived by these groups in contact with "controlling images" (Collins, 1990) on race, gender and class encountered in Western fictional television series. The aim will be to explain how these emotional experiences are negotiated, that is, how media violence expressed through these images is cognitively integrated or resisted by dominant groups. To do so, I will identify which cognitive behaviours support emotional discourses and practices (Wetherell, 2012) in reference to "controlling images" on race, class and gender broadcast in tv series. I will show how the concepts of imaginative resistance (Hande Tuna, 2020) and affective realism (Barrett, 2017) can be used to better grasp politically a decolonial interpretation of the emotional dimension of the dominant groups' agency.

The Emotion is the Message. A Quantitative Inquiry into the Politicians' Social Media Activity During the COVID-19 Pandemic in Hungary.

Gabriella Szabó, Balázs Kiss, Lilla Szabó

Centre for Social Sciences, Hungary

Despite the growing number of studies discovering the strategic use of emotions in political communication, many aspects of the mechanisms involved in the emotionally loaded discourses are still unclear. The proposed empirical analysis measures the use of affective expression in social media according to the Warren TenHouten's categories of emotions. The four pairs of opposite primary emotions such as acceptance and disgust, joy and sadness, anger and fear, anticipation and surprise are investigated to map out to what extent the used emotional words and which were the most dominant in the Covid-19 related Facebook messages. With the aid of corpus linguistics' technique, we defined the list of expressions, which potentially indicate the display of TenHouten's primary emotions. We collected data from the social media profile of political leaders of parties having seats in the Hungarian National Assembly and analyzed the content of 1064 Facebook posts between March 4 (Hungary's first confirmed coronavirus case) and December 31, 2020. Data suggest that politicians offer emotion-focused coping by delivering direct messages to the followers about the modification of feelings ("be careful"; "do not panic"; "Let us be proud"; etc). We argue that such diverse use of emotional expressions and connotations (like metaphors) intentionally and selectively interpret the meaning of an event or a situation, therefore propose the subjective (re)evaluation of the story. By communicating certain affective states and directly propagating changes in the emotions, the political leaders take an active part in the cognitive reappraisal of Covid-19 in public discourses in Hungary.

434

Emotion Work, Meme Wars and the COVID-19 Vaccine Public Controversies

Monica Georgescu

University of Bucharest, Romania

The beginning of the year 2021 also marked the official beginning of a global vaccination campaign against the novel Coronavirus. However, along with new vaccines, an old and multifaceted controversy re-surfaced: to vaccinate or not to vaccinate became a hot public issue once again. This research analyzes emotion work and feeling rules (Hochschild, 1979) related to popular COVID-19-related online memes. We analyze COVID-19 vaccine related memes from diverse public Facebook groups, and we identify the emotion work through which new feeling rules and account are advanced to support divergent realities of risk and safety.

In this study, we show how the apparent benign meme is weaponized and used as a tool by social movement organizations (Tarrow, 2011). There is considerable similarity in how vaccination-hesitant and vaccination-trustworthy memes appeal to public emotions, but there is also considerable difference, particularly in how emotions such as fear, suspicion, or outrage are justified and how they are invoked to consolidate social movements (McCarthy & Zald, 1977) and collective participation. This study highlights the critical role that emotion work has in public discourses on vaccination, both skeptical and confident, and documents the evolution of vaccination emotion cultures (Guenther 2009, Koschut 2017) stirred by the global COVID-19 pandemic.

Unfeeling Hope: Affective Practices Of Online Collapsologists

Karl Malmqvist

University of Gothenburg, Sweden

The hope to avoid or limit environmental catastrophe has been a problematic emotional feature of the environmental movement for some time (e.g., Rosenwarne et al 2015). However, as the future of the climate, of biodiversity, and of our energy and economic systems appears increasingly bleak – i.e., as catastrophe looks more and more inevitable – environmental activists are increasingly rejecting such hopes in favor of more adaptational stances (e.g., Bendell 2018; Ingram 2019), a tendency that has been described as a shift towards a post-apocalyptic environmentalism (Cassegård & Thörn 2018). Yet, all activists are part of the society they are trying to change, which means that they are also part of the emotional regime of that society. To actually become agents of change subjects, they need to deintegrate from society's feeling rules (King 2006). For environmentalists, this might involve deintegrating from feeling rules that prescribe hope in the possibility of avoiding environmental catastrophe through technological progress. The present paper investigates how participants in an online community of collapsologists (inspired by the collapsology literature, e.g., Servigne & Stephens 2020) try to practice such deintegration from technological hope. Analyzing social media postings and comments as well as interviews with participants in the community from an affective practice perspective (Wetherell 2012), the paper points to various ways in which the participants try to accomplish a non-hopeful emotional community by distancing themselves from proposed technical solutions to ecological, economic, and societal collapse. Implications are discussed.

RN11_T07_01 | Emotions in migration contexy

The Reception of Therapeutic Discourse as a Class Culture in Israel: Immigrant Families and Host Society's Emotional Culture

Rotem Leshem, Rakefet Sela-Sheffy

Tel-Aviv University, Israel

This talk discusses the use of therapeutic discourse in the identity work of immigrant descendants, and its implications for host society's emotional culture. While sociological literature discusses the therapeutic discourse as a class culture, introducing this perspective into immigration studies is still desired. Few studies deal with how therapeutic frameworks provide young immigrants, disconnected from their families, with the emotional capital needed for integrating into the host society's middle-class. Yet these are sporadic analyses on isolated cases. Contrarily, we look at the formation of a therapeutic disposition as a long-term cultural-emotional process that facilitates immigrant families' position-taking in the local mainstream.

The study is based on over 50 interviews conducted with three generations of Jewish immigrant families, who arrived in Israel from Eastern and Central Europe ('Ashkenazim') after World War II. The acculturation of these families is usually regarded as successful, entailing significant emotional change. We discuss the role of therapeutic discourse in the identity work of the second and third generations, in three aspects: 1. In transforming these families' emotional scripts by which self, family and society interplay. 2. In providing them new tools to talk about emotions and perform their selves in changing contexts. 3. In reorganizing the individual's emotional relatedness to collective identities (national, ethnic, or gender). Previously we have shown how the use of this discourse facilitated the migrants' acculturation. Here we discuss its implications for broader changes in the host society's emotional culture — with respect to the prevailing Familism ethos in Israeli culture; to inter-ethnic solidarity; and to gendered family care. These changes point at immigrants' role in filtering therapeutic discourse, thereby transforming host society's dominant culture.

Mourning And Mournability In Forced Migrant's Narratives Living In Nrw, Germany

Helen Sophia Schönborn

Universitat oberta de Catalunya, Germany

In the past decay many European countries have experienced increased forced immigration, which has made the question of living together a crucial one. Forced migration involves many different losses (e.g. people, places, homes, habits, beliefs). However, grief and mourning for these migratory losses is neither recognized nor well understood (Caseado, Hong, Garrington, 2010). For this, it is the aim to investigate social farmings and expressibilities of migratory grieving and mourning rather than the particularity of the individual experience.

While grief is generally understood as the emotional response to loss, mourning is considered to be the expression of grieving in practices or rituals (Jakoby, 2012). Mourning implying gathering, ritualized interactions and sharing is an inherently reciprocal process. The healing in mourning rituals might take place in mutual recognition of the other's loss and the worth of this loss. Recognition might allow people to smooth grieving and to construct a new relationship with the loss. For forced migrants, losses are numerous and overwhelming, which might make mourning a great challenge. It is the aim of this article to explore the possibilities of mourning migratory losses considering its reciprocal nature and thus the role of local citizens.

This study concentrates on the region NRW (Germany) and Catalonia (Spain) as a contrast case because these regions have experienced highest immigration while having different experiences of recent forced immigraiton. Open-ended autobiographical interviews have been conducted with forced migrants and citizens of the respective country (18-30 years old). Interviews were analysed following a Grounded Theory inspired approach.

436

Managing Loss and Grief After Family Reunification: Emotional Care of Teenagers of Migrant Background in the Barcelona Area

Montserrat Ferrás Murcia, Alberto Martín Pérez

University of Barcelona, Spain

This paper presents the results of three years of experience in emotional care of teenagers of migrant background recently arrived in Spain, in their first year after family reunification, in a municipality of the Barcelona area. Among various care programs for families and their reunited children, we focus on the development of a specific activity of emotional care carried out by the local authorities in cooperation with different educational and social actors, from which we gathered a set of different testimonies of teenagers and their families about their emotions after family reunification. We adopt an ethnographic perspective, from a participant observation developed at the same time that the emotional care workshops were conducted. In the stories of reunited teenagers and their families, we highlight two emotions that emerge from the vital process of parental migration and subsequent family reunification: loss and grief. Loss is presented from the perspective of children who were left for several years in the country of origin under the care of other relatives while their parents were working and living to Spain. It is the loss of the family bond that generates strong family and social integration conflicts when arriving in Spain. Regarding grief, we focus on that of the parents and their feeling of guilt in front of such a forced situation. Finally, the paper reflects on the role that the emotional care workshops play, not only in bringing out emotions, but also in contributing to conflict resolution and better social integration.

The Fine Line Between Staying and Leaving: Rupturing Narrative of Emigration and Emotion in the Latvian Emigration Towards the West

Iveta Kesane

Latvian Academy of Culture, Latvia

In the literature emigration from Eastern Europe towards the West has been explained by socioeconomic and structural factors. Recent studies explore also emotional dimension of this emigration. Based on the field work where I did 59 in-depth interviews with those Latvians who have left and 19 in-depth interviews with those who have remained at home I find that, in several instances, the line between staying and leaving is fine. This fine line can be explained as a narrative of emigration motivation that ruptures. These "rupturing narratives" (Rosen, 2017) shape as emotionally „deep" (Hochschild, 2016). I provide several vignettes from my fieldwork to reveal, for example, how initially socioeconomic motivation to emigrate in emigration gets re-narrated to frame life at home as emotionally rewarding despite socioeconomic precarity or how socioeconomic motivation to leave cede in front of emotional needs to be with one's children or how inability to access emigration gets reframed as a chance to empower oneself at home. These examples challenge conventional reading of emigration as rationally coherent stories of households or individuals.

RN11_T07_02 | Love and desire

Relationship Desire and Wellbeing: Cross-Sectional and Longitudinal Analyses of Relationship Desire and Life Satisfaction

Elyakim Kislev

Hebrew University, Israel

Existing literature on relationship desire and life satisfaction among singles provides mixed findings from a limited range of datasets. Accordingly, this study uses data from the Panel Analysis of Intimate Relationships and Family Dynamics (pairfam) studies in order to investigate patterns of relationship desire and life satisfaction among divorced and never-married adults. The results of cross-sectional analyses showed that never-married men and women, as well as divorced women, depicted negative correlation between relationship desire and life satisfaction. Yet, the perceived benefits of singlehood are a stronger correlate of relationship desire than life satisfaction, thus reducing the likelihood of a halo effect argument. Furthermore, a panel data analysis indicated that decreases in desires for a relationship are significantly associated with greater life satisfaction for all but one of the demographic groups investigated: divorced men.

A « Spontaneous » Sexual Desire? Women's Emotional and Material Work on Heterosexual Intercourse

Cécile Thomé

Ined, France

Sexual desire is very widely studied nowadays, whether by the neurosciences, psychology or medicine. The common point of all these approaches is that they seldom take into account the social conditions that allow, encourage, or on the contrary prevent sexual desire. It is thus decontextualized and, consequently, largely depoliticized, as if it occurred outside any system of domination. Based on the theoretical framework of the sociology of emotions, this paper aims to fill this gap by offering a sociological approach of sexual desire.

Drawing on interviews I conducted in France with 71 men and women on their intimate lives, but also on quantitative data (French quantitative studies on sexual and contraceptive behavior), the paper investigates the spontaneity of heterosexual desire and the material conditions of its possibility. It shows that in a heterosexual relationship, desire can only come spontaneously for some individuals – especially men – and at the cost of the work of other individuals – especially women. To allow men's desire to express spontaneously, not only do women have to perform a kind of emotional work (in the sense of Hochschild), but also different forms of material work (on their display, the contraception they use, etc.).

By investigating sexual desire from a sociology of emotions perspective, this paper shows that in addition to participating in an unequal model of sexuality, the behind-the-scenes work on the sexuality that underlies women's experience thus entails a risk for them: that of distancing themselves from their own desires, and therefore to be less sexually satisfied.

Choice or Taboo? Betrayal in the Opinion of Academic Youth - an Empirical Commentary

Joanna Wróblewska-Skrzek

Cardinal Stefan Wyszynski University, Poland

Betrayal is a timeless phenomenon. Betrayal, adultery or infidelity, regardless of the etymological approach, date from the beginning of civilization. Interestingly, the moral evaluation of betrayal and its consequences has always had strong cultural connotations. What characterizes betrayal in modern times is its universal character, availability and form. It seems essential to establish whether today's youth, when building their intimate relationships, are guided by an individual choice or by social prohibitions and orders? The aim of the article is to show not only the way of defining betrayal by assessing attitudes falling within the spectrum of betrayal - both in the physical and intimate (emotional) aspect, which can define betrayal, but also the conditions that can cause cheating. The proposed reasons for the betrayal are explained in terms of both biological and cultural correlates.

The presented empirical material was collected as part of the research project "Academic youth in the times of the pandemic about family and religion". The survey was conducted online using the CAWI technique in selected academic centers in Poland, in spring 2020. (N = 621). The research was exploratory and show the subjective approach of the respondents to selected phenomena, in this case to betrayal. The conducted analyzes indicate a crisis of closeness, the lack of ability to establish lasting relationships and relationships, as well as a decline in empathy and an increase in narcissism in today's societies. There is also a visible tendency to seek romantic love with a simultaneous need for sexual freedom

Emotion Regimes In Market-Driven Welfare Services: Between Anxiety And Solidarity?

Sigrid Betzelt[1], Ingo Bode[2]

[1]Berlin School of Economics and Law, Germany; [2]University of Kassel, Germany

Contemporary studies of welfare state transformation in Europe reveal both a growing role of mar-ket-based governance and precarious work for growing sections of the population. What has hith-erto attracted much less attention are emotional repercussions within welfare-providing organisa-tions, concerning the interface between workers and management: interaction with citizen-consumers; and social bonds at society level. We argue that two dynamics coincide here. First, ob-jective insecurity has grown not only for users but also for service agents – due to, among other things, volatile (quasi-)market dynamics and competitive performance measurement within and across provider organizations. Simultaneously, agents are faced by vulnerable user groups feeling uncertain about their future and social support on offer. Second, within welfare-providing organiza-tions, new organizational tensions challenge subjects emotionally, with the latter torn between managerial prescriptions and socially perceived necessities. We assume that all this is amenable to a new 'emotion regime' fuelled by feelings of anxiety, impacting on workers, management and users alike. In this regime, emotions become a means of gouvernmentality, e.g. when managers use fears to discipline employees or to increase the latter's resilience, even as workers develop diverse coping strategies. Concerning the regime's wider ramifications, various scenarios are conceivable. Thus, work ethics under pressure could produce feelings of solidarity with vulnerable user groups and feed into strategies of resistance. However, the aforementioned tensions may also produce anti-social resentments and destroy social bonds. Drawing on diverse strands of sociological schol-arship as well as own case study research, our paper will substantiate these reflections by inspect-ing two fields of social welfare provision in Germany: vocational further training and elderly care.

439

Emotion Work Under a Universalized Social Programme for Trauma-based Care - A Case Study of Kindergarten Teachers Caring for Refugee Children

Tale Steen-Johnsen[1], Lisbeth Ljosdal Skreland[2], Eric Kimathi[3]

[1]University of Agder, Norway; [2]University of Agder, Norway; [3]University of Agder, Norway

A programme for trauma-based care (called TBO) is currently being introduced by the municipality of a mid-sized Norwegian city. The aim of the programme is to enable kindergarten teachers to accommodate refugee children into the institutional setting of kindergartens. In this article we apply the lens of emotion work, inspired by Hochschild (1979, 2003)-to understand how TBO-a universialised programme based on attachment theory, influence the emotional interaction between kindergarten teachers and refugee children. We suggest that the programme provides "feeling rules"-describing the appropriate way of caretakers to accommodate newly arrived refugees. The dominant feeling rule of TBO, is to make the refugee children feel "safe". The study outlines how the kindergarten teachers adapt to these feeling rules in different ways, and how they become governing for the interaction between the teachers and the refugee children.

Relevance: There is ongoing scholarly debate on what attachment theory means for how caretakers view the development of children, and how this view of children has implications for practice (i.e. Søberg Bjerre, Jacob Madsen, and Petersen 2021). We discuss the implications of TBO to the work of the kindergarten teachers but also shed light on adjacent questions such as what being treated as potentially traumatized mean for the refugee children.

The data which forms the base for our discussion is eight semi-structured interviews with kindergarten teachers working in kindergarten specializing in accommodating newly arrived refugee children in Norway. We also relate our discussion to data from participant observation in the same kindergarten.

Shame Dynamics As Challenges For Social Work Services

Sara Blumenthal

University of Klagenfurt, Austria

I present first results of my ethnographic study "Shame dynamics in interactions between youth and pedagogical professionals in residential care in Austria". Using a Grounded Theory approach, I ask about the occasions, the modes of expression and the handling of shame in the context of aggression in interactions. Thomas Scheff (2014) states that shame has basic social-regulatory functions in Western societies but is concealed because these societies tend to devalue shame as weakness. Sighard Neckel, referring to Scheff, elaborates that shame and shaming also serve to negotiate social status ascriptions, for example, through group-based devaluations and social exclusions (cf. Neckel/Pritz 2019). A main finding of my study is that two male caregivers in two facilities express an emotional burden related to youth´s aggression. The caregivers' negative generalizations were accompanied by limited pedagogical work in the two facilities, potentially generating shame among the addressees of this social service. Given this empirical result, I draw on Goffman's stigma theory and point out challenges for residential care facilities as well as Social Work in general.

FREEZE! A Phenomenological Account of Action Paralysis

Laura Danique Keesman

University of Amsterdam, Netherlands, The

When confronted with violent incidents, police officers are expected to act in the situation at hand. This article examines the critical moment of not acting, that is, of freezing. Criminological and sociological studies of violence have, to date, paid little attention to such vulnerable and stigmatized experiences, and the situational context in which they occur. The aim of this article is first to explore what the term freezing refers to: what kind of behaviours and what they have in common. Second, to study the experience of freezing from a phenomenological and embodied viewpoint to understand the ways in which officers try to deal with it. Building on neurological insights and theories on emotional-corporeal transformations (Katz, 1999), this article shows that freezing is a self-enclosing transformation in which officers lose the ability to

intentionally act. Drawing on 20 months of ethnographic fieldwork and 68 interviews with Dutch officers, the analysis reveals that freezing is not just characterized by bodily cessation but also directionless behaviours, and occurs when officers encounter unexpected circumstances. Finally, this article demonstrates that exiting a paralyzing experience requires collective team effort and that those who freeze feel they have abandoned their police role. This article is relevant to sociological studies that aim to further our understanding of the embodiment of social life and knowledge (Fourcade, 2010), and contributes to policing studies by showing how embodied experiences play a key role in police work. By examining in situ experiences, this article generates a thorough understanding of on-the-spot emotion/body regulation.

RN11_T08_02 | Organizations and marketization of emotion

Emotions and Cultural Mediation: the Culturalisation of Social Sensibilities in British Advertising

Nicolás Alfonso Arenas Osorio

The London School of Economics and Political Science, United Kingdom

This paper explores the connections between emotions, culture and the economy within the framework of advertising practices. Based on semi-structured interviews with seven London-based advertising practitioners, this study aimed to analyse the role of emotions in advertising communication in order to answer the following research questions: How do advertisers organise the elicitation of emotions as a process of cultural mediation? And, how emotions are circulated/reproduced according to the prevailing social sensibilities in British culture? The theoretical framework is focused on the concepts of cultural intermediaries and emotions from a sociological perspective. In this way, starting from the premise that emotions are social dispositions that circulate and are reproduced among social agents (Ahmed, 2004a; Scribano, 2019), it is argued that the elicitation of emotions in advertising constitutes what Moor (2012) denominates a work of

'culturalisation', a process that comprises the continuous interpretation and redefinition of culture through emotionally-laden messages to foster advertising communication. The interviews revealed that advertisers perform a work of culturalisation when mobilising consumers through humour and feelings associated with togetherness, which the interviewees identified as the most typical emotional resources in British advertising. It is concluded that advertising's cultural mediation depends not only on the interpretation of cultural meanings but also on the identification of the prevailing social sensibilities that shape culture. These findings are relevant as problematise the ways in which the relationship between culture and the economy in the context of consumption practices is not only mediated by rational elements but also by non-rational settings.

Selling Happiness: The Use Of Therapeutic Narrative In Personal Stories Of Pursuit Of Happiness

Giedre Plepyte-Davidaviciene

Institute of Sociology at the Lithuanian Centre for Social Sciences, Lithuania

441

Striving for happiness is one of the most apparent features of current consumer societies and their cultures. Ample and detailed instructions in pursuing a happy life can be found in self-help literature, traditional or internet media. Such instructions are also being provided in courses or practices by professional psychologists as well as self-taught teachers. To one of the categories of such trainers belong persons who declare that they have undergone self-transformation and have themselves achieved personal happiness. In light of such self-transformation, they organize various programmes or consultation services of "teaching happiness". The aim of this presentation is to demonstrate how the therapeutic narrative is used to promote services that promise happiness. I will present the main findings from the analysis of in-depth interviews conducted with people who claim to have undergone self-transforming experiences leading to personal happiness and who now provide the aforementioned "happiness services. The emphasis will be placed on the construction of first-person life stories that represent the personal path to happiness. The data demonstrate that narratives of happiness are highly related to the narratives of self-awareness and self-realization. Such narratives are seemingly constructed around the ability to overcome obstacles and suffering and free oneself from the

pressures of the external world through continuous emotional management. I argue that due to the historical and cultural contexts of Lithuania, Lithuanian therapeutic narratives adopt not only current western patterns but are also based on specific, local cultural tropes, narratives, and discourses.

Managing Happiness (And Other Emotions) With Coaching

Jose Luis Condom Bosch[1], Ana Burgués[2], Josep A. Rodriguez[1]

[1]Universitat de Barcelona, Spain; [2]Universidad de Granada. Spain

In the context of a study about the organizational field of the happiness industry (Research Grant CSO2016-77248-P, Spanish Ministry of Science) we discovered how a new professional on the supply of happiness products had emerged: the coach for happiness.

Surveying the internet, we have identified different social spaces that promote coaching for happiness or similar services. These websites offer services and explain the benefits of hiring a coach in order to manage "negative" emotions. We found a hub of "life coaches" proposing access to different professionals. It contains public information and contact access to more than 3,000 coaches. From those, we selected a sample of over 300 coaches under the categories "life coach" and "happiness coach" and analysed their offer, CVs, personal trajectories and all the public material available. We used Social Network Analysis for assessing the relational structure of benefits, coaching approaches, values and personal career of such professionals.

Our findings are:

This professional space is in permanent construction, creating discourses that connect personal motivations to be a coach, the results and goals of the process of coaching, and tools for managing feelings or emotions. This net of values and practices are the core of the knowledge that legitimate this professional space. We found two types of coach related with two ideological spaces: one managing happiness and the other managing a set of emotions not far from happiness but instead more specifically connected with economic success.

Legal Encoding As Emotion Management: Analyzing Narrative Transformation in Court

Alessandra Minissale, Stina Bergman Blix

Uppsala University, Italy

The narrative turn in socio-legal studies was motivated by the aim of unpacking actual legal practices of decision-making as a process involving interpretations and evaluation of human experiences. Narratives as stories of intentions and actions are interpreted by legal professionals and jurors/lay judges who need to transform lay people's accounts of events to fit them within objective legal categories. Previous research has mainly focused on lay parties or jurors, showing that this transformation often leaves laypeople confused and flustered and that jurors' decisions build on their construction of stories that they subsequently fit with legal categories. Notably, both strands of research have focused on discourse, to a large extent leaving the role of emotions aside. Here, we develop Charles Tilly's differentiation between the different logics of everyday stories and professional encoding by focusing on how legal professionals' transformation of narratives in court (encoding) influences their emotional attunement with the story at hand. First, we argue that this process is linked to the strict demand for dispassion in legal settings; second, we propose a framework of three dimensions of legal encoding that regulate emotional attunement with the narratives: demarcation, fragmentation, and proximation.

An Inherently Fragile Power Tool: A Conceptual Expansion of Emotional Capital in Court

Cecilia Yvonne Nordquist, Stina Bergman Blix

Uppsala University, Sweden

The discussion of emotional capital reappears tidally in the field of sociology and education. Since the early 1980s, this capital form has been viewed as an inherently feminine capacity employed when no other capital forms are available. In the early publications, emotional capital was conceptualised as growing out of social capital, tightly linked to occupations of care and education. In recent years, emotional capital has instead been associated with cultural capital, a change that has widened the range of occupations where this capital form can be valued, e.g. politics and research, including men to a larger extent. This widening scope of emotional capital has run in parallel to an emotionalization of society, where emotion has become a category of value in society generally, as well as a key tool to exercise power.

This paper develops the conceptual understanding of emotional capital in two ways. First, by rooting the concept in interactionist theory, we emphasize the inherent fragility and strength of this capital form. Second, we expand the research on emotional capital into elite professions, here judges, to develop a taxonomy of types of emotions that are considered available to capitalise on. Judging is an interesting profession since it is tightly linked to power, yet, we argue, depend on emotional capital as a tool in leading hearings and making judgements. We agree that emotional capital relies on cultural capital, but argue that the gain from successfully employing this capital form, its exchange value, is social, anchoring emotional capital in social interaction.

From Uncertainty to Judgment: The Emotional Undercurrents of Legal Decision-Making

Stina Bergman Blix, Nina Törnqvist

Uppsala University, Sweden

Autonomy and independence are key features of legal decision-making. Yet, decision-making in court is fundamentally interactional and collective, both during the information gathering phase of hearings, and in evaluations during deliberations. Depending on legal system and type of court, deliberations can include different constellations of lay judges, jurors, or judge panels. Here, we explore how legal professionals organize the decision-making process in order to integrate independent decision-making within a collective social order. In particular, we focus on the emotional undercurrents of the decision-making process — how emotions guide the interaction rituals involved and motivate rational inferences. Theoretically, the paper departs from an emotive-cognitive judicial framework, which understands emotion and reason as intersecting and continuous. By adding an interactionist perspective, we unveil the collaborative efforts of objective decision-making and critical assessments of evidence. We trace how interactional and contextual factors such as power relations and professional norms influence the participants' inclination to develop and hold on to certain emotions while ignoring others. We show that the route from not knowing to judgment involves moral, performing, and epistemic emotional processes. The analysis builds on extensive ethnographic fieldwork in Sweden, including shadowing and interviews with judges and prosecutors, as well as observations during preliminary investigations, court proceedings and deliberations. The paper actualizes the importance of objectivity work as a joint accomplishment and contributes with a nuanced account of how the decision-making process unfolds in the criminal justice process.

Migration, Emotions, and Boundary Work: Emotional Responses to Migration among the Czech Public

Bernadette Nadya Jaworsky, Radka Klvaňová, Alica Rétiová, Ivana Rapoš Božič

Masaryk University, Czech Republic

Migration can be a very emotion-laden issue, both for newcomers and for host societies. As Boccagni and Bladassar (2015: 74) put it, "[S]ome of the most emotive issues of our times concern not so much the migrant condition as the politics of the migrant phenomenon." Yet, most studies look at the role of emotions in the actual movement and settlement processes of migrants. We contribute to this gap by examining the emotional responses to migration among the Czech public, in both urban and rural settings. Czechia is not a major destination or transit point for migrants and refugees; however, the issue figures high on the political agenda and in the public sphere. Drawing upon the strong program in cultural sociology, we approach emotions as an inherent part of the meaning-making processes of social actors. Qualitative, in-depth interviews reveal a range of emotional responses to migration, such as admiration, pity, joy, discomfort, or shame; it is more complex than simply noting the presence of fear and xenophobia, or alternatively, an openness to diversity and newcomers. Many of the research participants express ambivalent or contradictory sentiments, often based on the country of origin, perceived race, and positioning on a "hierarchy of tolerance." Our aim is to better understand the role of emotions in the boundary work that sustains migration-related attitudes.

Boccagni, Paolo and Loretta Baldassar. 2015. "Emotions on the move: Mapping the emergent field of emotion and migration." Emotion, Space and Society 16: 73-80.

Parody: An Act of Resistance To Racism

Cecile Vermot

Sup Biotech, France

Patson is a comedian born in Ivory Coast who was trained at the Jamel Comedy Club. In his sketches, he uses parody to denounce and question French society about its racism and stereotypes towards "Africans". This form of humor, which could be described here as ethnic, allows him to embody and represent the stereotypes related to slavery, post-colonialism, racism, violence and police discrimination while claiming them. The parody will be considered here as an act of resistance of an infra-political nature. Indeed, as we will see during this presentation, it allows Patson to unmask the absurd and irrational side of racist stereotypes and also of populist discourse in France. Nevertheless, the audience must be aware of the practices of this specific humor; otherwise, his sketches could be interpreted as offensive acts or as literal confirmations of the statements themselves, and thus not lead to the same emotions in the audience

Searching For The "Orange Feeling" – The Creation Of An Imagined Community At A Large Danish Music Festival

Annette Michelsen la Cour[1], Mette Kousholt[2], Emilie Kirstine Holse[3]

[1]University of Southern Denmark; [2]University of Southern Denmark; [3]University of Southern Denmark

What draws 130.000 young people to attend a 7-day open air music festival? The answer is captured in the notion of The Orange Feeling. The name refers to the main stage called The Orange Scene, previously belonging to the Rolling Stones and now the trademark of the festival. When asked to put this feeling into words, respondents described the feeling of togetherness, connectivity, community and emancipation. In a mixed methods study of the feelings attached to the

cancellation of the Roskilde Festival in 2020, the socalled Orange Feeling, that participants share during the festival, was investigated. Due to the cancellation, the study captured young people's emotions of chock, sorrow, sadness, despair and disappointment. The findings indicate that the participants collectively work to create and uphold the socalled Orange Feeling, which symbilizes good and respectful behavior during the festival. Further, the Orange Feeling transforms into a bodily experience during the festival, a happiness that manifests in your body. An important component of the feeling is the unique quality of representing something "un-Danish", suggesting that the Orange Feeling is freedom from everyday life demands, openness towards and care for fellow festival visitors, sharing of resources, warmth and a very strong feeling of belonging to a joyful community. Orange Feeling constitutes a societal utopia distinct from mainstream Danish culture, social norms and everyday life. In this imagined and emotional community with 130.000 strangers, Orange Feeling is constantly recreated, reinvested and reinvented during the 7-day festival. However, it also puts pressure on the individual to uphold this emotional investment, euphoria and enchantment defining the Orange Feeling.

RN11_T10_01 | Emotion in public institutions (3)

Epistemic Emotions in Criminal Procedure. An Example of the Use of Epistemic Emotions as a Tool to Scrutinize the Process of Evaluating Evidence in Cases of Rape

Moa Bladini, Åsa Wettergren, Sara Uhnoo

Gothenburg university, Sweden

In this paper we discuss the structure of evaluating evidence suggested by the Swedish Supreme Court in cases of rape. The theoretical framework derives from sociology of emotions, and epistemic emotions in particular. Epistemic emotions are crucial to cognitive process, they guide attention, motivates and supplements reason (De Sousa 2010, Barbalet 2011, Nussbaum 1996).

A crucial task for a judge is to sort out legally relevant facts from irrelevant ones. In criminal cases judges meet victims, offenders and witnesses telling their stories about an event. The most fundamental and challenging task is evaluating evidence presented by the parties. Swedish criminal procedure is characterized by the principles of free admission and free evaluation of evidence (Ekelöf 2009; Fitger 2014). Although, there are a few rules and principles guiding the evaluation of evidence, some of them codified, others in case law from the Supreme Court. A few years ago, a case from the Supreme court suggest how to structure the evaluation of evidence: starting with ony the evidence presented by the prosecutor. The process shall continue to include the evidence presented by the defense only if the court finds that the evidence presented by the prosecutor fulfils the standard of proof, i.e. beyond reasonable doubt. If not, the court will end up in a verdict of acquittal. The case has got a wide impact in lower courts.

In this paper we will analyse the method presented through concepts drawn from sociology of emotions, and the epistemic feeling of certainty in particular as 'the feeling of certainty freezes the process of inquiry' (Da Sousa 2008).

The Void of the Victim Story – Doubt and Certainty in Rape Cases with Missing Victim Stories

445

Sara Uhnoo, Åsa Wettergren, Moa Bladini

University of Gothenburg, Sweden

This paper analyses epistemic emotions in legal evaluation of rape cases where crucial pars of the victim story is missing. A rape legislation requiring voluntariness, effective in Sweden since July 1 2018, challenges popular norms around 'real rape'. It widens the criminalization of sexual acts to where an active party fails to secure consent from the other, leading to an increase in 'word-against-word' cases where technical evidence is lacking. The legal method of evaluation then begins with the victim's story, tested against: 1. Assumptions about 'credible story-telling'; 2. Assumptions about victim-adequate emotive-cognitive behaviour after the event, evidenced by a) objective circumstances like calling 112, or b) witness testimonies. If the victim's story is deemed credible/reliable, it becomes a baseline for the court's evaluation of the defendant's story. With an emotion-sociological framework, our analysis interprets the chain of evaluation in terms of according 'ontological trust' to the

victim's story by submitting it to a 'certainty-doubt-test' and if certainty is reached, the story is effectively deemed 'true'. Flawed victim stories, where there is no memory of the actual event, may per se indicate rape because the accused has taken advantage of a victim in 'a vulnerable state' of e.g. intoxication. However, when a story is flawed, 'ontological trust' cannot be secured. For lack of supporting evidence, the defendant's claim that sex was voluntary can only be refuted if the victim claims to remember. The analysis highlights emotional orientations of the rational legal evaluation method and its sometimes irrational consequences in rape cases.

Inclusions and Exclusions in the Academia: Affective Landscape in Neoliberal University

Johanna Kristiina Hokka[1], Pia Johanna Olsson[2]

[1]Tampere University; [2]University of Helsinki, Finland

One of the features of neoliberal university is its competitive nature. The intensified competition is argued to poison the collegial, collaborative and altruistic space of academia and create "soulless" academics: disillusioned and distressed academic workers that engage in competition with one another (Archer 2008; Davies & Petersen 2005). Simultaneously, collaboration has become a modern mantra of neoliberal university and a strategic management tool directed at increasing research performance. These conditions generate a complex set of inclusions and exclusions in academia.

In our paper, we look at neoliberal university as an affective landscape. We understand the ongoing processes within the academic communities taking place in an intersection of material and imaginary places and spaces and creating affective cultural politics that affect the everyday lives of those involved in academia. (Davidson, Park & Shields 2011) We ask: How do academics in different positions negotiate between the competitive ethos in the neoliberal university and belonging in academia? What kind of affective practices are scripted into discourses of competitiveness and collaboration?

Our analysis is based on the social media discussions and interviews of Faculty deans and researchers in social sciences and humanities in Finnish universities. We use discursive reading focusing on the affective practices (Wetherell 2012) in the material and open up the multiple and contradictory emotions that academics experience in the neoliberal university.

The paper is part of a project Academic affects in which we focus on the affective economy of research strategies and the moral imperatives, values and practices they impose.

Affective Dilemmas & Research Funding in Finnish Academia

Elisa Kurtti

Tampere University, Finland

While research is actively positioned at the center when imagining ways towards environmentally and socially sustainable alternative futures, it is also essential to make sense of the ways in which today's academia is constructed and how this frames, as well as facilitates, the everyday of scientific work that enables this shift in the first place. Science policies and management of higher education can often be seen as strategic and rational, even void of emotion, despite the fact that academic work is permeated by affects, many of which can also contradict one another. Enthusiasm towards research might not be enough if it is pressed down by individualistic competition and constant expectations for excellence.

I apply the concept of affective dilemmas to analyze the ways in which contradictory affects construct the meaning of research funding within the highly competitive funding system in Finland. I use theory directed content analysis to examine the ways in which affective dilemmas concerning research funding are discursively constructed in interviews (n = 30) of administrative personnel in Finnish universities. By this approach I showcase one methodological way of empirically approaching emotions in sociology. The presentation also grounds discussion over how the current situation impacts the ways in which alternative futures can be built by the means of research.

446

RN11_T10_02 | Emotions in space and social interaction

Emotional Assemblage of Place in the Process of Authentication

Karen Ann Blom

Jönköping University, Sweden

The attempt for objectivity within research often results in the careful extraction of human emotion. This results in an incomplete understanding of the interactions and motivations surrounding human beings and the societies in which they are a part. Emotional geographies provide a cross-disciplinary example of how to attempt to embrace emotions in the conceptual and experiential understanding of the socio-spatial interactions and expression. This article explores how individuals verbally construct authentication of genealogical relevant places, the choices of which elements are included/excluded, and how they use this authentication process to situate themselves as a continuation of the past. This study is significant in challenging the perception of the passivity of individuals and place, by highlighting the multiplicity of individuals' interactive emotional engagement and performance based on Deleuzian desire.

Participants of this study comprise of 16 Swedish Americans previous contestants of the Swedish reality genealogy television programme Allt för Sverige (in English, Great Swedish Adventure). A programme focused on individuals' family history, contestants are exposed to Swedish historical and cultural places and activities, competing in elimination challenges with the goal to win a family reunion. Drawing upon qualitative data collection of questionnaires and semi-structured interviews, participants' descriptive narratives were examined developing from Dovey's theoretical framework of "place-as-assemblage" through narrative discourse analysis.

Results of this study revealed that individuals describe not stagnant historical places, but rather performatively construct and/or deconstruct using a variety of components to create an emotional assemblage of place reflective of their own purposes and desires.

Emotional Geographies of Full and Empty Nests. Emotion Maps as a Tool to Research the Spatiality of Emotions

Bogna Maria Dowgiałło[1], Magdalena Żadkowska[1], Magdalena Gajewska[1], Magdalena Herzberg - Kurasz[1], Marianna Kostecka[2]

[1]University of Gdańsk, Poland; [2]Adam Mickiewicz University, Poland

Our presentation addresses theoretical and methodological problems connected with the spatiality of emotion.

In the first section, we introduce a technique called the emotion map (see Gabb) that we have used in 40 online in-depth interviews with parents whose children have grown up and are leaving home. In the next section, we compare spatial emotion rules (cf. Margies) of „a full nest" (a house with children) and „an empty nest" (a house without children). Using emotion maps both as a source of graphic data and as an elicitation tool we aim to portray changes in the patterning of affective behaviour in the families during the transition to the empty nest phase.

Drawing on examples from our study, we frame the presentation around three questions:
• Do emotions „take place"?
• How to research the spatiality of emotions?
• What are the advantages and disadvantages of a mapping technique?

In particular, we focus on the answer to the question of whether the emotion map technique is limited to the observation of conscious, rationally managed emotions or whether it might capture the interactive, relational nature of emotions too.

447

About Acts of Moral Outrage A Sociological Attempt at Defining the Facial Expression of Moral Outrage

Christine Campen

University of Koblenz-Landau, Germany

It seems that in times of crisis public communication develops emotional tendencies. Moral arguments become more prominent and moral outrage is the chosen weapon to defend and protect political opinions, views, and even agendas. In addition to communicating morally wrong or right behavior, moral outrage can create alliances between people with matching moral views. This seems to be especially important to generate votes and strengthen party affiliation.

Whereas the used language of moral outrage has been examined in sociological research as well as in sociological theory the nonverbal cues of moral outrage have been hardly discussed, despite research showing that nonverbal actions play a major role in communication. As a result, attempts of defining the emotional expression of moral outrage have been scares and mostly dominated by psychologists linking moral outrage to the emotions anger and disgust but fail in finding a generic expression.

The proposed paper will show results of a study that aims to define this generic facial expression of moral outrage by using the Facial Action Coding System by Ekman and colleagues. It is assumed that by defining a facial expression of moral outrage not only analyzing moral communication would benefit but – as moral outrage is an emotional response to socially constructed moral standards – it would be the first socially formed emotion discovered that has a generic facial expression.

Assessing the Spatial Distribution of Perceived Social Impacts of Protected Areas on Local Communities

Vassilis Gkoumas[1], Andreas Kontoleon[1], Chrysovalantis Malesios[2], Nikoleta Jones[1]

[1]University of Cambridge, United Kingdom; [2]Agricultural University of Athens, Greece

Protected Areas (PAs), a widely used policy for nature protection and the promotion of long-term ecosystem resilience, often negatively affect the wellbeing of local communities by restricting certain activities, such as agriculture and recreation. Lack of conformity with regulations and low support for PAs, by locals, have been identified as key factors preventing PAs from meeting their conservation targets. This paper explores the perceptions and attitudes of local communities at the National Park of East Macedonia-Thrace, in order to provide a policy-relevant understanding of the social impacts of PAs and their spatial distribution within the PA. The data has been collected through a quantitative survey of a sample of the general population of the PA, which was identified using cluster sampling that ensured representation of all the regions of the PA and its surrounding areas. The data analysis is separated into two phases. First, the effect of perceived social impacts on the attitudes of the local communities towards the PA is assessed using an ordinal regression model. Second, the paper examines the spatial distribution of the perceptions and attitudes of local communities in relation to their proximity to the borders, the centre, and the zones of differentiated protection of the PA. The paper provides a comprehensive overview of the impacts of PAs on multiple stakeholder groups and a rare insight into the effect of spatial planning and zoning of the PA on the distribution of impacts.

Climate Vulnerability amidst Conflicting Discourses: Between Policy-Makers and Affected Communities

David Champagne

University of British Columbia, Canada

The spatialization of climate vulnerability provokes deep-seated questions for sociology. How do we account for the social and spatial boundaries implicated in climate vulnerability? How can sociological explanations depict the unintended consequences of modern capitalism as an intricate part of community experiences?

In this paper, I debate the theoretical significance of the spatialization of climate-related vulnerability through discourse analysis. Numerous environmental studies document how certain areas become "sacrifice zones" where, under climate denial and profit-driven development, unprecedented injustices are on the rise (Lerner 2010; Sze 2007). Furthermore, the environmental injustices faced by these communities is routinely banalized by dominant discourses (Taylor 2009). Still, while sociological research depicts the overwhelming relegation of environmental harm on the poorer, additional research is needed to elicit the meaning of climate change injustices for local communities.

In my presentation, I mobilize contrasting cases of sustainable policies and local community discourses about climate vulnerability in order to debate the concept of "closure" defined as the set of practices, symbols, rules and regulations that a given collective mobilizes to restrict access to opportunities for others. Such a process is accomplished by drawing on an array of imagined or assessed characteristics of those who are made to be excluded. My presentation follows two themes. First, I discuss Wacquant's (2007) genealogy of poverty in North America in an era of advanced marginality, a new system of socio-spatial relegation and closure. Second, I question to which extent this genealogy implicates a new landscape of climate vulnerability taking the shape of a climate apartheid in North America (Dawson 2017).

Intended Improvement or Unintended Diversion? Discretion of Local Environmental Bureaucrats in Poland

Renata Putkowska-Smoter[1,2], Mateusz Smoter[1,3], Krzysztof Niedziałkowski[1]

[1]Institute of Philosophy and Sociology of the Polish Academy of Sciences, Poland; [2]Institute of Sociological Sciences and Pedagogy WULS - SGGW, Poland; [3]Institute for Structural Research, Poland

Nowadays, cities are responsible for 75% of global CO2 emissions, and urban citizens are highly exposed to hazardous pollution, extreme weather, and climate change. The literature on urban environmental governance points out that bureaucratic structures can serve as an important layer of facilitation, testing, and practical implementations of required environmental solutions. On the other hand, studies of institutions and organizations suggest that reactions of bureaucratic structures to external pressure and political changes can have various forms, including distancing themselves from changes and social control. Therefore, a public debate and reforming trends that have been underway for the past thirty years (such as New Public Administration) are focused on calibrating discretion to the "appropriate" level which would ensure both organizational flexibility and consistency with social and supervisors' expectations. However, those studies only to a limited extent explore the spontaneous and bottom-up calibration of discretion. To fill in this gap, we carried out a collective case study of Polish local bureaucracy and interviewed 22 environmental bureaucrats from 8 Polish cities. We consider this case study as a fairly emblematic example of post-Soviet rapid decentralization, which has transferred significant responsibility and expectations to local authorities, but without sufficient resources. We argue that such legacy in combination with a further increase of responsibilities of local governance after 2004 EU accession, and together with the complexity of environmental issues, created circumstances for spontaneous and bottom-up calibration of local environmental discretion, which brought both improvements in the operation of local bureaucracies and unintended consequences questioning their legitimacy to some extent.

A Circular Economy for Water in Europe: Addressing the Social Challenges to Implement Sustainable Solutions

Carla Gomes, Luísa Schmidt, Rosário Oliveira, Ana Delicado

Institute of Social Sciences of the University of Lisbon, Portugal

Climate change and urbanisation are increasing pressure over water resources, and the fresh water available per capita in Europe has already fallen by 25% over the last 50 years. Facing this situation requires the implementation of a circular economy for water, as current EU policy emphasises. Social scientists have the key role of addressing the drivers and barriers to the implementation of 'water-smart' solutions in European societies, including the level of acceptance of these trends by decision-makers and citizens.

This presentation introduces H2020 project B-WaterSmart - Accelerating Water Smartness in Coastal Europe (2020-2024), which aims to promote innovative, efficient and resilient solutions to the management of the urban water cycle in relation to agriculture, industry and domestic consumption. Six Living Labs (Alicante, Bodø, Flanders, Lisbon, East Frisia, and Venice) will co-create and demonstrate tailored 'water-smart' solutions, which can then be replicated in other parts of Europe and the world.

The project ultimately aims at developing innovative models of adaptive governance through 'Communities of Practice' (CoPs). The ICS-ULisboa is supporting the CoPs by analysing the social drivers and barriers for the adoption of 'water-smart' solutions – such as public perceptions of risk towards water reuse - while considering the needs and concerns of different social groups. The methodology and preliminary results of this collaborative process will be presented for open discussion. B-WaterSmart aims to contribute to the EU Green Deal and its Circular Economy Plan, in alignment with the SDG and the Paris Agreement.

RN12_T01_02 | Environmental Conflicts

The Resilience Turn in Environmental Peacebuilding

Fábio Reis

Centre for Social Studies of the University of Coimbra, Portugal

Following its meteoric rise in the global policy arena, resilience is routinely advocated by the United Nations (UN) as the main instrument susceptible of strengthening peacebuilding activities, in an effort to promote sustainable peace. However, the implementation of resilience in peacebuilding has hitherto only engendered lacklustre results. Notwithstanding, resilience terminology is becoming increasingly significant in environmental peacebuilding initiatives, as it is especially geared towards capacity building in communities vulnerable to the harmful effects of climate change. Thus, it is noteworthy to assess if resilience can produce fruitful outcomes alongside a more pragmatic, context-based, environmental peacebuilding approach. In that view, the aim of this research is to answer the question "how can resilience strategies foster the promotion of sustainable peace in environmental peacebuilding interventions?". It is argued that resilience, as currently implemented by the United Nations, hinders the promotion of locally driven pragmatic solutions towards the construction of sustainable peace. Thus, by focusing on the UN's peacebuilding practices, this research will explore three levels of analysis: first, assesses the implications of the resilience turn in peacebuilding; second, discerns the broader interrelatedness between resilience and environmental peacebuilding; and third, highlights the potential and limits of both approaches towards the creation of sustainable peace.

Contesting Forest Values

Maarit Laihonen, Merja Porttikivi

Aalto University, Finland

In this project, we study manifestations of forest values, by looking at the forest discourse from the cultural premise of confronting ecological and economical values. The dominant Finnish forest discourse is traditional and unquestioned and has guided the legislation strictly until 2014. The 'new' approaches to environmental issues and new knowledge of environmental degradation have questioned the outcomes of the tradition. We analyse this dichotomy, and the ways in which the values are legitimated, in the materials gathered from news and social media, forest and natural resources centered media, and education and forest-specific events. We utilize a three-layered model on power and policy to reveal how concrete policies, courses of action, and practices dictate the use of forests.

The question of the use of forests is currently tightly linked to so-called bioeconomy - a thinking and policy framework in which biobased sources could replace the fossil economy. Bioeconomy, Green New Deal and circular economy, are economy- and growth-driven ideological constructs, presented as coherent pathways to sustainable societal development. These frameworks have been offered to actors of societies during the last decades from global policymaker, EU, and national levels. It is crucial to unpack the implicit effects of the dominating processes that have direct implications to environmental justice.

"Communities at Risk": Contentious Politics of Waste Management in Russia

Yulia Kuzmina

European University at Saint Petersburg, Russian Federation

Waste management policy in Russia aims to be economically efficient, while environmental concerns tend to fade into the background. Due to that, waste sites are often built or planned to be built near inhabited localities with established infrastructure. Communities living next to local unwanted land represent "communities at risk" (McAdam and Boudet 2012); risk denotes the risk of mobilizing and engaging citizens in collective action. What factors account for the variation in the mobilization against waste facilities in Russia? I address this question through the study of the communities at risk in Russian regions. To do so, I apply the Contentious politics framework. This paper discusses the cases of mobilization (or its absence) regarding waste facilities aiming to reveal the factors increasing the likelihood of the protest. I argue that even within the narrow political opportunities of electoral authoritarianism, the political context is still multifaceted. The stream of contention over the waste management policy is shaped by the political system's openness on a local level, the elites' division, the electoral vulnerability, and communities' social capital. Data covers the protests against waste facilities in Russia from January 2017 to December 2020. The comparison of Russian regions uncover the variation in regional political regimes, and, most importantly, the variation in political opportunities on the local level, despite the "power vertical" (Petrov 2011). Moreover, this research reveals the mechanisms of the contention aside from the protest mobilization: the analysis also depicts how the strategies of main actors involved on the local level - that is, local citizens and local authorities - contribute to the outcome, i.e. the suspension of waste facility projects.

The Complex Nature Of Fissured Landscapes As A Social Reshuffling Of Environmental Heritage

Sophie Némoz

University of Bourgogne Franche-Comté, France

The aim of contributing to critical reflections about the political and social dynamics and patterns of adapting to climate change consists here in combining an analytical approach and an empirical interest in fissured landscapes. Building on the recent work of anthropology (Lowenhaupt Tsing, 2017) and history (Boucheron, 2019), this cross-disciplinary research produces insights in the "brushy edges" separating the past from the future of damaged worlds in which we live. Our sociological perspective (Némoz, BRECHE, 2021) doesn't condemn or sentence to pessimism. It offers an opportunity to fundamentally reflect on the resources of remnants. The worth of life forms is thus considered in terms of observable and identifiable modes of acting on its environment. Our thorough study of realities on the ground within homes uninhabitable takes into account the discourses about drier landscapes and warmer climates as well as the gestures. The paper will examine the gaps and the relevance of such a conceptualization thanks to the ethnographic methods of in-depth interviews with inhabitants, workers, scientists, municipal officials, statesmen and observations of daily lives involving field notes, photographs and maps. Exploring the breaches in that way firstly provides access to the "Conscience of the Eye" (Sennett, 1990). The design and social life of local landscape is viewed as a silent overhaul. Before considering the rifts as resources, this sense of malaise about an environmental heritage will be analyzed. The reshuffling of landscape will be enlightening as a more recent experience seeking cooperation and co-construction of work in common. In this regard, the lenses of our cross-cutting approach will open new perspective on the complex nature of scenery.

RN12_T01_03 | Energy Transitions 1

Quo Vadis Poland? The Sociotechnical Imaginaries of the energy transition in Poland.

Tadeusz Józef Rudek, Katarzyna Rabiej-Sienicka, Aleksandra Wagner

Jagiellonian University, Poland

Humanity is facing a climate catastrophe. Despite global commitment to work together in tackling climate change, transitions are not happening similarly in different parts of the world. Many scientists claim that one of the key aspects of stopping the catastrophe is the energy transition. However, the European Union is setting an ambitious goal of decarbonising its energy system by 2050, Poland remains a member opposing those changes. Our research uses the lens of Sociotechnical Imaginaries (Jasanoff, Kim, 2015) to understand the dominant and alternative imaginaries of Poland's energy transition to explain why Poland is very reluctant to implement fast changes into its energy system.

We conducted 19 narrative interviews with key actors in the energy sector (politicians, businessman, academic, representants of the church and NGOs), associated with a qualitative analysis of strategic documents of the energy policy in Poland published after 1989 and analysis of government funding programmes for science (Polish National Centre for Research and Development). Consequently, we mapped the dominant and alternative sociotechnical imaginaries of the energy transition in Poland. The analytical framework was based on a sociotechnical imaginaries circulation model developed by us and used to explain their action in the polish energy transition.

The study's outcome shows that dominant sociotechnical imaginary of an energy system in Poland is connected with preserving the existing system focused on energy security with a significant role of coal and lignite and prosumers as supporters for the centralised energy system. Still, the alternative imaginaries (associated with decentralisation, energy democracy and renewables), are getting traction and become more important. Based on the outcomes, we reflect on possible energy transition paths in Poland.

Social Innovation for the Energy Transition: An investigation of Frontier Case Studies by the COMETS Project

Winston Gilcrease, Alessandro Sciullo, Osman Arrobbio, Dario Padovan

University of Turin, Italy

In the face of increasing threats of climate disruption and energy security, organizing a new energy future is crucial now more than ever. One positive outlook is the drive for innovative grassroots solutions towards a renewable-based energy transition. Collective Action Initiatives (CAIs) have been supporting this approach, aiming to create more economically and socially inclusive communities. CAIs are contributing to the evolution of a decentralized, inclusive model where customers are changing behavioral practices in addition to empowering their role in the decision-making processes. The energy transition to renewables will be accelerated when citizens are engaged, helping to build trust and stronger cooperation among communities, as well as support more inclusive regulatory systems. While CAIs in the energy sector have potential to offer a number of advantages that address social and environmental challenges, they still represent a small share of the energy system. The H2020-funded COMETS Project is investigating CAIs and their various socially innovative aspects and dynamics in the energy transition. Frontier case studies, described as highly innovative and niche cases, are being considered. These CAIs represent a particularly pioneering contribution to the future of social innovation in the energy transition. Based on several dimensions (including social, spatial, evolution, economic, material and performance indicators), as well as most recent debates on the potential innovations for CAIs, 'Frontier' case studies from Europe and beyond will be discussed. We aim to present the innovative social outputs from this investigation that can help further drive forward citizen engagement in the energy transition.

The Role Of Habitus In The Energy Transition: How Social-Ecological Attitudes, Values And Practices Shape The Social Acceptance Of Post-Fossil Energy Systems In Germany

Martin Fritz[1], Thomas Friedrich[2]

[1]University of Jena, Germany; [2]Institute for Social-Ecological Research, Frankfurt, Germany

Large energy projects such as wind power or biogas plants are often socially contested despite the high general acceptance of renewable energies among the affected population. These disputes involve a variety of interests and values that interact in complex ways, e.g. with regard to what people consider a cost-effective, environmentally friendly, welfare-oriented and participatory implementation of an energy project.

By drawing on Bourdieu's theory of habitus, we offer a relational perspective for understanding energy transitions to sustainable power and heat supply, e.g. through solar systems, heat pumps or bio-energy technologies. We consider habitus as typical sets of socially incorporated dispositions. According to Bourdieu, they constitute a comprehensive and relatively stable mentality which shapes people's actions, thus being an important factor that limits or facilitates the potential to social change.

We analyse data from the survey 'Environmental Awareness in Germany 2018' and apply factor as well as cluster analyses to identify social-ecological habitus from a larger set of the survey's items on general social-ecological attitudes. We then compare the habitus in terms of their specific energy related practices. This provides new knowledge about who supports or rejects the transition to a post-fossil power and heat supply, including the associated technologies and measures.

Finally, we complement these findings with the results of a qualitative interview study in which various stakeholders in the German residential sector were asked about economic, practical and social barriers and drivers towards a post-fossil heat transition.

How Sociotechnical Imaginaries Evolve and Shape Energy Policy Work and Interventions. Insights from the Case of Valencia.

Stefano Magariello

Anglia Ruskin University, United Kingdom

Due to the significant impact of cities on global CO_2 and other GHG emissions, local authorities are required to act quickly and effectively towards low-carbon energy configurations. In this energy transition, municipalities and local policy workers play a crucial role.

In this context, the concept of sociotechnical imaginaries, applied to political visions of desirable futures, is key to investigate how energy policies are developed and implemented in urban areas.

To understand how sociotechnical imaginaries evolve throughout time and contribute to shaping energy policy work practices and interventions, I undertook a thematic analysis of fifteen publicly available policy documents issued by the municipality of Valencia (Spain). All documents were published between 2010 and 2019 and concern urban energy transition goals and actions. The collection was part of my PhD research fieldwork which also included twenty-six semi-structured interviews with local policy workers and virtual attendance to selected policy meetings, events and activities.

Provisional results suggest that the sociotechnical imaginary underpinning the case study's energy policy framework entails ideas of right to energy, accessibility to renewable energy for everyone and direct citizens participation in clean energy production.

The main aim of this paper is to further investigate how this sociotechnical imaginary evolved during the last decade and how it affected energy policy work and initiatives on a municipal scale.

Alongside this, also taking inspiration from social practice theories, the aim of my PhD is to investigate how sociotechnical imaginaries interact with policy work practices, ultimately contributing to bridging two different theoretical approaches.

Commodifying the World? Against the Economy of Ecosystem Services

Luigi Pellizzoni

University of Pisa, Italy

The idea of pricing nature for saving it has gained major traction with the rise of carbon trading and the whole economy of ecosystem services. However, this has not corresponded to significant effects on climate change, biodiversity loss and other ecological challenges. Is this because nature has not been marketized enough, or because of a fundamental flaw in its commodification? To answer, the paper elaborates on valuation, the underlying moral economy of work and the relationship between work and energy established during industrialization. The result is a fully plastic compound, at once material and abstract, natural and social, hence amenable to a single metric. Ecosystem services even question the alleged need for capital of a moveable frontier of commodification, everything appearing already a commodity. Yet, radical incompleteness of information and incommensurability of values makes their success self-defeating. The proliferative logic of commodification entails its apparently inexorable diffusion, yet acknowledging its vicious circularity leads to reframing criteria of efficiency, pointing to a new grammar of goals, values and relations among people and with things, as some emergent mobilizations seek to do.

Meritocracy and Environmental Reform. Exploring Recent Perspectives on Populism and their Implications for Environmental Action.

Kris Van Koppen

WUR, The Netherlands

Populism and anti-environmentalism typically go hand-in-hand. In recent publications, several authors – including Daniel Markovits, David Goodhart, Elisabeth Currid-Halkett, Arlie Hochchild, Thomas Frank, and Michael Sandel – connect the growth of populist movements with the rise of new forms of inequality and injustice, tied to a meritocratic discourse. In different ways, they discern new class divisions between practically educated, locally bound, low- and middle-income workers, and university-educated, cosmopolitical, high-income professionals and managers. This paper explores the critique of meritocracy and finds that it is relevant to environmental policy and environmental justice. Implications, among others, are that policies and plans for environmental reform need to be locally specific about their economic consequences and should avoid suggestions of moral and cultural superiority. The paper's conclusions may be summarized with a paraphrase of the well-known environmental movement slogan: "Act globally, think locally".

455

Public Acceptance or Public Engagement? Competing Imagined Publics in a Transdisciplinary Research Project on Mining Legacies

Diana Ayeh

Helmholtz Centre for Environmental Research, Germany

In recent years there has been a trend towards transdisciplinary research projects in which scientific actors and actors from civil society corporate in the joint production of knowledge. These approaches are reflected in various concepts such as citizen science, real word experiment, living lab or real word laboratory. Drawing on a transdisciplinary research project on mining legacies in the German Ore Mountains (Erzgebirge) which uses the latter concept, this presentation investigates notions of public involvement held by the different actors of the project and how they (potentially) influence research design and outcomes. It is argued that the emphasis on "public acceptance" instead of "public engagement" tends to incorporate and reproduce dominant notions of risk management in the global mining industry.

The presentation is structured as follows: Analytically, it will first introduce different concepts of transdisciplinary research designs, i.e. the real world laboratory and the role of the public therein, contrasting these with the concept of Social License to Operate (SLO) prominent in mining industry. Empirically, the presentation then draws on the consideration of the example at hand as a "lab in the making" and a critical reflection on the role of social scientists in collaborative research projects aiming at developing technologies which could be used in mining contexts around the word. Third, the presentation analyses notions of the public within research design and practice, based on participant observation of interactions among and interviews with key actors of the research alliance.

The public acceptance of the Barcelona Superblock model

Christian Oltra[1], Roser Sala[1], Sergi López-Asensio[1], Silvia Germán[1], Àlex Boso[2]

[1]CIEMAT, Spain; [2]Universidad de la Frontera, Chile

As air quality has become an increasingly political issue and cities are forced to improve air quality, a variety of policy instruments that impose restrictions on traffic in demarcated areas are being put in place across cities in Europe. In Barcelona, the Superblock model has been proposed as an innovative land use intervention to reclaim space for people, reduce motorized transport and air pollution, and mitigate the effects of climate change. Although it is assumed that residents generally support this intervention, there is little research on residents' perceptions on the personal, social, and environmental impacts of the Superblocks. In this communication we examine residents' attitudes towards this intervention. The study was conducted through a self-administered survey (online) and focus groups among residents in Barcelona. We analyze self-reported affective states associated with the superblocks, perceived legitimacy and trust, intervention-specific beliefs and acceptance.

456

RN12_T02_02 | Science, Technology and the Environment 1

Performing Citizen Science For The Environment: Datafication, Environmental Data and Data Practices

Paolo Giardullo

University of Padova, Italy

The growing number of citizen science projects dedicated to the environment signals the need as well as the profileration of environmental data (Hecker, Gerbe, Bonn 2018). This is coherent with the perspective of the datafied world presently we are living in. Many scholars concentrated on the outcomes of the process that brought to the current situation as a matter of concern. For sure, the pervasively presence of data collecting devices raise critical questions about crucial issues such as commodification of users and unpaid digital labour (Iliadis e Russo 2016), a growing threat for privacy and unethical use of data and metadata (Gidaris 2019) as well as the acquisition of state function by online platforms within a liberalisation framework (Van Dijk et al 2018). In parallel, the same ecosystem of web applications, platforms and devices available opens oppportunties for environmental monitoring intersecting different levels. To mention a few, citizens engaged in environmental conflicts, career scientists dedicated to biodiversity and official monitoring newtorks all enjoy of a platformized society for data collection, elaboration and accessibility. They are all econpassed by the label of citizen science (Haklay 2012) and the data practices approach (Bates et al 2016; Leonelli 2014) allows to understand the levels of engagement and to give account of the configurations of an overwhelming process in the case of environmental monitoring.

Looking at data collection, data validation and data accessibility as key practices is crucial to see different configurations of how citizen can participate in environmental monitoring with different aims and assumptions. I will delve in these issues comparing experiences explored through indepth interviews with projects' spokespersons and digital ethnography (Hine 2005) of online dedicated platforms.

Towards a Transformative Expertise? The Co-production Of Global Epistemic Infrastructures And Institutionalized Policy-relevance

Monika Berg, Rolf Lidskog

Örebro University, Sweden

What science is needed for the transformative change to a sustainable society? The expert organizations the IPCC and the IPBES have, in different reports, expressed the need for transformative change, and the need to develop knowledge and expert advice about how to initiate, foster and govern transformative change. Starting with an analysis of how these expert organizations understand transformative change and its requirements, this paper explores what kind of expertise is requested to promote green transformation and what kind of institutional conditions it presupposes. The paper presents an analysis of the relations between epistemic infrastructures (the material, institutional and normative infrastructures that condition and shape different scientific fields), and the policy advice and solutions that it supports. We argue that IPCC and IPBES form part of an international epistemic infrastructure, which conditions the kind of expertise that is developed, and thereby what kind of expert advice is produced. Furthermore, this infrastructure grants epistemic authority to particular forms of knowledge. However, a more diverse set of social scientific knowledge – such as environmental sociology or environmental ethics – may play an essential role for a green transformation. But for them to do so, they should not be squeeze into the current epistemic infrastructures of global environmental expertise. Instead, the paper stresses that their potential to foster transformative change demands other epistemic infrastructures and other forms of science-policy relations.

457

Silicon Preparedness, Digital Propagation and Ecological Planning

Emanuele Leonardi[2], Giorgio Pirina[1]

[1]University of Bologna, Italy; [2]University of Parma, Italy

The Covid-19 syndemic reveals how unexpected events can disrupt the "usual" functioning of capitalism. As argued by a number of critical scholars, epidemics and pandemics represent an outcome of planetary anthropization and the overriding of the techno-sphere on the metabolic timescales of the biosphere (Edward, 2017). Several political ecologists argued that the current crisis has made the link between climate change and the capitalist mode of production more explicit. The recognition of an increased risk of epidemics and pandemics (biosecurity) has translated into national preparedness and response plans based on World Health Organization guidance. The concept of preparedness can be framed in various ways. In this paper we will focus on the digital dimension (digital preparedness), as during the pandemic phase a significant proportion of social relations have been digitally restructured. In order to understand (digital) preparedness, it is necessary to situate it against the background of productive relations adequate to the digital economy, which depend on what we have called digital propagation, namely the pervasive worldwide diffusion of electronic artefacts, digital services and infrastructures, on the basis of a permanent connection. It therefore depends on a significant energy metabolism and raises questions about the need for an energy transition to renewable sources.

In order to underline the deep-rooted character of preparedness within the Californian Ideology, we will propose a further definition: silicon preparedness. In other words, with this expression we seek to unveil the "work/energy ratio" that preparedness must take into account in order to contribute to effective planning.

Insufficient Relationship Between Digital Technologies and Nature: Platform Economy and Degrowth Movement

Mariusz Baranowski

Adam Mickiewicz University in Poznan, Poland

Research on the ever-growing digital reality is crucial not only because of its impact on social relationships and forms of communication but above all, because of its measurable impact on nature. As noted by Paul Kingsnorth (2018: n.p.), "[i]t is estimated that the internet will consume a fifth of the world's electricity by 2025." Faced with the unavoidable challenge of limiting the high-carbon economic growth, we are discussing options for the transformation of heavy industry, heating systems, food industry, fertilizer-based agriculture, etc., ignoring the role of new digital technologies. In order to fill this gap, the article aims to explore the complicated relationship between information and communication technologies (Baranowski & Mroczkowska, 2021) and nature (Hornborg, 2019) through the prism of the three currents of the global environmental movement (Anguelovski & Martinez Alíer, 2014). In this conceptual and analytical paper, the digital reality has been operationalized with the help of the platform economy category, allowing empirical analysis of the impact of this type of economy on nature. Secondary data analysis was used to stamp out the impact of the platform economy on nature, particularly in terms of the latter's commodification (Ziółkowski et al. 2020). The conclusions drawn from the mainstreaming of the environmental movement into the relationship between digital technologies (platform economy) and nature (cf. Jarvis, 2017) cast a new light on the existing empirical data. An economy based on the synthesis of nature and technology (Eco-Efficiency approach) is not a satisfactory scenario for the future, especially from the perspective of the degrowth economy.

458

RN12_T02_03 | Environmental Activism

Reshaping Citizenship Through Environmental Activism: An Example From Ethnically Divided Bosnia And Herzegovina

Aida Kapetanovic

Scuola Normale Superiore, Italy

Post-war Bosnia and Herzegovina is a society divided along ethnic lines experiencing a never-ending process of transition to democracy. In such a context civil society remained weak and NGO-driven, giving little space for local, grass-root environmental activism. Nevertheless, in the last decade, local grass-root environmental associations, supported by international NGOs, are spreading attention on environmental issues and raising awareness on the valuable natural resources and wildlife present in the country.

Today Bosnia and Herzegovina has come to play a leading role in a regional environmental campaign, that involves the "Guardians of the Rivers" in a struggle in defense of the last wild rivers in Europe from the threats of hydro-power plants construction. Defining the water and the environment as local commons, rural communities are defending them against the interests of private investors and political ethno-nationalist leaders. By re-framing their attachment to the territories through an ecological perspective and building networks that cross their ethnicized geographies, the "Guardians of the Rivers" are laying the grounds for a redefinition of the community and of citizenship alternative to the ethno-national one.

Drawing from literature on environmental struggles, LULU movements and social movements in divided societies, the aim of the research is to investigate how are the "Guardians of the Rivers" framing an alternative collective identity based on pluralist participation, environmental awareness and democracy and whether they can foster a new idea of citizenship able to overcome ethnic divisions. The research will be grounded on empirical data retrieved from in-depth interviews and ethnographic fieldwork.

The Roots of Environmental Activism in Provincial Turkey through the Prism of Two Mobilizations against Coal-Fired Power Plant Projects: Generations, Socializations, Specificities of Local Context and Configuration of the National Politics.

Umut Sari

Centre Max Weber, France

459

How does one become an environmental activist in provincial Turkey? Through the comparison of two groups mobilized against the establishment of coal-fired power plants in Adana and Bartin, in terms of their social origins and trajectories, professional backgrounds, and reasons for engagement, two main activist types are distinguished: ecologists and anti-capitalists. A closer look at the trajectories of ecologist activists makes it possible to construct four activist profiles and to account for the intertwined effects of a number of factors on engagement in ecological activism: belonging to one of the three generations studied, socialization sites (i.e. family, school, neighborhood, university and professional organizations), the socio-political context of the city, and the political configuration at the national level, with particular respect to its oscillation between democracy and authoritarianism. The concept of "career" and the prism of a micro-sociological approach enable to think of the dialectic between the subjective experience of actors who face with contingencies on the one hand, and the determinations engendered by internalized dispositions, the impact of previous socializations and the forces of the socio-political structures that surround them, on the other. The focus will be on the continuity and changes in the ideological representations of the activists throughout their engagement, but also on the biographical transformations that they entail.

Fridays for a Female Future? Frontline Women as a Prototype of a New Social Figure

Julia Wustmann, Angelika Poferl

Technical University Dortmund, Germany

The discussion about the climate crisis received its own kind of boost from the Corona pandemic, as medical studies suggest a connection between climate change, environmental degradation and pandemic diseases. Accordingly, the Fridays For Future movement calls for the fight against global crises to be thought together. These and other demands are postulated by frontline people in the movement, who are conspicuously often addressed as women. The presentation deals with the phenomenon of female frontliner in ecological protest movements and asks why and how this phenomenon is currently asserting itself and what symbolic and material framings are associated with it. The empirical starting point is the portrayal of Greta Thunberg as a 'saint' in social media. According to our first thesis, such a sacralisation points to a symbolic unavailability of frontline women. Their thoughts and actions are typified as untouchable and thus ‚withdrawn' from profanising access and questioning. However, such images of saints also circulate in climate change-sceptical contexts. The sacralising framing thus becomes, so the second thesis, a ‚proof' of something that is only supposedly unavailable, which calls for exposure and desecration in the deliberate breaking of taboos. Theoretically, we interpret these processes as an expression of legitimacy struggles and multiple horizons of relevance that are in principle permeable in the context of a reflexive modernity. Related to this hypermedial dynamic, we assume thirdly that the de/sacralisation of frontline women represents a partial aspect of an overarching heroisation process and that a new social figure emerges: the crisis heroine. We interpret this new social figure and the associated new scope for thought and action as the result of a cosmopolitics of the social.

Stolen Dreams And Childhoods - A Discourse Analysis Of The Generational Justice Frame In Greta Thunberg's Speeches

Marthe Elden Wilhelmsen

University of Agder, Norway

My contribution is on climate communication with the focus on the Generational Justice Frame Greta Thunberg uses in her speeches. The research builds on a qualitative content analysis of selected speeches, and offers a critical discourse analysis with an inductive approach to frame analysis. The theories used are on the mental barriers and climate framings by Stoknes, climate imaginarias by Levy & Spicer and Johnstone's theories on social movement frame analysis. Drawing on previous research which identified numerous frames this contribution zooms into one of the most important of these: The Generational Justice Frame. In her speeches, Thunberg makes a distinction between generations, and frames the climate crisis as a generational issue. In doing so, she defines the problem as the climate crisis, the reason as money, the bad guys as the leaders and the victims as the young generation. Framing the problem as a case of generational injustice, and positioning herself as an authentic victim of the problem, Thunberg has successfully managed to influence the global agenda of climate policy. One can argue that her way of framing the climate crisis has allowed the focus on the debate to shift, as she has become the megaphone of a generation, not by contributing with new science or facts, but by framing the climate crisis in a different way, being persistent and representing the victims.

The Most Common Environmental Concerns and Adherence to Some Eco-Friendly Practices Among Ukrainians

Olha Maksymenko

Institute of Sociology of the National Academy of Sciences of Ukraine, Ukraine

The attitudes towards environmental issues shared by different groups of Ukraine's population, along with their willingness to take up some eco-friendly practices, constitute the focus of this study. Structurally, it can be divided into two parts. The first one involves the analysis of findings from several nationwide surveys carried out by different research institutions (or polling companies) from 2015 through 2020 (N = 1800–2000). In each survey, a respondent was supposed to answer the following questions: a) which environmental problems (given on the list) worry him/her the most; b) who should be held responsible for such a state of affairs (the government, local authorities, politicians, big businesses, ordinary citizens, etc.); c) what the respondent is personally ready to do (or doing at the moment) in order to somewhat improve the current situation or tackle the environmental crisis. The data were gathered from all Ukraine's regions, except for the Autonomous Republic of Crimea and non-government controlled areas (NGCA) in the East. The second part of the study presents the results of interviewing high-school students (9th, 10th and 11th graders) in order to determine the prevailing type of worldview with regard to the "human–nature" relationship (anthropo-, bio- or ecocentrism). For this purpose, the author designed a questionnaire consisting of 30 statements with three alternatives to choose. The interviews have been conducted since November 2020, and to date about 40 students from Kyiv and Poltava have participated.

Environmental Concern in Neighbourhood Context: Comparison of Rīga Port Communities at the Individual Level

Jānis Daugavietis

Institute of Literature, Folklore and Art, University of Latvia, Latvia

The paper compares the five neighbourhoods of Riga port respondents' answers to a number of nonprobability on line survey questions on the perceived quality of the local environment. We ask whether there are any significant predictors in the case of these neighbourhoods and whether all population groups are similar and equally critical in their assessment, as shown by the preliminary analysis.

Many environmental concern studies show that the strongest predictors of worries about the ecological situation are gender, political ideology, educational attainment and age (see McCright, Sundström 2013, Dunlap 2016, Givens, Jorgenson 2011, 2013, Klineberg et al 1998 etc.). At the same time, they are not universal and, in some studies, other indicators are statistically significant, such as race, health, residence or more specifically, such as place attachment (Vorkinn, Riese 2001) or intensity of visited nature for recreation and appreciation of the natural world (Alcock et al 2020). Differences are determined not only by the context of the particular research case, but also by the tools used (Klineberg et al 1998).

The measurement approach of this study is traditional for environmental sociology - we asked directly about the perceived seriousness of different types of pollution. For the analysis, an index of eight indicators was created ("To what extent are you concerned about these environmental issues [in the neighbourhood]?" - dust, odours, noise, vibrations, denied access to the Daugava, water pollution, light pollution at night, heavy traffic). Different socio-demographic groups of similarity or difference were tested using the nonparametric test for two independent samples and linear regression.

The specifics of our study are nonprobablity online survey, the scale (urban neighbourhoods) and socio-historical context or researched areas

461

A Simulation Model For The Postdiction Of The Failure Of The French "Gilets Jaunes" Movement

Georg P. Mueller

University of Fribourg, Switzerland

In terms of the participation dynamics there are many forms of political protest: some conflicts escalate till the regime breaks down, others fluctuate chaotically around an equilibrium, or de-escalate until the protest movement collapses. This paper proposes a contagion model, which encompasses by the variation of its main parameters all these protest dynamics.

The mentioned model is based on the interaction of three groups: (a) already mobilized citizens, who are protesting against the government and its policies, (b) non-rebellious but frustrated groups, which may become mobilized by imitating the rebels, and (c) repressive governmental forces, which attempt to reduce the number of mobilized citizens. The integration of these processes results in a logistic growth model. By formal reasoning and computer simulation, it can be shown that for many parameter configurations the modelled protest participation steadily grows or declines to stable shares of mobilized citizens, including the possibility of final zero-participation. However, for other parameter configurations the time-discrete logistic process may also result in chaotic fluctuations of protest.

The proposed model is tested with participation data of the French protest movement of the "Gilets jaunes", which is exceptionally well documented (see https://de.wikipedia.org/wiki/Gelbwestenbewegung or https://en.wikipedia.org/wiki/
Yellow_vests_movement). It started in November 2018 as a reaction to the planned increase of fuel prices, led to regular protests during weekends, and finally vanished in the middle of 2019. In this paper, its steady decline and rather long life are explained by its particular model parameters, empirically extracted from the mentioned participation data.

Intergenerational Relationships And Environmental Sustainability: Youth Influence On Family Consumption And Feeding Patterns

Alejandra Bermúdez Ruiz, Andrea Rizo Barroso, Anna Escobedo Caparros

Universitat de Barcelona, Spain

Family and personal relationships play a relevant role in the progress towards more sustainable and equitable futures. They can either promote or inhibit pro-environmental behaviours and practices, with family and friendship networks acting as agents in social and cultural adaptation.

How do young people, empowered by the climate change social movement, influence food and family consumption patterns in a Mediterranean urban cultural context? How do young people perceive and characterize their environmental practices in relation to those of their parents and grandparents?

Results from an exploratory research carried out in Barcelona (Spain) show the young generation potential to promote household's adaptation to the ecological transition and families' adherence to the movement for environmental sustainability. Family meals become a catalyst to develop more sustainable changes, where women play a leadership role. This qualitative study is based on discourse analysis based on 120 university student's descriptions of their environmental practices and experiences, those of their parents and grandparents, and on the other hand, on 8 group interviews (with young people and one of their parents or grandparents) discussing the impacts of adolescent and adult children nutrition sustainable practices on their households and family networks.

We corroborate the existence of new intergenerational relationships and negotiations, where learning becomes bi-directional, also transmitted from children to parents, through the key factor of feeding and consumption in the family home. We conclude proposing a characterisation of generations based on their environmental experience and practices.

Keywords: Climate change, youth, intergenerational relationships, environmental sustainability, sustainable diets, household, family.

Cognitive, Practical and Normative Aspects for Household Recycling

Berit Skorstad, Benedicte Forsland

Nord University, Norway

Along with the UN-SDG 12 regarding responsible production and consumption, recycling of materials has become one of the most important tasks in a transformation to green societies. This paper addresses some aspects of one of the members of the recycling institution; the households. As a part of this institution, the role of households' efforts are essential for the societal task of recycling. However, the part (role of) that households play are not always clear for the members as they are somehow in the outer edge of this institution. Institutions are here seen as a set of roles, relations and regulations regarding a common task in society. The research question for this paper is; How do the household comprehend and perform their role in the recycling institution, concerning knowledge, practices and regulations. In simple terms the question is why, or why not, do people recycle. What knowledge do they have about the waste cycles, how do practical conditions shape their everyday recycling, and how do they appraise the importance of this activity? A follow up question here is the importance of these issues for what they actually do in everyday life when handling waste? The data for analyses is based on surveys and interviews of households and waste management. The analysis will be based on what we call institutional mapping, along with interpretation of meaning. The paper is based on a study which is a part of a bigger research project on the formation of the recycling institution in Norway.

RN12_T03_02 | Sociology and Climate Change

Air travel practices in Swiss Universities of Applied Sciences – A case study

Francesca Celllina, Luca Morici

University of Applied Sciences and Arts of Southern Switzerland (SUPSI), Switzerland

The travel practices by the academic community are becoming a «hot topic» in climate-related research. On the one hand, the climate impact of flying to conferences and project meetings is increasingly debated. On the other hand, also following travel restrictions imposed by the COVID-19 crisis, new practices are emerging, such as virtual meetings or multi-site conferences.

Against this rapidly evolving background, we explore travel practices in universities of applied sciences (UASes) a context that, to our knowledge, has not been analysed in previous research. UASes are in general more locally oriented and characterized by less institutional pressure for internationalisation, publication in scientific journals, and presentation to conferences, than the "traditional" universities. Understanding the "hows and whys" of travel practices in UASes can therefore provide such institutions with relevant knowledge to inform their policy-making towards sustainability and focus their efforts on the practices with the highest carbon footprint. To this purpose, we run a case study in the University of Applied Sciences and Arts of Southern Switzerland (SUPSI). Our analysis, which exploits both data from travel refunding procedures (years 2017–2019, n=260 employees) and insights from interviews to frequent travellers (Summer 2020, n=8), is grounded in a conceptualization of academic travel practices based on Social Practice Theories.

Current findings show that a limited part of SUPSI employees travels. However, the practices of such travellers highly overlap with those previously identified for "traditional" universities. Furthermore, such practices have only been partially modified by the COVID-19 crisis. Climate-wise, there is therefore room (and need) for policy interventions aimed at reducing flying practices also in SUPSI.

463

Building Translocal Commons: Climate Justice Networks in Turkey and Germany

Hande Paker

Bahçeşehir University, Turkey

The weak commitment of states to decreasing global GHG emissions and the increasingly prevalent perception that the UNFCCC process is ineffective in resolving the climate emergency is in contrast to the powerful (worldwide) societal demand for effective climate action marked by the largest climate protests to date, the emergence of a youth movement, increasing visibility of direct action, local anti-coal struggles, and the urgent call of the scientific community. As decisions required to address the climate emergency remain unmade in the sphere of states, civil society emerges as the actor with the loudest voice urging action. The paper analyzes translocal climate action, identifying mechanisms for building commons around a shared anti-coal focus and commitment to climate justice. Drawing on research on climate networks in Turkey and Germany, I show that a common ground is constructed through engagement with frames and interactions among local, national and transnational CSOs, networks and movements. I then establish that the construction of a common ground is never a smooth or 'depoliticized' process but one replete with social and political cleavages that are not brushed off but directly integrated and contended with. The interactions, frames, inherent conflicts and effectiveness of climate networks are identified through 39 in-depth interviews with representatives of transnational, national, and local environmental organizations in Turkey and Germany, as well as participatory observation at COP21, Breakfree action, and numerous climate-related meetings in Turkey and discussions in the workshops that I organized, which brought together representatives of environmental civil society in Turkey.

Review of Soft Interventions Aimed at Changing Travel Behaviour

Jonė Vitkauskaitė-Ramanauskienė

Kaunas University of Technology, Lithuania

The transport sector is one of the biggest emitters of greenhouse gas emissions (GHG) and is largely responsible for climate change. Various technological solutions, such as electric vehicles have the potential to reduce its negative impact. However, the market share of electric vehicles grows too slow to reach acceptable levels of GHG. A shift in human behaviour, on the other hand, could produce such an outcome in a more timely manner. For this reason, scholars have been testing interventions aimed at motivating individuals to change their travel behaviour. The study aimed to obtain a general understanding of soft interventions' application in the transportation domain. A literature review analysing all aspects of soft interventions' design, methodology and reported outcomes was conducted. The results identified several limitations of this research field: it is geographically confined to western countries, the prime interest is in individual travel behaviour, studies often lack theoretical grounding, rely on self-reported data and measure short-term effectiveness of the interventions. Due to variation in methodologies, study designs and measures used, it is hard to make any comparisons or inferences about their effectiveness in changing human travel behaviour. Finally, mixed results related to independent variables suggest that no inferences can be made about the role of gender, age, education, number of cars and having children in intervention's impact on travel behaviour. On the other hand, findings give reason to believe that marital status and income do play a role.

Uncertainty and Perplexity. The Case of Italian Quality Growers Facing Climate Change

Cristiano Felaco

University of Naples Federico II, Italy

Over the world, climate change has driven a re-activation of peasants as a political identity. United by the threat of climate change to traditional livelihoods, as well as to food security over-all, peasant movements have begun to converge around the notion of Agroecology: an extended vision of agricultural practice that draws on traditional forms of peasant knowledge, in combination with new technologies to incorporate notions of ecological balance and social justice. Some go as far as proposing that Agroecology can form the basis for a new progressive subjectivity, however, not all manifestations of such new peasant subjectivities take the form of collective movements with clear ideological visions. Ever since the 1990's Europe and Asia have seen a re-discovery of peasant life, as young university graduates increasingly chose to return to the land and put up small scale peasant businesses. The contribution focuses on how such neo-rurals, that share a common peasant condition of small scale and capital poor agricultural production, faces climate change. To accomplish this goal, we adopt a qualitative approach to interview growers belong to the elite of Italian neo-rurals, the 'youth association' of the Italian farmer's organization Coldiretti "Coldiretti giovani". These neo-rurals illustrate how climate change might be confronted through social enterprise, rather than social organization. Their response shows that despite their relatively high endowments of cultural capital and their embrace of modern technologies, climate change exceeds the mitigating capacity of their Changemaker ideology and leaves them in a condition of perplexity.

RN12_T03_03 | Sustainable Food Practices and Food Cultures 1

The Protein-transition: A Challenging Pathway Towards A Sustainable Food System

Peter Oosterveer

Wageningen University, Netherlands, The

Producing animal-based protein is recognized to have larger environmental impacts and be more resource-intensive than is the case for plant-based proteins. The livestock sector is estimated to contribute 14.5% of our global GHG emissions, and, in some conditions, to also increased land degradation, and air and water pollution, and declining biodiversity.

465

Yet, animal-based foods provide some important vitamins and minerals (e.g. iron) that are particularly valuable to young children in low-income countries - whose diet is otherwise poor. The livestock sector also provides livelihoods to millions of smallholders, including amongst the poorest, and to generate about 40 percent of global agricul¬tural income.

Transforming the role of meat in the global food system is challenging because of the combination of environmental, dietary, health, economic and socio-cultural dimensions involved. This challenge is even further complicated by the presence of equity issues at the center of a nutrition-health-environment nexus.

This paper will address in particular that narrowing the debate to a traditional political-economy frame would miss some important nuances. Indeed, persuading people to give up meat for the sake of saving the planet, has met with fierce opposition from meat lovers. When it comes to food, it is therefore not just about private sector interests versus public environmental conservation NGOs; instead it is also about the perceptions, views and interactions in the decision-making processes involving individuals, institutions, public and private policy-makers, investors, suppliers and consumers. This paper takes the case of the Netherlands to explore these wider dimensions.

Creating Niches In Territorial Food Systems: Practices Of Artisanal Bakeries

Bálint Balázs[1], Diana Szakál1, Csilla Kiss[2], Ádám Fülöp[3]

[1]ESSRG, Budapest, Hungary; [2]CAWR, Coventry University, Coventry, UK; [3]Pipacs Bakery, Budapest, Hungary

Collaborative agri-food initiatives comprise value chain actors anchored in territorial food systems that seek the relocalisation of our food provisioning (Triboulet et al. 2019). These food value chains also rebalance the farmers' position and reach a win-win for producers and consumers. Also, they maintain food knowledge linked to landscape, production system, traditions, local economy. Our case study is based on a cooperative case study research co-shaped by a farmer-miller-baker network in Hungary comprising of several farmers, millers and bakers who work with breeders, researchers, seed savers and conscious consumers. Since the seminal study of Daniel and Isabelle Bertaux (1981) in France, the actual practices of this artisanal trade shed light on the ways of organising the value chain. In our study, qualitative interviews with the grain value chain actors revealed how the fair price of bread is constructed and what it entails to the understanding and guarantees of quality along the value chain. Artisanal bakeries seem to struggle to show the real value and true cost of our food. Consumer focus groups further explored how the added value of homegrown quality grains, heritage varieties, landraces are assessed. The research has been funded by the EU H2020 project COACH (grant agreement No 101000918).

Exploring cultural aspects in Social Life Cycle Assessment of agri-food systems.

Carmen Capdevila

Universitat de Barcelona, Spain

The debate about how to make current agrifood systems sustainable has acquired a relevant position in public agenda in recent years. However, there is no clear consensus about the definition of socially sustainability or proper assessment methodologies based on social theory. In this sense, Social Life Cycle Assessment (S-LCA) proposed by the Life Cycle Initiative aims to be a standardized method to address the social pillar of sustainability using a life cycle thinking. Generally, the impact categories used in S-LCA belong to one of these broad six groups: human rights, working conditions, health and safety, cultural heritage, governance and socio-economic repercussions. These categories are mostly addressed through objective and external indicators set up by international organizations, paying little attention to cultural and valuable experiences of individuals. For that reason, this research, as part of my PhD, aims to contribute to the discussion about socially sustainable food production based on exploring cultural imaginaries in farming related to sustainability and comparing them with top-down indicators of social sustainability. This study undertakes qualitative face-to-face interviews with different actors of the value chain, mainly in the production stage, in which categories used in S-LCA are assessed from a bottom-up perspective. Case studies selected are two different food systems in Spain (rural and peri-urban contexts) where food production has great importance for socio-economic development so transition to sustainable systems is desirable. This paper will present the overall working framework and preliminary results of in-depth interviews with actors in the agricultural value chain in the two selected case studies.

466

Quality Alternatives to the Hegemonic Agri-food System. Framing the Tensions Between Participatory Guarantee Systems and Third-party Certifications

Josep Espluga-Trenc[1], Marina Di Masso[2], Mamen Cuéllar Padilla[3]

[1]Universitat Autònoma de Barcelona, Spain; [2]Universitat de Vic - Universitat Central de Catalunya. Agroecology and Food Systems Chair; [3]Universidad de Córdoba. Instituto de Sociología y Estudios Campesinos

Despite its economic importance and contribution to the availability of cheap products, the current agri-food system, based on mass production and distribution of food, is among the major drivers of negative impacts in terms of social and environmental externalities (greenhouse gas emissions, water and soil depletion, biodiversity loss, territorial depopulation, nutrition-related diseases and related public health costs, etc.). The awareness of this situation has led governments and social groups to increasingly promote alternative formulas prioritizing product quality over quantity. There are two main different approaches: On the one hand, we find State agencies promoting policy strategies to highlight distinctive elements as the geographical origin of the goods (appellations of origin, etc.) or the form they have been produced (organic farming, etc.), conceptualizing this alternative agricultural model as "non-anonymous" and/or "territorial friendly", and building consumers' trust through so-called third-party certification systems. On the other hand, we find social groups or collectives trying to achieve similar goals but through the development of so-called participatory guarantee systems (PGS), addressed to build territorial social networks linking more directly producers and consumers and transforming the nature of their mutual interrelationship. Through a critical analysis of metaphors, in this communication we present a comparative analysis of how each of these models has been framed, in order to understand their transforming potential of the logic that drives the hegemonic agri-food system.

RN12_T04_01 | Environmental Values, Perceptions and Beliefs

Communicating Changing Environmental Values for Organizational Members

Niina Susanna Erkama, Pien Geertje ter Beek

University of Twente, The Netherlands

Many contemporary organizations want to invest in developing and communicating improved environmental values in order to attract customers, motivate employees (Gössling, 2011), and to maintain a social license to operate (Soyka 2012, Matejek & Gössling, 2014). Organizations that aim for improving their environmental values and sustainability need to open discursive spaces for these topics to help the organizational members to make sense of the new values and enable them to contribute to them (Perey 2015). Organizational narratives have a central role in creating such discursive spaces, as they make communicable what is considered valuable in an organization (Starkey & Crane, 2003), and create a common ground for social action within an organization (Bartel & Garud, 2009). However, the role of narratives during a transition towards a more sustainable and environmentally oriented organization has not received attention in the previous literature (Preuss & Dawson, 2009). Therefore, in this study we focus on the meaning of organizational narratives for organizational identity change towards more sustainable organization. We conducted a qualitative case study (based on documents and 16 interviews) in a large Dutch organization to learn about organizational narratives during such change process. Our findings illustrate how narratives of new environmental values in an organization might meet resistance due to organizational identity conflicts, disagreements on the rhetoric-action alignment interpretations and lack of continuum in the organizational narrative, even if better sustainability would, in general, be a welcomed idea by the organizational members.

467

Centrifugal Migration of Urbanites to the Non-Urban Territories: The Second Life of Rural Settlements in the Near North of Russia - Modernization and Archaica

Nikita E. Pokrovsky, Uliana G. Nikolaeva

National Research University "Higher School of Economics", Russian Federation

This article discusses the features of counter-urbanization that occurs when urban residents move to their second homes or cottages in the summer months or stay there during the whole year. As a result of the interaction of social factors emerging from partial urbanization, social/class implosion, and the rapid growth of large urban centers, Russia today has two powerful contrasting migration trends. The first is centripetal migration, or the movement of the rural population to large cities. The second form of migration is centrifugal migration or counter-urbanization, that is, the movement of the urbanites to the countryside. This process is accompanied by the formation of a special (from the point of view of phenomenology) "life world" with associated mental structures, such as "home", "hearth", "ownership", "historical memory", "world of alien things"," memory of former owners", "abandonment in space "," loneliness vs. solitude"," archaica", etc. A powerful rise in de-urbanization migrations of citizens in the spring of 2020, initiated by the Covid-19 pandemic, was reinforced by the introduction of strict quarantine measures ("self-isolation mode") by the state, with bans on leaving the house, on free movement around the city, with a complex system of issuing digital passes. The transfer of many employees to remote/distant online work in organizations, the sending of employees on forced leave, as well as the transfer of students and schoolchildren to distance learning accelerated the decision to move [Pokrovsky, Makshanchikova, Nikishin, 2020]. De-urbanization in Russia, which has not yet completed the cycle of urban transformation, for the first time in recent decades has identified itself as a significant socio-migration process, has taken significant proportions and certain forms.

University Students' Environmental Concerns Revisited: New Evidence From A Follow-up Survey In Saskatchewan, Canada

Rozzet Jurdi-Hage, H Sam Hage, Henry Chow

University of Regina, Canada

In response to calls for more theoretical and empirical assessments of the predictors of environmental concern in different subgroups (e.g., university students) and social milieux (e.g., Saskatchewan — Canada's second largest oil-producing province and a major producer of natural gas), this paper attempts to investigate the attitudinal and behavioural indicators of environmental concern over time, utilizing datasets that will allow for comparative insights into changes — or resistance to change. Specifically, based on a recent questionnaire survey of over 300 undergraduate students attending a medium-sized public university in Saskatchewan, this paper will critically examine the students' environmental attitudes and behaviours. In order to provide a more comprehensive framework for understanding the determinants of various types of environmentally responsible behaviours, we will apply the value-belief-norm theory of environmentalism in this Canadian postsecondary context, which is embedded in a setting heavily focused on expansion of resource extraction. As the follow-up survey adopts the same methodological approach and employs many of the same measures used in the initial study undertaken about a decade ago, this paper will also provide an assessment of the changing patterns in university students' environmental attitudes and behaviours and offer pertinent institutional recommendations that encourage students' pro-environmental behaviours.

468

Public Perceptions, Practices And The Climate Crisis

Sarah Irwin, Katy Wright

University of Leeds, United Kingdom

Attitudinal data shows extensive public concern about the climate crisis. It is widely commented that such attitudes do not translate into commensurate actions. Influential psychological and behavioural science perspectives see this as a kind of disconnect and point to an attitude-behaviour gap which in turn informs policy options and communications strategies. Theories of practice offer a profound critique, switching the analytic lens away from individuals and onto the carbon intensive social, institutional and cultural arrangements, and systems of energy provision, through which people enact their daily lives and which, in turn, they reproduce (eg. Shove 2014). However, there is relatively little sociological research into how people themselves view these enactments. For example, how do they think about emissions, pollution and climate change in relation to everyday practices? How do they reflect on the tensions which arise? In exploring these questions, the paper describes results from a new study of public views and the climate crisis. A survey (n=1676) based in a UK city collected attitudinal data and open ended responses to vignettes posing everyday dilemmas. The survey was followed by qualitative interviews with a subset of respondents. We explore how participants see behaviours and actions to be embedded in social arrangements, relationships and commitments, and often in tension with values relating to reducing emissions and tackling the climate crisis. We also examine how people themselves see interconnections between individual actions and societal change. We argue that better engaging with complexity in lay understandings is important both for theory and policy.

RN12_T04_02 | Social Theory and the Environment 1

Beyond Climate Fixes: From Counter-Publics to System Change

Les Levidow

Open University, United Kingdom

The familiar slogan, 'System Change Not Climate Change', has stimulated public debate about low-carbon societal futures and transitional pathways. Protest has strengthened demands to transform the dominant production systems that cause climate change and other environmental harms. Yet the political system has promoted market-based instruments, meant to stimulate future technological solutions. This techno-market framework evades the causes of environmental harm and so perpetuates them, while displacing state responsibility onto anonymous markets. Climate fixes provide an alibi to defer decarbonisation measures while awaiting elusive technofixes such as climate-smart crops, biofuels, Carbon Capture & Storage (CCS), etc.

469

For all those reasons, climate fixes have provoked public controversy, whereby counter-publics mobilise to promote transformative alternatives. These encompass low-carbon solutions such as municipal-owned renewable energy, solidaristic agroecological systems, etc. Many alternatives localise production-consumption circuits, impose lower resource-burdens, enhance socio-economic equity, and devise or adapt appropriate techniques for those aims through grassroots innovation. Such initiatives can be replicated by mobilizing collective skills, solidarity networks and cooperative organisation. Together they can help to contest, change and replace harmful production systems, towards a general redesign for a circular economy, thus stimulating system change.

Given that divergence between techno-market fixes versus transformative mobilisations, these rival agendas can be illuminated through several analytical concepts, namely: ecological modernisation reducing environmental problems to eco-efficient design, neoliberal environmentalism constructing new markets as the main solution, and solidaristic commoning which build alternatives. Each agenda has a sociotechnical imaginary linking a distinctive form of natural resources, technoscientific knowledge and social order. Together

these concepts help integrate aspects which may otherwise seem separate, thus highlighting rival agendas.

Skepticism, Regulation, Reconciliation: Approaches to Environmental Issues in the Western Conservative Thought and the Outlooks of Eco-Conservatism

Önder Güneş

Concordia University, Canada

This presentation focuses on the outlooks and foundational tenets of eco-conservatism which has been proposed by some Anglo-American conservative intellectuals as a response to the rising environmental skepticism and denialism of the conservative movement during the 1990s. The relationship between Western conservatism and environmentalism has always followed an erratic path throughout the last five decades. Until the 1970s, the traditionalist currents of the conservative political and intellectual movement were enthusiastically endorsing environmentalist claims and willing to introduce environmental regulations, especially in the United States. However, in the next ten years, this enthusiasm swiftly turned into an attitude neglecting the urgency of global environmental problems and questioning the scientific ground of such claims. During the 1990s, some conservative intellectuals have attempted to generate a new search for reconciliation against the denialist conservative backlash by arguing that the growing gap between conservatives and environmental concerns has been preventing the former from taking meaningful action. This 'reconciliation turn' have brought about various eco-conservative perceptions. The presentation mainly analyzes these eco-conservative ideas and examines political, economic and social motives that pave the way for the transformation of conservatives from the perception of conservation to skepticism/denialism and to the idea of reconciliation. This study has two main arguments: First, the fundamental reason that lies behind the reconciliation literature has been, with Gramsci's conceptualization, the desire to establish cultural hegemony on the ecological movement in political field. Second, eco-conservatism is a domination strategy that is compatible with the interests of the capital. This strategy, I argue, has no tangible solution proposal for global ecological crises

and tries to eliminate the radical character of environmental movements.

The Social Sciences and Social Transformation for a Sustainable Future

Karin M Gustafsson, Erik Hysing, Maria Ojala

Örebro University, Sweden

Science has for a long time provided knowledge on society's negative impacts on the environment and its consequences such as climate change and biodiversity loss. This knowledge has long since shown us that the way we live is not sustainable, neither in the long run nor in the near future. This scientific knowledge provides a message that urges policy-makers to create social change and that asks social science for guidance on how to create this social change. This study argues for and problematises the social sciences' important role in providing knowledge on social transformation for a sustainable future. This is done by first presenting an overview of the rich literature on social transformation that has been developed as an answer to this question of how to create a sustainable future; (i) how transformative change has been theoretically described to happen, (ii) who has been identified as responsible for the creation of transformative change, and (iii) what society the transformative change is described to create. Second, the review will be problematized to elaborate on how the social sciences, through their unique knowledge, skills, and existing theories can further our knowledge on social transformation. A specific focus is put on existing theories on knowledge, emotions, and visions for the future, and how these theories may enhance and concretize what we know about how to create transformative social change.

470

Occasional Environmentalism: Negotiating Ecological Citizenship and Its Limits on the Frontiers of Europe

Diana Mincyte, Aiste Bartkiene, Renata Bikauskaite

City University of New York, United States of America

Short-term volunteering for environmental causes has become a popular form of civic participation that remains overlooked in relevant scholarship. We develop a notion of occasional environmentalism to begin identifying the characteristics and political implications of plug-in activism linked to the green political theory of ecological citizenship. We argue that occasional environmentalism echoes ecological citizenship by valorizing moral imperatives and individual activism over institutional responses to environmental issues, blurring the lines between civic participation and entertainment, and transforming local politicians into occasional activists. Occasional environmentalism diverges from the post-cosmopolitan vision of ecological citizenship by being embedded in local histories, the logic of market economies, national identities, and state-building processes. We ground our arguments in an illustrative case of the global cleanup campaign Let's Do It! and its adoption in Lithuania, where it has emerged as a trendy if contested form of environmental civics.

RN12_T04_03 | Energy Transitions 2

Debating Energy Futures in Portugal Through Energy Democracy: Towards a Just Transition?

Vera Ferreira, João Mourato

Institute of Social Sciences, University of Lisbon, Portugal

Albeit geographically scattered and highly politically disruptive, the debates on energy futures and (just) energy transitions are reaching mainstream politics and policy worldwide. The Green Deal foresees Europe as the world's first climate-neutral continent by 2050. Similarly, in 2016 the Portuguese Government pledged to achieve carbon neutrality by the middle of this century, and it has been developing several public policy instruments to accomplish this goal. Notwithstanding energy transitions' growing political centrality, what constitutes "just transitions" – particularly their social and ecological manifestations, as well as their conceptualization and operationalization challenges – has not been fully assessed.

Therefore, our aim is to identify and discuss how the concept of "just transition" is being mobilized in the Portuguese political and energy landscapes. This is all the more important as there are diverse energy futures in Portugal, conveyed by various actors, both in the political sphere and the energy sector (including the State, energy companies, cooperatives, and renewable energy communities).

Accordingly, first we systematize the existing body of literature on energy futures and just energy transitions, specifically engaging with the concept of "energy democracy". Drawing from this literature review, we then examine the Portuguese case, and forward a preliminary analytical framework to critically evaluate the conceptualizations of "just transition" embedded in different energy futures. Hence, we intend to recognize the dynamics of social and ecological (in)justice that potentially overlap, reproduce, reinforce or, on the contrary, can be mitigated during the transition to carbon neutrality.

Extracting Resistance: Coal, Environmental Policy, and Economic Development in the Chinese Hinterland

Daniel Yoder Zipp

UCLA, United States of America

China is the king of coal. Over half of the world's coal was mined and burned in China from 2014 through 2016. But, since 2016, China has actively sought to dethrone king coal. Xi Jinping's first Five-Year Plan made sweeping changes to China's economic, social, and environmental policies. Chinese leadership has cemented the environment as a "prominent part of the central government agenda and discourse" (Ran 2017), which include the recentralizing attempts under Xi which has made local-level actors more responsive to environmental policies. Considering the substantial limitation on subnational actors' discretion, we would expect there to be significant changes in environmental policy implementation. Local officials in Shanxi and Henan—two of the largest coal producing provinces in the country and world—implemented Xi's policies and did so enthusiastically from 2016 until 2018. However, since then coal production and consumption has steadily increased. What does this sudden and enthusiastic implementation of environmental policies tell us about Chinese state processes and the role of the central state's designs, incentives, pressures, and interests in meso-level implementation? Why are there different levels of pro-environmental policies implementation in provinces that rely on extractive industry for political and economic power? I conducted 93 interviews with key informants and officials and 53 with coal miners in Shanxi, Henan, and Beijing over 11 months and supplemented my interviews with participant observation. I propose a new way of studying the Chinese state in the Xi Jinping era called interstitial débrouillardise to theorize the mechanisms authoritarian environmental governance

Commoning Through Collective Action in the Energy Field

Osman Arrobbio, Winston Gilcrease, Dario Padovan, Alessandro Sciullo

Università di Torino, Italy

Collective action stands as a foundation for social life. Any action of any member of the social body is wrapped in bundles of collective action, which involve agents and agencies of different nature. Collective action produces collective goods, but we can also say that collective action is a process of "commoning" that produces commons.

Energy is in a wider way a common because it is free and everywhere. However, it must be kept and transformed in forms having less entropy. This process can be seen as commoning in the sense that people acting together organize themselves to transform - through technical apparatuses having different degrees of complexity - useless energy into useful energy.

The first outcome of collective action is a collective good, and such a good, as in the case of energy, is not appropriable or eligible to be privatized for individual profit and utility. The production of collective goods also means that people who are engaged in a collective action can collectively control and own the collective good, which is managed in a common way and produces welfare (rather than profit) for the collective and beyond. This contribution aims at showing evidence of the way collective action produces commons. It will show the results of a participatory research, carried out within the H2020-funded COMETS project, with 30 energy communities and cooperatives in six EU countries.

How Access to 'Sunlight' in Buildings Enables Social Order: The Case of Boroondara in Australia

Neha Yadav, Steven A. Wolf, John {Jack} R. Elliott

Cornell University, USA

This case study highlights the interplay between technical and social dimensions of solar access policies for dwellings stipulated by the City of Boroondara in Australia. Boroondara is a garden suburb located near Melbourne. Boroondara's policies on solar access are executed by controlling height and setback of dwellings, and sub-divisions of a plot. These regulations promote direct access to sunlight, prevent overshadowing of and excessive visual bulk on neighbouring properties. Much of the scholarship and real-world practice is focused on digitally simulated models that technically operationalise solar architecture, and the ecological imperatives thereof. We reconsider this line of assessment with the knowledge that management of natural resources operates amidst social, political-economic and racial tensions. We probe the invisible exchange between such forces as it applies to Boroondara. We ask - Why is Boroondara using solar access policies? What is the meaning of 'Sunlight' in Boroondara? We employ multiple qualitative methods: field study, semi structured interviews with stakeholders, photo documentation, archival and media analysis. Using Atlas.ti, we analyse 167 data files which show that regulating solar access helps the city prevail its neighbourhood character through prevention of excessive development and high-rise buildings. The criterion for solar access enables stakeholders to overturn proposals of densification that seek to accommodate new residents, a growing share of whom are Asian immigrants. We discover that access to 'Sunlight' implies amenity, a sense of place, achieving the Big Australian Dream, inter alia. A more informed, inclusive and transparent discourse can guide the design and use of ecological tools by pre-emptively recognising the interplay between technical and social dimensions.

Development Of Locally Adapted Sustainability Indicators For Commercial Real Estate Management

Markus Winkelmann, Jürgen Kopfmüller

KIT, Germany

In the frame of the "Stadt-Land-Plus" research program, which aims to improve the sustainability of German regions and explore the relations and mechanisms of urban-rural developments, the KoOpRegioN project (2020-2023, financed by the German Federal Ministry for Education and Research) focuses on the sustainability of commercial real estate management and how inter-communal cooperation can support this. The perimeter is the Northern Black Forest region with the city of Pforzheim, situated in south-west of Germany. The inter- and transdisciplinary designed project aims to establish a "community of practice" with relevant local stakeholder groups. Its purpose is to engage in a co-design process for developing a regional perspective on sustainable commercial real estate use and management and to support cooperation in particular among rural and urban communities. Since commercial real estate management is still not a priority topic in urban sustainability practice and research, the key objective is to develop a common understanding of sustainability criteria and indicators usable in the region, based on the Integrative Sustainability Concept of the Helmholtz Association (ICoS), literature reviews and stakeholder views. Thus, theproject has to deal with tensions between practical values and interests and the pursuits both, scientific goals and consultancy support of regional actors.

In the presentation, the transdisciplinary development process and first results of locally adapted sustainability indicators will be outlined. Moreover, impacts of this co-design process on social acceptability of sustainability measures within the frame of commercial real estate management will be discussed.

473

The ODSLocal Case - Fostering Local Sustainability Under the Agenda 2030

Luísa Schmidt[1], João Guerra[1], Madalena Santos[1], Lia Vasconcelos[2], Filipa Ferreira[2]

[1]Universidade de Lisboa; [2]Universidade Nova de Lisboa

The paper here proposed presents an ongoing sustainability implementation project: ODSLocal - Municipal Platform for Sustainable Development Goals. Through a comprehensive mobilization process for all Portuguese municipalities, the platform aims to stimulate a broad and open local sustainability movement with strong multiplier effects. It highlights local actors and their initiatives and promotes the creation of an extensive and committed community of change in a post-pandemic context, where new challenges and requirements emerged.

To such an end, it will operate at three levels:

1. INFORM - Municipal Portal: i) dedicated and updated information annually on the indicators of each of the 17 SDGs; ii) georeferenced mapping of projects and good sustainability practices existing in the municipality carried out by the local governments and other local agents and institutions; iii) a private and autonomous area for the management and systematization of information with export features and the preparation of informative summaries.

2. EMPOWER - Training program for local sustainability agents, involving mayors, technicians and communities' key actors, to create a national network of trainers on SDGs and the 2030 Agenda at the local level. This program aims to implement Dynamic Laboratories, ensuring responsible involvement of various actors and encouraging partnerships to sustainability networks construction.

3. OUTREACH - Communication and dissemination strategy on a national scale will value and project each municipality's practices and progress. e.g., the attribution of the ODSlocal Awards will distinguish Projects, Practices and SDG Partnerships rewarding cases that show top performance or positive dynamics.

Toward An Hybrid Framework Of Strategic Foresight And Policymaking: An Empirical Study On The Use Of Strategic Design For Social And Environmental Missions

Yuna Amie Lee

University College London, United Kingdom

Wider digitalization through science and innovation has accelerated the growth of knowledge as the basis of policy solutions and increased the uncertainty of complex interconnected domains. In the current policy process, there has been a growing interest in more open approaches that incorporate creativity and innovation based on design into scientific data-driven strategic foresight methodologies to implement more effective policymaking. Yet, there is a lack of a common theoretical foundation for this comprehensive approach with design, and substantial changes in policymaking practice are insignificant. In light of this, this research contemplates the question of how effectively policymaking practices have been implemented through the synthesis of scientific, technology-oriented innovation with the strategic design for tackling complex societal challenges and devising more significant insights to make society greener and more liveable. Here, this study conceptualizes the notions of a new collaborative way of strategic foresight that aims to maximize mutual benefits between policy actors and citizens through the cooperation stemming from evolutionary game theory. This study applies mixed methodology, including interviews of policy experts, with the case in which digital transformation and strategic design provided future-oriented solutions or directions to cities' sustainable development goals and society-wide urgent challenges such as COVID-19. As a result, artistic and sensual interpreting capabilities through strategic design promote a concrete form of ideas toward a stable connection from the present to the future and enhance the understanding and active cooperation among decision-makers, stakeholders, and citizens. Ultimately, an improved theoretical foundation proposed in this study is expected to help strategically responding to the highly interconnected future changes of the post-COVID-19.

RN12_T05_02 | Environmental Attitudes and Behaviors 3

Attitudes on Climate Change and on Energy Policies in Two European Countries: a Sociological Approach

Ana Horta[1], Luísa Schmidt[1], Line Vanparys[2], Françoise Bartiaux[2]

[1]University of Lisbon, Institute of Social Sciences, Portugal; [2]Université catholique de Louvain, Belgium

Public engagement has been considered key to sustainable energy transitions and action to tackle climate change, as effective policy strategies require public support and acceptance. However, public perspectives on the challenges of climate change and energy transition still need to be better explored, and effective public engagement should not be taken for granted. Specific socio-political contexts, infrastructures, and practices, among other factors, may condition the acceptance and adoption of changes. In this presentation, we highlight climate justice and energy justice as well as gender differences as relevant frameworks to understand issues that may arise as forms of resistance to energy transitions and climate policies, as well as to point out that such changes may aggravate forms of inequity, and lack of trust, if social costs are not met. We do this by analysing data from the European Social Survey. We focus on two countries, Belgium and Portugal, to investigate how levels of concern about climate change and support for renewable energy relate to gender and to the divide between people with low income, and the more educated and well off. The paper explores these results and provides an in-depth analysis of these specific national contexts in order to contribute to cross-national research and to examine critically "the relative importance of individual-motivational versus national-contextual variables in public energy preferences" (which is one of the goals stated for this survey). Finally, we discuss the relevance of notions such as 'concern' and 'worries' used in the European Social Survey which are inspired by psychological models, in particular the Value-Belief-Norm (VBN) model (Stern, 2000).

"Spanish People's Attitudes Towards the Environment and Climate Change. A Quantitative Temporal Evolution Approach"

M. Victoria Sanagustín-Fons[1], Ana Serrano[1], Cristina Sarasa[1], Rosa Duarte[1], Ignacio Cazcarro[2]

[1]University of Zaragoza, Spain; [2]ARAID, Spain

In the first descriptive phase we made a deep study about all the surveys and barometers where the Spanish attitudes and opinions towards environment and climate change were measured all along time (last 25 years). Then, a second phase was made, an analysis of the evolution of these two main domains in Spain. This is a crucial issue on the political agenda both in our country and globally; proof of this is precisely the UN's Agenda 2030 (2015) and the SDGs (Sustainable Development Goals) through which attempts are being made to involve both public and private institutions and citizens as a whole. The theoretical framework has three main standpoints, the one about social attitudes and their influence on social behaviors; the theory about post-materialist values in current societies and finally, the symbolic world and habitus of people in relation to both phenomena climate change opinions and environment's Spanish attitudes. In order to understand this evolution, the research is based on the questionnaires carried out by the CIS (Sociological Research Centre) in Spain. Descriptive statistics and analysis of correlations between variables were applied. The main conclusions are based on significant differences taking into account sex, age, level of education, political spectrum, habitat size, and risk perception. Women are more likely than men to recycle and not use the car as an environmental improvement activity; risk perception depends on age, all political spectrums tend towards greater environmental awareness, and a positive relationship between level of education and perception of the environment was found. NB: This research has been funded by a 2019 research grant from the CIS (Sociological Research Centre), which is part of the Spanish Ministry of the Presidency.

475

Preaching Water- Drinking Whine? Is Political Pro-climate Engagement of Adolescents Associated with a Climate-friendly Lifestyle?

Michael Brenner-Fliesser[1], Sebastian Seebauer[1], Matthias Penker[2]

[1] Joanneum Research Forschungsgesellschaft mbH, Austria; [2]University of Graz, Austria

Background: Young adults are main participants in climate-change movements (Nissen et al., 2020) . However, besides political engagement, individual efforts at combating climate change should also include personal lifestyles. It is not clear yet, how political engagement and personal lifestyles interact: Cognitive dissonance theory suggests that pro-climate engagement corresponds with a more climate-friendly lifestyle (Castiglione, 2020). By contrast, compensatory beliefs may justify carbon-intensive consumer choices if adolescents argue to have already 'done their part' by participating in political engagement (Capstick et al., 2019).

Method: A sample of 502 Austrian students in the final year of high school were surveyed on climate-relevant behaviour, sociodemographic information and political engagement (Mean age: 18.0 (SD=0.8), 52% female). Individual Greenhouse Gas (GHG)-emissions were calculated in seven consumption domains (diet, mobility, flying, heating, electricity, hot water use, buying clothes and electronics). Political engagement was measured in four categories (political action, organisational membership, offline persuasion, online persuasion).

Results: GHG-emissions are lower for adolescents showing political engagement in all categories, except for the use of electronic devices for adolescents performing online persuasion. Differences between engaged and non-engaged adolescents are especially pronounced regarding diet and buying clothes. Engagement in online persuasion features the strongest association with overall GHG-emissions.

Discussion: There is no evidence that performing political climate actions is undermined by a less climate-friendly personal lifestyle. Encouraging adolescents to pro-climate political engagement may also lead to a more climate-friendly personal lifestyle and vice versa, implicating, that measures to support one sphere may be beneficial even beyond the targeted sphere.

A Collaborative Approach to Build Teaching Materials on Local and Sustainable Food Systems for Vocational European Schools

Rita Queiroga-Bento[1], Idalina Dias Sardinha[1], Sarah Cohen[2], Phillip Dietrich3, Danijel Davidovic[4], Carla Deo[5]

[1]University of Lisbon / Lisbon School of Economics and Management, Portugal; [2]La Bergerie National / Global Sustainability Officer, France; [3]University of Natural Resources and Life Sciences | Department of Sustainable Agricultural Systems, Austria; [4]University of Maribor | Faculty of Arts, Slovenia; 5Osservatorio Europeo del Paesaggio, Italy

Local and sustainable food systems (LSFS) gained popularity in facing the challenges played by the capitalized agri-food sector. Increasing literature describes diverse forms of such systems and observes erratic use of terms as equivalents like short food supply chains (SFSC). The European Parliament approved in 2013 financial incentives for SFSC implementation within the Community Support Framework. Although there is no agreement among authors on the definition and sustainability assessment of LSFS, stakeholders require agro-food sector's transformation. Agro-vocational education and training (AVET) is seen with a key role in qualifying the sector's workpower to meet the food systems challenges, while urged to adapt its pedagogical approaches. With the contributions from Sustainability Education, a shift in AVET in direction to competence training is needed, favouring experiential and interdisciplinary learning, which is hindered by the scholar tradition of formal education. Thus, there is a need to better understand LSFS in EU as well as adequate pedagogical tools to teach it at AVET level. The ERASMUS+ EducLocalFOOD project seeks to respond to this challenge, targeting 5 EU countries, and applying transdisciplinary and participatory approaches. Hence, 25 vocational teachers and researchers in the agricultural and pedagogical fields, after describing the understandings and operationalizations of LSFS in each of the 5 countries, inquired on the most suitable contents and pedagogical resources so to built together a pedagogical toolkit. A systemic and multi-interdisciplinary pedagogical approach was found to be the most appropriate. The toolkit is now being tested by the AVET teachers in different countries and contexts to

476

further improve and customise it. Final results can only be issued after this phase, which is to be completed in June 2021.

RN12_T05_03 | Social Theory and the Environment 2: Jean-Paul Bozonnet session

Academic Landscape of Social Research on Environmental Attitudes and Behaviors

Audronė Telešienė[1], Markus Hadler[2]

[1]Kaunas University of Technology, Lithuania; [2]University of Graz, Austria

A wealth of academic papers has been published to explain environmental attitudes and personal environmental behaviors. Yet there is a lack of effort to systematically review and analyze this academic discourse. The aim of this article is to investigate the order and content of this discourse, i.e. which theoretical approaches have been employed and which empirical evidence was used to study individual environmental attitudes and behaviors and test the validity of the different theories. An initial review of entries at SCOPUS and Web of Science Core Collection led to the selection of "Environment and Behavior" journal as the most typical case of the studied academic landscape. We adopted a quantitative content analysis approach to explore academic texts published in this journal between 1971 and 2019 (190 texts in total). The systematic literature review shows a growth of theoretical diversity and intensity of the academic discourse in the post-2000 period, a dominance of socio-psychological explanatory models, and a geographically limited empirical evidence base.

Among other results, our subsequent content analysis revealed that New Ecological Paradigm (NEP) and Theory of Planned Behavior (TPB) are the most commonly mentioned theoretical concepts. NEP most often co-occurs with Postmaterialism Theory and Dominant Social Paradigm. Theory of Reasoned Action usually occurs as precedent of TPB. The empirical evidence has been often drawn from non-nation-wide studies with non-representative samples, most often coming from North-

American countries. This questions the generalizability of some theories and leads us to discuss how sociology has been meeting the global environmental challenges.

Condorcet, Godwin, Malthus: The Debate on Natural Limits to Social Progress, Yesterday and Today

Ernest Garcia

Universitat de València, Spain

A debate emerged at the end of the 18th century. Substantially it is the same discussing today limits to growth. Condorcet (1973-4) asserted that human improvement would never stop. He ruled out the possibility of the finitude of the planet becoming a barrier with arguments that, in today's language, refer to hopes that threats are distant in the future, as well as the ecoefficiency, dematerialization and postmaterialism. With his second thoughts Condorcet invented sustainable development! Godwin (1793) supported the same by adding that unending progress would be possible only by abolishing government, property, marriage and the associations in order to liberate the individual; creating this way a world without war, crimes, law courts and government, without disease, anguish, melancholy, resentment, death and sex. (It is hardly surprising that this paradise on earth, anarchist as well as individualist, is quite similar to christians' heaven: the dominance of spirit over matter has been a basic belief of the industrial society since its very beginning). Malthus rose against these dreams (1798) by saying that nature represents an insurmountable obstacle to their realization, that necessity, the "imperious law of nature", restrains all the organisms, including humans, "within the prescribed bounds" (the idea that earned him Darwin's praise and the enmity of many social philosophers). Malthus argued that Godwin's vision of society, so beautiful, lies unfortunately in three errors: that all social ills come from institutions, that eliminating property would give rise to unending wealth, and that equal sharing will always solve material shortages. Even in its literal terms, the debate anticipates much of what is today discussed about sustainable development and degrowth. The subject deserves a careful review.

477

Environmental Expertise for Social Transformations: The Role of Social Science

Rolf Lidskog, Adam Standring, James White

Örebro University, Sweden

What role should social science play in the struggle to develop more sustainable pathways for society? This crucial and indeed complex question is the point of departure for this paper, which explore the roles of social science expertise in the work towards sustainability. The background is the increasing quest for transformative change, visible in the work by expert organisations' such as the IPBES and the IPCC but also in national and international work to reach objectives of Paris Agreement as well as Agenda 2030 and its Sustainable Development Goals.

This paper takes this situation as point of departure and elaborates on the character of a social scientific expertise for transformative change. Drawing on findings from Science and Technology Studies (STS), environmental sociology and critical social theory, it first discussed what is needed to be an expert and claim epistemic authority over a domain. Thereafter it explores what it means to be a social scientific environmental expert and reviews current forms of this kind of expertise. Finally, the paper discusses risks and benefits attached to social science expertise.

RN12_T06_01 | Urban Natures

Energy Savings or People's Empowerment? Evidence from Small-scale Energy Poverty Interventions in Pilot Urban Areas of the Mediterranean

Sergio Tirado Herrero[1], Lluc Canals Casals[2], Toni Cantero Gubert3, Mariana Catalina Jiménez Martínez[3], Irene González Pijuán[4,5], Mònica Guiteras Blaya[5], Joana Ortiz Ferrà[3], Lidija Živčič[6]

[1]Universitat Autònoma de Barcelona (UAB); [2]Universitat Politècnica de Catalunya (UPC); [3]Institut de Recerca en Energia de Catalunya (IREC); [4]Sheffield Hallam University (SHU); 5Enginyeria sense Fronteres (ESF); 6Focus Association for Sustainable Development

478

While the European Union is spearheading global action on the climate emergency, millions of Europeans are unable to access a sufficient level of domestic energy services for fully participating in the lifestyles, customs and activities that define membership of society. The recognition of this condition, defined as energy (or fuel) poverty, has triggered action at all levels, some of which includes small scale interventions aimed at helping affected households save energy at home. This approach often relies on changing habits and behaviour under the assumption that people in energy poverty use more energy than necessary due to the inefficiency of the dwelling or appliances and what has been labelled as 'energy illiteracy'. Contrary to such claims, it has been argued that people affected by energy poverty display very careful domestic energy consumption practices, which in turn result in underconsumption and unmet energy service needs. This predicament is empirically assessed with data collected for the Horizon 2020 project EmpowerMed, which show the impacts of two types of support mechanisms (individual household visits and collective advisory assemblies) on vulnerable households who voluntarily participate in the project's six urban pilot sites in coastal areas of the Mediterranean. Preliminary results from Barcelona indicate that financial savings in the domestic energy bill do not necessarily translate into energy and carbon savings because household supply

contracts offered by dominant energy providers are often poorly suited to the needs of the energy vulnerable. They also support the need to go beyond a symptomatic treatment of energy poverty and of the potential of individual and collective agency for affected people – especially women – to confront their 'vulnerable consumer' status.

Social Barriers For The Usage Of Available And Accessible Urban Green Spaces

Charlotte Noël, Lisa Van Landschoot, Christophe Vanroelen, Sylvie Gadeyne

Interface Demography, Vrije Universiteit Brussel, Belgium

Our living environment impacts on our health and wellbeing. Negatively through 'environmental negatives' and positively through 'environmental positives' such as urban green spaces (UGSs). The physical and mental benefits of interaction with nature are well-established in literature. From a public health perspective it is thus important that people make use of UGSs. Therefore it is important to understand why they are under-used. That is why in this qualitative research we identified social barriers that prevented potential users within the Brussels Capital Region (BCR) to make use of available and accessible UGSs.

Insights were generated through 51 individual face-to-face in-depth interviews with a diverse group of UGS-users in terms of age, gender, migration background and socio-economic situation.

Results showed that barriers for UGS-use were firstly safety-related and secondly related to elements that interfered with a pleasant experience resulting from the feeling not to be 'in place' or from a deviation of the dominant social needs of potential users. The identified barriers resulted in different degrees of use. Integrality is one aspect. We distinguished three different dimensions of the integrality by which UGSs are used; the physical integrality, the temporal integrality and the sensational integrality of UGS-use.

While there are many benefits associated with UGSs, a continuous social evaluation of these physical places might produce social barriers resulting in a decline of their use, a more superficial use or even in their complete avoidance.

Supply and Demand of ES Provided by Trees in Rural and Urban Municipalities – Case Studies of Nysa and Racibórz in Poland

Piotr Matczak[1], Krzysztof Mączka[1], Patrycja Przewoźna1, Marcin Mielewczyk[1], Adam Inglot[2]

[1]Adam Mickiewicz University, Poland; [2]Gdansk University of Technology

Trees provide many ecosystem services (ES) to people and fauna (e.g., birds, insects) in urban and rural areas. They shape landscapes and perform various environmental functions over the centuries.

The potential for the provision of ES in Poland is higher than the European average. Nevertheless, the number of trees in the central parts of Polish cities decreases, and it deteriorates the potential of ES provision for residents. Moreover, the range of impact of particular ES vary significantly. Some ES have only a local impact, and others influence a distance far from the Service Providing Area. The type of local community, rural and urban, also influences the management of natural resources. It is essential not only to assess the ES supply but also demand from a local community.

This work aims to assess the scope people use the 18 ES provided by trees and the differences between ES supply and demand in two municipalities, the urban and the rural ones. We apply the participatory mapping and geo-questionnaire methods to identify ES provided by trees to the local inhabitants in experts' opinions (supply) and to identify which ES are mostly used by inhabitants (demand).

The results show the differences between experts' perceptions, revealed via participatory mapping, on ES supply provided by trees in rural and urban areas. ES demand, indicated via the geo-questionnaire, exhibits no difference for the types of areas, which is the opposite of the experts' perception of ES.

479

Socio-Environmental Movements in the Making of a Degrowth Urbanism: Lessons from Milan and Barcelona

Viviana Asara[1], Laura Centemeri[2], Daniel Delatin Rodrigues[3]

[1]Vienna University of Economics and Business, Austria;
[2]Centre d'Etude des Mouvements Sociaux, EHESS Paris;
[3]Università di Milano-Bicocca

Our contribution sets out to explore and reflect on the distinctive features of a degrowth urbanism. Urban degrowth implies a transformation of both the spaces and infrastructures of the city and the collective ways of living, imagining and practising the city, what Richard Sennett defines the cité as opposed to the ville. This implies that a degrowth urbanism must not only elaborate an agenda of interventions to transform the "ville" but also seriously think about how to reconcile "ville" and "cité". Our main hypothesis is that ecological prefiguration from below is necessary to this purpose but is not sufficient on its own. Based on empirical work on two urban regeneration projects located on agricultural and industrial areas in Milan and Barcelona, we explore the conditions for socio-environmental movements involved in prefigurative practices to play a role in steering urban transformations towards degrowth. In the case of Milan, movements are highly fragmented due to differences in political cultures, a repressive environment, and the polarising effect caused by the controversial Expo 2015 event. Ecological prefiguration thus remains interstitial and is forced to adapt to the margins of action left by public and private actors. In the case of Barcelona, on the other hand, the movement manages to build collaborations between different movement cultures animated by a vision of "cooperative urbanism" that reconceives the relationship between urban planners, inhabitants and users. By entering into (non-subservient) negotiations with the urban government, the movement contributes to the design of the "ville" while practically transforming the "cité".

RN12_T06_02 | Environmental citizenship

Environmental Citizenship in the context of Education and Advocacy in Turkey

Cigdem Adem

Ankara Rivers Study Group, Turkey

Environmental citizenship contributes to the debates on how to attain a sustainable society and it is thought to improve the possibilities of democracy to produce sustainable outcomes. According to Dobson (2010), environmental citizenship indicates pro-environmental behaviour, in public and in private, motivated by a trust in fairness of the distribution of environmental goods, in participation and in the co-creation of sustainability policies. It is based on the active participation of citizens in heading towards sustainability. Cosmopolitan Environmental Citizenship underlines the interconnection and interdependence on a global scale beyond national boundaries (Beck 2010). It frames the discussion from a critical point to globalisation while discussing ecological footprints and virtues.

For Dobson (2003), one of the institutions where sustainability flourishes are schools. The first section the paper will critically analyse Turkish primary and secondary school textbooks for 4th grade on Human Rights (Altay et. al, 2019), Citizenship and Democracy (Altay et. al, 2019) and for 6th grade on Social Knowledge (Yıldırım et. al, 2019) from an environmental citizenship perspective. The study further examines two textbooks (Demir et.al 2016 and Kıncal, 2015) of teaching Social Science Education which are taught in the second year of undergraduate study.

Environmental citizenship focuses on rights rather than responsibilities. Within this context, the paper, moreover, analyses articles of the 1982 Constitution related with the environmental rights and duties of the State and the citizens. In addition, the study evaluates the role and importance of these articles in recent environmental controversies.

480

The Politics of Imagined Climate Futures: A Sociological Approach to Social Responses to Climate Change

Anna Clot-Garrell

Universitat de Barcelona, Spain

In October 2018, the report released by the United Nations Intergovernmental Panel on Climate Change (IPCC) indicated that the world is headed toward a dangerous temperature rise by 2030 if dramatic action is not taken. The rise of new social movements concerned with raising awareness for and taking action against immediate environmental risks and challenges might be understood as a response to this scientific warning. In October 2018, the now global Extinction Rebellion was founded in the UK, while the Fridays for Future demonstrations that have also spread worldwide emerged in August 2018 from the climate strikes of the young Swedish activist Greta Thunberg. Environmental activism has a long tradition as well as youth activism, but the rise of these new climate movements and protests in which young people have come together as the result of a widespread contemporary agreement on climate change is new. These mobilizations certainly require attention in order to understand current social responses to the environmental crisis. Drawing on qualitative empirical research on climate change and new environmental movements in Barcelona, this paper examines the narratives and practices of these new environmental groups understood in terms of "generational collectivities" (Boltanski, 2018). Specifically, I explore how climate messages and ideas travel crystallizing in local practices, and how within and via these practices and actions young activists project themselves into and engage with the future.

Climate Citizenship – Diversifying Citizens´ Role As Climate Actors

Anni Emilia Turunen[1], Suvi Huttunen[2]

[1]University of Jyväskylä, Finland; [2]Finnish Environment Institute, University of Jyväskylä

Climate citizenship is commonly understood as citizen activity aiming at climate change mitigation and climate justice. Climate citizenship is practiced in consumption choices, wider lifestyle patterns, and political activity promoting needed societal changes. However, citizen agency is often seen as individual and the role of the collective agency has been overlooked. Thus, there is a need to widen the view of who is acting for climate change mitigation, why, and how. An understanding of citizenship as the collective agency could provide something new to the attempts to resolve the climate crisis.

We develop the understanding of climate citizenship and collective citizen agency using interviews among civil society actors active in climate issues. They include a) professional environmental organizations, b) new, often loosely organized groups focusing on climate issues, and c) other organizations, which have a professional, hobby, or scientific background, but which are increasingly active in the area of climate change. The interviews are employed to find out why and how civil society actors act on climate change, how is their agency constructed and what implications does this bears on climate citizenship. The study generates knowledge on the role and functioning of emerging climate action of citizens at the community level and contributes to developing climate policies to enable and encourage civic action and climate citizenship.

481

RN12_T06_03 | Energy Transitions 3

On the Role of Consumers' (Non-)interest in Adoption of Smart Grids

Ekaterina Tarasova

Linköping University, Sweden

In future, electricity networks will have to accommodate larger shares of renewable energy as well as electricity use needs to become more effective. Development of smart grids is a strategy comprised of new technologies, business models, regulations, products and services that is designed to meet these challenges. Electricity consumers are often depicted as central actors in smart grids as they are expected to engage in managing their electricity load and by this contribute to more efficient and flexible electricity consumption. Smart grid imaginaries include the idea of users becoming interested in managing their electricity load. The research on smart grid users often considers the role of interest for diffusion of smart energy products and services, among other drivers. Interest in smart energy technologies is regarded as crucial for consumer engagement. This paper proposes to critically discuss the role of non-interest of electricity consumers in smart grids, smart energy products and services and its implications for smart grid development and implementation. The analysis builds on 30 semi-structured interviews with state, business, and third sector actors in Sweden.

Waste Wood Instead Of Coal. The societal impact of two new processes in the steel industry.

Markus Hadler[1], Michael Brenner-Fließer[1], Ingrid Kaltenegger[2]

[1]University of Graz, Austria; [2]Joanneum Research Graz, Austria

Consumers have articulated an increased demand for environment-and climate friendly products. Recently, also positive social impacts of products have gained interest. The steel industry is of pivotal importance in this regard, as many of our daily products rely heavily on steel. Hence, we present results of a Social Lifecycle Assessment (s-LCA) of two product innovations in this industry – the use of waste wood instead of coal and the extraction of ethanol from the exhaust fumes.

We present results from the H2020 project "Torero" (www.torero.eu), which supports the refitting of a steel factory in Ghent, Belgium, and the accompanying analysis. Our approach follows the s-LCA principles defined by the UNEP/SETAC-guidelines (UNEP/SETAC, 2020). Categories in which the most severe impacts can be expected are determined by using the Social Hotspot Database. Data for the indicators is collected via interviews and questionnaires (wood waste treatment, steel production, ethanol production sites) and also from background data bases (gasoline production, gas extraction).

Our analysis is ongoing. So far, it shows advantages for the new system regarding social impacts, especially in the categories of labour rights and governance. The overall advantages of the new system, however, are reduced because of the necessity to substitute waste wood by gas for thermal energy production (the current use for waste wood). Our research thus indicates that the replacement processes must be considered in detail when assessing the environmental and social benefits of these new processes in the steel production.

Social Perceptions of Subsurface Geo-energy Projects in Poland

Katarzyna Iwińska[1,2], Aleksandra Lis[2], Krzysztof Maczka[2]

[1]Collegium Civitas; [2]Adam Mickiewicz University

European Countries committed to carbon neutrality targets by 2050, ensuring implementation of more RES in the energy mix. One of the solutions for EU member states is to develop geothermal energy (mid-depth or mine water heat extraction). This paper examines geo-energy's social perception as a new technology introduced to people who live in "mining regions". We analyse data using the framework of place attachment and the "coal mining identity" and other factors that affect the attitudes towards a low carbon technology.

The research was conducted using CAWI (N=1500) in three coal mining regions of Poland. It analyzes the perception of people living in mining communities, as well as those who live in the areas close to the hard-coal mines that were closed (in Lower Silesia Region), that are in many years of transition (Upper Silesia) and that, still exist (Upper Silesia and Lublin voivodship). We used an informed survey approach in which a description of mine water heat geothermal and its credible impacts is provided. In addition to the statistical analysis, we used GIS (geographic information system) methods to identify some variables and to better understand the trends in different locations.

The results show an overall positive attitude toward geo-energy applications. The majority of the respondents support the idea, and inhabitants of medium-sized towns are more optimistic about the possibility of obtaining energy than inhabitants of villages and small towns. Men perceive more costs however in general women are less positive about geothermal projects.

Our study will provide a greater understanding of the link between individuals who identify with mining, the place that facilitated it and their perceptions towards the implementation of subsurface geo-energy projects.

What differences Nuclear Compensations bring to Municipalities?:A Comparison of Japanese cases

Yoichi Yuasa

Kanto-Gakuin University, Japan

Nuclear host municipalities are provided some benefits for hosting nuclear power plants. We call this benefit nuclear compensation. Nuclear municipalities in Japan have long histories with nuclear power plants and the compensations. Over time, these municipalities may come to deeply on the compensations. Long-term compensations may have significant impacts on these municipalities. It is therefore important to consider how the compensations work and if the municipalities have changed by receiving them.

In this presentation, we will compare some nuclear municipalities with non-nuclear municipalities in Japan. This can make clear how the nuclear municipalities have changed by receiving the compensatons.

For analysis of the long-term trends, we will use data on their public finances and the voting result of national elections. The first hypothesis is that the vote share of pro-nuclear political parties will increase in nuclear municipalities. The second is that some differences of expenditure accounts can be found between nuclear and non-nuclear municipalities.

The impact of nuclear compensation may be different by size of population. Amongst nuclear municipalities in Japan, the largest population is around 200,000 but the smallest is under 2,000. So, we will take nuclear and non-nuclear municipalities with small and large population.

After the Fukushima nuclear disaster, many nuclear reactors are abolished and preparing to be decommissioned in Japan. For some nuclear municipalities, this means that they can lose their resources of compensations. Then, what will happen in them? It is important to know municipalities' dependency for thinking of nuclear municipalities' future.

The Nationalism of Environmental Concern

Antonia María Ruiz Jiménez, José Manuel Echavarren Fernández

Universidad Pablo de Olavide, Spain

The intertwining of the study of collective identities and environmental issues is rare in academic research and therefore the research on identity as a possible trigger for environmental concern. Historians have dealt with the issue of how nature and ideas of nature have shaped national identities (for example Nash, 1982), but those works haven't transformed somehow in cross-national quantitative studies analysing environmental concern. In this investigation we consider that national identity can be a possible explanation for environmental concern. After all, it is easier to develop concern about things one is attached to, and people with strong feelings about their country should be expected to be concerned about nature as part of the national domain. Several authors have also pointed out the instrumentalisation of ecologist discourses by radical right-wing political groups (Zimmerman, 1995). This is especially interesting given that right-leaning individuals traditionally have been found less likely to show environmental concern (Dunlap, Xiao, and McCright 2001). Employing multivariate analysis using data from the World Values Survey 6th wave (2010-2014) we find that pride for the nation acts as a trigger for environmental concern for right-leaning individuals whereas it shows no effect on the environmental concern of left-leaning respondents.

Do Central Europeans Care for Their Natural Environment? A Cross-National Analysis of ESS Data from Round 4 (2008) and Round 9 (2018)

Bruno Šimac, Tijana Trako Poljak, Vladimir Ivanović

Faculty of Humanities and Social Sciences Zagreb, Croatia

This paper examines the attitudes on care for the natural environment through a cross-national comparison of Central European countries based on European Social Survey (ESS) data from Round 4 (2008) and Round 9 (2018). In the theoretical part of the paper, we discuss Schwartz's 'Human Values Scale' and the way in which it has been adapted for ESS to include 21 items corresponding to 10 basic human values (including universalism, which includes care for the environment). We then rely on the existing literature to discuss the current situation regarding environmental attitudes in seven CE EU countries (Austria, Croatia, Czech Republic, Germany, Hungary, Poland, and Slovenia). These countries were chosen because they share common geo-political position within the EU as well as their historical ties. In the empirical part of the paper, we focus on one item of 'Human Values Scale' related to human care for the environment and analyze cross-national changes in responses over the 10-year range of ESS data. We also construct materialistic and post-materialistic values indices from the remaining items and correlate them with the care for the environment, as these values have been shown to be good predictors for environmental attitudes in previous research. Furthermore, we also correlate the responses on the care for the environment with key socio-demographic characteristics. To better understand the cross-national results, we will additionally analyze ESS data from Round 8 (2016), which included the Climate Change module, and the International Social Survey Programme (ISSP) Environment module (2010). This research was conducted as part of the project SECRURAL funded by Croatian National Science Foundation (UIP-2019-04-5257)

Key words: Human Values Scale, Universal Values, Natural Environment, European Social Survey, Central Europe

Inconsistency Between Pro-Environmental Attitudes and Behaviours: a Systematic Literature Review

Vidas Vilčinskas

Kaunas University of Technology, Lithuania

The latest Intergovernmental Panel on Climate Change (IPCC) report highlighted the human impact on climate change and the importance of taking action to limit global warming to an appropriate level. Inclusion of various societal groups can help to achieve the required goal, and individual human action is one of the factors. However, in academic literature attitude-behaviour gap term appears, which is seen as a barrier to individual pro-environmental behaviour. The approach reveals itself among individuals holding pro-environmental attitudes, yet actual pro-environmental behaviour is not executed. Consequently, it is important to understand the approach better. By reducing the gap, desired behaviour could be promoted. Climate change and environmental attitude-behaviour gap research is relatively frequent. Despite the fact, a systematic literature review has not been conducted so far under this specific topic.

The aim of this study is to conduct a systematic literature review on climate change and environmental attitude-behaviour gap. Current research relies on 42 survey data based articles that were extracted from Scopus database. Further, articles were coded, and quantitative content analysis has been employed. This allows to explore the main tendencies of attitude-behaviour gap research over the last 10 years. Several research related questions can be answered, such as: what theories were used in the articles? What analysis methods are employed when analysing attitude behaviour gap? What research gaps are identified by the authors of the text?

Exploring The Heterogeneity Of Individual Environmental Attitude

Alessandro Sciullo, Osman Arrobbio, Dario Padovan

Università di Torino, Italy

In order to tackle climate change, the need of an active involvement of social actors and of the general public in the societal transition has been increasing in recent years and calls for effective engaging policies, well-targeted in consideration of the heterogeneity of the social actors to be involved. In line with this challenge, the paper aims at providing a multi-perspective understanding of the perceptions of climate change. By relying on data from the eighth round of the European Social Survey (ESS8), types of individuals are defined based on a diversified set of socio-cultural factors, considered at the individual as well as at national level, that could be connected with the wide heterogeneity of beliefs, perceptions, behaviours and concerns related to climate change and to mitigation measures. Four types of individuals were identified: environmentalist, institutionalist, self-committed and skeptic. Our results show that individuals' environmental sensitivity can be associated with a wide variety of other factors and that groups of individuals defined on the basis of their environmental attitudes are strongly heterogeneous with respect to other domains of the social life in the diverse national contexts. These complex interplaying of diverse sources of heterogeneity are aspects that needs to be carefully taken into consideration when designing and implementing intervention aimed at facing the challenge of climate change by actively involved diverse stakeholders and the wider public.

Hype Cycles and Techno-Scientific Promises: the Saga of the European Pressurised Reactor in Finland, France and the UK

Markku Lehtonen[1,2,3]

[1]Universitat Pompeu Fabra, Spain; [2]Ecole des Hautes Etudes en Sciences Sociales, France; 3University of Sussex, the UK

The European Pressurised Reactor, a "3rd Generation" nuclear reactor was in the early 2000s portrayed as the showcase of what was to become a French-led European "nuclear renaissance". As compared with "Generation 2", it promised incremental improvements, i.e. being above all safer, but also cheaper, consume less uranium, and produce less radioactive waste. Once the EPR moved from promise to implementation, troubles mounted at the prototype construction sites in Olkiluoto (Finland) and Flamanville (France), and later at Hinkley Point (UK). What critics have dubbed "European Problem Reactor", has since then led to the demise of Areva, and turned into a major headache for the French government and nuclear industry.

The paper examines the history of the EPR from the perspective of sociology of expectations, drawing on Joly's concept of "Regimes of Economics of Techno-scientific Promises". Drawing on computer-aided socio-linguistic analysis (with the Prospéro software) of press articles from France and the UK (+5000 articles for each) for the period 1993-2020, the paper traces the history of EPR by identifying key turning points, the processes of construction of the promise, and the counter-narratives challenging the legitimacy and credibility of the promise. The analysis highlights the interaction between country-specific narratives, material elements, and institutions at various levels (sites of construction, development of the design, national discourses) in (de)constructing the legitimacy and credibility of the promise. The paper breaks new ground by applying the concepts of sociology of expectations to an incrementally improved rather than revolutionary new technology, in the nuclear sector with a heavy legacy of failed promises.

Making Mining Good: Mineral Exploration and the Justification of Future Mining Operations

Tobias Olofsson

Lund University, Sweden

Metals and minerals hold a paradoxical position in the contemporary debates on "green" technologies and sustainability. While essential to the electrified vehicles, renewable energy systems, and technologies proposed as solutions to global heating, the extraction and processing of metals and minerals come at significant environmental and social costs. This paper investigates how mineral explorationists justify future mining projects and how these justifications involve navigating the tensions of paradoxicality which connects mineral resource economies with social and environmental goods.

Drawing on a database consisting of interviews with actors in the Swedish mineral exploration and mining sector, ethnographic field notes from participant observation at mineral industry events, and a corpus of preliminary environmental impact assessments produced by Swedish explorationists and miners, the paper outlines how environmental and social values are used as signifiers of worth to justify the desirability of projected mining operations. Moreover, the paper explains how explorationists rely on spatial and temporal boundaries to make distinctions between beneficial and detrimental mining in order to frame their projects as more desirable than mining operations in other jurisdictions or in other times.

The Influence of the Shipbuilding-Cartography Revolution in the Making of a Capitalist World-Ecology, 1400-1600

Engin Burak Yilmaz

SUNY-Binghamton, United States of America

This paper analyzes why Portugal was the first state to start European colonial expansion in the fifteenth century and how the shipbuilding-cartography revolution helped the colonial expansion of Portugal. The shipbuilding-cartography revolution originated in the Iberian Peninsula in the fifteenth and sixteenth centuries and is conceptualized as a linked revolution in shipbuilding technologies, scientific developments in cartography, and innovations in instruments of navigation. Understood as such, the shipbuilding-cartography revolution was influential in the reasons behind why it was the Portuguese that led European colonial expansion in the fifteenth century. As a result, this paper underscores how the shipbuilding-cartography revolution was a crucial factor behind Portuguese colonial expansion and how in return it was produced by colonial expansion itself. In addition, the paper tries to demonstrate how the shipbuilding-cartography revolution played a crucial role in the emergence of a capitalist world-economy by tracing the historical geography of Portuguese colonial expansion in the first half of the long sixteenth century (1450-1557). The significance of Portuguese colonial expansion for European colonial expansion and the significance of the shipbuilding-cartography revolution to Portuguese colonial expansion are underscored using a world-ecological perspective. In this respect, the Portuguese colonial expansion is conceptualized through movements of commodity frontiers linking capitalist production, ecological transformation, and technological and scientific development ushering in the makings of the modern world. The world-ecological perspective allows for a conceptual narrative that presents technological and scientific developments in a dialectical relationship with processes of environment-making, state-formation, and capital accumulation.

Beyond Leakages and Communication. Reconsidering Trust in Carbon Capture and Storage.

Danny Otto, Matthias Groß

Helmholtz Centre for Environmental Research, Germany

All over Europe we can find public and political opposition to various technologies and regulations connected to a zero carbon economy (be it wind power, CO2 taxes, alternative energy solutions, Carbon Capture and Storage). This opposition has recurrently been linked to a lack of trust in technologies, procedures and actors involved. For a rapid transformation of energy systems, it is therefore crucial to understand how trust emerges or erodes around these topics.

For carbon capture and storage (CCS) discussions of trust often evolved around the issue of potential leakages from CO2 stored in underground formations. While this is a central concern of publics, we argue that it can be misleading to focus trust-building efforts on this topic. So far, it has been shown that trust in CCS goes beyond its technical properties. Psychological research highlighted the relevance of stakeholders and particular communication activities. However, it remains an open question how these findings can be understood from a sociological perspective. Drawing on recent discussions in science and technology studies on a relational theory of trust (e.g. Engdahl/Lidskog 2014) we aim to broaden the considerations of relevant influences on trust in technologies. We combine these theoretical insights with empirical work (content analysis, expert interviews) on CCS in Germany to widen the networks of trust usually considered for this technology.

Carnistic frames of "sustainability"–social processes surrounding "food" animals in the Swedish Organic Sector

Josefin Frida Velander

Karlstad University, Sweden

Food production with non-human animals leads to dire consequences in regards to climate change, species extinction and the exploitation of sentient beings. Yet the non-human animals situated in agriculture continue to be constituted as consumable and exploitable in the face of these problems. The study demonstrates the social processes around how carnistic practices and the relations of 'unsustainabilities' and dominance associated with them is made normal and legitimate in the Swedish organic context. The organic sector consists of networks of actors that aim to address the environmental and animal ethics criticism surrounding the common agricultural practices. The study examines organizations in the organic farming sector in the Swedish context and which frameworks they produce around sustainability and farm animals as food in this arena. The study also shows whether the non-human animals' own subjectivities and agencies are recognized, denied and used and in what ways. The results of the study argue that the organic sector produces carnistic frames of sustainability around organic meat production by narratives of sustainable food production that put "food animals" at the centre and re-configures these as "sustainably" consumable. The results are significant in that they show how dominant human-animal relations in the food industry is maintained and reproduced in sites of production that are framed as "ethical" and how notions of sustainability in food production is framed and limited by carnistic norms and practices.
Josefin Velander is a PhD student in sociology at Karlstad University, Sweden. Her field of interest is critical animal studies, environmental sociology, posthumanism and queer studies.

Food & Fashion: The Role Of Cultural Industries In Local Economies

Silvia Mazzucotelli Salice, Eleonora Noia

Università Cattolica del Sacro Cuore, Italy

This paper wants to investigate the convergence dynamics of two production sectors, the agri-food and textile sectors, which have long been considered cultural industries (Hesmondhalgh, 2013), and which are increasingly involved in processes of territorial empowerment and enhancement of local knowledge, resources and relationships. For this reason, the research work aims to investigate what are the common characteristics between the two sectors, and their role in the context of proximity economies.

Moreover, both the agri-food and textile sectors are today called to similar challenges: first of all that of sustainability, environmental and social, which concerns both production practices and distribution and consumption practices. Secondly, the local challenge: in the face of internationalized and globalized supply chains, the issue of the local today appears particularly significant, especially in the face of the changes due to the Covid-19 pandemic, which have imposed decisive rethinking and redefinitions of globally interconnected supply chains, as well as urban distribution models and relations between the economies of cities and those of peri-urban territories.

Furthermore, the new relationships and new links between producers and consumers that occur locally take on different configurations than in the past and outline on the one hand strategies for appropriating the advantages given by digital technologies, especially in terms of communication and expansion of offer; on the other hand, the rediscovery of the local and the relocation of the supply chains appear to be in discontinuity with a recent past of exaltation and extremeization of the global production, distribution and consumption chains.

Sustainability In Farming: An Italian Case Study

Melanie Sara Palermo

University of Macerata, Dept. ECHT, Italy

Current environmental, economic, and social problems and challenges we face impose on us to re-think our lifestyle and adopt sustainable practices fighting some trends, among them the exploitation of natural resources and the loss of biodiversity. In such a context, consumers pay increasing attention to food-quality, asking for sustainable supply chains that respect the environment and animals. By adopting the perspective of environmental sociology, this study analyses how sustainability is carried on in the farming sector referring to an Italian network of farmhouses. It is formed by about 80 members that participate in the Italian event "Caseifici Agricoli Open Day", an initiative created around the social and cultural value of cheese, considered as a product linked to the local community and the territory. Through the analysis of interviews made to farmers from March 2020 until February 2021, several good practices and common trends will be described: many farmers identify sustainability with km0 production, the absence of chemical products in feeding animals, extensive farming, and the practice of transhumance. Moreover, because of its national visibility, the event may play a pivotal role in promoting sustainability in farming activities, as a national event may easily attract the attention of consumers, policymakers, and stakeholders as well. Finally, the research emphasizes the role that farmers, and their activity in general, may have in the development of sustainable practices, thus underlying the social value of food, in this case, the main character of an event, and the relation between man and nature.

Food Governance for Sustainability: Key Issues, Actors and Approaches

Nerea Esmorís-Varela

University of Oviedo, Spain

Several events in 2020, with COVID-19 as a trigger, have made the inequality and unsustainability of the current food systems even more obvious. This recognition has contributed to bringing international attention into the urgent necessity of joining efforts to establish sustainable, healthy, and egalitarian diets worldwide.

Furthermore, as a myriad of international publications – such as the Green Pact (EU, 2020) or the 'Glasgow Declaration on Food and Climate' (2020) – have corroborated, achieving more sustainable diets and food systems globally is crucial for the viability of the Paris Agreement and the Sustainable Development Goals (SDG).

Governance mechanisms are considered as essential tools to move towards more sustainable and fair food systems on a planetary manner. This presentation aims to answer synthetically three relevant questions regarding food governance: a) what is food governance and who exercises it; b) why is food governance so important in the sustainability field; and c) what approaches and governance standards should be adopted on the path to achieve sustainable food systems worldwide.

Environmental Inequality in Four European Cities: A Study Combining Household Survey and Geo-Referenced Data

Andreas Diekmann[1], Heidi Bruderer Enzler[2], Jörg Hartmann[3], Karin Kurz[3], Ulf Liebe[4], Peter Preisendörfer[5]

[1]University of Leipzig; [2]University of Zurich; [3]University of Göttingen; [4]University of Warwick; [5]University of Mainz

Combining individual-level survey data and geo-referenced administrative noise data for four European cities (Bern, Zurich, Hanover, Mainz; n=7,450), we test the well-known social gradient hypothesis which states that exposure to residential noise is higher for households in lower socioeconomic positions. In addition, we introduce and test the "environmental shielding hypothesis" which states that if there are environmental bads in the neighborhood, privileged social groups have more and better opportunities to shield themselves against them. Our results show that for many residents of the four cities, observed road traffic and aircraft noise levels are above WHO limits. Yet estimates of spatial error regression models only partly support the social gradient hypothesis. For example, the proposed negative relationship between income and noise exposure is rather weak. Albeit socioeconomic groups tend to be equally confronted with road traffic and aircraft noise, high-income households are still more able to evade environmental noise. We find that based on characteristics of their residences and on investments in noise protection appliances, they are able to shield themselves against environmental bads in their neighborhood. This confirms the environmental shielding hypothesis.

Perceptions of Environmental and Mobility Injustice Though Climate Diaries.

Elena Giacomelli[1], Sarah Walker[2]

[1]University of Bologna, Italy; [2]University of Bologna, Italy

This paper analyses the intertwined concepts of 'environmental justice' (Schlosberg, 2004) and 'mobility justice' (Sheller, 2018) focusing upon two case studies - Guatemala, and Cambodia - through the interdisciplinary lenses of Sociology and Human Geography. These two concepts reflect the interconnecting strands as emerge from the research project ClimateOfChange: the right to mobility, the right to live in a healthy environment, and the unequal access to such rights across the globe. Empirical data is drawn from remote interviews with key actors, in-depth interviews with local participants impacted by climate change, together with a one month climate diary, capturing visual individual perceptions of climate change and mobility. Through this visual diary format, and in depth interviews, we analyse the impact of injustices upon climate vulnerable people living in these two countries.

This methodological innovation aims to capture the intersectionality of lived experiences, understandings of the climate crisis and how it impacts upon everyday lives. By drawing out knowledge of people directly affected by the climate crisis and their perceptions and understandings of their own mobility, the overall goal is to challenge Eurocentric formulations of 'climate migration' to enhance a more politicised understanding of this complex issue.

490

Environmental Justice as a Third Civil Movement - A Bridge Between the Movement for Civil Rights and the Environmental Movement - A World Review and Case Arab Society in Israel

Carmit Lubanov

Association of Environmental Justice in Israel, Israel

The attribution of the origin of the environmental justice movement (EJM) to the emergence of the American Civil Rights movement of the 1960s is already part of the environmental justice history. In retrospective, EJM has evolving globally by paving milestones reflected by vast scientific publications, unique academic programs, breakthrough policy and legislation and wide grassroots activity worldwide – all constituted a clear call for environmental justice. Yet, although environmentalism and the EJM are related, there are differences.

Environmentalism in general focuses upon the risky impact of human's actions on the environment, where the EJM conceptualizes the work of environmentalism by emphasizing the manner and scale in which adversely impacting the environment in turn impacts on defined population groups. At the heart of 'environmental justice' are social issues of racism and economic inequality.

Therefore, in countries where democracy is jeopardized and the prevailing political situation enables violation of human rights on different background, the realization of the necessity of addressing the environmental issues of minority and low-income groups, are highly dependent upon active and sustained engagement from both the government and civil society, and inclusive attitudes are crucial for understanding how to advance environmental justice.

The article will present examination of 3 case studies in Israel relating to planning rights for Arab localities, social mobility and environmental 'mainstream' position relating development of Arab communities. The 'Environmental justice' examined by constructing a database aimed to draw practical conclusions and on role EJ plays in the public discourse and of environmental decisions making process.

Environmental Justice at the Environmental Courts? Mining, Socioenvironmental Conflicts, and Environmental Compliance in Chile

Maria Akchurin

Loyola University Chicago, United States of America

Chilean environmental courts, set up by environmental policy reforms less than a decade ago, have become new arenas for political struggles around questions of environmental justice. As specialized administrative courts, they reflect a broader tendency toward the judicialization of politics while also being situated in a growing environmental bureaucracy tasked with regulating extractive industries. In this paper, I study a set of mining cases in northern Chile to analyze how legal challenges in the courts influence the implementation of environmental laws, affecting both the ecological stability of fragile ecosystems in the Atacama Desert and the communities that depend on them. I argue that court proceedings have symbolic and procedural consequences for ongoing socioenvironmental conflicts, as well as some limited potential to impact the distribution of environmental harms. Litigation, alongside other strategies involving institutional politics and social protest, renders the gaps between formal policies and actual practices visible and legible as problems state agencies are obligated to address, even in the context of broader state commitments to extractive development. The paper draws on interviews, legal and administrative documents filed with the environmental courts, video recordings of public hearings, legislative history documents, documents produced by government agencies, and media sources.

Sociological Research on Biological Diversity and Nature Conservation

What Can We Learn About The Resilience And Sustainability Of European Nature Protected Areas From The COVID Pandemic?

James McGinlay, Nikoleta Jones, Vassilis Gkoumas, Andreas Kontoleon

University of Cambridge, United Kingdom

The COVID-19 pandemic led to many European countries imposing lockdown measures and limiting people's movement from Spring 2020 onwards. During periods of less strict lockdown, management authorities of many nature Protected Areas (PAs) in Europe then had to introduce measures so that users could safely visit these protected landscapes. However, measures to safeguard public health are often in conflict with other PA management measures aiming to minimize disturbance of wildlife and ecosystems. Furthermore, many PA sites faced significant challenges: overcrowding, a new profile of visitors, problematic behaviour, and conflicts between different user groups.

By means of two workshops with a range of European PA management actors, and online surveys of residents in or near a number of National and Nature Parks, we investigated the challenges that emerged due to COVID-19 for PA management, their deeper causes and possible implications.

We consider what the COVID-19 crisis may tell us about the sustainability and resilience of life in such protected landscapes for local people and visitors, as well as of their ability to deliver protection of biodiversity and landscape quality.

We highlight three areas in which management of protected areas can learn from the experience of this pandemic: managing visitor numbers in order to avoid overcrowding through careful spatial planning, introducing educational campaigns, particularly targeting a new profile of visitors, and promoting sustainable tourism models, which do not rely on large visitor numbers.

The Relationship between Societal Dynamics and Biodiversity Effects: A Conceptual Model for Comparative Studies

Jens Jetzkowitz

Museum für Naturkunde Berlin, Germany

While the UN Agenda 2030 and the framework of so-called sustainable development goals represent the search for sustainable pathways in a globalized world of modern societies, it is not certain that the outcome of the agenda process will improve how planetary boundaries are dealt with. In particular, attention must be devoted to the effects that socio-structural developments can have on natural dynamics (cf. Mikkelson et al. 2007). The conceptual framework of the Intergovernmental Platform on Biodiversity and Ecosystem Services (IPBES) provides a sound starting point for studies on this relationship, especially with its distinction between (direct and indirect) natural and anthropogenic drivers of change in the natural conditions of human life. And it, furthermore, encourages the systematic investigation of the interfaces between nature and society.

This presentation takes up these impulses, continues one step further and provides a generic conceptual model, which traces back direct biodiversity-damaging practices to specific macrostructural societal constellations. This can be used to explain why some chains of actions more likely lead into biodiversity loss while others avoid this consequence. Since we concentrate on societal structures and their dynamics, our approach differs fundamentally from those that evaluate root causes only case-related, but not in the context of general ideas of societal change (cf. e.g. Wood et al. 2000). Accordingly, the components of our conceptual model and their relationships are discussed with references to relevant theories (practice theory, functionalism, treadmill of production, ecological modernization). The explanatory power of the entire model is demonstrated by interpreting exemplary cases.

492

What Are the Roots of the Conservation Conflict over Wildlife? Insights from the Cases of Large Mammals in Poland

Krzysztof Niedziałkowski[1], Renata Putkowska-Smoter[2,1]

[1]Institute of Philosophy and Sociology, Polish Academy of Sciences, Poland; [2]Faculty of Sociology and Education, Warsaw University of Life Sciences

Recent years have brought numerous conflicts over wildlife conservation in Poland, which were widely reported by media and attracted considerable public attention. We analysed three such cases to identify the key dimensions of these conflicts using institutional approaches as a theoretical background. Data was collected through desk research and 50 semi-structured interviews with representatives of key groups involved. When looking at the historical development of discussions around the conservation of the wolf, the European bison, and the moose, we found out that despite their different formal and management status the discussions around them followed a similar trajectory: from debating the need to restore the populations to controversies over the level of human impact on their management and its character. These controversies later translated into institutional changes. We suggest that such discussions will likely increase in the future and more participatory approaches are required to mitigate conflicts.

Human-Mosquito Biting Networks and the Dynamics of Mosquito-Borne Disease

John R.B. Palmer

Universitat Pompeu Fabra, Spain

This article explores how the topology of human-mosquito biting networks can affect disease dynamics. It draws on citizen science data to make inferences about the degree distributions of the human and mosquito nodes in the tiger mosquito biting network in Spain, considering geographic variation in mosquito and human population densities, and human mobility patterns. It then uses agent based models to explore the epidemiological consequences of these distributions. It compares the basic reproduction number for simulated outbreaks using the homogeneous mixing assumption and using a range of degree distributions estimated from the data. The results will provide important insights into the extent to which traditional, homogenous mixing models of disease dynamics give misleading risk estimates, and how this can play out across geographic space. The article will provide a starting point for improving estimates of mosquito-borne disease risk and designing effective interventions.

RN12_T08_03 | Energy Transitions 4

Strategies of Vulnerable Households to Face Energy Poverty: A Qualitative Case Study in Zaragoza (Spain)

Iván López, Cristina Monge Lasierra

University of Zaragoza, Spain

The main objective of this research was to describe the strategies of vulnerable households in the city of Zaragoza (Spain) to face energy poverty and how these strategies vary between different types of households. Also, we identified the discourses of these households on energy poverty and social actors such as public institutions, energy providers, political parties, or family members and friends. We did 15 in-depth interviews to households suffering from energy poverty and analyzed them using qualitative analysis software. The sample included households with minors, single-mothers, migrant families, poor workers or unemployed, or those having members with severe health problems. Some of the specific topics we addressed were the households' perception of both the excessive cold and heat in the dwelling and their responses; the experience with the energy bills; supply cuts or disconnections due to the non-payment of gas and electricity bills; households' measures for energy saving or aimed at reducing electricity consumption in the home; household strategies against inadequate temperatures in the dwelling; looking for a new apartment or changing the energy company. Some of the main conclusions are: energy bills play a central role in theses household's budgets, especially the heating bills rather than the electricity bills; having the social bonus or the a home ownership are determinant factor when dealing with extreme temperatures in the dwelling of the energy bills; and dilemmas when facing energy bills and strategies to cope with inadequate temperatures are more intense in dwelling with minors of members with severe health problems.

Energy Citizenship: Local Solutions For The Energy Transition And Fight Against Energy Poverty

Erika D'Aleo, Monica Musolino, Agatino Nicita

[1]Consiglio Nazionale delle Ricerche - ITAE, Italy;

Community-based initiatives are becoming increasingly important in the renewable energy sector and are still playing an important role in support of the ecological transition.
In this context, we propose a comparative analysis of two different case studies in Sicily (southern Italy).
These bottom-up initiatives aim at involving citizens in energy transition processes through the adoption of cost-reduction strategies to allow a wider affordability to renewables in an economically depressed context. The examined two cases aim to achieve this goal through community-based practices.
In the first case, it is a photovoltaic panel purchasing group, which operates at regional level in Sicily and whose main objectives are: getting, through collective purchasing, more advantageous prices, thus allowing a wider number of people the possibility of generating and consuming photovoltaic energy; the activation of a circular economy system that also includes the recycling of photovoltaic panels; education and awareness-raising activities about energy and environmental issues.
The second case study concerns the establishment of an experimental energy community in the city of Messina, as part of a broader urban and social regeneration project in a highly marginalised neighbourhood. It is therefore the realisation of a community welfare model. The overall intervention has been promoting and implementing by an NGO and mainly involves population groups living in conditions of severe socio-economic deprivation and mental health problems, with the intention of promoting actions to combat (also) energy poverty.
Methodology: The analysis of the case studies was carried out following a qualitative methodology involving workshops with stakeholders and in-depth interviews with both practitioners and end-users/members.

Building an Energy Citizen. Empowering Technologies, Energy Consumption Habits and Change

Debora Cilio[1], Giovanni Brusco[2], Giuseppe Giuseppe Barone[2], Stefano Mendicino[2], Gaetano Polizzi[2]

[1]Università della Calabria, Italia - Dipartimento di Scienze Politiche e Sociali; [2]Università della Calabria, Italia - Dipartimento di Ingegneria Meccanica Energetica e Gestionale

Transition to an energy system based on Renewable Energy Source which also implies greater use of electricity in all fields of daily life, requires a radical change in energy consumption styles. This can only be achieved through awareness of consumption data in ever closer to 'real time'.

Through the description of measuring and control devices and the analysis of data provided by a sample of users, the authors aim to discuss, with a transdisciplinary approach, potentials, and limits, in using smart meter device and smart energy tools in the redefinition of energy consumption in favour of greater efficiency and increased self-consumption in the presence of renewable generation systems (i.e., PVS).

Starting from the hypothesis that increasingly precise measurement and control systems can not only trigger processes of empowerment of end users, bringing them closer to the energy market and redefining the boundaries of a system too often perceived as "taken for granted" and of purely technical competence, but can represent the first step in building local energy communities and initiate a sustainable and responsible energy change.

According to the Moderators of European Individual-Level Pro-Environmental Behaviours, Sustainable Consumption Seems to be a Privilege for Wealthy and Well-Educated Citizens

Öykü Hazal Aral, Jordi Lopez-Sintas

Universitat Autònoma de Barcelona (UAB), Spain

495

Research on environmental behaviour has typically focused their interest on the influence of individual-level factors or on nation's socioeconomic factors. Still, research into country-level drivers has usually considered a set of highly heterogeneous countries. This research explores Europeans' individual environmental behaviours. By focusing on data for the European Union (EU), rather than on data from OECD countries, we can study how theoretical drivers operate on countries that, although heterogeneous, share a common institutional framework. We have explored how country-level drivers could explain behavioural differences between Europeans, not only in terms of their mean behaviour but also in terms of impact in terms of theoretical constructs at the individual level. We have treated Europeans' behaviour as clustered in their country of residence and used a multilevel model that took into account the hierarchical nature of the data. This research strategy has enabled us to disentangle the impact of individual-level drivers from country-level drivers. According to our findings, country-level drivers' direct impact on the mean pro-environmental behaviours was as expected. However, even though educational development did not significantly affect the mean behaviours, it did mediate the effect of perceived behavioural control on pro-environmental behaviours. On the other hand, in affluent countries, strong subjective environmental norms and attitudes toward environmental behaviours had a greater influence on pro-environmental behaviours. Policy makers should improve their country's development level as specified by economic, educational development,

and income equality to foster sustainable consumption among its citizens. Intrapersonal factors alone cannot drive us to a sustainable future.

Promoting Environmentally Sustainable Energy Behaviour With Attitude-Based Segmentation Approaches – A Step Towards A Sustainable Society?

Nadine Haufe

TU Wien, Austria

Despite diverse efforts of policy makers and optimisation of technologies, the effects of energy consumption (especially in the fields of mobility and housing) on the environment are high and continue to increase. A central aspect for transformation towards a sustainable society is the reduction of individual energy consumption by changing the behaviour of consumers.

Energy consumption is influenced by many variables and shows big variance between individuals. In sociology it is assumed that behavioural differences can be described with features of social inequality. However, research has shown that the complexity of behaviour cannot be explained by socio-demographic and socio-economic variables alone. Therefore, the use of attitude-based approaches like milieu-based approaches has increased in the last years for understanding individual energy consumption more in depth, and to segment the population into meaningful (target) groups (e.g. market research). These approaches often focus on the chain of effects "knowledge - attitudes - behaviour change", but don´t bring the desired success because everyday energy behaviour is not understood as social practices that consist of routines and, in addition to knowledge and attitudes, also depend on material-spatial aspects. However, the material-spatial aspects determine the possibilities for behaviour change significantly and must be considered in order to promote environmentally sustainable energy behaviour.

This contribution discusses the advantages and challenges of attitude-based segmentation approaches and provides a new theoretical concept combining a milieu-based approach with the theory of social practices. Results of a Viennese case study illustrate the benefits of this theoretical concept for promoting environmentally sustainable energy behaviour.

Sustainable Food Consumption – A Question of Social Differentiation?

Miriam Trübner[1], Natascha Nisic[1], Stefanie Kley[2]

[1]Johannes Gutenberg University Mainz, Germany; [2]Frankfurt University, Germany

The growing global interest in sustainability can be seen most clearly in the expansion of organic food stores and the increased visibility and integration of organic and fair-trade products in regular supermarkets, discount stores, and even fast-food chains. Although the concept of sustainability seems to be omnipresent nowadays, little is known about the social structure of sustainable consumption. Against this background, we want to identify consumer segments in sustainable food consumption by drawing on the sociological approaches of lifestyle and social class.

According to Bourdieu (1984), consumer choices are a matter of both economic and cultural capital, reflecting class-specific differences in taste. In his analyses, the taste of the working classes is characterized by simple, 'strong' food served in substantial portions. Contrastingly, the dominant taste of the upper classes prefers fine, exquisite dishes. The middle classes strive to imitate the dominant taste, albeit their lower levels of resources force them to asceticism. In addition, Barlösius (2016) identifies a natural taste in the upwardly mobile middle classes which advocates healthy and eco-friendly food choices, characterized by a self-imposed asceticism for the sake of moral superiority.

Using a representative survey on nutrition and consumer behavior conducted in 2018 in Hamburg, Germany (N≈1200), we apply multiple correspondence analyses (MCA) in order to visualize the associations between consumption routines (shopping places, meat consumption, cooking practices), food preferences, and attitudes towards sustainability with sociodemographic characteristics. Social position clearly matters in the typology of sustainable food choice thus obtained, but the multifaceted motives for sustainable consumption are not solely determined by it.

Will We Ever "Learn From Our Mistakes"? Framing Environmental Problems In Times Of COVID-19 Lockdown (France)

Anne-Gaëlle Beurier, Justine Berthod

IHEAL-CREDA, Sorbonne Nouvelle, France

To contain the spread of the COVID-19 outbreak, the French government ordered a national lockdown from March 17th to May 10th 2020. At the beginning of the spring, French people thus experienced a strict limitation of their movement in public places, with very limited access to nature (Corneloup, 2020). Between April 22nd and May, 11rst, we realized an online survey to question the effects of this unprecedented situation on both the people's relationship with the nearby nature and their representations of environmental issues. Indeed, crisis and environmental sociologies question how environmental issues are requalified by individuals (Knight, 2018; Chateauraynaud, 2017) in relation with unevenly distributed resources and experiences.

The inquiry focused on the sociodemographic characteristics of participants; their lockdown experience ; their environmental behaviours and daily relationship with nature before and during lockdown; and opinion about how this crisis could transform how environment issues would be collectively engaged in the short and long terms. This study gathered in three weeks 1,200 responses, nationally, with various sociodemographic characteristics.

This contribution will explore how, in times of a global pandemic, people build different and competing framings (Gusfield, 1981) of the environmental issues, with various understandings of the causal relationships between the environmental crisis and the COVID-19 outbreak. It will then examine how this is related to individual socioeconomic characteristics and material conditions of lockdown experience. Also, it will question the capacity of questionnaire-based surveys to capture how the cognitive categories used to frame environmental issues are transformed in times of crisis.

Climate and COVID Discourse: Convergence and Differences in their Value Structure

Manuel Rivera

Institute for Advanced Sustainability Studies (IASS), Germany

A refined socio-psychological theory of Basic Human Values (Schwartz et al., 2012) serves as a conceptual framework for comparing the public representation and perception of the climate and pandemic emergencies, i.e., of what is told to be "in crisis" and what is deemed desirable to overcome the critical predicament. In analyzing current public crisis communication and individual attitudes in Germany in view of their normative emphases, the paper offers insight on how the communication about COVID, centered in (but not limited to) the articulation of conservation values, might serve as a facilitator or, rather, as an obstruction to climate awareness. Both strands of discourses will also be discussed with regard to their common value gaps, mainly with regard to "openness to change" values (freedom, stimulation).

The methodological vehicle to empirically register the values represented in public discourse, is a specific vein narrative analysis that registers the value-loaded "objects of desire" and perceived actantial contributions to obtaining those objects (Greimas, 1966), as well as concrete actions and contexts that are deemed conducive to societal goals and, therefore, values (Burke 1969; Schmidt and Rivera, 2020). The paper will flesh out how this approach is useful for understanding public crisis communication, and fill it with cursory evidence obtained through media articles, leading to plausible hypotheses rather than conclusive data. Those hypotheses will be triangulated with evidence about value preferences of German citizens obtained through secondary analyses of recent representative population surveys as well as through two original surveys conducted with the specific purpose of understanding if and how the pandemic is perceived to offer benefits as well as costs (Rivera and Beyerl, upcoming).

Roller-coaster Of Climate Crisis Communication: From Emergency Declaration To COVID-19 Situation

Justas Kažys, Emilija Fišeraitė, Diana Samulionytė

Vilnius University, Lithuania

During the last several years' climate change communication evolved in very different directions. Experiencing up and downs in quantity, and, none the less in quality. The enormous rise in the number of media articles in 2019 (climate movements and emergencies) were followed by the rapid decrease situation in 2020 (COVID-19 pandemic). As the media information is the mirror of society our research aimed to analyse communication changes in media as reflection of the society moods, interests and relevancy. According to "Special Eurobarometer 468" (2017) report 'Social Networks and Internet' is the second biggest (42%) and still growing source of the environmental information in EU; therefore, our research includes quantitative and qualitative analysis of 'Climate Change' topic on the leading online media sources in Lithuania (delfi.lt, 15min.lt, lrytas.lt). First, we focused on the main messages of the headlines. We made deeper comparison of different time periods, main themes and additional factors (affiliations, images, place) of the headlines. Secondly, we frame the articles into categories (Nisbet 2009) to catch the main messages in climate crisis communication covered by media. Thirdly, we added the analysis of Lithuanian social media (Facebook) before and during the corona virus situation (the end of 2019 and 2020) to illustrate the whole picture of perturbed communication of 'Climate Change' topic. For finding and analysing the topic we used "SentiOne" social media analysis tool.

Interactions Between Experts And Newspapers About Climate Change

Line Vanparys

Université Catholique de Louvain - UCLouvain, Belgium

Newspapers impact the way scientific expertise about climate change is disseminated because it is one of the main sources of information on this issue. Moreover, the media determine which issue will be transformed into a social one, thus influencing public perceptions, and how expertise will contribute to policy definition. However, even though expertise on climate change is supported by scientific consensus, its treatment by the media is far from homogeneous. The question to answer in this review is therefore: in the written press how to explain the differences in media coverage of climate expertise? This study covers several countries – Argentina, Brazil, Canada, USA, India, Sweden, Tanzania – and focuses mainly on the current period and on the last 20 years. It is based on a review of literature made of quantitative studies about media coverage of climate change and/or the relationship between experts and the media. Several elements impacting media coverage are highlighted: the editorial policy, dominated by the editor, and newspaper ownership; ideological culture, which influences the amount of coverage given to a phenomenon; standing actors, who are the persons who determine the terms of reference used in the discussion; the gap between journalistic and scientific norms - two fields with different operating logics, but not irreconcilable; the current stage of the evolution of the press, mass circulation; the construction of the public career of the problem; and national factors: framing elements that vary by country and have various consequences.

RN12_T09_03 | Knowledge and Ignorance in Dealing with Environmental Issues

Tracing the Social Concerns beneath 'Intractable' Knowledge Disputes: Debates about Research Findings on Sustainable Consumption in Sweden

Mikael Klintman

Lund University, Sweden

In recent years, the binary of truth and falsehood has received immense attention in academic and public debates not least concerning environmental risks of various consumer practices. The popular focus on disinformation, conspiracy theories, and (other blunt) lies manifests this. Whereas such falsehood needs to be continuously scrutinised, of course, far more pervasive and subtle tendencies mustn't be overlooked. These include efforts among GOs, NGOs, companies, and municipalities – organisations that are often benevolent and 'environmentally concerned' – of managing scientific (per definitions non-absolute) knowledge claims in profoundly social and political ways.

This paper aims to investigate how disputed knowledge claims about various types of 'sustainable consumption' are treated in framing processes - within and across such organisations - about the physical outcomes, as well as the potential consumer acceptance of the prescribed changes.

Theoretically, the paper uses concepts from ignorance studies, such as Steve Rayner's categorisation of denial, dismissal, and diversion.

The paper is a frame analysis of written reports based on debates deliberations between GOs, NGOs, and industry organisations in Sweden, placed in an international context

The empirical cases to be examined may include research findings of (i) specific, novel foodstuffs promoted in the name of sustainability; (ii) sustainability-oriented disputes about lunch menus in the public sector; and (iii)

consumer (non-)acceptance of regulations and restrictions on allegedly unsustainable food consumption.

By extension, the paper will suggest ways for resolving knowledge disputes by reframing the focus from the substantive/epistemic dimension of the knowledge claims into the social, procedural, and practical concerns that are often the core of so-called intractable knowledge disputes.

Who Owns the Wind? Wind Theft as a New Challenge for the Sociology of Not Knowing

Marco Otto Sonnberger[1,2], Matthias Gross[1,3], Daniel Horn[1]

[1]University of Jena, Institute of Sociology, Chair of Environmental Sociology; [2]University of Stuttgart, Center for Interdisciplinary Risk and Innovation Studies (ZIRIUS); [3]Helmholtz Centre for Environmental Research (UFZ), Department of Urban and Environmental Sociology

The expansion of renewables gives rise to multifaceted social conflicts, most prominently conflicts over the distribution of benefits and burdens. In this regard, the issue of "wind theft" is a particularly interesting issue. The term wind theft denotes the effect when neighboring wind farms lower each other's power production efficiency by reducing wind speed and thus "stealing" wind and decreasing profitability (Pryor et al. 2020). Due to changes in the direction of wind and wind speed, the extent of wind theft can hardly be assessed. In a legal sense, it is also nearly impossible to identify the "victim" and the "offender" (van der Horst & Vermeylen 2010). With the ongoing expansion of wind power, it is likely that wind theft will become a more and more virulent issue leading to respective social conflicts. Especially, since in public discourses on renewables, wind is commonly framed as a public good where usage by one party does not restrict its usage by another party.

In this presentation, we lay out a conceptual approach for analyzing wind theft from a sociology of non-knowledge or "ignorance studies" perspective and, by so doing, make this phenomenon and its uncertainty implications better accessible for sociological analysis. We thereby contribute to deepen the theoretical understanding of the unavoidable governance of non-knowledge in the context of renewable energy transitions.

Who's To Blame For The Climate Crisis? The IPCC, The Institutionalization of Global Climate Knowledge And The Diffusion Of National Responsibility

Adam Standring

Örebro University, Sweden

It is increasingly acknowledged by the global scientific community that the climate crisis constitutes an urgent and immediate threat to humanity yet substantive policy solutions remain tentative at best and at worst a distant prospect. Given this divergence between what is what is known and what is done, it is important to understand what are the trade-offs between producing authoritative, global knowledge of climate change and the ability to assign national responsibility and blame for it. To what extent does the institutionalization of global knowledge production inhibit the development of substantive policy change? Using interviews with experts from the Intergovernmental Panel on Climate Change (IPCC), as well as analysis of IPCC documents and procedures, we analyse how increased institutionalization and bureaucratization has helped solidify international consensus on the science of climate change at the expense of prompting action to resolve it. The IPCC has become the preeminent international organization for the communication of climate knowledge. A network of international climate experts produces regular global assessment reports constituting the definitive state-of-the-art on the extent of climate change, predictions for future trends, the impact on human and non-human systems and measures to mitigate and adapt to the consequences of climate change. The IPCC's mandate requires it to be 'policy relevant yet not policy prescriptive' and governmental agreement of the final assessment reports grants them epistemic legitimacy and authority yet the very procedures that allow governments to agree on the nature of climate change – commitments to consensus and positivistic notions of science - also function to inhibit necessary policy change.

Actionable Knowledge: Science-Society-Policy Interface to Anticipate Climate Change.

Camille Jonchères

Inrae, France

The integration, implementation and appropriation of scientific expertise is a strategic issue that is still underdeveloped by regional authorities in the framework of their climate change adaptation policy. The objectives of public action, which are often consensual, stumble over their operationalization and open the door to sociology in order to "clearly isolate what is causing concern and indifference in the contemporary world" (Mills, 1968). This paper highlights the science-practice interfaces as media for constructing alternative narratives (Shepherd et al., 2018).

And it proposes to expose, in the line of a pragmatic sociology (Barthe et al., 2013), what is problematic for the actors of these "worlds that have their own conceptions and rules" (Mormont, 2007). What are the mechanisms for translating scientific knowledge into political action? How can knowledge be made actionable for practice as well as for science (Porter et Dessai, 2017)? One of the specificities of adaptation to climate change is to act in a context of uncertainty and imperfect predictability of its impacts. This implies integrating flexibility into planning, placing the discussion on how to update the rules rather than on their purpose. Thus, new governance models are being developed through "anticipatory governance" approaches (Quay, 2010), the course-of-action approach (Lemos et al., 2012) or the principle of "decide without deciding" (Callon et Barthe, 2005), the presentation of which may question the ability to promote radical and inclusive transformations that are commensurate with the challenge of climate change.

RN12_T10_01 | Participation, Acceptance and Environmental Governance 3

The Participation Of Indigenous Peoples And Local Communities In The Convention On Biological Diversity From Norms To Action.

Louisa Parks[1], Elsa Tsioumani[2]

[1]University of Trento, Italy; [2]International Institute for Sustainable Development

The Convention on Biological Diversity (CBD) is considered by many scholars as one of the more promising sites of global environmental governance as far as the inclusion and recognition of indigenous peoples and local communities is concerned. This paper discusses how the CBD has evolved over time in terms of the spaces it accords these groups. We draw on legal and political analyses of the CBD and its decisions to identify these. Specifically, we build on a frame analysis of the CBD's decisions since its beginnings. On that basis, we argue that the most concrete opportunities for indigenous peoples and local communities are provided by calls for their direct inputs, without any gatekeeping role for national state bodies, and by the emphasis on their role in implementing the Treaty on the other. We then discuss to what extent these opportunities translate into actual engagement and implementation by indigenous peoples and local communities. We analyse the role of national law in hindering or facilitating such opportunities, and reflect on examples contributed by indigenous peoples and local communities themselves as detailed in the local biodiversity outlook. We also draw on existing literature, both legal and political, and interviews that provide some evidence of the experiences of communities excluded from these CBD processes. Indeed, a key finding of the proposed paper is the need for further research that seeks out these excluded voices, without which the true extent of inclusion in the CBD cannot be fully understood.

The International Regulation of Transnational Commons: Regime Formation, Institutional Design and Implications for Near-Earth Asteroid Mining

Florian Rabitz, Eglė Butkevičienė

Kaunas University of Technology, Lithuania

Transnational commons are shared natural resources for which no effective access regimes exist. Without international access regulation, they are prone to overuse. As the technological and economic capacities for access are distributed highly unevenly, lack of regulation also raises questions of fairness and equity regarding the distribution of benefits resulting from the use of such resources. We presently witness intensifying commercial interest in Near-Earth Asteroids (NEAs), known to contain deposits of precious- and other metals of significant value. While international law (broadly) treats NEAs as the common heritage of humanity, no operational rules currently exist regarding their use as "the province of all mankind" (as stipulated by the Outer Space Treaty). This paper elaborates a) the conditions under which international regimes for transnational commons emerge, and b) the relevant institutional design elements for combining access with a fair and equitable distribution of the resulting benefits. To do so, we analyze two historical cases: The international regimes for deep-sea mining as well as for crop genetic resources. Our findings suggest a) that the successful formation of a comprehensive international regime for NEA mining is unlikely in the absence of multilateral package deals, the scope for which is narrow; and b) that onerous obligations regarding compliance and the sharing of benefits will deter potential users, leading to underutilization and limiting the scope for benefit-sharing. Our analysis suggests that a phased approach, which would combine an initial soft-law instrument with a ratchet mechanism, would have greater political feasibility and larger aggregate effectiveness than the conventional approach to the international regulation of transnational commons based on binding international law with stringent monitoring- and compliance procedures.

Knowledge co-creation and collective experimentation in Urban Living Labs facing complexity

Pia Laborgne[1], Suchomska Joanna[2,3], Michał Wróblewski[3], Wojciech Goszczynsk[i3], Heyder Monika[1]

[1]EIFER; [2]PZR; [3]NCU

The Urban Living Lab (ULL) approach provides space for innovative local collaboration in knowledge co-creation and experimentation in the context of research and practice for sustainability transitions. Nevertheless, especially complex issues such as the urban Food-Water-Energy (FWE) nexus present a challenge to the realization of such ULL.

This presentation discusses the integration of different knowledge systems and inclusiveness as key aspects and challenge of Urban Living Labs. Based on the project "Creating Interfaces -Building capacity for integrated governance at the Food-Water-Energy-nexus in cities on the water" we present ULL as a frame for a local knowledge co-creation and participation approach. The project aims at making Food-Water-Energy linkages better understandable to the stakeholders (citizens and associations, city government, science, businesses) and to facilitate cooperation and knowledge exchange among them with the perspective to increase urban sustainability, resilience, and quality of life. Urban Living labs are realized in three cities: Tulcea/Romania, Slupsk/Poland and Wilmington/USA. Creating Interfaces is financed by JPI Urban Europe and Belmont Forum 2018-2021, co-financed by the Horizon2020 programme under grant agreement No. 830254.

The presentation will address major challenges regarding the FWE nexus concept in a knowledge co-creation context and approaches to address these. It will also discuss the current ULL framework and how to develop it further by identifying major elements concerning reflexivity, rethinking the research process and roles of researchers and stakeholders as well as the development of transdisciplinary skills.

Just Transition or Ecological Solidarity? Reflecting the Justice Turn in Environmental Governance

Suvi Huttunen, Aino Rekola

Finnish Environment Institute, Finland

Just transition is a new buzzword in climate and environmental governance. While it is gaining ground in various national, EU and UN-level climate policies as well as public and policy discussions, there is a need to examine the concept's meaning and place in environmental governance. What kind of development and transition does the concept promote? What kinds of discourses does it create and do they facilitate rapid and effective responses to climate crisis?

In this study we place just transition in its context and examine the ways it has been utilized in different level policies and academic research. Just transition is an important concept, which coins the need to make environmental policies locally acceptable and respect people's socio-economic needs. Simultaneously, it risks the dilution of environmental sustainability and achieving the needed rapid transformation. Just transition fits nicely in the continuum of ecological mordernisation adding a managerial layer of social justice assessment to environmental policymaking. In the global North, justice is easily coined at the national level, which gives disproportionate emphasis on maintaining advantages achieved via privileged position in the current economic system. As a predominantly anthropocentric concept, justice towards non-human nature remains unaddressed. We need concepts, which help the inclusion on non-human nature and global perspective to the consideration of sustainability transformation and its fairness. We propose that instead of just transition, a concept grounded on solidarity, such as ecological solidarity, can create better ground for enabling a truly transformative change, capable of addressing also the root causes of unsustainability.

RN13 | Sociology of Families and Intimate Lives

RN13_T01_01 | Covid-19: Challenges for Families and Familu Research I

Family Well-Being In Pandemic Times

Thomas Eichhorn, Simone Schüller, Hannah Steinberg, Claudia Zerle-Elsäßer

German Youth Institute, Germany

Families are the epicenter of the ongoing COVID-19 pandemic. We contribute to furthering the understanding of how family well-being has been affected by providing empirical evidence from two waves of a German longitudinal family panel (AID:A) that surveyed about 800 families with children below age 18 in 2019 and again in August/September 2020. We thus go beyond often-cited evidence from ad-hoc surveys that capture snapshots rather than change. Furthermore, the unique data allow incorporating the parents' as well as children's perspectives. Based on panel analyses, wee investigate a wide range of family well-being indicators including e.g. perceptions of the "family cohesion", "individual life-satisfaction" or "harsh parenting" behavior. We quantify changes in family well-being, investigate intra-family and intra-couple differences and examine sociodemographic pattern. Interestingly, we find that on average children report an improvement in family cohesion, while parents tend to report a decline. While in about half of two-parent families, at least one parent reports a drop in life satisfaction between 2019 and 2020, in only a small fraction of those, both parents experience a drop. In a much larger fraction of those families it is only one parent—and relatively more often the mother—that experiences a loss in life satisfaction. A similar pattern becomes evident with respect to harsh parenting behavior, which shows an overall increase that is mainly due to mothers' behavioral changes. This might point toward an unequal intra-family-distribution of the overall burden on families.

Regulation of Everyday Family Life During the Covid-19 Epidemic

Tanja Oblak Črnič, Alenka Švab

University of Ljubljana, Faculty of Social Sciences, Slovenia

In the presentation we will focus on the changed dynamics of family life due to the first wave of the COVID-19 epidemic and the consequent quarantine in the spring of 2020. Forced nuclearisation required a rapid reorganisation of otherwise self-evident and established social patterns and relationships, above all new adjustments of care relations both inside and outside the private sphere. We were interested in how family members have experienced, accepted and accommodated to emerging external circumstances, and what everyday strategies they have adopted in order to face with them. The focus was put on new demands in the intertwined spheres of work and family obligations, especially in the light of the fact that private sphere has been assigned with several additional functions, otherwise carried out by educational and daycare institutions. Based on data from a quantitative exploratory on-line survey on everyday life during the spring quarantine conducted in April 2020 on a sample of 711 respondents, we analysed changes in practices and everyday routines, such as shopping, domestic labour, childcare, work obligations, and caring for other family members. The focus was also put on perceptions of how the epidemic has changed interpersonal relationships and family lives. The aim of the research was also to identify the most obvious distinctions within the existing social structures with a focus on gender, age, economic and educational differences. In particular, the research aimed to point to the main social inequalities and potential vulnerable groups within the forced nuclearization of everyday life.

503

The (re)structuring of Daily Life During the COVID-19 Related Restrictions in Switzerland: Challenges and Coping in Intact Families, Lone Parent and Step-parents Families

Laura Bernardi[1], Sandra Constantin[2], Jean-Marie Le Goff[1], Benjamin Moles Kalt[1], Cléolia Sabot[1], Núria Sánchez-Mira[1], Joana Soler Torramilans[1]

[1]Institute of Social Sciences and NCCR LIVES, Université de Lausanne, Switzerland; [2]Department of Social Policy and Intervention (DSPI), University of Oxford

Compared to the neighboring countries, Switzerland underwent loose form of lockdown in response to the spread of the Covid-19 in the spring of 2020. Schools were closed, teleworking was promoted but not enforced, and there was no strict home confinement. The article aims to compare the reorganization of daily life between intact families, lone-parent families and stepfamilies in this context. How did parents reorganize their daily and weekly time use to reconcile working obligations, childcare and home-schooling, as well as other family activities?

First, we hypothesised that the reorganization of daily life would vary by family type. We therefore examined the unequal opportunities and constraints that parents faced in alternating between work, childcare or home-schooling, depending on the differential presence and involvement of (step)parents. Second, we expected heterogeneity within family types depending on social stratification, employment characteristics and conditions, the children's degree of autonomy and the type of physical custody.

We draw on data from a national representative panel survey and two longitudinal qualitative studies conducted in French-speaking Switzerland. We first analyse data on the organization of time and homeschooling from the ad hoc Covid-19 wave of the Swiss Household Panel (SHP) survey. We then analyse the semi-structured interviews conducted during and after the first partial lockdown by the studies "Becoming a parent" (intact families) and "Multiple pathways of lone parenthood" (lone and step-parent families), which included comparable questions about the (re)structuring of daily activities. Statistical and interpretative analyses will be triangulated to uncover parents' agency in driving the observed patterns of school-work organisation.

Home As A Mixture Of Spaces During The COVID-19 Pandemic: The Case Of Migrant Families In Poland

Anzhela Popyk

University SWPS of Social Science and Humanities, Poland

The spread of coronavirus has led to significant modifications in the majority of social and private institutions. For most families, home is now the location of many activities that are usually kept separate, such as work, school, entertainment, and socialising. Migrant families, for whom school was a primary place for socialising, were forced to 'host' school at home. As a result, migrant families' homes have been reconstructed from a private household and intimate dwelling place to a mixture of spaces. This paper investigates how migrant families in Poland have experienced the COVID-19 lockdown. The study adopts the theory of social diffusion and the concept of social solvation to demonstrate the diffusion of spaces and formation of a special social unit located within the home. This work demonstrates how migrant families in Poland assess and access distance education. Moreover, it presents the way the diffusion of spaces has changed families' schedules, domestic practices, and routines. The analysis draws on a qualitative study of migrant children (n=19) and parents (n=18) that was held during the lockdown in the spring and summer.

This paper adheres to the following structure: first, the author presents the concept of 'home' and its meaning for family life. Second, 'school' as a social unit is characterised, highlighting the role of school in migrant families' adaptation and socialisation process. Third is a brief description of the theory of social diffusion and the concept of social solvation, followed by the methodology. Finally, the findings and conclusions section is followed by the hypophysial viewpoint on how home, as a place and space, might look when the lockdown is over.

Family Policies in Spain: Can They Contribute to Increase Fertility Rates?

Begoña Elizalde-San Miguel[1], Vicente Díaz Gandasegui[2], M. Teresa Sanz[3]

[1]Public University of Navarre, Spain; [2]University Carlos III of Madrid, Spain; [3]University of Valencia, Spain

Keywords: family policies, gender equality, fertility rates, This paper relates to the theme "Family policies and interventions".
This proposal aims to contribute to the current research on the relationship between family policies and fertility by examining the different combinations of policies that, from a gender equality perspective, may contribute most to increase fertility.
In this paper we will focus on the case of Spain, one of the countries with the lowest fertility in the world (also within the European context, with only 1.23 children per woman). This fertility pattern does not match the reproductive desires of the families, since evidence has proved a consistent ideal of "two-children family" despite the constant fertility decrease over the last three decades. This "fertility gap" is interpreted as the consequence of unsatisfactory social and political conditions dedicated to childcare. Thus, public policies must be adjusted to contribute to reduce this gap between fertility preferences and actual reproductive patterns.
In this way, this research applies the tools provided by mathematical sociology. The application case consists of adapting, validating, and using the Spanish model during the 2007-2019 to identify the existing relationship between both dimensions, fertility and public policies. Based on that model, some instance strategies have been tested in different scenarios for the 2020-2030 period. The results allow to identify what is the most efficient combination of family policies in terms of parental leave, care services and cash transfers that, from a gender perspective, will be most efficient to increase fertility rates in Spain.

Can Family Services Provide Early Support? Unmet Needs Among Parents Of Young Children In Finland

Katja Ilmarinen, Sakari Karvonen, Johanna Lammi-Taskula, Maaret Vuorenmaa

Finnish institute for health and welfare, Finland

The study analyses the unmet need for help and support in family life and parenthood in families with young children in Finland. This kind of help is in principle provided by municipal social services in the form of home help or social work, but in practice need of services is often not met. Despite a recent reform aiming at a more universal provision, the share of families with children who have received this help has increased only slightly.
A nationwide survey (2018) covering parents of four-year-old children (n=10 458) was studied to find out: 1) What is the self-reported prevalence of unmet needs and 2) Which socioeconomic factors associate with unmet needs. Approximately half of the parents who reported a need for family social work had not received it, or the service was not sufficient. The rate of unmet need for home help was even higher: nearly 70%. The unmet need for support related to child's behavior or to parent's own coping was 21% and 54%, respectively. Preliminary logistic regression analyses suggest nearly all individual socioeconomic factors to be associated with the unmet service need.
According to parents' experiences the unmet service need is high. The results show that the policy goals of the recent reform to better cope with the needs of families and early prevention have not been met. Moreover, Finnish parents and families are in an unequal position in the availability of services and support as there are clear differences between socioeconomic groups.

"Comparative Analysis of Parental Leave and Care Policies: Guidelines for Advancing Gender Equality Policies in Chile"

Maria Jesús Chaparro-Egaña

Universidad de Barcelona, Spain

Work-life balance policies present a challenge in Chile; this is a problem that has increased due to the prevailing economic model, and that has had its most evident face in this context of Pandemic, work-life balance policies are presented as an alternative to address this inequality. In Chile, policies in this area have been designed from a family perspective, in which the care of children or dependents is understood from the home and family.

Therefore, this thesis will work from a gender perspective, with the intention of highlighting the importance of generating public policies that not only include this perspective but also the need to move towards transformative gender policies.

Although Chile has advanced in conciliation measures, such as parental leave, it is necessary to advance in co-responsibility, which implies moving away from the traditional model of sexual division of labor.

International evidence of those policies that have advanced towards greater equality will be analyzed in order to offer orientations to the Chilean public policy, considering the gender approach, making a comparative analysis between Chile, Spain, Sweden and the Netherlands, comparing their state models and the effects of their policies according to official statistics. This research is a concrete contribution to public policy, contributing to the debate and reflection on this matter, not only in Chile, but also in Europe.

Parental Choices for Childcare (ECEC) Services in Urban and Rural Areas

Jurga Bucaite Vilke

Vytautas Magnus University, Lithuania

There is extensive empirical evidence on social-economic and demographic inequities of parents and their approach to formal childcare (ECEC system). The importance of the accessibility and availability of formal childcare services is highlighted by the political agenda, also looking from the social investment approach. However, the territorial effect in terms of the size of a residential place is not considered enough to explain the differences in parental approach to childcare. The presentation discusses the impact of territorial dimension on the perception of access to childcare and family welfare priorities by families with different socio-economic backgrounds in case of Lithuania. We use the subsample of representative population survey data of working-age generation cohort (34-48 years old cohort) focusing on respondents who have children below seven years and benefit from formal childcare services. The main results contribute to the explanation of parental preferences to benefits-in-cash or services-in-kind (childcare) family welfare priorities and their social-economic backgrounds, including residential location.

RN13_T01_03 | Family Relationships in various Contexts and Life Course Stages I

Family Configurations In The Transition Into Frailty Of Elderly. The First Results Of An Empirical Research Conducted In Italy.

Donatella Bramanti, Sara Nanetti

Università Cattolica del Sacro Cuore - Milano, Italy

The health crisis has highlighted the needs and criticalities already present in the social fabric. In particular, family care relationships towards older people present new risks and new opportunities.

This paper intends to explore the relational and intergenerational complexity of care, through a focus on the pathways of aging in the transition to frailty and vulnerability. Will be proposed the first results of an empirical research carried out in Italy, entitled Redesign (FRAIL ELDERLY, INTERGENERATIONAL SOLIDARITY AND AGEING FRIENDLY COMMUNITIES). The research adopts intergenerational dyadic interviews as a methodological tool, which involve a target of elderly people (identified on the basis of frailty indicators) and their younger reference person (recognized and indicated by the elderly themselves). The unit of analysis considered is therefore the network of the intergenerational couple (dyad): elderly and caregiver (or person of reference).

The analysis of the dyadic interviews, conducted through the use of the NVivo Software, will present the characteristics of the transition to the fragility of the network and the different strategies implemented at the onset of a critical event in the life of the elderly person. In particular, through qualitative analysis, will be outlined an articulated framework of the transition that explain: the stressful events that contribute to triggering it and the actions implemented by the actors involved. Finally, a critical discussion will be proposed on the protection and empowerment factors arising from family relationships and on the risk elements that may compromise this transition.

AGEING – FAMILY – FRAILTY - CARE

How Do Grandparents Experience And Envisage Ties With Grandchildren Over Time? A View From The Polish Rapidly Ageing Population

Weronika Kloc-Nowak

University of Warsaw, Poland

Keywords: grandparenting, intergenerational ties, distance, adulthood, communication technology

The presentation is based on the results of a research project on Polish grandparents' adaptation to spatial mobility (both internal and international). The study aims to bridge the gap between the literatures on transnational families and the contemporary transformation of family practices. My case is Poland, where the society combines strong intergenerational and family obligations with intense out-migration and fast pace of population ageing.

The dataset is eight focus group interviews with grandparents living in Poland, conducted face to face and online during different phases of the coronavirus pandemic in 2020 and 2021. The participants were grandmothers and grandfathers whose grandchildren live in close proximity, in distant locations or abroad. This novel approach enabled us to emphasize the dimensions of distance and transnationality in the discussions on grandparenting norms, practices and expectations for future. I compare the perspectives of the non-migrant grandmothers and grandfathers on the emotional care and maintenance of ties with grandchildren of different ages and living in different locations in Poland and abroad. I explore if and in what ways having grandchildren abroad makes maintaining ties with them more challenging than in internally dispersed families. The timing of my data collection necessitated exploring the reactions to the restrictions in face to face contact and travel related to COVID-19 pandemic, a historical event that is experienced differently by members of each generation, also depending on their health status and care obligations. Going beyond these contemporary challenges, the analysis explores how the relationship with grandchildren evolves or is expected to evolve into their adolescence and adulthood.

The Influence Of Family Models Diversity On Intergenerational Relations Between Parents and Young Children, and Young Children Wellbeing.

Marta Ortega-Gaspar[1], Almudena Moreno-Mínguez[2], Carlos Gamero-Burón[1]

[1]University of Malaga, Spain.; [2]University of Valladolid, Spain.

In this paper we analyze the effect of different family models on intergenerational relations between parents and young children in a sample of Spaniards young children. Base on the theoretical antecedents related to the complexity of family structures (Thomson, 2014) and their implications for the parents-child ties (Ganong & Coleman, 2016) and the special relations between divorced parents (fathers and mothers) and their children (Hetherington,1993; Kalmijn, 2012; Kalmijn, 2015; Köppen,Kreyenfeld, & Trappe, 2018). The main objective of this study is to know if intergenerational relations varies among different family models and if young children wellbeing differs according to the different family models, they live in. For this purpose, we analyze HSBC (Health Behaviour in School-aged Children) 2014 data for Spanish children (families) that offers the children perspective (this is an important original contribution). A descriptive and an explanatory analysis have been developed in order to know the effects of the different family models on children well-being and on the parents-children relations. It is observed that those children that live in a non-intact family (a non-traditional family model, father-mother and children) in general, suffer a negative impact both at the level of life satisfaction and at the level of their relations with their parents. The results offer a deeper knowledge about the different family realities impact on children-parents relations and, young children well-being.
Key words: Family models, children wellbeing, parents-children intergenerational relations, HSBC survey.

No Children – No Solidarity? How Childlessness Shapes Intergenerational Financial Support

Tamara Bosshardt

University of Zurich, Switzerland

This paper aims to investigate how childlessness influences downward and upward financial transfers between adults and their parents. Financial support between parents and their children does not stop as soon as the latter come of age, but is part of lifelong intergenerational solidarity relations. Financial transfers predominantly flow down the family lineage but also upwards from children to parents. In many countries, family solidarity structures compensate for the shortcomings of public welfare systems. Over the past decades, western countries were confronted with an increase in childlessness which is changing today's family structures and challenges social welfare systems. Based on parent–child dyads (n=8,623) from the SwissGen project (2018/2019), I present family structures of the childless and adults with children in Switzerland and multivariate logit models to test whether opportunities, needs, and social norms explain different transfer behavior. Results show that the childless do not receive more financial support but give more to their parents than adults who have children themselves. These effects are mediated by age, gender and education. Thus, the childless provide more support to their parents in old age, whereas they cannot rely on future support from own children. As family forms change, aging societies need new forms of solidarity within and across generations.
KEYWORDS: Intergenerational Solidarity, Childlessness, Financial Transfers, Switzerland

Effects of Modernization on the Formation and Dissolution of Families in Kurdish Tribes: Example of Van Province, Turkey

Aylin Çiçekli

Akdeniz University, Turkey

In spite of widespread adoption of individualism with the help of modernization discourse around the World, the phenomenon of the tribal society as a collectivist organization still manifests itself prevalently among the Kurdish population of Turkey, who dominantly live in the Eastern Anatolia and the Southeastern Anatolia regions today.

Thus, the study aims at unfolding the processes of formation and dissolution of families associated with Kurdish tribes in the face of modernization. To this end, documents belonging to divorce cases that resulted with dissolution of families between 2013-2019 are retrieved from the Family Court of Van Province and the Legal Assistance Office of the Bar Association of Van Province. The patriarchal ideology and the related societal roles based on gender are being formed and primarily reflected in the families of the Kurdish tribes. Examination of the divorce cases of man and women members of the Kurdish tribes shows that divorce-which has long been considered as a cardinal sin by tribal codes-has at least started to be exercised among the tribespeople. The rise of divorce cases among Kurdish tribe members signifies importance when considering its liberating effect from the tribal rules such as "bride enters the family with her gown and leaves with her shroud". A detailed investigation of the divorce cases also shows that tribal marriage applications such as bride exchange, arranged marriage, levirate/sororate marriage, and child marriage are among the major causes of dissolution of families among tribespeople.

Key words: Kurdish tribe, family, marriage, divorce, modernization

Structural Constraints or Ethno-cultural Dispositions? Understanding Adolescent Childbearing Among Roma Girls in Hungary

Ildikó Husz[1,2]

[1]Centre for Social Sciences, Hungary; [2]Corvinus University of Budapest, Hungary

The incidence of teenage childbearing has increased in Hungary in the last ten years. This tendency is mainly observed in the 18-19 age group, but there is also some increase in the fertility rate for younger ages. Although Roma girls are more likely to give birth during adolescence, only one-third of teenage mothers identify themselves as Roma (Microcensus 2016). Yet it is widely believed that teenage childbirth is an ethno-cultural phenomenon, rooted in the traditional culture of the Roma. Previous research, however, has shown that early childbearing is more related to the poor socio-economic status of the Roma than their ethno-cultural norms, but the causal relation is not well understood. Our study focuses on exploring the roles that social status and cultural norms play in the adolescent childbearing of Roma girls, and identifying the mechanisms through which poverty and ethnic exclusion lead to teenage motherhood.

This paper is based on the analysis of interviews carried out with young Roma mothers (N = 27) living in poor rural settlements in Hungary. Thematic coding was used to analyze the interviews.

Using a multidimensional wellbeing approach (see Sumner 2010), the results highlighted that Roma girls have the opportunity to excercise control and increase wellbeing in very few areas of their lives. In the vast majority of interviewees, the consequences of poor socioeconomic status were manifested both in dysfunctional parental family and in school failure. Romantic relationship and pregnancy together served as an appropriate means of achieving independence from parental family and drop out of school legally. In contrast, cultural norms played a minimal role in fostering teenage childbearing.

The Role of Older Siblings in the Educational Attainment of Children with and wihout Migration Background in Secondary Schooling

Marion Fischer-Neumann

Universität Duisburg-Essen, Germany

Although three-quarters of children under the age of 18 in Germany grow up with at least one sibling as another attachment figure in the family, previous educational research has focused primarily on the characteristics and resources of the parents. In existing educational literature, siblings have so far been mentioned mainly when referring to the abundance of children in migrant families and its negative influence on parental investment of resources and time in the education between the first- and subsequent-born children.

Yet, sibling relationships have specific structural advantages and specific qualities compared to parent-child relationships for socialization influences (e.g., horizontality, longevity, the oscillation between love/trust and rivalry/competition). Furthermore, siblings possess educationally relevant resources that can be transmitted for educational acquisition. In particular, older siblings have a theoretical significance as role models and surrogate parents, which may be particularly evident in migratory situations, where they can potentially compensate for the disadvantages of parents in host-country-specific human capital and educationally relevant socialization conditions (e.g., lack of competence in the national language, inter-ethnic contacts, and knowledge of educational institutions) by having a lead in the educational system and acting as a bridge to the host-society context.

The theoretical core of the paper is the synthesis and extension of existing social class and migration-specific value-expectancy considerations of educational trajectories in secondary school by the sibling perspective. Hypotheses are made about compensatory and protective effects of older siblings in association with the (migrant) parents.

The hypotheses are tested by multilevel analyses of longitudinal data from the household survey "Socio-Economic Panel" (SOEP) that allow by its structure to link information of both, parents and older siblings, with that of respondents.

Family Affairs: Educational Strategies And Priorities Towards A Transcultural Identity Of German-Italian And Romanian-Italian Parents For Their Descendants. A Comparative Study In Turin.

Tanja Schroot, Roberta Ricucci

University of Turin, Italy

510

Hofstede's (1991: 5) definition of culture as "collective programming of the mind" distinguishes members of certain groups from those of other categories. Inter-culture is thus considered a mediating force among actors with different backgrounds. If the role of the intercultural delegate is allocated to the child(ren) in a scenery of mixed families, parent's expectations for their descendants' involvement in cultural practices and arrangements may vary significantly. The provision for a transcultural space and corresponding practices corroborates the parental desire to participate in both worlds – physically and virtually - and the children's need for defining its sense of belonging. Circulating cultural capital within the created transcultural environment plays a significant role for the formulation of identity, as they provide competencies for its perception and performance. In a European space that is increasingly characterized by "changing traditional bonds (…) and new issues of tolerance and respect for others" (COM 2018: 55), the Commission has engaged in the promotion of education as vehicle for personal (identity) development and active citizenship. 'Civic competence' and 'Cultural awareness' are among the core competences to be trained within formal (school) and informal (family) learning contexts to adopt citizenship as a critical, ambiguous and pro-diversity concept that underlines the benefits of pluricultural identities instead of pointing to one-way, detached cultural commitments. This is where the current research ties in. The central question is, how socio-cultural identity is transmitted by parents to their children through education. How are priorities for cultural transmission negotiated in family, which strategies are defined by parents and executed by their descendants? In other words: how is the hyphen between Italian and German, or Romanian and Italian whittled or balanced?

N13_T02_01 | Covid-19: Challenges for Families and Family Research II

Handling the Situation: Attitudes towards the Lockdown in Spanish Families

Laia Pi Ferrer, Rejina Mary Selvam, Rita Cavallotti

Universitat Internacional de Catalunya, Spain

Since 2020, the world has been shaken by the Covid-19 pandemic. Due to the rapid expansion of the virus worldwide, national governments adopted harsh policy measures restricting individual behavior and movements in a surprisingly homogeneous manner. Spain was not an exception, and from 14 March until 21 June Spanish Government ordered the state of emergency. Indeed, the pandemic has generated a situation of uncertainty and stress concerning a completely unknown situation. In this paper we study how Spaniards describe their lives during the coronavirus emergency through free word association (first three words that come to mind). Although the majority of the terms have a negative connotation (uncertainty, fear, anxiety), there are some that have a positive connotation (calm, patient, serenity, hope). Therefore, what factors drive certain ways of describing the living experience during the lockdown in Spain? Our paper will shed light on this question by examining the attitudes towards the coronavirus emergency regarding certain economic, geographic, social and family factors.

Mothers' Strategies to Reconcile Roles and Responsibilities During the Coronavirus Pandemic in Austria

Ulrike Zartler, Vera Dafert

University of Vienna, Austria

The COVID-19 pandemic and the accompanying restrictions multiply parents' roles and responsibilities: They are called to juggle caregiving responsibilities, workplace demands, teaching tasks, household work, mental, and emotional work. Extant research indicates that mothers are shouldering the bulk of these tasks. Drawing on family stress theory and family practice theory, and based on an ongoing qualitative longitudinal study, we ask: Which strategies have mothers developed to reconcile roles and responsibilities during the coronavirus pandemic?

The Austrian-wide study includes 74 working mothers of kindergarten and school-aged children, and consists of problem-centred telephone interviews (49 respondents) and diary entries (25 respondents). Data collection started in the first week of lockdown I in March 2020 and has been continued since, including nine completed waves of data collection so far. Data have been analysed using the Grounded Theory coding scheme.

We identified seven key strategies. The respondents strongly relied on strategies of self-optimisation and personal responsibility that allowed them to remain independent of others (restructuring daily routines, working during off-hours, reducing work hours, lowering their own needs, using media for childcare). Only two of their strategies involved active contributions of other family members (working in shifts, involving relatives). The elaboration of these strategies demanded careful preparation and organization and was at the expense of the respondents' individual needs for regeneration. We discuss the consequences of these strategies for mothers and for their families, elaborate on the evolvement of these strategies over time, and outline their relations to policy ascriptions to maternal roles during the pandemic.

511

Family Practices and Relations of First-Time Mothers During COVID-19

Marta Buler, Paula Pustułka

SWPS Uniwersytet Humanistycznospoleczny, Poland

The restrictions imposed by the national governments in response to the emergence and spread of the novel coronavirus in 2020 affected various spheres of people's lives, including the realm of family relations and practices. Unlike other crises, which typically meant that family members rely on one another for emotional and practical support, the pandemic challenges the scope of family solidarities. This paper explores the particular junction between first-time mothers' limited capacity to leverage direct support from family members (e.g. grandparents as additional caregivers within first-time parenthood) and their resulting family practices around family relations during the national quarantine and the ongoing COVID-19 crisis in Poland.

The empirical material stems from the Qualitative Longitudinal Study (QLS) on intergenerational transitions to motherhood in Poland (GEMTRA project, 2018-2021) and features a subsample of biographical interviews (n=22) from the second wave conducted between July and November 2020 with women who gave birth to their first child between February 2019 and March 2020. Dedicated question blocks, including probes on the ongoing experiences of maternity, family relations and family practices during a pandemic, have been incorporated to the research tools of Wave 2, while the data from Wave 1 offers insights into women's expectations around everyday family practices and intergenerational support.

We argue that the crucial stage of family life reified in welcoming the first child (e.g. Miller 2007, Thomson et al. 2011) serves as a special grounds for examining how family relationships are maintained, altered or prioritized during the COVID-19 pandemic. We propose a typology of family relations during the 2020 pandemic through the lens of family practices and with an explicit focus on intergenerational family bonds.

RN13_T02_02 | Family Formation and Dissolution I

Transition to Marriage: Newlyweds' Perspective

Mariia Goleva

Saint Tikhon's Orthodox University, Russian Federation

In existing family studies married couples are usually considered as a homogeneous group. However, there are works devoted to rather narrow aspects of the marriage process: engagement [Schweingruber, Anahita, Berns, 2004], spouses' interaction during preparation for the wedding [Sniezek, 2005], wedding wishes [Mongilyova, 2015], interrelation between wedding expenses and marriage duration [Francis-Tan, Mialon, 2015]. Such studies show that not only the first years of marriage [Hickman-Evans et al., 2017; Sullivan et al., 2010] but also the period from acquaintance to marriage could be considered as a separate component of the "marriage story". Moreover, the newlyweds' perceptions of the initial stage of family relations vary.

The research focuses on the analysis of young spouses' retrospective narratives about the beginning of their relationship and its development, the decision to create a family and approach to wedding celebration (in-depth interviews with 24 couples (48 interviews), married for less than five years, conducted from March 2019 to February 2020 in Moscow and the Moscow region). The analysis showed that each of the steps of transition to marriage is attributed by informants with its own set of meanings. For example, a wedding was described as a "joint project" or "our wedding", an event "for us" or "for people", as a significant ceremony, sacrament or as "just a party". Based on the results, several hypotheses determining the noticed differences were put forward.

512

Decomposing Trends in Educational Assortative Mating - The Case of Ireland

Julia Leesch, Jan Skopek

Trinity College Dublin, Ireland

This study examines trends in educational assortative mating in Ireland over the past three decades – a time of rapid economic, demographic, and social change. Specifically, we are interested in how changes in three components – (a) educational attainment of men and women, (b) the educational gradient in union formation, and (c) educational matching in unions – have contributed to these trends. Based on Irish Census data, covering the period from 1991 to 2016, we apply a novel counterfactual decomposition method to estimate the contribution of each component. Preliminary findings indicate rising educational homogamy and a substantial increase in non-traditional mating patterns in which women partner 'down' in education both at the expense of unions in which the man has higher education. Our analyses show that those trends are mainly driven by changes in the overall educational attainment of men and women. Changing patterns of union formation showed a smaller but still substantial contribution to the observed trends. The strongest link between union formation and mating outcomes has been found for non-traditional unions – about one-third of their increase is attributable to changes in the educational gradient of union formation. Matching in unions contributed little explaining trends in educational assortative mating. The findings accord to previous research in showing that changes in patterns of educational assortative mating are mainly driven by structural opportunities and constraints. In addition, our results emphasize that changing levels of homogamy and heterogamy are also explained by changes in the educational gradient of union formation.

Performing the Bad Marriage? Doing Family in the Course of Fault Divorce

Viktoria Parisot

University of Vienna, Austria

Austrian family law is outstanding in Europe because fault-based divorce is still legally valid. These divorces include the proving of the partners' fault at the disruption of the marriage at court. Performing and displaying deficient relationships to achieve a divorce at court can therefore be seen as 'doing family' during a family transition. By comprehending family and law as interwoven practices, I ask which practices are done in the course of fault divorce proceedings, and how these relate to normative and legal ideas of marriage. For this contribution, I focus on practices that involve the divorcees.

Based on a qualitative multiple case study, I analysed 17 fault divorce files from the period 2013–2019. I used Situational Analysis and an analytical framework that had been developed within the research project.

Results show that the divorcees' involvement in fault divorces can be distinguished by three bundles of practices: Firstly, the initiation of the divorce is based on involving them into a proceeding. This includes producing narratives about their marriage and their partners, and connecting these narratives to the concept of fault in family law. Secondly, they become part of diverse legal practices like questioning them as witnesses. Thirdly, they deal with the courts' decision as a document that addresses them and their 'bad' marriage in particular ways. Therefore, it releases them as certain subjectivities from their involvement in the proceeding. To conclude, practice bundles of fault divorces are led by contrasting the legal concept of marriage and the divorcees' 'bad' marriages.

513

Violence in Post-separations: a Consequence of State Regulations

Helena Tegler, Marie Flinkfeldt, Stina Fernqvist

Centre for Social Work (CESAR), Department of Sociology, Uppsala University, Sweden

In Sweden, family policies strongly promote gender equality and children's rights. Post-separation child maintenance is underpinned by parents' shared legal responsibility and the assumption that children benefit from contact with both parents. According to these regulations, the liable parent pays an agreed monthly amount directly to the resident parent and public authorities are not involved. However, if there is a history of violence in the family, or if the liable parent does not pay, the Swedish Social Insurance Agency (SSIA) can function as an intermediary between the parents to make sure that children receive necessary financial support. This means that parents with experiences of such problems must disclose them to the SSIA, and the need for the SSIA to step in is then re-assessed every six months.

We argue that this scheme ignores the reality of gender inequality, parental conflicts, and intimate partner violence. For this analysis, we draw on a corpus of 649 recorded phone calls (~55 hrs) from parents to the SSIA. Post-separation conflict of some kind was disclosed in 133 of these calls, which were analysed thematically. Our analysis focuses on how violence is re-actualized in separated families through regulations and routines that facilitate economic abuse. We show how the SSIA in practice encourages parents to be in contact also in cases of possible violence, which may increase risks. Meanwhile, disclosures of experiences of violence to the SSIA can be traumatic. To avoid re-actualizing violence, abused parents may abstain from maintenance, which may bring financial hardship.

RN13_T02_03 | Family Relationships in various Context and Life Course Stages II

Relationship Between Parents and Children in Late Modernity: Comparing Military and Civilian Families.

Janja Vuga Bersnak, Andreja Zivoder

Faculty of Social Sciences, University of Ljubljana, Slovenia

The influence of parent-child relations on children' well-being and various aspects of their personal traits, social identity and social inclusion is well-documented in psychology research, particularly through concepts such as attachment and parenting styles (Baumrind, 1966, 1967, 1971; Maccoby & Martin, 1983). Much less is known about child-parent relationship in a specific social setting of military families.

Family life and life courses in the context of late modern societies are subjected to numerous challenges. Compared to civilian, military families face an even more complex situation, which is a result of repeated deployments of one or both parents, etc. This means that military families in general, and parent-child relationship in particular, are subjected to specific risks. In this respect, the parent- child relationship and a child's well-being need to be addressed, in order to assure optimal conditions for the growing up and development.

Within the research Military specific risk and protective factors for military family health and well-being, we have applied a mixed methods approach and observed the following, on military and civilian sample: 1) differences in parenting styles; 2) parental stress; 3) child well-being. Furthermore, we have measured the impact of military deployments on a child at the specific age.

The results will reveal potential differences between the civilian and military families, as well as negative impact of parent's military job on child's well-being. In addition, empirical findings will be contextualized with regards to contemporary late modern conditions, which will help us to identify how the child-parent relations and the child's well-being are constituted and negotiated amidst the two

514

greedy institutions (Segal, 1986) in the late modern conditions.

Shadows of the Past? The Influence of Childhood Experiences on Parent-Child Relationships in Adulthood

Bettina Isengard, Ronny König, Marc Szydlik

University of Zurich, Switzerland

Intergenerational cohesion across the whole life course is an important characteristic of parent-child relationships in contemporary societies. Although the emotional attachment between generations strongly depends – among other things – on current individual and familial circumstances, the main foundation of later parent-child-relations is laid in childhood. This includes, for example, parental conflicts and divorces, but also educational styles and quarrels between parents and young children. However, little is yet known about the impact of (early) childhood family events and behaviors on intergenerational cohesion in adulthood. Therefore, this contribution examines the extent to which family connectedness depends on childhood experiences such as tension, conflict and violence, but also affection, care and love. Research questions are: (1) Does the perception of parental upbringing during childhood have an impact on relationship patterns in adult life? (2) Do the relations affected by childhood experiences show gender-specific patterns regarding mothers and fathers, but also daughters and sons?

The empirical analyses are based on the representative study "SwissGen – Intergenerational Relations in Switzerland". The survey was conducted in 2018/19, including more than 10,000 respondents from 18 to 100 years in all three parts of Switzerland (German, French, and Italian Switzerland). The analyses prove that adult family generations are strongly connected through social interaction and cohesion. However, our multivariate analyses emphasize the importance of childhood experiences and their lasting impact on intergenerational relations in adulthood.

"My Whole Family is Not Really My Family" – Secure Care Shadows on Family and Family Practices among Young Adults and Their Family Members

Sofia Enell[1], Monika Wilinska[2]

[1]Linnaeus University; [2]Jönköping Univeristy

This study (based in Sweden) explores family practices and family display among young adults with a history of secure care, which limits and restricts contacts and therefore causes fundamental changes in relationships. Almost ten years after institutional placement, narrations of 11 young adults and 11 nominated family members reveal ongoing struggles between imagined and lived realities of family. These struggles are revealed by memories and emotions evoked by the context of secure care and show how deeply the secure care penetrated their family lives. By using the metaphor of shadows, we discern dimensions of secure care (moral obligations of parental responsibility, moral practices of parents as the only contact and the emotionally pervasive life situation) in the young adults' and their parents' moral understanding of the parent-child relationship as family. We call for more attention to the perversity of secure care arrangements, at both policy and institutional levels.
Key words: family, family practices, family display, secure care, young adults, parents, relations

Adult Children Move Out: Family Meals and Reflections on Parental Self-sacrifice at the Moment of Transition

Marta Medina

Adam Mickiewicz University, Poland

The paper presents the differentiation and change in the shared eating practices of parents and their adult children, linking anthropological and sociological theories of sacrifice with empirical research. Drawing on 26 qualitative, in-depth dyadic interviews, I will analyze the transformation of expectations sensed by the parents before and after their adult children leave home. While the study results confirm the significance of meals for family relationships, it further develops the findings in transition to the empty nest phase of family life. First, it examines the understanding of different aspects and distribution of everyday sacrificing in an intergenerational family, as well as the dynamics introduced by the life course transition connected with adult children moving out. Second, it analyzes how this transition carries in consequence a transformation in the food-related practices of the parents of adult children, who tend to pay less attention to the quality, variety, and regularity of their dinners once their children have moved out. Third, it explores children's visits to their family home that can trigger or modify old self-sacrifice patterns. Finally, it demonstrates the perceived gains or losses resulting from parents' long-term sacrifices connected with feeding their children.

Keywords: sacrifice, meals, family, adult children, empty nest, life course

The Impact Of COVID-19 On Family Relationships In Italy: Withdrawal On The Nuclear Family

Letizia Medina, Sara Mazzucchelli, Maria Letizia Bosoni

Universitá Cattolica del Sacro Cuore di Milano, Italy

516

The health emergency linked to the spread of COVID-19 has profoundly transformed people's lives, both from the point of view of family and significant relationships, and at work, substantially modifying the relationship between these two significant areas. This contribution is aimed at assessing how Italian families are facing the current situation in dealing with work and care responsibilities using data from a longitudinal CAWI study done during Phase 1 of the emergency (full lockdown, April 2020), Phase 2 of partial reopening (July, 2020), Phase 3 of second wave of emergency (December, 2020) with 306 participants, 83,3% women. Findings from this study will contribute to a more thorough understanding of how people have reconciled work and care responsibilities during the lockdown, as well as their coping strategies.

Findings from multivariate analysis have shown how health emergency and the related containment measures impact both personal/parental and work spheres, producing negative effects on the specific group of working parents, especially women.

The majority of respondents indicated that they continued to work mostly from home while simultaneously taking care of children. Moreover, married women and young people, and those without children, performed more effective coping strategies.

Such results reveal the challenges of a nuclear family unit, wherein parents are separated from parental networks and time between family and work must be reconciled. Such problems are particularly challenging for women.

Intimacy and Living Together in Times of Exit Restrictions. Pandemic Effects on Spatialities of the Home

Georg Wolfmayr, Susanna Azevedo, Raphaela Kohout, Ana Rogojanu

University of Vienna, Austria

The covid-19 pandemic has drawn our attention to our homes. Intimacy and living together require a variety of active human action even at ordinary times. Lockdowns, quarantines and other measures have led to an increase in time spent at home and therefore challenge established ways of doing intimacy and living together. People and especially families with children had to arrange and transform their homes, e.g. into offices, schools, fitness studios while renegotiating intimacy and living constellations. The pandemic situation has, as a consequence, affected different households in very different ways, which not only makes inequality visible, but also exacerbates it. While groups of lower income are often restricted to fewer square meters which may cause functional overlapping of spaces, wealthier groups with more living space available may adapt the requirements for different functions more easily. Against this backdrop, we examine how people re-arrange their homes during the restrictions to deal with these requirements. While analysing these responsive pandemic practices (Werron 2020) we pursue the question of how pandemic measures affect explicit and implicit homely orders i.e. spatialities in shared living spaces, and how they challenge arrangements about e.g. intimacy, privacy and living together.

The ethnographic data was collected during the second and third lockdowns in Vienna in November/December/January 2020. In addition to online interviews and online-video tours, participants were asked to document their everyday-lives through different media.

In The Absence Of Touch: Hardship Of Social Distancing Measures For Solo-living Women

Tanja Kamin, Nina Perger

University of Ljubljana, Slovenia

A pandemic is hard on everyone, but for some, living solo has made it even harder. In this paper, we present how solo-living women think, feel, and practice the COVID-19-related protective measures, particularly 'social distancing,' which restricts individual sociability to household members. We present data from a longitudinal qualitative study in Slovenia conducted in two phases: (1) during the first lockdown, in April 2020, and (2) during the second lockdown, in February 2021. We conducted semi-structured in-depth interviews with 23 solo-living women aged 25-69, living in Slovenia. The data show that younger participants are more affectively burdened by the COVID-19 pandemic and related measures, particularly by the inability to socialize outside of their own households and to use social infrastructures (such as cafés and cinemas) that are otherwise taken for granted and represent a significant socializing space for those living alone. A protective measure of social distancing, alongside other COVID-19 protective measures, may produce specific phenomena that are increasingly highlighted by the media but have not yet been empirically supported and conceptualized, such as 'pandemic fatigue' and 'skin hunger', a longing for physical presence and touch from others. Our data suggest both 'pandemic fatigue' and 'skin hunger,' particularly among younger participants who report increasing feelings of loneliness, isolation, and a troubling lack of physical co-presence due to limited sociability that

Family As A Total Institution: How "I" Transforms In Isolation

Nina Lyubinarskaya[1,2]

[1]Moscow High School Social and Economical Science, Russian Federation; [2]Saint Tikhon's Orthodox University as a research laboratory "Sociology of Religion

What happens to young couples during isolation? Are their ideas about themselves preserved or does the transformation of the «I» take place under new conditions?

If earlier the spouses spent time apart, each had his own set of daily practices and could manage his time independently, then during the period of isolation, many changes occur. The boundaries between personal and professional life are blurred, roles change, control practices appear, physical contact with the outside world is lost.

Since young couples are together all day long, difficulties arise with the idea of themselves, under the conditions of the usual image of the "I". If we use the language of Goffman's description, then "spatial restrictions and limited contacts with the world lead to the violation of personal boundaries and a change in the idea of oneself" (Goffman, 2019:50), therefore, some of these functions can be observed in the family during the period of isolation.

The main thesis is that during isolation in a couple, daily practices change and family members begin to control each other's actions. To describe the effect of control practices on a person's self, ten couples were interviewed - this is a total of 20 interviews. The study involved young families (up to 5 years) who were isolated from 2 weeks to 1 month.

The results of the study showed that during a lockdown in the family there are indeed some controlling practices of individuals' actions, which depend on the spatial capabilities of the apartment/house, the family's attitude to disinfection of personal belongings, as well as the presence/absence of work, contributes to controlling behaviour.

Lithuanian Working-class Parenting Styles: Normalizing Concerted Cultivation

Arturas Tereskinas

Vytautas Magnus University, Lithuania

Social scientists distinguish different cultural logics of childrearing related to families' social class positions. Middle-class childrearing style is often described as 'concerted cultivation' and the 'accomplishment of natural growth' defines practices prevalent among working-class and poor families. The repertoire of concerted cultivation that manifests middle-class privilege often involves hectic schedules of adult-organized activities and treats children as projects to be developed. The accomplishment of natural growth is based on a more open-ended schedule of children not strictly controlled by adults. Both concerted cultivation and the accomplishment of natural growth are underresearched in the Lithuanian and Eastern European context, where social stratification of family life experienced substantial changes in the last three decades.

Based on 23 biographical interviews with Lithuanian working-class parents the article analyses their different childrearing styles and parenting values. By examining how they organize and structure their children's everyday life, I demonstrate that most working-class parents are committed to concerted cultivation based on tight everyday schedule and regimented activities. I argue that Lithuanian parents tend to activate middle-class parenting values by practicing concerted cultivation that functions as their attempt to fit the neoliberal norms of achievement, competitiveness and instrumentalism, and the ideology of intensive or 'good' parenting.

"As a good mother should do" – Aspects of Doing Good Parenthood in Custody Proceedings.

Marlies Zuccato-Doutlik

University of Vienna, Austria

Parenthood as practice and its relation to the child's best interest is a complex construction. When it comes to parental separation and in case of dissent about custody, the practices of the 'troubled family' are displayed, negotiated and judged in court proceedings. From a practice- and discourse-theoretical view, family, law and gender are interwoven practices that are constructed in discourses where mutable collective knowledges are limiting possible actions for mothers and fathers. Court files from custody proceedings – understood as a field of discourse - enable the reconstruction of patterns and ideals of good parenthood. To add an innovative link to the research on (post-)divorce families, I ask: What aspects of 'doing good parenthood' can be found in court files, and which ideals and practices are referred to and judged how, by whom, and in which gendered way?

I will present first findings from a hermeneutic approach (interpretative pattern analysis) to court files from 25 custody proceedings in Austria between 1976 and 2019. First results indicate that despite the reformation of family law from a patriarchal to a cooperative understanding of family, gendered ideals of parenthood like 'motherly love' still appear to be efficacious. A caring relationship seems to involve different practices for mothers and fathers, concerning for example professional activity and working times, especially when it comes to childcare arrangements for younger children. Therefore, divorcing parents (have to) display and 'do' good parenthood in a gendered way to fulfill the ideals of 'a good parent' and to be judged as 'good' for the child's best interest.

The Impact of Children Departure on Family Practices, Patterns, and Emotions: Strategies of Transition to the Empty Nest Phase

Magdalena Anna Żadkowska[1], Marta Skowrońska[2], Filip Schmidt[2], Radosław Kossakowski[1], Christophe Giraud[3], Bogna Dowgiałło[1], Natasza Kossakowska-Berezecka[1]

[1]University of Gdansk, Poland; [2]Adam Mickiewicz University, Poland; 3CERLIS, University Paris Descartes, France

Comparing to other life course stages and biographical moments (e.g. getting married, having children), the empty nest phase has received little attention, considering its significance on the entire family system. Psychological studies on the empty nest phase have focused on the correlations between the departure of children and the psychological well-being of parents, while most sociological studies have addressed the questions of health and well-being to help develop social policies on ageing.

According to Bouchard (2013), there are two dominant approaches in the psychological perspective on the empty nest phase: the role loss perspective, which demonstrates the decrease of well-being due to the absence of alternative roles of parents after the departure, and the role strain relief perspective, which suggests an improvement in parental well-being, because the presence of children at home increased exposure to stressors. Our paper presents a relational approach to the empty nest phase. Based on 26 in-depth dyadic interviews and 48 IDI (supplemented with an on-line questionnaire) with 26 couples living in Poland, our study explores the transition in practices, values and attitudes between the full nest and the empty nest. We demonstrate that the roles strain and role loss perspectives are not mutually exclusive.

Our study explores in detail the complexity of the empty nest phase. It argues that the departure of children may involve ambiguous attitudes, practices and emotions of parents. We will present different models of the process of transition to the empty nest phase, paying particular attention to (1) the differences within a couple, (2) types of interactions and practices in a family – mainly in terms of proximity and distance; (3) the types and degree of interdependence of family members.

Bonds With The Mother And The Father Of Academic Youth. Support Or Escape?

Anna Linek

Cardinal Stefan Wyszyński University in Warsaw, Poland, Poland

Bonds with parents are one of the most important bonds that a person creates with others. Regardless of any changes, they have their undoubted value and the power to influence the people who build them. However, the time of growing up, especially at the stage of starting studies, is the period in a person's life when a lot happens in his relationships with others. The question arises - What are the relationships with the mother and father at this stage? Do parents provide strong support to their adult children? The main research problem is to show the assessments of young adults in relation to the ties they create with their mother and father, and the assessment of the support they receive or lack from their parents.
The empirical material used for the analysis was collected as part of the research project Academic youth on family and religion 2020. The study was carried out in the spring of 2020, using the CAWI - Computer Assisted (Aided) Web Interviews technique, among academic youth from various centers in Poland (N = 621). The scope of the research undertaken concerns the assessment of the bonds formed by young people with their mother and father, and their support. When making assessments, the academic youth appreciated, above all, the quality and strength of the bond with their mother. The relationship with the father was rated lower, especially in the area of showing feelings, honest and open communication, trust and care.

RN13_T03_03 | Family Formation and Dissolution II

International Migration and its Short-term Effect on Partnership Stability

Lisa Mansfeld

University of Duisburg-Essen, Germany

Migration is a stressful process, implying far-reaching consequences in different areas of life. One of these areas is partnership stability. However, so far not much is known about the consequences of migration for partnership stability. To address this gap, this presentation analyzes the short-term effect of migration on the risk of partnership dissolution. It does so by taking into account two different types of migrants: emigrants left their home country while remigrants did so previously but then returned to their countries of origin. Three research questions are being asked. First, does international migration affect partnership stability? Second, are there differences by migration type? Third, does the effect depend on further migration-related aspects, including the number of migrations and/or its underlying reasons?
Hypotheses regarding these questions are deducted from exchange theory and the microeconomic theory of divorce on one hand and life course theory principles on the other hand. To test these hypotheses, data from the German Emigration and Remigration Panel Study (GERPS, providing information on internationally mobile Germans) and the Socio-Economic Panel (SOEP, providing information on the non-mobile German population) is used. Applying entropy balancing and logistic regression, results show that migration increases the risk of partnership dissolution. This holds for both emigration and remigration, but - in line with hypotheses - the effect appears to be stronger for the latter. Furthermore, the risk of partnership dissolution increases with multiple migrations and depends upon the underlying reasons for migration. These findings emphasize the need for assessing migration in a more differentiated way than just using a binary measure (migration yes/no) when considering family outcomes such as partnership stability.

Cohabitation Formation Pattern In Lithuania and Belarus

Irma Dirsyte[1,2]

[1]Social Research Center, Faculty of Social Sciences, Faculty of Social Sciences, Lithuania; [2]Institute of Sociology at Lithuanian Centre for Social Sciences, Lithuania

The diffusion of contemporary cohabitation became obvious and many young couples in Europe start family life from living together in one household and not being married. However, cohabitation has not a universal meaning and role in the family formation process and couples cohabit for different reasons and motives. Existing research proves, that union formation pattern depends on socio-economic and socio-demographic characteristics, it varies by country and changes by time. For example, in Sweden and France cohabitation is more universal and in Eastern European widespread of cohabitation and duration of it depends on education level (Hiekel 2014).

In this paper, I used sequence analysis and dissimilarity matrix cluster approach to investigate cohabitation status in 10 years from living together in one household. The focus of the paper is Lithuania and Belarus, two countries with rather different transitional paths after the 1990.

The analysis based on harmonized pooled Lithuanian and Belarussian datasets from two surveys: the Families and Inequalities Survey from 2019 for Lithuania, and the Generations and Gender Survey 2020 Belarus Wave 1 from 2017. The data contains calendar (by month) retrospective information about union formation and childbearing and comprehensive socio-economic, socio-demographic characteristics about each respondent and its partner. The data contains information on birth cohorts 1970-1984 and lets to investigate cohabitation formation pattern on individuals, who are finished the most active partnership formation phase.

Based on sequence dissimilarity, I identify 3 clusters ("Prelude to marriage", "Unstable union", "Cohabitation as an alternative to marriage"), then applied multivariate analysis to investigate probability to belong to different union sequence cluster by income, country, education level and sex.

How Alternative Partners Affect the Development of Living Apart Together Relationships in Young Adulthood

Andreas Filser[1], Richard Preetz[2]

[1]Group for Social Research Methods, Institute for Social Sciences, University of Oldenburg, Germany; [2]German Family Panel (pairfam), SOCIUM Research Center on Inequality and Social Policy, University of Bremen, Germany

Forming stable intimate relationships is a key milestone in the transition to adulthood. Intimate relationships commonly start with a phase of living apart together (LAT) when both partners do not live in the same household. Previous studies suggest that the phase of LAT is highly transitory for most couples with high rates of cohabitation or separation. However, longitudinal studies that investigate factors that affect cohabitation or separation are still rare.

The aim of our paper is to focus on the role of the availability of alternatives partners for the relationship development of LAT couples. Theoretical assumptions from sociological, demographic, and evolutionary models suggest that the availability of potential alternative partners are barriers for cohabitation and risk factors for separation. However, no study has applied these assumptions to LAT couples yet.

We use waves 1 – 11 from the German Family Panel (pairfam) and link LAT couple data with official population data from the German Federal Statistical Office (640 couples). We measure both partners' alternatives using age-specific sex ratios on the district level. Using multilevel time-discrete event history models, we analyse LAT couples' transitions with competing risks of (1) remaining in a LAT relationship, (2) cohabitation, and (3) separation. First results suggest that LAT partnerships are affected by the availability of alternative partners in young adulthood. The chance to move in together is highest when women have many alternatives, but men do not. Contrary to theoretical expectations, we do not find a significant association with separation.

521

Lat Relationships and Coupledom After the Age of 50

Christophe Giraud

Université de Paris, France

My paper is focused on the characteristics of stable non-cohabiting relationships (LAT) in the population of separated or divorced adults over 50 years of age in France. I question the conjugal dimension of these relationships. Five dimensions of coupledom are successively analysed: the naming of the relationship and of the partner, the couple as a support of patrimony, the couple as an intimate relationship, the couple as a gendered organisation of domestic tasks, the couple as the center of individual life.

My analysis is based on a qualitative survey of new intimate histories after 50 years of divorced, separated or widowed individuals, conducted from 2013 to 2018. I'm particularly interested in individuals between 50 and 60 years of age (i.e. born between 1953 and 1964), in a stable non-cohabiting relationship (at least one year). It should be noted that these individuals very often still have grown-up children, sometimes in school, who live with them. My corpus is composed of 11 men and 24 women in a LAT relationship belonging to the high and medium fractions of the population.

The analysis shows that these relationships very often deviate from many of these five dimensions and do not constitute a prelude to entering into a cohabiting couple. They do not aim at the joint management of assets, they refuse any division of labour, they are no longer the centre of individuals' lives. But individual still search the ideal of shared experience, which is common to coupledom and friendship.

RN13_T03_04 | Same Sex Couples I

What Counts as Family? Plural Practices, Intimate Networks, and Claims of Gay and Lesbian Parents in Italy

Paolo Gusmeroli

University of Padua - Italy, Italy

Couple access to medically assisted fertilization or adoption (included stepparent adoption). This mirrors a general trend – well documented in surveys on Italian population – of a growing acceptance of LGBT intimate relationships paired with a persisting and widespread opposition to LGBT parenthood.

When it comes to lesbian and gay parenting, both the public debate and scientific research focus on the so-called "new generation" of subjects who plan to have children as a same-sex couple, raising awareness on their exclusion from reproductive and family rights in Italy. Much less visible, also in terms of political mobilization, is the social experience of lesbian and gay parents with children from heterosexual relations.

This invisibility leaves out of the debate issues related to multi-parenting and the recognition – both by law and society – of same-sex blended families. Furthermore, their family arrangements challenge the simplifying contrast between same-sex and heterosexual families.

The contribution is based on two qualitative research carried out between 2015 and 2020. In-depth interviews have been collected with 27 lesbian and gay intentional parents, and 23 parents with children from previous heterosexual relationships. The aim of the analysis is to point out the common claims they share as non-heteronormative parents, but also the plural family practices and claims they bring at political level and in everyday life.

522

The Constitutional Case Of Same-sex Couple Recognition - Comparing The Role Of The Hungarian And The Italian Constitutional Court

Alexandra Sipos[1,2]

[1]Institute for Sociology, Centre for Social Sciences - Hungarian Academy of Sciences Centre of Excellence, Hungary; [2]Doctoral School of Sociology, Faculty of Social Sciences, Eötvös Loránd University

How do States recognize same-sex couples and their right to respect for private and family life? Different approaches exist in Europe aiming to accommodate the need for recognition and protection of same-sex couples. Hungary and Italy both provide the highest form of recognition to same-sex couples in an institution which is similar to marriage (registered partnership; civil union). But why not marriage?

The paper's main aim is to analyse and compare the role of the Constitutional Court of Hungary (Alkotmánybíróság) and that of Italy (Corte Costituzionale) in the recognition of same-sex couples.

In order to capture the abovementioned role of the Constitutional Courts, a list of relevant decisions is compiled for each country. Each Constitutional Court decision is analysed following these points: How is the notion of marriage understood? How does the Court envision the recognition of same-sex couples? The work of Martha C. Nussbaum serves as a theoretical framework to describe the current legislation from legal and societal aspects following these decisions. Afterwards, a legal comparative analysis is used to pinpoint the similarities and differences in the approach of the Hungarian and the Italian Constitutional Court.

It can be concluded from the comparative analysis that both Constitutional Courts played a crucial role in shaping the form of recognition and in advancing the rights of same-sex couples. Nevertheless, both Courts upheld that the institution of marriage requires partners to be of a different sex, reinforcing its heteronormative nature. Meaning that marriage equality will probably not be achieved in the near future in either country.

Keyword: legal sociology, marriage, marriage equality, same-sex couples

Becoming the Mother of a Transgender Child: Ethical Self-Formation, Emotional Work and Cultural Narratives of Good Mothering

Galia Plotkin Amrami

Ben Gurion University, Israel

The past decade has seen a growing presence of transgender youth in public spaces and also in academic research. However, scant scholarly attention has been paid to the mothering of transgender people, and especially how the process of child gender transition intersects within motherly subjectivities. Based on a content analysis of 11 in-depth narrative interviews with Israeli mothers of transgender children ages 8-24, I show that child gender transition necessarily implies a transformative process for the mother. When children undergo a complex socio-medical process of transition, their mothers experience social situations in which their conceptions and practices of mothering are challenged and eventually reshaped. Drawing on critical theorization of mothering in contexts of 'crisis ordinariness' (Berlant 2008) and mothering and stigma, I sketch the trajectory of the process of "becoming a mother" of a transgender child. I argue that this process is informed by the prevailing cultural discourse of intensive mothering that links mothers' "carework" and child's well-being. In order to fit cultural models of good mothering, some mothers are involved in promoting public awareness of transgenders, thus crossing the boundaries between the private and public spheres. Mothers are also involved in various "technologies of self-formation", namely, practices that enable mothers to transform themselves into ethical agents (Foucault 1997). While the process "moral becoming" that they undergo is structured by a wider affective regime of optimism, it is accompanied by diverse emotions as it "depends crucially upon the experience of acting in circumstances that are fraught and uncertain" (Mattingly, 2014).

"Divorce in Same-sex Couples: Child Custody Assignment and the Composition of Marriage in Spain"

Diego Becerril[1], Sofia Gaspar[2], Jose Jimenez[1]

[1]University of Granada, Spain; [2]ISCTE-Instituto Universitário de Lisboa, Centro de Investigação e Estudos em Sociologia, Lisbon, Portuga

Several same-sex couples have married after its legalization in Spain. Almost 15 years later, many of them have been divorced, and some of them have been involved in the process of custody assigning of the children. This paper examines how the custody modalities are distributed after the divorce of same-sex marriages, according to the its composition, and what social variables influence them. The methodology used is quantitative, and it is drawn from the Statistics of Annulments, Separations and Divorces (INE) of Spain. We conclude that shared custody is an increasing modality after the dissolution of these marriages, both in couples constituted by men and by women. In addition, the possession of minor or older dependent children, the number of children, the existence of custody regulations of each Autonomous Community and the failure of the sentence, are variables that determine the modality of the sentence.

RN13_T04_01 | Covid-19: Challenges for Families and Family Research IV

Coping With COVID: Older Europeans and the Challenge of Connectedness and Loneliness in Times of a Pandemic.

Ronny König, Bettina Isengard

University of Zurich, Switzerland

Social networks in old age are important for well-being and healthy aging. However, older adults have fewer contacts than their younger counterparts due to significant changes in their life, such as retirement or age-related losses, along with a declining health and mobility. Consequently, with increasing age, a growing proportion of people experience feelings of social isolation. This becomes even more important in times of a pandemic when social contacts should be minimized.

However, so far, little is known, how people and especially in old age deal with the challenges and limitations caused by the spread of COVID19. Therefore, this contribution examines the extent of social contacts and loneliness during the lockdown in summer 2020. Research questions are: (1) How often do the elderly stay in contact with their networks during the pandemic? (2) Are there different forms of communication (personal or electronic) for different groups of people observable? (3) Does those patterns of communication effect the situation of feeling lonely?

Therefore, this study investigates social contacts, loneliness and their linkage during the COVID-19 pandemic using representative data for 26 countries from the Survey of Health, Ageing and Retirement in Europe (SHARE). The analyses based on over 50,000 respondents aged 50+ indicate frequent private contacts during the pandemic. However, the frequencies vary between personal and electronic contacts and depend on the respective network members. Moreover, multivariate results showed that feelings of loneliness are directly related with the contact frequency, the type of communication as well as the constitution of the networks.

524

The influence of Children-Parent, Spouse Relationship Quality during COVID-19 on Work-Family Enrichment and Conflict

Rejina Mary Selvam, Rita Cavallotti, Marc Grau Grau

UIC-Barcelona, Spain

The main objective of the present research study is to determine the influence of quality of relationship among children-parent and spouse during COVID-19 on work-family alliance. The study aims at analyzing data collected from Spanish society regarding the family relationship quality (i.e., couple and children relationship quality) variables on supportiveness and togetherness as mediating variables over work family conflicts and work family enrichment. The data was collected from 614 families all around Spain from different sectors and socio-economic backgrounds. The results show that perceived children relationship quality by parents and couple relationship quality directly predicts work-family conflicts (negatively); whereas emotional sustenance and stress variables directly predict work-family enrichments. The findings explain essential theoretical and practical implications to future researchers, society and management.

Narratives Of Everyday Family Life Of Italian Young Adults During The First Covid-19 Lockdown.

Sveva Magaraggia, Daniela Cherubini, Maria Grazia Gambardella

University of Milan-Bicocca, Italy

The Covid-19 pandemic has forcefully brought out the interdependent nature of our lives, forcing us to "rethink the importance of families, communities, the ethics of love, hospitality, care" (Hanafi 2020).
In this paper we explore the responses of men and women aged 26-29 to the pandemic, based on the analysis of 62 semi-narrative interviews with young Italian residents conducted during the lockdown period and in the weeks immediately following (March - June 2020). The interviews are part of the first wave of the longitudinal study on life courses in Italy (ITA.LI - Italian Lives).
A typology takes shape from the analysis of these interviews, showing different ways of reshaping friendship, love and family relationships during the lockdown, as well as different subjective experiences of the health emergency and the pandemic. Furthermore, the transformations of perception of these ties and the need to relocate and recode them in a different spatial and temporal dimension - both in the everyday time, and in the future (in terms of planning, imagination, sharing, assigning priorities) - emerges.
The narratives bring to light strategies that allowed physical distancing not to equate to social distancing, and that enabled subjects to evoke the pandemic as motiv of rethinking, reshaping and of (not only negative) rupture. Drawing on these results, we reflect on the potential of a longitudinal and biographical perspective (Thomson & McLeod 2015) in the study of the impact of the pandemic on doing families and relational lives, discussing some research questions and directions for further investigation.

Families Of Neapolitan Students In Lockdown. A Research Experience At The Time Of The COVID-19 Pandemic.

Riccardo Zaccaria, Maria Camilla Fraudatario

Università degli Studi di Napoli Federico II, Italy
Keywords: (COVID-19 pandemic, family, Social Network Analysis.)

In Italy, family has always played a central role in the social and cultural dynamics throughout history. Every socio-political change has gone through a cultural change that has specifically concerned the conception of the family, its structure and system of values and expectations. The COVID-19 pandemic has affected every sphere of society, forcing everyone to a prolonged period of isolation in their homes. This has resulted in a drastic change in daily practices and thus the need to develop adaptive strategies. Family is one of the social actors most directly involved in the dynamics triggered by the pandemic. The main objective of this contribution is to focus on how the family has faced the challenges imposed by the COVID-19 pandemic. The study is based on the results of a research we conducted with the active involvement of a class of Neapolitan university students

525

and their families. We followed the principles and techniques of Social Network Analysis to observe a) the changes that occurred in family network structures during lockdown; b) the resources conveyed by family networks in terms of mutual help, material and immaterial support, understandings, and divergences. In addition, through in-depth interviews we delved into more intimate dimensions, such as changes in the perception of domestic space or the new configuration of daily roles within the family. Although limited in scope, this case study stimulates further reflection on the family in crisis situations and proposes a replicable empirical and methodological framework.

RN13_T04_02 | Work-Family Balance, Work-Family Conflicts, Parental Leave I

Work-Family Balance Dynamics Around the Birth of the First Child: An Exploratory Analysis Regarding Parent's Employment Arrangements in Switzerland

Yaku Fernando Fernandez Landa

University of Geneva, Switzerland

This study will analyze parents' work-family balance following the first childbirth using the Swiss Household Panel (SHP). Our aim is to tease out the relationship between the parents' employment characteristics—regarding standard and no-standard arrangements — and the dynamic of subjective well-being variables around the birth of the first child. We constructed a panel data spanning from 2004 to 2018 with an individual observation window that comprises five years. After applying fixed-effect regressions, the results show that women's work-family balance increases immediately after the birth of the child whereas men suffer a temporary decline. These results confirm partially the set point theory according to which life events only have a temporal effect on individual wellbeing. Furthermore, we find that the role of non-standard work arrangements

varies across genders which suggests that this type of work can help new fathers deal with parenthood although it implies a potential stressor for women. The particularities of the Swiss welfare state would be a factor behind these gendered trajectories. The promotion of family-friendly policies, both in the form of labor market measures and in terms of public spending – for instance enabling more public childcare centers– can level the playing field between genders. In this regard, the approval, in the last September, of the paternity leave is a step in the right direction.

Strategies of Informal Caregivers to Adapt Work: A Matter of Intensity, Tasks, Duration, and Felt Burden?

Klara Raiber, Mark Visser, Ellen Verbakel

Radboud University, The Netherlands

Informal caregiving, meaning taking health-related care of elderly and/or sick in the personal network, is known to be negatively related to work. Scholars usually focus on two strategies of informal caregivers to adapt their work: stopping work and reducing working hours. We argue that there are more strategies that similarly can have negative career consequences, like changing jobs, becoming self-employed, or quitting (additional) education. The focus on additional strategies for caregivers to adapt work, which were invisible in research so far, gives a more comprehensive overview of the employment consequences of informal caregiving. Building on role theories and the ethics of care, we examine under which circumstances informal caregivers adapt work, and the strategy used, by considering two main factors: (1) objective factors such as intensity, caregiving tasks, and duration, and (2) subjective factors including felt obligation and burden, and relationship indicators. We use detailed retrospective data on informal caregiving from the Netherlands, collected within the Longitudinal Internet Studies for the Social sciences (LISS) (N=3,802 caregiving episodes of 1,851 caregivers). Our preliminary results indicate that felt burden plays an important role in all strategies, except for becoming self-employed, meaning that perceiving caregiving as heavy is a major determinant for caregivers to adapt work. In line with previous literature, we find that high caregiving intensity motivates to reduce working hours or to quit work. For the strategies that were not considered before, we see that a long caregiving duration stimulates job changes or quitting with education.

Distrust in Daycare – Why German Mothers Remain in Part-Time

Kerstin Ruckdeschel, Sabine Diabaté

Federal Institute for Population Research, Germany

30 years after reunification, there are still major differences in the use of public childcare for children under 3 years between the old and the new federal states in Germany. It is assumed that not only the provision of infrastructure but also the acceptance of care options explains these differences. The decisive factor is the parents confidence that their children feel comfortable and are well taken care of in childcare institutions. However, the direct link between trust in childcare infrastructure and actual use of early childhood care has been little studied so far.

The survey Familienleitbilder (concepts of family) of the Federal Institute for Population Research, a panel conducted in 2012 and 2016, allows to determine the extent of this trust in different forms of external childcare (daycare center, childminder or grandparent) and how this effects actual childcare arrangements of families. Results show a clear increase in distrust from care provided by grandparents (37%) via day care centres (41%) to individual child minders (54%). We find significant differences between social groups, e.g. by education, religiosity, gender or number of children. Furthermore, we can show that attitude is dependent on experience, as it changes with the use of care outside the home. Implications for a needs-oriented family policy can be derived from the results. In regard to East and West Germany we find a strong persistence of respective historically embedded day care cultures in combination with different workforce participation of mothers.

New Practices During the Pandemic? A Qualitative Study of Parents' (Re)negotiations of Care and Housework During Covid-19

Jenny Alsarve

Örebro University, Sweden

The aim of this paper is to explore how parents (re)negotiate care and housework during the covid-19 pandemic. Drawing on qualitative interviews with Swedish mothers and fathers of school-aged children, the paper seeks to contribute with new knowledge on what happens to the everyday life practices when an unexpected, external event – the Corona pandemic – affects social interaction as well as labor work and thus possibly also the caring and housework practices in families. Previous research indicates that life changing events, such as becoming parents, moving in together, or sick leave influence how couples divide the unpaid work. These events might bring about a need to renegotiate the division of care and housework. In a similar vein, the pandemic and its restrictions, which influence the everyday life (such as recommendations to work from the home) might trigger renegotiations of care and housework. The paper is part of a longitudinal study, which means that we have access to the couples' reasoning and divisions of work over time. The results indicate that while a majority of the interviewed parents have been widely affected by the restrictions, not least regarding change of workplace and restrictions concerning social interactions, only some argue that this has led them to renegotiate and modify the division of housework and care.

RN13_T04_03 | Family Policies and Interventions II

Government Support, Active Participation of Families and Optimistic Vision of the Future During Covid19. Results From A Longitudinal Research

Moscatelli Matteo, Carrà Elisabetta, Ferrari Chiara

Catholic University Milan, Italy

During the emergency caused by the Covid-19 pandemic, the Italian government has implemented some measures that have involved significant changes in family life and in its organization. Families were asked to make a fundamental contribution to allow some essential activities, strengthening an attitude of delegating to families the responses to social needs, taking for granted their willingness to take action. In this paper with try to analyze the iif the commitment of families for the common good is correlated with an adequate perception of government support and with an optimistic vision of the future. The longitudinal research entitled "The family at the time of COVID-19" (N = 2985) took place in two different moments of the pandemic period: the phase of the first hard lockdown and the one in which in virus seemed more silent (March and July 2020). All these phases have been marked by a certain dissatisfaction with the intervention of the policies, which worsened over time. Involvement and diversity, are the principles on which the respondents expressed the most negative opinion: this seems to indicate, on the one hand, that families do not feel heard by the government and, on the other, that policies still suffer from a standardized approach. Feeling supported by the government as a family (Family impact index), is closely correlated with an optimistic view of the future (scale of positivity) and the belief in the possibility that families can contribute to social change has a mediating effect. The results confirmed the hypothesis that the combination of active participation and support is able to foster an optimistic vision for life and the future.

Welfare Recipient Families – Employment as a Driver for "Re-normalization" for Family Lives?

Andreas Hirseland[1], Daniel Kuehn[2], Wiebke Hoffmann[2]

[1]Institute for Employment Research (Federal Employment Agency Germany); [2]Augsburg University, Germany

Over the last decades neoliberalism was a main driver for increasing social inequalities regarding material wealth as well as social and cultural participation. For many, parenthood turned out to be a risky life-event leading to poverty and welfare dependency. Even in a comparatively rich country like Germany every seventh child lives in a family struggling with poverty and welfare recipience, in many cases exacerbated by parental long-term unemployment. Welfare policies based on activation principles consider (unconditional) employment as the main remedy against social exclusion. However, only little is known about these families' lives, their everyday struggles and their views on their future prospects.

Based on qualitative data from a larger survey – designed at the Institute for Employment Research and carried out in cooperation with Augsburg University – the presentation deals with everyday practices and experiences by families affected by long-term unemployment and welfare (N = 36) in comparison to families who overcame that situation by finding publicly funded or regular work again (N = 27). The focus is on the impact of parental unemployment to family roles, family cohesion and the upbringing of children as well as social and cultural participation. Methodologically, a complete survey of family households was carried out with a mixed method approach consisting of open in-depth interviews, on-site observations and case-related household-data.

Our findings provide insight into the dynamics that foster feelings of estrangement and their impact on family-life during periods of unemployment as well as the conditions under which return to employment generates feelings of 're-normalization'. They indicate that the belief that any work is better than none as prevalent in activation-oriented welfare policies does not prove to be true unconditionally.

Political Parties' Views On Family Policies In Spain

Emma Lancha Hernández

Universidad Carlos III Madrid, Spain

Electoral platforms of political parties put in evidence society's demands, which at the same time link citizens and parties. It is for this reason that we consider the study of proposals of the different political parties towards the family to be fundamental in order to better understand citizen's demands around this issue.

Therefore, the aim of this project is to analyze the electoral platforms of the general elections in Spain of the 10N, studying those parties that have a greater representation (PSOE, PP, VOX, UP, Cs), and including for a broader understanding, other regional parties such as the PNV and ERC, which also have a considerable number of seats in the Spanish parliament. Consequently, we will be able to link proposals in relation to the family with ideological aspects and different cultural visions, as well as regional preferences.

In order to achieve this objective, the methodology used is based on the comparative research criteria of the OECD Family Database. The qualitative analysis consists of a classification among seven types: parental leave, dependent child allowance, educational services and childhood (0-3), dependency and care, conciliation, family typologies, and a set of other important issues and rhetoric around the situation of the family.

Ultimately, this work sheds light on the differences between different parties and party families. The rhetoric is more present in the traditional parties, while the new ones present a greater number of proposals. In addition, a clear left-right axis is distinguished, although with clear differences from the regionalist parties, thus coinciding with the great decentralisation of the Spanish State.

Doing Family in Times of Political Turmoil: The Impact of the 2019 Hong Kong Protest on Family Relationships

Ruby Lai

Lingnan University, Hong Kong S.A.R. (China)

In an era of political upheaval and ideological polarization, the impact of political crisis often spills over to the intimate domain and affects family relationships. Focusing on the 2019 Hong Kong Protest, this article unfolds the consequences of political unrest on family lives. Based on data collected through in-depth interviews with 36 individuals who participated in the 2019 Protest, this article illustrates the divergent effects of the political incident on family relationships. While some families were driven apart, some individuals reinvigorated their immediate and extended family ties, motivated by a sense of political solidarity. When conflicts were unavoidable, individuals might utilize a variety of strategies to alleviate the damages caused by political disagreements, such as maintaining distance, avoiding politics, controlling information of their political participation, and initiating mutual communication. The findings suggest that the impact of the political event was mediated by the political stands of the family members, the relationship quality among family members, and the development of the political incident and the socio-political environment. It is observed that family disruption tended to occur in families initially having a poor relationship, whereas closely bonded families demonstrated greater resilience to political dissonance. The findings also illustrate the fluidity of family relationships and its interplay with the broader societal structure. For instance, the changing social and political circumstances would affect individuals' political attitudes, thus reshaping the interactions among family members.

Digital Romance: Ethical Issues Of Artificially Intelligent Matchmaking

Liliia Sergeevna Pankratova

Saint Petersburg State University, Russian Federation
The process of sexual liberalization, increasing role of intimacy as the main motive for a couple formation lead to structural and substantial changes in the process of creating social ties in private life. The key problem in modern society is the emergence and institutionalization of the pair as a social unit. An individual is faced with the problem of where and how to find a partner. The Internet is becoming a popular, well-developed alternative space for romantic encounters. Social networks, dating applications in the fight for the consumer attention introduce new methods, algorithms for effective selection of a candidate based on an artificial intelligence (AI). Mostly these technologies work with big data, namely social media mining. This vector of modernization of online dating services — aggregation and usage of a large amount of information about clients (with the help of AI— allows us to talk about the growing vulnerability of an individual in communicative space of the Internet. In this regard, questions about ethical principles, cultural norms and values that determine development and application of AI systems in the online dating industry are significant. Particular attention should be paid to the problems and possibilities of political and legal regulation in the field of ensuring information security of citizens. The purpose of this presentation is to identify, conceptualize and problematize the ethical aspects of the online dating industry regarding the implementation of AI technologies into modern services, to consider the directions and possibilities of its deontological coding, governing AI in modern society.

Digital Intimate Partner violence (IPV): types, responses and demands

Núria Vergés Bosch, Leon Freude, Elisabet Almeda Samaranch

University of Barcelona, Spain

Gender based violence (GBV) is one of the main current social problems, especially for women and within families. Intimate partner violence (IPV) is extremely worrisome, due to its prevalence, perversity and impacts. Recently, the Catalan Government included Digital GBV in the law against GBV. However, we still know little about that. To explore Digital GBV, at the end of 2019 we designed and distributed a survey that obtained 270 responses. We aimed to identify the main typologies, its impacts, the responses of women and their demands. Although Digital GBV facilitates anonymity, 45.2% of those surveyed knew their online aggressors. 62.4% of them where their partners or ex partners. For this communication we focused on the Digital IPV and its particularities. We carried out a bivariate and multivariate analysis, through correlations and regressions. We aimed to answer what forms do Digital IPV take, how do women respond to that and what do they demand. Our main results show, first, that the main Digital IPV against women would be online monitoring and surveillance, digital blackmailing, unauthorized access to accounts and devices and gaslighting. Second, women that suffered Digital IPV mainly resort to seeking support and care from close networks, as well as to prevent future attacks and much less to strategies of collective or public action. Finally, our results highlight the strong connection between online and offline GBV. We conclude that more public support is needed, as well as research and action in this regard.

'Addictive' for Children And 'Helpful' to Parents: Electronic Devices as a Non-human Actor in Family Relations

Malgorzata Sikorska

University of Warsaw, Poland

The main aim of the presentation is to analyze the role of electronic devices used by children in parents–children relationships. Starting with the assumption that material objects are non-human actors ('actants'), the author explores the parents' perspective on electronic devices, seen simultaneously as addictive for children and helpful to parents, and their impact on family practices.

The thesis proposed is that electronic devices seem to actively influence and re-shape the power dynamics of families. Specifically, first the use of the devices by children reveals processes where children's influence appears to increase and parents' influence appears to decrease. Secondly, the way in which parents attribute agency to electronic devices reveals their anxieties and uncertainties about raising children, and about parenthood in general.

electronic devices have become an integral part of the parents–children relationship as active non-human participants in child-care.

The agency of devices as 'actants' is clearly visible in everyday sociomaterial practices described by parents where electronics are making children 'addicted'. In this case, the agency of devices means the loss of parental control over children, who isolate themselves from the 'real world' and get transferred 'to a different reality', often unknown by adults. The agency of devices is also observed in their role as parents' 'helpers', because adults are frequently unable to deal with children without the assistance of electronics in their daily practices. Thus, devices gain a degree of autonomy in parents–children-devices relations.

The presentation is based on the results of qualitative research: in-depth interviews with 54 parents (including: 24 parental couples and 6 single parents). Two rounds of interviews were conducted. The research was carried out in Poland.

Perspectives of Families Governance Facing Challenges of Virtual Learning Technologies -Can diverse families function as their children's educators in virtual and distance learning reality?

Esther Serok

Hebrew University of Jerusalem, Israel

The paper presents a research study on the sociological and educational impact of global cultural diversity on the role of families as educators, lately, relating to the impact of virtual learning during the Covid19 pandemic. Specifically, it presents the fieldwork and findings of qualitative research, involving educational settings in which innovative methods have been developed to include families from diverse cultures as educators, thus decrease inequality and minimizing social gap.

The study explores methods to overcome the inequality and processes that will build families' resilience thereby promoting equality, helping the family to regain its leadership role assigning responsibility for strengthening their role as educators and knowledge transmitters.

The study's findings demonstrate that an effective partnership between the family and the educational framework improves the learning process. The study's conclusions show the contribution of families' multiple intelligences to the child's development and to the school's success in achieving its educational agenda. The latest global COVID19 pandemic created a new sever crisis where families faced unexpected technological challenges while their children are engaged in distance learning, suffering from lack of computers and access to internet connection, thus increasing inequality. Therefore, families' governance is challenged due to lack of technological knowledge.

It is also increasing the need for formal education as a vehicle for minimizing inequality and enabling social mobility. The paper will present studies conducted in a widely diverse type of families and schools in Israel along with innovative educational programs developed, tested and implemented during and after the study.

Key words: family, technological knowledge, cultural inequality, COVID-19 pandemic.

RN13_T05_01 | Covid-19: Challenges for Families and Family Research IV

Pandemic Times and Domestic Violence Victims Support Services in Portugal

Maria das Dores Guerreiro, Joana Aguiar Patricio, Leonor Castro

Cies_ISCTE-University Institute of Lisbon

On 18th March 2020, Portugal entered a state of emergency due to the covid-19 pandemic. Several governmental measures were approved, including compulsory home confinement. Overall, these confinement measures have worsened the risk of victims of domestic violence, regardless their gender, age and historical of violence.

Additionally, several policy measures were implemented to support victims of domestic violence, mainly regarding the services and the functioning of the National Network to Support Victims of Domestic Violence (NNSVDV).

This paper presents data collected for a research project funded by the Portuguese Foundation for Science and Technology, under the scope of the Gender Research Notice 4 COVID 19, developed at the Centro de Investigação e Estudos de Sociologia (Cies-Iscte), about the services provided to victims of domestic violence in the pandemic context, especially those of the NSSVDV. Based on two questionnaire surveys applied to these support services, the presentation focuses services, its staff and volunteers, providing a portrait of forms of action in the face of the pandemic and contributes to decision-making regarding future measures for strengthening the services provided. These surveys were replied by 124 services and 114 individuals (staff and volunteers).

Conflicts in and counselling of stepfamilies: Evidence from Germany

Ulrike Hegemann, Valerie Heintz-Martin, Claudia Zerle-Elsäßer

German Youth Institute, Germany

In Germany around 10% of all families are stepfamilies, where one parent is the biological parent to the child(ren) and the other is a stepparent who lives within the family household. Besides the stepfather or stepmother families, some have an additional common child (blended stepfamilies); in other families, both parents bring a child into the relationship (complex stepfamilies). Given this complexity, problems in stepfamilies arise. Whereas conflicts in stepfamilies are already well examined, less is known about how many stepfamilies seek for counselling and what problems are addressed. The aim of our paper is to identify types of conflict and the prevalence of stepfamilies' drawing on professional counselling.

In order to do so we first use data from the survey "Growing up in Germany AID:A II" (2014) with around 740 stepfamilies in comparison with 11.200 nuclear and 1.028 single-parent-families. Second, we use an additional online survey, where we interviewed around 300 counselors of youth and family counselling offices about their attitudes towards stepfamilies, about what makes them special compared to other family types and certainly about their special conflicts and needs of advice. First results show that the main conflicts in stepfamilies deal with the allocation of time, money and love. Conflict levels and types rise with the complexity of the stepfamily and the data suggests that often single parents seek for counselling, reporting conflicts with the new partner of the other biological non-resident-parent of the child (secondary stepfamily).

Keywords: stepfamilies, family conflicts, family counselling

No Visitor's Days. The Impact Of The Pandemic In The Family and Intimate Relationships Of Prisoners In Spain

Ana Ballesteros Pena1, Estíbaliz De Miguel Calvo2

1Universidade da Coruña, Spain; 2University of the Basque Country

Prisons are specific contexts for the study of family and intimate life. Incarceration results in the rupture and alteration of relationships, which are limited to visits, phone calls, and letters. Yet prisons also constitute a world of relations (Goffman, 1961) where incarceration operates by remaking personal bonds (Haney, 2013), which ultimately helps to survive imprisonment (Comfort, 2008), cope with it (Severance, 2005), or get security (Ojeda, 2013). In parallel, specific kinds of relations around prison life, such as ties between families of prisoners, also emerge. In this paper, we address the impact of public policies against COVID-19 on the relationships of prisoners with their loved ones in Spain. To do so, our research draws on three sources: a review of official data and prison policies implemented between March 2020 and March 2021, an analysis of the information published by organizations of relatives and supporters of prisoners, and interviews with key informants. We describe the negative impact of lockdown measures on the mental and emotional wellbeing of prisoners and the many obstacles families and friends have to deal with (secondary prisonization, Comfort 2008). We also explore the possibilities and reconfiguration of relations that emerge in this new scenery in the midst of the fears, uncertainties, and injustices worsened by the crisis of COVID-19 around prison walls. Finally, our research has also identified new forms of solidarity and new patterns of intimate life within prisons, between inside and outside, and between those loved ones outside. Keywords: prison, COVID-19, family relationships, intimacy, Spain

"We Were Just Left In The Dark": Families' Experiences With Incarceration During COVID-19

Paul Jakhu

University of the Fraser Valley, Canada

The unfolding events of COVID-19 has led to a rapid surge of interest and concern within the academic and public arena (Simpson & Butler 2020, Akiyama & Spaulding 2020). Studies exploring the situation of inmates have often pointed towards their particular vulnerability to the virus and the consequences of outbreaks insides prisons (Montoya-Barthelemy et al. 2020). Seemingly lost within this growing body of research is the experiences of prisoner families' during the pandemic. This study explores how the events of COVID-19 have shaped the reality of everyday life for families of inmates. In this paper, I detail the changes in prisoner families' lives – their concerns, relationship with correctional institutions, and their connection to their incarcerated relative. Results from eleven in-depth interviews reveal that the COVID-19 pandemic has exacerbated and created new and painful challenges for prisoners' families. The risk rhetoric adopted by correctional facilities has supported harsh restrictions on prisoners' rights which has resulted in further loss of connection between family members. Families are placed on a continuous on-call duty in order to maintain a relationship with their incarcerated relative. Policy recommendations are provided that place an emphasis on the inherent human value in families over 'tough on crime' ideologies.

RN13_T05_02 | Work-Family Balance, Work-Family Conflicts, Parental Leave II

Factors Affecting the Length of Unpaid Parental Leave in Spain

Pedro Romero-Balsas

Universidad Autónoma de Madrid, Spain

This study analyses the effect of working conditions, educational background, job mobility, grandparental availability and co-worker attitudes on the length of unpaid part- and full-time parental leave in Spain. The length of parental leave is a key factor in both the work - family life balance and the furtherance of gender equality in childcare. The conditions affecting the length of unpaid full- and part-time leaves in Spain have not been compared to date. The data for the analysis were drawn from a 2012 survey of 4000 parents with at least one child under the age of 13 across the country on the social use of parental leave in Spain. Multivariate models were built using Cox proportional hazard regression to analyse the data gathered from a sub-sample of 142 households for the part-time and 96 for the full-time model. The results attest to the heavy impact of working conditions on the length of unpaid full- and part-time parental leave. The latter is also used to adjust working hours to childcare demands when workplace flexibility or employer support for work-family balance is perceived to be lacking. Job security is a primary determinant in the length of unpaid leave in Spain. The results suggest that full- but not part-time leave entails a substantial opportunity cost for the most highly qualified parents.

Contesting The Incontestable – The Political Struggle Over Gender Equal Parental Leave In Finland During The 2010s

Mikael Nygård[1], Josefine Nyby[2]

[1]Åbo Akademi University, Finland; [2]London Metropolitan University, UK

Recently, one main goal of Finnish family leave policy has been to enhance gender equality by increasing fathers' engagement in family leave and child rearing. One way of doing this has been through so-called 'daddy quotas', that is, individualised leave periods that are forfeited if the father does not use them. However, this policy pursuit has not met with the same success as it has in the other Nordic countries, and in Finland the uptake rate of parental leave is lower than compared to e.g. Sweden. Previous research has explained this gap mainly as a reflection of more rigid institutions and discord between stakeholders, whereas political factors have not been paid the same amount of scholarly attention. This chapter seeks to rectify this shortage and to contribute to the literature on political drivers of family leave reform. The aim is to analyse how the idea of gender equality has been constructed and contested by governments and leading political parties in Finland during the 2010s. We argue that one reason for Finland being a Nordic laggard in terms of gender-equal family leave is actually ideological. Although gender equality is a unanimously shared value on a general level of the political system, there are major differences between parties when it comes to the role this should have in family leave. Consequently, the idea of traditional mothering and parental freedom of choice still holds sway in Finland, which poses challenges and even obstacles for policy pursuits towards a more gender-equal family leave.

Matthew Effects of a Gender Equality Oriented Birth Leave Reform in Spain

Anna Escobedo, Lluís Flaquer

University of Barcelona, Spain

Between 2019 and 2021 Spain has implemented a radical reform of birth leave, in European comparative terms, based on the principle of individual, non-transferable, well paid, gender neutral leave around birth. From January 2021 employed mothers and fathers have the same leave entitlements and benefits at birth, basically 16 paid weeks each fully paid by the Social Security institution. Meanwhile parental leave remains unpaid and thus non-affordable for most employees, and leave to take care of sick children problematic, even though exceptions have been made during the covid19 crisis, which have highlighted the absence of more general regulations covering ordinary child sickness.

Data indicate that after the reform male users and public expenditure devoted to non-biological parents is overcoming use and social expenditure on employed-mothers on leave. This raises issues of gender equity. May it be that the gender neutrality around birth, translate into unintended social impacts amplifying gender or social inequalities particularly amongst mothers in more difficult employment situations?

Our main contribution is to discuss and estimate using Social Security data what we conceptualise as Matthew and Matilda effects of this 2019 intended gender neutral reform in leave regulation around birth, while at the same time acknowledging for its transformative potential. The Spanish case is discussed with OECD and Eurostat Data in the framework of present European debates on de-gendering the use of leave arrangements, comparative innovation and research on leave arrangements, in connection to the deployment of the 2019 EC Parental Leave Directive until 2024.

Can Fathers' Leave Take-Up Dismantle Gendered Child Care Practices? Evidence From Finland

Johanna Närvi[1], Petteri Eerola[2]

[1]Finnish Institute for Health and Welfare, Finland; [2]University of Jyväskylä, Finland

When becoming parents, men and women even in gender equal relationships often adopt a more gendered division of labour. In Finland, mothers take most of the family leave, although fathers' take-up of ear-marked leave has been increasing. Studies have suggested that father's take-up of leave is associated with him taking more responsibility in unpaid care work. We analyse the interconnection between father's leave take-up and the gendered division of care – playing with the child, physical care (e.g. feeding, clothing) and 'mental labour' such as making decisions for the child – in Finland. The analysis is based on survey data from mothers (1100) and fathers (550) of a four-year-old child. The data includes retrospective information on the parents' leave take-up as well as information on how different child-care related tasks are shared between the parents at the moment of the survey. We use logistic regression to analyse whether the father's take-up and the length of leave increase the risk of the father taking equal / more responsibility for different child-care related tasks when the child is about four years old. The results show that in families with two working parents, some of the concrete tasks related to the care of the child were shared more equally if the father had taken a longer leave. We conclude that a long enough leave quota for fathers could contribute to changing the gendered parental practices in families.

Keywords: parental leave, fathers, division of care, parental practices, gender equality

RN13_T05_03 | Family Patterns, Values and Practices II

Diversity In Partnership Trajectories And Reproductive Outcomes In Spain

Sergi Vidal[1], Danilo Bolano[2]

[1]Centre for Demographic Studies, Spain; [2]University of Lausanne, Switzerland

Long-term declines in fertility were paralleled by declines in the formation and stability of marital unions in many countries in the last quarter of the 20th century. Recently, separated but complementary literatures have empirically addressed micro-level dynamics of fertility outside stable marital unions, addressing the role of non-marital fertility, childbearing in step-families or multi-partnered fertility, and the associated evidence suggested that childbearing is increasingly occurring outside the first marital union. However, it remains unclear the extent to which heterogeneous partnership dynamics led higher diversity in reproductive life courses, contributing to variations in completed fertility. In this study, we address the question of how does(in)stability of partnerships over the life course matter for outcomes in reproductive behaviour? We innovate by analysing entire partnership trajectories during reproductive ages, to shed light on the dynamics that are relevant for repoductive outcomes. We examine the full set of individual's partnership episodes since age 16 for variation in partially completed fertility (age 41, for the purpose of this study), and cumulative fertility (between age 20 and 41) using fata from the Spanish Fertility Survey (2018) for 7,656 women born between 1962 and 1977. We deploy machine learning methods (i.e. Boruta and Lasso) and account for interactions across individual's partnership episodes, to test several hypotheses on the associations between partnership dynamics and reproductive behaviour. This research makes a contribution by connecting the relevant literatures on partnership and fertility, showcasing how partnership dynamics are a major driving force for changing fertility regimes.

Attitudes towards Single-Parent Families in Europe

Boglárka Herke

Centre for Social Sciences, Hungarian Academy of Sciences Centre of Excellence, Hungary

Studies often investigate related policies, the employment and socioeconomic status of single parents, and the well-being of single parents and their children (e.g. Bernardi and Mortelmans 2018; Nieuwenhuis and Maldonaldo 2018). Attitudes towards single-parent families is a less often analysed topic. The paper provides an overview of attitudes towards single parent families in 35 European countries based on data of the European Values Study (2008). The analysis covers two statements: 'If a woman wants to have a child as a single parent, but she doesn't want to have a stable relationship with a man, do you approve or disapprove?' 'If someone says a child needs a home with both a father and a mother to grow up happily, would you tend to agree or disagree?' Four clusters of countries could be distinguished. In the first cluster, the agreement level with the first and the disagreement level with the second statement are both moderate (e.g. most Scandinavian countries). In the second cluster, there is a moderate level of support towards the first statement, but a low level of disagreement regarding the second statement (e.g. most of the post-socialist countries). The third cluster composites countries (Denmark, Iceland and Spain) with extreme high level of support towards the first and a moderate level of disagreement regarding the second statement. The fourth cluster includes countries (e.g. most of the Southern European countries), with conservative attitudes regarding both statements. The paper investigates these clusters in more detail.

The Effect of the Simple and Complex Single-parent Household on Low Birth Weight. The Spanish Case.

Chiara Dello Iacono, Jesús García-Gómez, Mikolaj Stanek

University of Salamanca, Spain

The decline of the traditional family model has given way to the rise of different types of households, including simple and complex single-parent households. In this specific case, the simple one is made up of single mothers with children and the complex one is made up of single mothers with children plus other people, generally the child's grandmother or grandfather.

There is a large body of literature on the effect of household structure on birth outcomes. Mothers who have a partner and live with her have better outcomes than those who do not have a partner and live alone (Albrecht, Miller and Clarke 1994; Castro 2010; Barr y Marugg 2019). However, there have not been many studies focused on the specific effect of family support within single-parent households and how the latter affects birth outcomes. Based on a comparison between the two types of single-parent households, the aim of this study is to analyse whether household structure influences low birth weight of children.

This research takes advantage of the opportunity to use a new database linking the Natural Population Movement records from 2011 to 2015 with the 2011 Spanish Census, provided by the Spanish National Institute of Statistics.

Logistic regression results indicate that there is a relationship between single-parent household structure and low birth weight, since complex single-parent households are supported by some family members.

Fathers, Mothers and Children: Visitation Rights For The Non-Resident Parents In Latvia

Andris Saulītis

University of Latvia, Latvia

When divorced partners cannot agree on the visitation rights of the non-resident parent, the dispute can be brought to the court. In Latvia, the law does not give the judges any guidelines on how to make the judgment, except that it must be made "in the interest of a child". This study looks at the court decisions in Latvia for the period 2017-2019 on the non-resident parent's visitation rights to explore how the judicial system frames family and childcare after divorce. How many hours, days and holidays non-resident parents, on average, are spending with their children? Is it equal for men and women, or there are signs of discrimination for any of them? The findings from the quantitative study of court decisions show that non-resident parents are spending significantly less time with their children than the residing parent. However, for the most part the taken decisions highlight what society considers as socially acceptable regards post-divorce family life.

What Influences Paternal Childcare Involvement From Nine Months To Eleven Years Post Birth In The UK?

Helen Norman

University of Leeds, United Kingdom

Fathers' roles have been adapting over the last three decades but 'breadwinning' remains pivotal to 'good' fathering and the work schedules associated with fathers' employment remains key in shaping their involvement in childcare and domestic work. Yet questions around the relative impact of fathers' and mothers' employment on paternal childcare involvement remain unanswered, and little is known about the longer term impacts – namely, whether the way that parents' organise their work and childcare arrangements in the first year of the child's life influences paternal childcare involvement as the child grows older. This paper builds on earlier analysis (e.g. Norman et al 2014; Fagan and Norman 2016) using the UK's Millennium Cohort Survey to explore what influences paternal involvement in childcare at five key stages of the child's life: nine months, three, five, seven and eleven years post-birth. Through longitudinal structural equation models, I identify which household and employment factors are associated with paternal involvement and at what stage of the child's life these influences are most important. I also establish (i) the longer-term impact of taking leave from work in the immediate post-birth period and (ii) whether being involved in the first year of parenthood shapes fathers' later (pre- and school-age) involvement at ages three, five, seven and eleven. The findings shed light on what enables and hinders fathers from being involved parents at different stages of the child's life, and they also help us to evaluate which policy interventions are the most effective in supporting fathers' long-term childcare involvement.

Mothers As Main Caregivers. Competences, Responsibilities And Wishes

Mittzy Arciniega-Cáceres, Mònica Figueras-Maz

Pompeu Fabra University, Spain

This proposal presents the results of the doctoral thesis titled "The Construction of Motherhood in Mommy Blogs Discourses. Motivations, perceptions and preferences of readers" (2019) that analyzed the discourse of 40 posts and their comments of the 5 mommy blogs with the greatest visibility in Spain in relation to the topics that most interest mothers. In addition, these results are complemented by the ones obtained in the recent research "The ideology of intensive motherhood as the axis of gender symbolic violence" (2020) that performed 6 life stores to mothers and their adolescent daughters.

Specifically, the proposal focuses on the results linked to the research question: what is the model of motherhood that predominates in the discourse of blogs aimed at mothers? and more specifically to the objective aimed to discover mothers perceptions regarding the representation of parenting roles On the other hand, the construction of the theoretical framework was based on key concepts such as the definition of intensive motherhood by Sharon Hays (1998) or the postulate "the personal is political" by Carol Hanish (1969).

Both investigations suggest that the dominant idea of intensive motherhood is the responsible for women identifying the figure of "good mother" with the role of "caregiver" (understanding the absence or incompetence of the father). The same way, although many mothers say they do not agree with current models of fatherhood; on the other hand, they defend biological motherhood that places the father in a position of incompetence in relation to the care of children. All of this generates contradictions between their interests and their ideals, feelings of guilt and frustration.

Keywords: motherhood, parenting roles, co-responsibility, motherhood ideals and imaginaries.

538

Do Involved Fathers Promote Gender-Egalitarian Attitudes in Their Children? A Study on the Intergenerational Transmission of Gender Roles

Tomas Cano, Heather Hofmeister

Goethe University of Frankfurt, Germany

Objective: This study examines the influence of four dimensions of paternal involvement in family life across 10 years on the gender-role attitudes of their children by age 14: paternal warmth, childcare time, and housework time, as well as maternal sense of fairness with the division of domestic tasks.

Background: Recent research suggests that, in wealthy democracies, paternal involvement in the lives of children is increasing. Yet while previous studies on fathers' involvement have considered paternal influence on child cognitive or socio-emotional outcomes, studies have not addressed paternal influence on children's gender-role attitudes. Meanwhile, studies on the intergenerational transmission of gender roles have analyzed maternal influence on children's gender-role attitudes and neglected the role of paternal influence. This study engages these two strands of research in response to the relatively unaddressed question of the effects of paternal involvement in children's development of gender-role attitudes.

Method: We used the Longitudinal Study of Australian Children (LSAC) with biannual observations over 10 years for 2,025 children born between 1999-2000 who lived with both biological parents.

Results:

Multivariate regression models indicated that, among paternal involvement measures, the most powerful predictor of children's gender-role attitudes at age 14 was the time fathers spent doing housework—particularly when mothers were not employed. It was, however, fathers' housework time relative to mothers' housework time, rather than hours total, that had the biggest impact on children's gender-role attitudes.

Conclusion: These results suggest that co-responsible distribution of unpaid labor (and especially of housework) between parents when children are young, leads to increased gender egalitarianism in the attitudes of children at age 14.

Fertility and Social Uncertainty in Lithuania: the Analysis of 1970–1984 Birth Cohorts

Alina Norgelaite

Lithuanian Centre for Social Sciences, Lithuania

A lot of studies have been conducted in order to identify and to explain declining or low fertility in Central and Eastern Europe as well as in Lithuania since 1990s. The investigations are mainly based either on theoretical framework of the Second Demographic Transition or economic theories that correspondingly emphasize the impact of changes in cultural values or structural economic constrains. The emerging new theoretical framework, covering uncertainty and vulnerability considers not only economic, but also social factors, provides an opportunity to investigate fertility issues from a different angle.

The aim of this presentation is to reveal the main findings of the research of 1970–1984 birth cohorts in Lithuania. These cohorts have experienced various types of uncertainty and vulnerability caused by the consequences of the collapse of the socialist system in the 1990s. The interconnections between uncertainty and fertility are analyzed retrospectively. The research is based on analysis of biographical interviews conducted in 2018-2019. The analysis is focused on preconditions and factors of planned fertility. The results show that some stability was required for childbearing. For instance, despite the fact that cohabitation was the preferred form of primary union formation, the marriage for these cohorts was an important condition for fertility intentions.

539

Postponement of Childbearing and Health Outcomes of Mothers

Anna Šťastná, Jiřina Kocourková

Charles University, Czech Republic

The shift in childbearing towards older ages has constituted one of the most significant demographic and societal trends observed in central and eastern European countries since the 1990s. Therefore, increasing attention is being devoted to the consequences of fertility postponement, especially in connection to low fertility, increasing rates of childlessness, changing life cycle and timing of its various stages, as well as norms and values associated with parenthood. Despite there are advantages of later motherhood, reproductive ageing represents a decline in fecundity, difficulties of conceiving and increased use of ART. Moreover, advanced maternal age is also a risk factor for adverse birth outcomes. Older mothers are at higher risk of pregnancy complications and complications related to delivery (miscarriage, preterm birth, low birth weight, stillbirth, multiple births, caesarean section).

This paper will focus on the impact of fertility postponement on the health risks of mothers in Czechia, where the process of parenthood postponement has taken place very intensively over the last 30 years from the very young age of mothers in the early 1990s to the current timing of reproduction on the European Union average. Findings can serve to increase awareness of potential mothers or for implementation of relevant family and health policies.

The research will be based mainly on anonymised individual data obtained from national health registers managed by the Institute of Health Information and Statistics (IHIS). These registers contain data on the reproductive history of mothers, the course of the pregnancy, childbirth and the new-born child.

Fertility Postponement in Spain: Does it Inevitably Lead to a Smaller Family Size?

Cristina Suero

Spanish National Research Council (CSIC); Carlos III University of Madrid (UC3M)

Fertility postponement is considered a major underlying cause of fertility decline. Since women's reproductive period is relatively short, the later a woman starts having children, the less time she has to achieve her desired family size. Among the different causes of postponement, researchers stress the difficulty to reach adequate economic and occupational stability to form a family. For women with tertiary education, this stability may come later, delaying the age at first motherhood. However, these women may end up in their reproductive careers with a larger family size than those with lower educational attainment.

I use the 2018 Spanish Fertility Survey to assess the effects of the postponement of the first child on the final number of children women achieve in Spain, an interesting case of study given the lowest-low fertility rates and the late age of entry into motherhood. Using Poisson regression models and including interaction effects between age at first birth and educational attainment, I observe that late mothers end up in their reproductive careers with fewer children than those who start earlier. Nevertheless, this effect is not as perceptible among women with tertiary education, who end up with more children than late mothers with lower educational attainment. The higher household income these women achieve contribute to this ability to catch up. These findings are relevant because they illustrate the consequences on fertility derived from the precariousness among young individuals in Spain, especially those with lower educational levels.

540

Can Covid-19 pandemic influence the fertility intentions among Hungarians?

Ivett Szalma

Centre for Social Sciences, Hungary

Current special situation caused by the pandemic also could affect individual decision-making about fertility for different reasons. Actually, it can have a double relevance. One is when somebody gets infected by COVID-19 and the other when somebody is affected by the social, economic, cultural, and psychological consequences of Covid-19 (Settersten et al. 2020). The direct relationship between COVID-19 infection and fertility are already proven. For example, Khaili and co-authors (2020) found that there is a relationship between Covid infection and male reproduction and it also has an effect on pregnancy outcome (Khaili et al. 2020). However, the effect might be larger in volume than the infection. COVID-19 can have an indirect effect on fertility and family patterns because of many reasons. Just to mention some cases: pregnant women don't know whether their partner can be inside the maternity ward (Davis-Floyd et al 2020), or whether they will get the sufficient treatments. In addition, it can also have an effect via economic uncertainty (Luppi et al. 2020).

In this research we aim to examine how the Covid-19 influence young men and women fertility intentions in Hungary. To answer this question, we use both quantitative analyses based on the representative survey conducted in Hungary at the end of 2020 and 40 interviews that were conducted among 20–40-year-old men and women who have maximum 1 child in Hungary. Our preliminary analysis of the Hungarian representative survey has shown that around 10% of couples who planned to have children before Covid-19 have postponed or changed their plans due to the pandemic situation. The interviews can show the exact mechanism behind their decisions' changes.

RN13_T06_02 | Work-Family Balance, Work-Family Conflicts, Parental Leave III

Perceptions And Practices Of Gendered Parenting In Transitional Phases Of The Life Course.

Marie-Kristin Doebler[1], Julia Gerstewitz[2]

[1]Eberhard Karls Univerity Tuebingen, Germany; [2]Justus-Liebig University Giessen, Germany

541

Research question: How do pregnant couples on the verge of becoming parents and parents becoming so-called "empty nesters" discuss and anticipate their (changed) parenthood?

Theoretical approach: We focus on family-biographical transitional situations. According to anthropological initiation and ritual research (van Gennep 1981, Turner 1964) as well as sociological life course research (Kohli 1985; Mayer/Huinink 1990; Scherger 2007) they show a particular crisis potential and a specific need for response.

Data and methods: Qualitative content analysis was conducted upon advice books and internet forums dealing with pregnancy, birth and the transition in the so-called "empty nest". Respective findings were amended by hermeneutically analysed ethnographically observed birth preparation courses and narrative interviews with parents whose children left home.

Main findings and interpretation: The proposed paper presents results of a German research project on becoming parents, separation and moving out of the children. In the first transition phase (entering parenthood), an external and self-attribution of primary maternal responsibility is established through references to the body. This is consolidated and legitimized by naturalization and results in gender-differentiated care and employment constellations. Although, family upheaval phases do offer the opportunity to restructure everyday family life and to renegotiate tasks there is a tendency for couples not to fundamentally change once established divisions of care and labor after the children left home, let alone to return to distributions effective prior to entering parenthood.

The Promotion of Caring Masculinities in Spanish Companies. How Does it Work?

Paco Abril[1,3], Cristina Castellano-Serrano[2], Teresa Jurado-Guerrero[2]

[1]University of Girona, Spain; [2]Uned; 3Universitat Oberta de Catalunya

This organizational analysis is based on five case studies of Spanish companies, which display some good practices for involving men in personal and familial care activities. We aim to show the Work Live Balance (WLB) which exist in middle-large companies of different sectors and which are used by men to care for their children, their partners, elderly relatives or themselves. Based on qualitative interview data from organizational experts, male employees with caring obligations who actually take up some measures and also their partners, it contributes to the ongoing debate on a developing concept of caring masculinity. This contribution reveals a more complete picture of care sharing and its effects on family life and gender equality. It focuses on barriers hindering men's taking up unpaid care tasks, as well as support factors, including a multidimensional approach on different levels, such as company cultures, gendered substructures/informal structures, leadership, relevant players and networks, implementation of official regulations and role models within companies. The findings highlight that the organizational culture of companies is key to enable caring masculinities, in particular how leadership at different levels manage diverse WLB needs and how co-workers, in particular other men, react to demands to adapt working conditions to care responsibilities. Directors, Human Resources staff, supervisors and workers' councils' representatives have the capacity to manage and decide on how to facilitate WLB for all employees and to include gender experts into decision making. In addition, information, communication, training and awareness raising is very important to change gender stereotypes and to promote men's use of measures without penalisations (loss of wage, of opportunities for training and of promotion opportunities).

Work-Life (Im)Balance? An Explorative Qualitative Study Among Mothers and Fathers of Persons with Disabilities in Poland.

Marta Sałkowska

Collegium Civitas, Poland

The aim of this paper is to reconstruct the meaning of professional activity and to present strategies for coping with work-life balance among parents of persons with disabilities in Poland. Research proves that having a child with disability very often results in a lower financial status, work overload, and the necessity to manage the child's rehabilitation. The theoretical context of the study includes Herbert Blumer's concept of giving meaning to objects as well as Erving Goffman's notion of stigma by association. The context of the study is illustrated by a brief description of the sit-in protests organized by persons with disabilities and their parents in the Polish Parliament in 2014 and 2018. As such, it refers to the social policy system in Poland. The explorative study was carried out among mothers and fathers of persons with various disabilities in Poland. Individual in depth interviews were conducted with eight participants. The results show two main types of strategy: working-mode-related and values-related. Both generational and gender differences are present in managing work-life balance.

542

Parenthood and Gender Gap in Leisure: a Cross-national Time Use Comparison

Anna Martinez Mendiola, Clara Cortina

Pompeu Fabra University, Spain

Research on gender inequality has amply assessed the paid work, housework, and childcare gaps existing among men and women in current families. Yet, research on gender inequality in the use of time for leisure activities has been less prevalent, and the search for cross-national differences on the gendered leisure patterns has almost been omitted. Through a set of Fix-effect regression analyses, this study aims to broaden the knowledge about gender inequalities among mothers and fathers with under-aged children by analysing differences in leisure time. The main contribution of our study is that

we analyse gender differences in European countries adopting a couple perspectives as we are able to analyse simultaneously the time use of both partners and address gender differences within the couple. The institutional context is introduced by comparing countries that represent different gender cultures and different levels of diffusion of the dual-earner dual-career family model. Results reveal how mothers do gender through leisure, resulting in less leisure time, less quality in leisure, and more time on children-oriented leisure being alone. The family arrangement of couples deeply moderates the existent gender gaps, with mothers on Female Breadwinner couples strongly suffering from leisure deficits. Whilst the country's cultural and contextual factors shape the relationship between gender and leisure, no great evidences were found for the moderating role of socio-economic, socio-cultural, and relative resources of couples. This study uses the Multinational Time Use Study (MTUS) for five countries (Finland, Spain, Italy, France, and the UK) which surveys were run between 2008 and 2014.

RN13_T06_03 | Family Formation and Dissolution III

Postdivorce Kinship Networks

Christian Fang, Anne-Rigt Poortman, Tanja van der Lippe

Utrecht University, The Netherlands

Kinship networks comprise a range of relatives commonly residing outside of the household, such as people's siblings, cousins, or aunts and uncles. Kinship networks change across major life course transitions, such as marriage and divorce. Whereas it is generally acknowledged that marriage extends kinship networks to a binuclear structure (i.e., the partner's relatives become part of people's kinship network), the effects of divorce on the structure of kinship networks are less clear.

In this contribution, we explore how the kinship network of married parents differs from that of divorced parents. We consider the extent to which ten different kin (i.e., parent's own and their respective (ex)partner's parents, siblings, nephews/nieces, aunts/uncles, cousins) are featured in the kinship networks of married or divorced parents. For our theoretical framework, we extend existing notions of kinship hierarchies, genealogy and equity to include also more distant kin (e.g., cousins)

about which little is known. Furthermore, we theorize how the postdivorce kinship network differs within the group of divorced parents, i.e., between different residence arrangements (sole/shared residence) and forms of repartnering. We base our analyses on recent large-scale (N=4,800) survey data from the Netherlands. For each of the ten different kin, respondents were asked whether they considered them part of their family, relatives, or neither.

Preliminary results show substantial differences between the kinship networks of married and divorced parents. Specifically, the (ex)partner's kin are included to a lesser extent, with this being especially so for more distant kin (e.g., the ex-partner's cousins). These tendencies appear magnified when parents have a new cohabiting partner or spouse after divorce and in case of sole-custody arrangements as opposed to shared residence.

How Children Of Separated Parents View Their New Post-Divorce Family?

Coralie Theys

University of Louvain, Belgium

543

In the context of everchanging family configurations, this paper focuses on children of separated parents' conceptions of what their family is. It is based on an ongoing research project entitled MobileKids: Children in Multi-Local, Post-Separation Families (ERC Starting Grant project – supervision: Prof. Laura Merla) which seeks to understand how the lives of children are affected by divorce, mobility and multilocality in the context of shared custody arrangements, and how children accommodate to this family situation. Moreover, as children's own accounts and experiences of contemporary changes have largely been overlooked up to now, this project considers children as active social actors that can, to various extents, exercise agency and influence on their own lives as well as on the lives of the people surrounding them, while being constrained by institutions.

Based on the analysis of in-depth qualitative interviews – through the mobilization of creative, visual and participatory methods (Socio-Spatial Network Game & Relational Maps) – with over 8 children (ongoing fieldwork) aged 10 to 16 in Belgium, this paper presents how children in shared physical custody perceive the contours and the substances of their family. Contours, here means the actual people that children consider as being a member of their family. Substance, here refers to the dimensions (values, affects, or practices) that

children mobilize to classify, recognize or negotiate the place of each member inside their perceived family – which is particularly of interest in the presence of step-family members.

Stepparents' Financial Contributions In Contemporary Stepfamilies

Ece Arat, Anne-Rigt Poortman, Tanja van der Lippe

Utrecht University, The Netherlands

Parents invest two key resources to improve children's life outcomes: money and time. The rise in stepfamilies has led to concerns as stepparents may invest less than biological parents. So far, research focused on stepparents' time involvement. We know very little about stepparents' financial contributions, especially for stepmothers and nonmarried stepparents. These are important gaps as financial contributions is a notably gendered parental task, also one that can be legally required depending on the type of relationship between the stepparent and the biological parent, and children's residence; e.g., in the Netherlands, married stepparents with resident minor stepchildren are required to provide financial support. In this research, we study the extent of stepparents' financial contributions to their stepchildren and what determines these contributions. We investigate the roles of stepparents' gender, type of relationship in a stepfamily, children's residence, stepparents' other responsibilities (i.e., another child from a previous relationship), their income, and children's other parental figures (i.e., other biological and step-parents). We, further, examine whether these determinants differ depending on stepparents' gender. Our data comes from the second wave of the New Families in the Netherlands survey (2015/16; N~3500) among divorced and separated parents with minor children. Because of its large scale and recency, the dataset includes sufficient numbers of nonmarried stepparents (i.e., cohabiting and LAT), those with part-time and nonresident stepchildren and stepmothers. Our descriptive results show that stepmothers contribute less than stepfathers. Marital ties, co-residence with stepchildren, and not having other responsibilities correlate positively with stepparents' contributions. The results of multiple regression analyses will be presented.

Stepmothers´ Experiences of Care

Hanna Samzelius

Örebro University, Sweden

This presentation discusses results from an ongoing study about care between generations in Swedish stepfamilies. To be more precise, I examine stepmothers' experiences of care during the upbringing of a stepdaughter. The study is based on 19 life story-interviews with 1) stepmothers who have become step grandmothers and 2) stepdaughters who have become mothers. This presentation is based on nine interviews with stepmothers. It focuses on care during the stepdaughters' childhood, in particular how care is done as a moral practice and negotiated with stepdaughters and parents over time. Underlying values, principles, motives and possible turning points are examined. The result shows that stepmothers´ relationship to stepdaughters is in several ways characterized by ambivalence. For example, while norms related to motherhood seem important when negotiating the relationship, claiming the role of a mother is considered morally wrong. Also, although the relationship between stepmothers and stepdaughters is sometimes regarded as close, it is yet never seen as close as biological relationships. Results also indicate that principles of justice and the best interest of the child guide negotiations of the relationships. The meaning of these principles are however negotiated in different ways. Finally, while most stepmothers in this study seem to take on a lot of caring responsibilities, they simultaneously find ways to morally legitimatize not taking on specific caring responsibilities. This result differs from research findings indicating that stepmothers find it difficult to morally legitimatize why they do not take responsibility for the care of stepchildren.

RN13_T06_04 | Family Research Methodologies and Methods

"Triangulating Perspectives in Family Research"

Susanne Vogl, Eva-Maria Schmidt, Ulrike Zartler

University of Vienna, Austria

Transition to parenthood affects both partners. To understand dynamics and sense-making within this time of change, the perspective of both partners should be taken into account. Multiple perspective interviews (MPIs) involve interviewing members of a social group separately and triangulating their accounts during analysis to gain insights into the functioning of families. The integration of perspectives allows for a richer understanding of family dynamics. In addition to individual accounts, dynamics and negotiation processes within the couple can be reconstructed.

However, the integration of perspectives is a challenging endeavor. Such approaches are inherently challenging due to the complexity and volume of data involved. Little attention has been paid to the methodological challenges of data analysis in multiple perspectives, particularly with dissonant data. To illustrate the importance of this aspect, we draw on the triangulation metaphor and related epistemological and ontological perspectives, which determine analytic choices and thus yield different forms of knowledge. We show how triangulating perspectives can extend individual-level results, but also how researchers should go beyond a descriptive level of analysis for convergent and dissonant accounts to realize the potential of MPIs. Convergence should not be assumed too hastily, yet, there might be dissonance that cannot be resolved. (Self-)reflection on epistemological views, interpretive practice, and the purpose of MPI as well as their interrelation can increase the strengths of MPI approaches. This in turn can strengthen current family research and broaden the perspective from single family members to a more holistic understanding.

Mixed Methods Approach in Family Migration Research

Inga Sabanova[2], Dafina Kurti Sinatra[1]

1University of Cologne, Germany; 2Trinity College Dublin, Ireland

Despite the emerging importance of mixed methods research across the social sciences, the combination of quantitative and qualitative methods in family research is limited. One of the reasons is that most researchers are trained either in quantitative or qualitative approaches, but not in both. The main advantage of quantitative study design lies in the standardised questions and the respective analysis with large comparability across demographic groups, time points, geographic locations. However, experiences and dynamics in migrant families are very heterogeneous that need the most appropriate and effective data collection design, methods and tools to capture those. To emphasise the advantages as well as the limitations of the qualitative approach in family migration research, we will look at a case study with the qualitative study design that explores the experiences of Baltic women as mothers in Ireland. This paper will critically reflect and discuss our experience with quantitative and qualitative study approach in family migration research. Respectively, it aims to show arguments for the appropriateness of the mixed methods approach for investigating family issues and addressing meaningfully relevant research questions that will advance the study field of family migration.

545

Partnership, Fertility And Social Class: Adoption Of The Social Space Approach

Aušra Maslauskaitė[1], Irma Dirsytė[2]

1Vytautas Magnus university; 2Lithuanian Social Research Center

Current developments of the demographic family events (family formation, childbearing, union dissolution) consistently prove the increasing role of the social stratification. Many countries witness the new social inequalities in fertility. For example, in the Nordic countries, the highest childlessness is among low educated women, childbearing in cohabitation is more prevalent among the low educated. Educational gradient in marriage is also increasingly positive in many countries. Divorce in many countries is more pronounced among the low educated.

Though the stratification of the demographic family behavior attracted a lot of interest, the predominant category remains education. However, currently, one observes the heterogeneity in the educational outcomes. University degree does not guaranty a stable and high-paying job as it was several decades ago.

In this paper we apply the multidimensional concept of social class introduced in the works of Bourdieu (1984; 1996) to the analysis of the partnership and fertility behavior.

Our paper focuses on Lithuania, we use the Families and Inequalities Survey (2019) dataset, which collects rich information on birth cohorts 1970-1984.

In the initial steps of analysis, we applied the multi-correspondence analysis and constructed the social space, which included axis of cultural and economic capital. In the next step, we added to the social space separately the variables on age at first marriage, number of children, marital status. Our preliminary findings show the stratification of the family behavior across the social space. In the further steps of the analysis, we intend to simultaneously consider the fertility and family behavior in the social space. The initial conclusion suggests the potential for the integration of the social space analysis into the family demography research.

Investigating Family Relationships Through Ordinary Domestic Commensality

Fairley Le Moal[1], John Coveney[2], Isabelle Mallon[1]

[1]Université Lumière Lyon 2, Centre Max Weber; [2]Flinders University, College of Nursing and Health Sciences

Ordinary family meals, also called domestic commensality, constitute unique lenses to investigate intimate family lives, as they are social and cultural events of socialisation into family dynamics. The convivial and healthy meal terminology is often used to refer to domestic commensality, implying that family members coming together to eat necessarily generates a positive experience. This normative representation is heightened in the context of the Covid-19 pandemic, during which family meals are often presented as "comforting" compensations during challenging times for families. Family meals are often valued, in particular, for the opportunities they provide to develop communication and strengthen or sustain relationships. However, most of the research on domestic commensality is based on narratives of family food practices, often delivered by mothers, instead of observations of actual practices involving the entire household. How do family interactions and relationships enfold in the context of ordinary domestic commensality? To what extent can ordinary family meals be observed by the researcher, in particular during the Covid-19 pandemic? Our investigation is mainly based on in person observation of ordinary family food practices in ten middle classes families in Lyon (France) and individual semi-directive interviews with the family members. The fieldwork covered a range of practices and interactions, such as the anticipation and preparation of the meal, table manners and conversations and the cleanup. This paper addresses the methodological challenges of investigating ordinary family meals in a context similar to extraordinary commensality and discusses the interactional and relational aspects of domestic commensality.

RN13_T07_01 | Diversified Family Boundaries and Kinship Networks I

Beyond the boundaries of the Nuclear Family: Childless Women's Relationships with Children of Others in Lithuania

Lina Sumskaite[1], Margarita Gedvilaite-Kordusiene[2]

[1]Vilnius University, Lithuania; [2]The Institute of Sociology of the Lithuanian Centre for Social Sciences

Based on individualization theory, there is no obvious reason why childless individuals should invest in the relationships with their kin (Pollet et al. 2006). Among the few studies that include childless women's relationships with children, it was found that childless women still do parenting work (Martin & Kendig 2012). Yet the ways that childless women communicate with other people's children is still an unresearched area.

The analysis is based on 40 semi-structured qualitative interviews conducted in 2017-2018 with single and coupled women who are voluntarily and involuntarily childless. Two generations of women were interviewed: those who are still in their reproductive years (27- 49) and those who are beyond their reproductive years (50-71).

We aim to reveal the relationship between childless women and the children of these women's relatives or friends.

Most of the interviewed women were involved in taking care of their siblings' or close relatives' children during a period in their lives, and in some cases, these women became substitute parents. The feminization of care work predetermines that such childcare support is not considered as important by childless women. Some women built friendly relationships with children in professional settings: at schools, kindergartens, children choirs, foster homes etc. Only a few women avoided contact with children in their personal lives. The concept of 'community parenting' (Kessler 2007; Evans & Holland 2012), which culturally was a common practice in the beginning of the 20th century in Lithuania, allows us explaining childless women's involvement into childcare, which expands the traditional definition of parenthood.

The Meaning Of Family In Context Of Foster Care: Theoretical Perspectives.

Judite Ie, Almudena Moreno Mínguez

University of Valladolid, Spain

Contemporary studies within family sociology focus primarily on family relatedness as a socially constructed, recognising that family now take various forms and includes a whole range of permutations and living arrangements. Although, sociological theories relating to family, and intimate relationships have developed considerably the last decades, their application in research in foster care where children live apart from their biological families is limited. By using sociological theories related to family and close relationships, and by borrowing the concept of child agency from childhood studies, there is potential for creating new approaches on how to understand the lives of children currently in substitute living arrangements, and advance professional discretion and communication. This is a gap, in which the present article will contributes to and extend current scientific knowledge in family sociology. Considering the relevance of living space and family arrangements presents a new opportunity to understand families, and highlights the kind of family relationships that may be found in foster care. This study is on-going, and preliminary results will be presented.

Three-generation households in a Central and Eastern European country. The Hungarian case.

Judit Monostori

Hungarian Demographic Research Institute, Hungary

In most European countries, the proportion of three-generation households (TGH) is on a steadily declining trend. There are several reasons for this: the loss of the role of the household as an economic unit, the widening of individual earnings, the extent of the pension scheme and change in attitudes. However, in several developed countries (UK,USA,Canada) the proportion of TGHs has increased significantly recently. This phenomenon is explained by the global economic crisis of the late 2000s. The research examines how economic crises affect the proportion of TGHs in Hungary; how do these affect different strata of society? To answer these questions, we used the 1980-2016 censuses/microcensus. The research finds that in the years of the post-1990 economic crisis, the proportion of TGHs among the lower social strata increased significantly. While in other social strata the declining trend remained. As a result, social disparities increased, and TGHs were increasingly linked to the low-status group. The crisis of the late 2000s, which lasted much shorter and was much less profound than before, found no such effect.

Previous research has found that the TGHs is closely linked to demographic life events and a significant proportion of TGHs last only a short time in an individual's life cycle. Using data from Hungarian GGS the study investigates how the share, transition patterns of TGHs vary by age of the children, mother's relationship status and education attainment of parents. Our research finds that the proportion of TGHs is significantly higher among parents with small children and single-parent families and also among low-educated parents. Compared to the American results (Pilkauskas,2013) the proportion of long-term TGHs is particularly high in Hungary.

Families and Partnerships Among the Oldest Old Population in Germany – How Divers Are They?

Stefan Mauritz

University of Cologne, Germany

Background In the sociology of the family there is an ongoing debate on the pluralization of living arrangements. However, not much is known about the families and partnerships of the oldest old population. This contribution examines therefore the heterogeneity of the living arrangements among the population aged 80 years and older in the most populated German state, North Rhine-Westphalia.

Data and methods: Data is derived from the representative survey "Quality of Life and Well-Being of the Very Old in North Rhine-Westphalia" (NRW80+). The panel study was conducted from 2016 to 2020 and covers information of 1,863 individuals aged above 80 years. The prevalence and the transitions of different living arrangements are presented and the measure of entropy is calculated to quantify the amount of heterogeneity.

Results: The most prevalent living arrangements in old age are to live alone, to live with a coresidential partner, and to live together with other family members. Also living-apart-together (LAT) turned out to be a common partnership type. The heterogeneity of living arrangements is high for the age group 80-89 years but it is declining for older age groups.

Conclusions Because of the considerable heterogeneity of living arrangements, the oldest old population should be considered more adequately in the debate on the pluralization of living arrangements. Transitions from coresidential partnerships to LAT are assumed to be a result of one partner moving to a nursing home because of health reasons.

Having a Son, Having a Daughter: Shifts in Roles for Fathers' Involvement in Care.

Brunella Fiore[2], Alessandra Decataldo[1], Noemi Novello[3]

[1]University of Milano-Bicocca, Italy; [2]University of Milano-Bicocca, Italy; [3]University of Milano-Bicocca, Italy

Sociological studies deepen the transformations in male parenting, highlighting increasingly individualized paths in life courses. Less attention is paid, however, to whether these transformations involve fathers of boys or girls in a different way, despite neuroscience and social psychology have clearly shown differences in having a daughter or a son and fathers shape attitudes, behaviors, expectations on this "diversity".

The "mighty girl effect" (Borrell-Porta, Costa-Font and Philipp 2019) shows that where daughters are present, the times of fathers dedicated to domestic work and family care are lengthened, more protective attitudes and behaviors increase and, consequently, educational choices are better monitored (Sharrow et al., 2018).

This proposal presents the outcomes of a cross-sectional analysis trough the three different waves of data by the Istat Multipurpose Survey "Aspects of daily life": 1993, 2000 and 2017 (latest wave available) years. A latent class analysis towards stability and changes in fathers' care is proposed. We analyze the relationship between fathers, daughters and sons within the sampled households, focusing on care time and on the choices (also in terms of motivations and expectations) of the children's school path (starting from the attendance of the pre-primary level). In particular, we examine changes over the three decades of the fathers' care and how latent trait representing fathers' care is associated with demographic characteristics.

The Impact of Parental Leave Reform on Fathers' Leave Take-up in Luxembourg

Merve Uzunalioglu[1,2], Marie Valentova[2], Margaret O'Brien[1]

[1]University College London, UK; [2]LISER, LU

In this article, we examine the immediate impact of 2016 Parental Leave Reform in Luxembourg on first-time fathers' parental leave take-up behaviours across different type of workplaces. With the reform in 2016, Luxembourg's parental leave policy became more generous regarding payment, more flexible regarding the modalities of use, and offered a more extended coverage period. An interesting detail about the reform is that it covers not only the parents who had their children in the post-reform period but also the parents whose children under the age of six by the time of the introduction of the reform. This detail in the policy design lets us employ a quasi-experimental design. We apply propensity score matching method using social security register data provided by Luxembourg's General Inspectorate of Social Security (IGSS data). Our study sample comprises Luxembourg-resident first-time parents who had their children born between December 2014 and June 2015 (pre-reform) and December 2016 and June 2017 (post-reform), which makes up 775 fathers and 775 mothers. Descriptive numbers show a sharp increase for fathers' parental leave take-up in the post-reform period. Our preliminary estimations results indicate some 17 per cent increase in parental leave take-up among fathers who had their first child in the post-reform period compared to fathers in the pre-reform group. Looking at parental leave rich households, where both parents are eligible for the leave, we find that partners' characteristics play an essential role in this group of fathers' parental leave take-up more strongly than their workplace characteristics.

Families with Stay-at-home Fathers in Hungary: An Alternative for Mitigation of Parents' Work-life Conflict

Éva Sztáray Kézdy, Zsófia Drjenovszky

Károli Gáspár University of the Reformed Church in Hungary, Hungary

Work-life conflict of parents with young children has long been a topic of interest to scholars, but for a long time it was considered rather a female issue. In recent times, in parallel with changing family roles more and more researchers are dealing with the dilemma of the work-life balance for fathers (e.g. Hobson & Fahlén 2009, Brandth & Kvande 2019, Duckworth & Buzzanell 2009), and increasing attention is being paid also to stay-at-home fathers (e.g. Kramer et al. 2015, Chesley 2011). However, despite the fact, that complicated coordination between career and family life affects the family dynamics, there has been a lack of research on work-life-conflict from the respect of the relationship between both parents' attitude towards family roles, work, and their labour market situation. With our presentation we are filling this gap by answering the question to what extent can involved fatherhood mitigate the work-life conflict of both parents. In our qualitative research, based on 31 semi-structured in-depth interviews with Hungarian stay-at-home fathers and questionnaires completed by the mothers, we focus on a special group of families where the father actually stayed at home with the child(ren) while the mother had a paid job. Analysing the data, we set up a typology of stay-at-home father families of four characteristic family patterns on the basis of the evaluation of both parents' work-life balance. Furthermore, we found, that balanced sharing of domestic works also helps reducing the WLC of the examined families.

Fathers On 2-Months' Parental Leave – A Sound Or An Insane Idea? Exploration Of The EU Directive ("Work-Life-Balance") Perception And Impact On Polish Families.

Marta Magdalena Bierca

SWPS University of Social Sciences and Humanities, Poland

The paper is inspired by the UE Parliament directive that obliges EU members to introduce by 2022 minimum of two months of non-transferable parental leave for fathers. For now, only 13% of Polish parents heard about the directive (IQS; 2020), and parental leave is perceived as attributed to women (only 1% of fathers took it in 2019). Even if the family and gender pattern in Poland is subjected to ongoing sociocultural change and move towards egalitarian, post-materialistic values (Inglehart 1977), Polish family remains traditional on the level of practices. Moreover, the COVID-19 lockdown strengthened traditional division of household chores (IRCenter 09.2020).

The author poses a question: is Polish family ready for the EU directive? How will that affect Polish families?

During the presentation, the awareness and perception of the EU directive in will be analyzed. The focus will be put on the key benefits as well as drawbacks that the directive may bring. Due to a qualitative perspective, the author will present main fears and hopes attributed to the experience of 2-month parental leave for fathers. Taking the pandemic context in consideration, the author will explore if, and how, the COVID-19 experience impacts the perception of family roles, caregiving responsibility, as well as openness to take on parental leave by fathers.

In consequence, the author will deliberate if the EU directive would be an engine to promote equality in the longer perspective, or rather a challenge for Polish families which may see a shift towards conservative notion as more valuable.

RN13_T07_03 | Family Planning, Fertility, and Reproductive Technologies II

Partnership Norms Towards Assisted Reproduction in Hungary

Judit Takacs[1], Ivett Szalma[1,2]

[1]Centre for Social Sciences, Hungarian Academy of Sciences Centre of Excellence, Hungary; 2Corvinus University of Budapest

We will examine the general attitudes of heterosexual men and women between the ages of 20 and 35 to assisted reproduction technologies (ART) as well as their partnership norms related to accessing ART.

This issue is a relevant topic in Hungary because several public policy measures have recently been adopted that may affect their use (as of February 1, 2020, six fertility clinics were nationalized, and from July 1, 2020, not only are assisted reproductive treatments freely available, but also examinations and medicines have become free in Hungary). On the other hand, the Hungarian government has just introduced restrictions on adoption by single persons in order to exclude gay men and lesbian women from the adoption process. However, single women including lesbians have access to ART. To better understand how young men and women think about the links between parenting and partnership forms we conducted eight focus group discussions among young men and women (n=50).

The preliminary results show that there is an overall positive attitude to assisted reproduction. Regarding partnerships norms we found that there is a debate among the focus group participants concerning whether or not same-sex couples should have access to ART. One of the results is that young people admit that they do not have sufficient information about this topic, and they would like to learn more about it.

Determinants of Self Induced Abortion among Married Women in Ekiti State, Nigeria.

Beatrice Damilola Adeoye1, Adeyemi Ezekiel Odedokun2, Sarafa Babatunde Shittu3, Anthony Adeyemi Adebayo4

1Department of Sociology, Federal University Oye- Ekiti, Ekiti State, Nigeria, Nigeria; 2Department of Sociology, Federal University Oye- Ekiti, Ekiti State, Nigeria, Nigeria; 3Department of Demography and Social Statistics, Federal University Oye- Ekiti, Ekiti State, Nigeria, Nigeria; 4Department of Sociology, Federal University Oye- Ekiti, Ekiti State, Nigeria, Nigeria

Social-culturally African society frowns at the practice of induced abortion and It is a fact that abortion is illegal in Nigeria. It's a concern that in-spite of availability of contraceptive services, quite a number of married and un-married women practice abortion. The study administered open-ended questionnaire on 240 married women and 20 IDIs on 20 female married nurses from Teaching Hospital. Findings revealed that, high level of awareness and availability of contraceptives in the study area. Majority (74.6%) of respondents never used any modern family planning method, 46.2% had practiced abortion at a time or the other. Some of the determinants factors discover are misconceptions, believes and perception that are rooted in social and cultural value. Recommendation based on the findings: remedy for mortality related to abortion should go beyond reproductive health awareness; social cultural factors must be address and there is need for active involvement of men (husbands) in family planning programs and implementation.
Key words: Induced abortion, Maternal health, Unintended/Unplanned pregnancy, Perception.

International Surrogacy During a Pandemic: Who is the Victim?

Jakub Valc[1], Hana Konečná[2]

[1]Masaryk University, Czech Republic; [2]University of South Bohemia, Czech Republic

Introduction: International surrogacy is an increasingly common way to have a child. As this is a largely uncontrolled business or market, it is not possible to determine the number of procedures per year, but we can talk even about tens of thousands. The procedure is often associated with huge problems, the most serious of them is the ex post registration of the child in the applicant's home country.
The unexpected Covid-19 pandemic brought a new problem based on sudden travel restrictions prevented applicants from personal contact with a pregnant surrogate mother, from participating in birth of a child and from taking the child into their own care, including subsequent return to the applicants' home country. Pictures of babies "imprisoned" in the home countries of surrogate mothers have appeared in the world media.
The presentation of the situation was very interesting. Our paper seeks answers to the questions of who is described as a victim in this situation and the reasons why and who calls her that.
Methods: Discursive analysis of available media texts in Czech, English and German, published in 2020.
Results: We identified the following main groups of victims, in our analysis, so far: applicants, child, surrogate mother. The description of the victim is usually very emotional and who is identified as the victim is very much related to the focus of the commentator.
Keywords: international surrogacy, pandemic, victim, media

Why We Need Better Studies Of Help-seeking For Infertility – A Review Of Existing Studies And Their Conceptual And Methodological Problems

Jasmin Passet-Wittig[1], Arthur L. Greil[2]

[1]Federal Institute for Population Research, Germany; [2]Alfred University, NY, USA

Medically assisted reproduction is now broadly available in developed countries and its use keeps increasing. However, many people who can be considered eligible for treatment do not use it. Despite the fact that a considerable number of papers have been published in this highly interdisciplinary field of research, we do not have a systematic understanding of who does and who does not seek medical help for infertility and why. This study aims to provide a summary of existing quantitative studies on the determinants of medical help-seeking, discuss core conceptual and methodological problems and thus offer a guide for future research on this topic. This narrative reviews includes 39 studies published between 1990 and 2019. Determinants are assigned to five categories: socio-demographic variables, socio-economic factors, reproductive history, attitudes, and psychological factors. While there has been considerable research on socio-demographic and socio-economic factors, relatively little is known about personal values and attitudes and psychological characteristics. As they seem to be important, further research is needed. Findings from different studies are difficult to compare because of differing research designs and analysis methods. Importantly, the central concepts "infertility" and "help-seeking" are not clearly defined. Most studies completely lack an underlying theoretical foundation. We propose to treat infertility related action as fertility behavior as it aims at realizing a desire for a child. More research is needed that treats help-seeking as a couple phenomenon and considers different stages of help-seeking. Moreover, studies should consider how macro-level structures relate to individual decision-making on seeking medical help.

Examining Transnational Care Circulation Trajectories Within Immobilizing Regimes of Migration: Implications for Proximate Care

Laura Merla[1], Majella Kilkey[2], Loretta Baldassar[3]

[1]UCLouvain, Belgium; [2]UoSheffield, UK; [3]UWA, Australia

In this paper we argue that the current political context of restrictionist migration policies is dramatically affecting people's capacity to cross borders to engage in proximate care with their relatives, which is a central, yet often overlooked, feature of transnational care practices. We examine how the wider context of temporality, restrictive mobility, and heightened uncertainty about the future affect people's ability to be mobile and to move back and forth for caregiving. In examining the wellbeing effects of such restrictions, we highlight their variable impact depending on factors such as socio-economic positioning, life-course stage and health. The first sections of the paper present the care circulation framework and the particular meaning and function of proximate forms of care, as well as the main categories of care-related mobility that support this. We illustrate the main dynamics and challenges faced by transnational family members who engage in these care-related mobilities, through three vignettes involving care circulation between India and the UK, China and Australia, and Morocco and Belgium. In the final section, we discuss our vignettes in relation to the political, physical, social and time dimensions of current regimes of mobility that impact on care-related mobilities. We argue that the regimes of mobility that currently govern care-related mobilities are best understood as 'immobilizing' regimes with important and undervalued implications for ontological security and wellbeing. We conclude with a discussion of how the covid-19 pandemic exacerbates this situation.

552

Intergenerational Support Structures. The case of Romanian Transnational Families

Ionut Foldes

Babes-Bolyai University, Romania

This paper describes the latent categories of intergenerational support among Romanian transnational families. Theoretical perspectives such as intergenerational solidarity, the circulation of care and copresence from a distance provide insightful knowledge about why and how transnational families work. The case of Romania is an excellent field of study thanks to the increased outmigration of Romanians towards the developed world. Moreover, previous findings highlight the fact that migration from Romania is highly family-oriented. Based on nation-wide survey data, this work stresses the point that migrant adult children and also non-migrant elderly parents are actively involved in maintaining a family life across borders, comparable to what it was before migration. It is illustrated how care circulates transnationally by distinguishing between upward solidarity, downward solidarity and solidarity without practical support. Finally, this paper highlights how family history and individual structures of needs and opportunities describe these three latent structures of family practices in a transnational setting.

The Division Of Housework Within Interethnic Couples Of Chinese Women And British Men Living In The UK

Hong Yang

The University of Edinburgh, United Kingdom

Family-based chain migration of female Chinese to UK has been highly gendered and socially accepted. However, little research exists on this growing phenomenon. The study seeks to explore power and intimacy of couples between Chinses women and British men through the lens of housework division, as domesticity offers a unique site for examining the roles of gender, ethnicity and their interaction play in the interethnic household. In-depth semi-structured interview is adopted with 16 couples to explore how interethnic couples perceive and coordinate household labour and gender hierarchy. The study has found that household chores are not mere blocks of tasks that could be clearly divided based on traditional gender norms. Performing ethnicity, for example maintaining ethnic identities and the sense of belonging through cooking, is one of driving reasons why some foreign wives show a clear propensity for domesticity. Besides, rather than harshly demanding wives to look after home well, many husbands nowadays are tend to have more flexible attitudes towards gender-role preferences and actively take up traditionally feminine chores. For some couples who find it difficult to share household chores fairly, outsource is a popular option to safeguard autonomy and avoid potential family tension. Furthermore, high standard of cleanness has long been linked to female gender roles. However, the results of the study indicate that the pursuit of tidiness/ hygiene can be cultural specific, due to the fact that different agents of socialisation have influences on how a person, regardless male or female, views tidiness and hygiene.

Changes in Intergenerational Relations During the Transition to Motherhood: A Longitudinal Study of Chinese Migrant Mothers-to-be Living in the Netherlands Under COVID-19 Pandemic

Haiyue Shan

Vrije University Amsterdam, Netherlands, The

The COVID-19 pandemic has changed family life and relationships globally as well as affected the perceived stress among couples, especially during the transition to parenthood. The fear and anxiety of pregnancy have impacted on the marital relationships, and low mood and loneliness as they missed contact with friends and family were often reported. Despite geographic separation in transnational families, a feeling of collective unity of "familyhood" is urgently needed. But how do the young parents-to-be sustain the connectedness and information exchange with family in the topic of parenting and childrearing in distance? This article is based a longitudinal study following three Chinese migrant women living in the Netherland from their three-to-four-month pregnancy till four-month postpartum

stage. Each participant was interviewed through digital communication Apps (WeChat and WhatsApp) from April to Dec 2020. The communication was in form of texting and voice recording. This study focuses on how the Chinese mothers-to-be in transnational families manage their intergenerational interactions with family member living in China about motherhood facing the restrictions under pandemic. It also highlights how social isolation and lack of family support reshape the expectations of motherhood. Meanwhile, to some extent the potential conflicts based on different values in parenting have become mild and relieved due to the long distance. "Absence makes the heart grow fonder" was expressed by all three participants that reflected the attitude towards a "new status" of Chinese family relations.

RN13_T08_01 | Family Patterns, Values, and Practices III

Disclosing Siblings' Relationships from Everyday Life and Family Events

Andreia Barbas[1], Sílvia Portugal[2]

[1]Faculty of Economics and Centre for Social Studies - University of Coimbra, Portugal; [2]Faculty of Economics and Centre for Social Studies - University of Coimbra, Portugal

This paper explores the full and half-siblings' relationships, aiming to understand them through their diversity and temporality, and revealing them as a complex object. How siblings build their relationships? How they display these relationships inside and outside the family? Looking through the everydayness of these relationships reveals siblings' relationships constituted by activities, actions, and ties, which take on meaning at a moment in time and are (re)made over time.

The paper is based on qualitative research, that took place in Portugal, in 2018-2019, conducting 69 life story in-depth interviews. Photo elicitation was used during the interview. The interviews looked up to: a) individual and family trajectories;

b) narratives about family and relationships; c) temporalities, "family events" and traditions; d) everydayness: routines, domestic work, leisure, communication; and e) characteristics of siblings' relationships when comparing with others (for example,

parenting or friendship). All members of each sibling group were interviewed, and participants were selected by several criteria: age of the mother; type of family; size and gender of a sibling group; region and educational level.

This communication focuses on two variables that are crucial to understanding siblings' relationships: space and time. Firstly, cohabitation is the main feature – sharing the same space is a way of knowing each other and bonding. Secondly, space and time crossover allow to understand lifelong changes and discloses different levels of intimacy.

Lastly, events are important to siblings' relationships and to the definition of family identity, strengthen ties, and are crucial to legitimizing these relationships.

We argue that "doing" and "displaying" should be observed in siblings' relationships in two levels of interaction in this space-time crossover: daily contexts and extraordinary events.

Silence As A Family Practice: How Descendants Experience Parental Silence About Their Past. A Qualitative Study In The Context Of Compulsory Social Measures And Placements In Switzerland

554

Nadine Gautschi

Berner Fachhochschule, Switzerland

As part of the National Research Program NRP76, this paper investigates compulsory social measures and placements (CSMP) in Switzerland and tackles the perspective of the relevance of these measures to the present and the future. As part of the state welfare and guardianship system, Swiss authorities carried out measures against minors and adults according to cantonal practices and with practically non-existent procedural rights. CSMP caused considerable trauma to those affected and was considered a taboo subject in Switzerland until recently.

This contribution presents empirical results of a study that asks how the social practice of silence on a societal level about CSMP in Switzerland affects families, and how structures of silence are (re-)produced in families (Völter et al., 2005).

Drawing on biographical interviews, Grounded Theory Methodology was used to reconstruct how descendants

experienced their parents' silence regarding their experiences with CSMP.

The results show that the hidden parental past is paradoxically made present and absent at the same time in familial interactional processes. The presence and absence are manifested on the one hand in fragmented verbal forms of communication structured by avoidance, and through nonverbal forms conceptualized as "experiences of silent presence." These include, among other things, feelings of the offspring such as anxiety and compassion, and parental behaviors that are interpreted by the offspring in relation to the silenced past. It becomes clear that parental silence and its consequences can be accompanied by specific stresses for the offspring that must be endured and dealt with. Implications for research are discussed.

Keywords: Family practice / silence / compulsory social measures and placements / Switzerland / Grounded Theory

Family Secrets: Serendipity, Methods And Results Of Told Intimacy

Magda Nico, Maria Silva, Ana Caetano

Cies - ISCTE IUL, Portugal

Secrets are due to be studied sociologically. Whether they are individual or family secrets, they perform important social roles in the dynamics between people and families. Secrets are observatories of the internal dynamics of families, providing rich material for the understanding of family relations and the way they are linked synchronically and diachronically, as well as of the processes of individual management of intimacy, self-presentation and maintenance of the coherency of the biography. Secrets are also observatories of external dynamics. They reveal where the social rules, norms and values in context of the times, disclosing the different power relations of the social fabric in which families are/were inserted when the secrets were "generated" or maintained.

In the scope of the project "Linked Lives: a mixed, longitudinal and multilevel approach to the course of family life", 15 family histories were collected (with life calendars, genealogical trees and semi-structured biographical interviews). Serendipity gave way to the relevance of the family secrets, their natures, impacts and dynamics. Secrets were tackled as units of analysis, in order to protect both families and their secrets. In this communication we present an overview of types, themes, durations, functions, timings and consequences

of the secrets of and within families, always taking into account the gender and social stratification that lays beneath. We present a panoramic and critical observation on the diversity, complexity and relevance of secrets and taboos within family studies.

RN13_T08_02 | Work-Family Balance, Work-Family Conflicts, Parental Leave V

Motherhood Penalty: Beyond Bias? Understanding the Puzzle of Mothers' Career Penalty in 'Post-Biased Societies'

Sigtona Halrynjo[1], Marte Mangset[2]

[1]Institute for Social Research / Institutt for samfunnsforskning, Norway; [2]Oslo Metropolitan University

This paper present a critical review of perspectives on 'motherhood penalty' based on a systematic comparison of research on gender-gaps in wages, careers and hiring from different countries. Our review reveals an intriguing puzzle: While US and European studies of equal CVs, but varying gender and parental status, continue to display gender-bias disfavoring mothers, recent experiments conducted in the Nordics do not show such bias. Presented with the same CV at the same age, mothers are rather preferred than disfavored. Thus, the 'idea of motherhood' may no longer be interpreted as a problem in Nordics. Nevertheless, 'actual motherhood' still present itself as a major cause of gender-gaps in wages and careers.

To understand the puzzle of continued motherhood penalty in 'post-biased societies', we argue the need to move beyond the study of discrimination, perceptions, and preferences and develop our understandings of the structural and cultural conditions that shapes mothers and fathers opportunities to participate, achieve and build equal CVs – at the same time as they are building a family. The many policies of the gender-equal welfare states have transformed work- and family-life in the Nordics in ways that reduce biased perceptions, short-term motherhood penalty and increase gender-equal ideals. Still, recent transformations in the direction of

555

more individualized competition may create new challenges of gender-biased structures and outcome – requiring new research and new responses in order to achieve and sustain gender-equality in work and family life.

Shared Parenting In Germany - Rewriting The Norms And Values Of Modern Parenting After Separation

Nina Weimann-Sandig

University of Applied Sciences for Social Work, Education and Nursing, Germany

Shared parenting as a new model of joint custody after divorce or separation has been interna-tionally discussed as a new form of family live for several years now. Whereas other countries have already legally fixed shared parenting as normative model, the German family policy and jurisdiction seems to be still dominated by the traditional residential custody. Moreover, the model of shared parenting has raised controversial discussions of different lobby groups in Germany. The presented mixed-methods study examines the perceptions of parents and children practicing shared parenting in Germany. It especially analyzes the different perceptions of fathers and mothers towards shared parenting and gives emphasize to the well-being of teenagers being raised in shared parenting models. By examining the theoretical backgrounds of modern family sociology the paper discusses the challenges and chances, families are facing when deciding to do shared parenting after separation.

Early Motherhood as an Alternative Career? The Role of Social Policies in Shaping the Effect of Employment Status and Education on Fertility

Anna Gerlach

Goethe University Frankfurt, Germany

The mean age at first birth has risen significantly in Europe, but less so for low-educated women, especially if they are currently without employment. Often, early motherhood has a negative long-term impact on subsequent careers. However, the reproductive polarization differs across welfare regimes. Therefore, this paper examines the effect of education and employment status on the risk of having a first child for young women aged 18 to 26. I explore whether they postpone childbearing until they find a stable position or whether they choose motherhood as an alternative career and how this decision is shaped by different social policies. I utilize panel data for 28 European countries from the EU-SILC and the SOEP and combine it with information on social policies from Eurostat and the OECD.

Using discrete event history models, I show that social policies, which ease the compatibility of family and employment, such as extensive childcare availability and adequately long paid maternity leave, are negatively correlated with the birth risk for low-educated and unemployed or inactive young women. This supports the hypothesis that for women with poor labour market prospects, childbearing and employment are competing options. In contrast, family and unemployment benefits that mitigate the income effect of unemployment have a positive effect on fertility for women with fewer career options. Comparisons with older age groups show that these effects are specific to younger women, supporting the assumption that social policies have a distinct effect on women who have yet to establish themselves in the labour market.

The Influence of Parental Divorce on Children's Life Course in Japan

Nobutaka Fukuda

Tohoku University, Japan

[Objective] This study aims to investigate the influence of parental divorce on children's life course in Japan. Like other developed countries, the number of marital disruptions has increased in Japan over the past decades. While many studies have been hitherto conducted on the relation between parental marital disruption and children's life-course in Europe, there has been little research concerning the impact of parental divorce on children's life-course in Japan. The paper attempts to address the influence of parents' divorce on their childrens' living natal home, cohabitation and marriage from an international comparative persective.

[Data & Method] Data come from the Japanese Generations and Gender Survey (JGGS). This is a nationwide panel survey conducted from 2004 until 2013. The targeted population is Japanese men and women between ages 20 and 45. We selected male and female respondents over age 20 at the time of the first wave of JGGS. Event-history analysis was used to examine the influence of parental divorce on children's living home, cohabitation and marriage. Moreover, socio-economic and demographic variables were also included in our analytical model as independent variables.

[Results] First, results showed that parental divorce hardly increased the risk of children's leaving natal home. Second, the probability of entering a consensual union was greater for children who experienced parental divorce than those who did not experienced. Third, parents' divorce hardly decreased the hazard rate of marriage.

[Conclusion] As far as the present study shows, parental divorce increases a risk of cohabitation in Japan. Hence, while parental divorce tends to promote children to entering a consensual union, marital breakup has no bearing on home-leaving.

Keywords: Parental Divorce, Children's Life Course, Japan

When Parents Scream and Shout – Consequences of Inter-Parental Conflict for Children's Social Well-Being

Stephanie Hess

Otto-Von-Guericke University Magdeburg, Germany

The familial context influences children's social behavior and social well-being (CSWB) like no other sphere: Children learn their mode of communication and basics in interpersonal behavior primarily in the parental household. Inter-parental conflict (IPC) compromises family life and poses emotional strain for all family members. Consequently, children might not only suffer from conflict-stricken parental interactions but potentially suffer from harsher parenting behavior following those conflicts. A number of cross-sectional studies show that IPC is associated with child behavior and emotional problems. Drawing upon the Emotional Security Theory, this study explores longitudinal associations between changes in IPC and CSWB and whether parenting behavior mediates this association.

For the analyses I use data from waves 8-11 of the German Family Panel (pairfam) to perform fixed-effects regressions and mediation analyses. The data includes a total of 1,019 children (3,182 observations) between the ages of 7 and 17 who report on IPC, parenting behavior and their own prosocial behavior and peer problems.

The analyses reveal that increased IPC is associated with decreased emotional warmth and increased harsh verbal parenting behavior. Further, increased IPC is related to increased peer problems and decreased prosocial behavior in children. Lastly, the results of the performed mediation analyses indicate that the effect of IPC on CSWB is indeed transmitted via parenting behavior.

The results indicate that increased IPC leads to less warm parenting and harsher verbal parenting, which ultimately reduces CSWB. Consequently, it is likely that changes in IPC are directly and indirectly transferred to their children's social behavior and ultimately to children's social well-being.

Keywords: inter-parental conflict, peer-problems, prosocial behavior, parenting behavior, social well-being

Family Breakdown And Joint Custody From Children's Perspective.

Ignacio De Pouplana, Lidia Montoya

Universitat de Barcelona, Spain

How does joint custody affect the well-being of the children? Ultimately, the children are the most affected from the family breakdown so ¿why not ask them how they felt? So far, most research work on this issue in Spain has been made through the perspective of legal operators as well as parents. In order to gain a better insight into the implications of joint custody from the child's perspective, semi-structured interviews were made to ten young people from ages of eighteen to twenty years old from Barcelona. It is important to emphasize that all the participants belong to heterosexual dual-earner families. Our research allows us to gain a deeper understanding of teenagers' perceptions about this type of custody, that supplement previous research using indicators from the Health Behaviour of School-aged Children 2014 Survey. Therefore, getting an innovative perspective will allow us to know how they are enduring this situation from a qualitative longitudinal perspective.

We were surprised to find that each parent provides a certain set of needs for their children. Moreover, it is important to remark that in exclusive custody the parent that owns the custody usually finds it difficult to acquire a healthy work-life balance, as it finds him or herself with a huge amount of both labour and household work. Joint custody seems to satisfy wider needs of the children, or in other words, prevent that the children feel deprived from material and psychological well-being, according to our interviews.

Being a Bonus-Grandchild

Linn Maria Alenius Wallin

Lund University, Sweden

Since the 1970s, the number of couple separations have increased significantly, with many reconstituted families as a result. People of all ages separate and meet new partners, which increases the possibilities of bonus-grandparent/ bonus-grandchild relations to emerge during a lifetime. As many people periodically live in re-shaped families, a bonus-relation can be considered as a relationship that can occur suddenly, be interrupted, cut off, or become life-long. In this way, bonus-relations offer a variation of connectedness. In the unselected family, the bonus-grandparent/bonus-grandchild relation can go from very close intimacy to barely any contact at all. In this paper I explore how bonus-grandchildren define and understand closeness, and intimacy in their bonus-grandparent relations:

How do children view their relationships with bonus-grandparents, and what is the meaning of these relationships in children's daily lives?

In the empiric sample, there are children who has up to 16 grandparent and bonus-grandparent relations (due to parents and/or grandparents re-coupling several times), while for other children, the bonus-grandparent is the only older relative they have. From the perspective of the children, the closeness and importance of the relationship depends on the doings of care and intimacy performed by the bonus-grandparent, where being treated the same or differently from an eventual biological grandchild is key.

Empirical data (biographical interviews, diary interviews, lifelines, drawing exercises with grandchildren) from bonus-grandparents, and bonus-grandchildren has been gathered. So far, more than 20 individuals have been interviewed, several in repeated encounters.

Keywords: Bonus-grandchildren, unchosen family, family of choice, step-grandparent, step-grandchildren

How Personal Conceptions of Family Shape Subjective Well-being? Differences in Women and Men's Family Understandings and the Effect on Subjective Wellbeing

Anna-Maija Castren, Antti Kouvo

University of Eastern Finland, Finland

Family members are highly important for individual's happiness. A wide body of research shows that support from a partner, family, and friends is connected to reports of greater subjective wellbeing (SWB). However, the way in which family is understood in many studies relies more on household composition than individuals' personal conceptions of family. This study assumes another perspective and draws on the configurational approach, where specific free-listing tools have been used to map individuals' subjective views of family. We investigate first, the differences in women and men's personal views on who belongs to their family, and second, how these views are connected to the respondents' subjective wellbeing. Our data come from a representative survey conducted in a Finnish small town (N=1965) in 2016. Besides descriptive statistics, we report marginal effects derived from regression models to study the effects of perceived family composition on SWB. The results show that while all respondents' views on their family composition were only rarely restricted to people they lived with, women included more people in their families than men and their multiple family relations were connected to a high level of wellbeing whether or not they were single or lived with a partner. In contrast, for men the high level of subjective wellbeing was connected to living with a partner, while the increase in the number of family members did not indicate higher level of wellbeing. Future research and theoretical implications of the results are discussed at the end of the paper.

Relationship Satisfaction of Couples Living in Switzerland in The Light of Couples' Residential Mobility and Network Overlap

Jacques-Antoine Gauthier[1], Gil Viry[2,4], Guillaume Drevon[3,4], Vincent Kaufmann[4], Florian Masse[4]

[1]University of Lausanne, Switzerland; [2]University of Edinburgh, UK; [3]Institute of Socio-Economic Research (Liser), Luxembourg; [4]Laboratoire de sociologie urbaine (LaSUR) EPFL, Switzerland

Network overlap, i.e. the degree to which partners share common network members, has been found to be an important characteristic of couple satisfaction. While many personal relationships are not common to both partners, having shared friends and family helps maintain an identity as a couple. However, there is little evidence about the effect of residential mobility on network overlap and on relationship satisfaction. One may hypothesize that residential mobility impacts negatively network overlap. Romantic partners who have moved to a new place from two distant regions and those where only one of them has moved to that place may share less friends and family members than couples where both partners live near to their place of birth. Couple satisfaction may also be negatively affected when the physical distance to relatives challenges traditional family roles, for example when parents live far away from grandparents. Evidence has shown that couples move sometimes closer to the woman's parents when they have children, which suggests residential strategies to facilitate childcare support from women's parents. Conversely, not being able to move closer to grandparents, may add strains on parents, especially mothers, and the conjugal bond.

Using the Swiss MOSAiCH 2019 survey data (N=2032), we construct a typology of couple's residential history. Multivariate analysis allows assessing the relationships between couples' spatial mobility patterns, the degree of their networks overlap and their conjugal satisfaction measured as a combination of self-reported general quality of the relationship, frequency of dispute and thoughts of separation. First results show that residential mobility has an influence on visits frequency, that varies according to distance and duration of residence in the region of origin, suggesting adaptive effects.

Life Satisfaction Linked to Different Independence from Parents Conditions in Romanian Emerging Adults

Sergiu Lucian Raiu[1], Maria Roth[2]

[1]Stefan cel Mare University of Suceava, Faculty of History and Geography, Romania; [2]Babes-Bolyai University, Cluj-Napoca, Faculty of Sociology and Social Work, Romania

The presentation refers to the statistical analysis of the 3rd wave of a longitudinal online survey on the transition of Romanian adolescents to adulthood. The study debuted in 2012, with a nationally representative sample (3509 final graders in high school), followed in 2014 (1509 respondents). In the 3rd wave, we tracked 854 respondents. The average age is 25.07 years, SD=0.46). Most of the young people in the initial sample are graduates of higher education: 40.5% have a bachelor's degree, 36.2% have a master's degree. There are also 13.7% who have graduated twelve classes, but without Baccalaureate. A percentage of 67.1% young adults in this sample left the parental "nest", 87.6% are employed, 60.2% are involved in a romantic relationship, 21.9% are married and 11.8% are parents. According to the conceptualization of dependency by young adults, we explored how the graduation of university studies influences employment, family formation and child bearing by gender and the life satisfaction, by "totally dependent", "partially independent" and "totally independent" young adults.

Children's Well-Being in Sole and Joint Physical Custody Families

Anja Steinbach, Lara Augustijn

University of Duisburg-Essen, Germany

Joint physical custody (JPC), a parental care arrangement in which children live with each parent about equally after separation or divorce, is an increasingly common phenomenon in many countries. This is a major shift away from the standard of sole physical custody (SPC), in which children live primarily with one parent – usually their mother – after family dissolution. Although attention to JPC by social scientists is growing, and the effects of this arrangement on children's well-being are the subject of highly ideological debates, there is currently little empirical evidence with statistical power on JPC. Using data from Family Models in Germany (FAMOD), a survey of post-separation families conducted in 2019, we investigated the asso-ciation between physical custody arrangements after separation or divorce and four dimen-sions of children's well-being: psychological, physical, social, and cognitive/educational. The results provided support for the hypothesis that children living in JPC families fare significantly better than children living in SPC families on all four dimensions of well-being. However, after controlling for a set of child, parent, and separation characteristics, as well as for the quality of family relationships, the differences between children from SPC and JPC families disappeared. In sum, the quality of family relationships was found to be more important for children's well-being than the physical custody arrangement.

Re-thinking Work-family Dynamics In Italy: an Analysis Of Promising And Innovative Practices

Isabella Crespi, Melanie Sara Palermo

University of Macerata, Dept. EHCT, Italy

The changes in the regulations concerning the work-family balance system in Italy over the last 20 years result from a critical reflection carried out at the national level. The main aim is to allow the companies concerned to experiment with positive actions to transform critical organisational issues into opportunities for growth and development, meeting both employees and managers' needs with family care responsibilities without underestimating productivity or company performance. Over time, Italian companies have paid more attention to the activation of innovative measures in reconciliation, experimenting with new formulas instead of focusing only on the parental leave mechanism and thus going beyond the obligations established by law and the national labour contract. In this contribution, we present

some of the possible actions to be implemented – using case-study methodology - at the level of both work flexibility, smart working and new service opportunities. We analyse two specific case studies that highlight positive experiences and innovations in the mutual enrichment perspective between families and companies. Results show that different forms of family-friendly practices and various type of company welfare can be introduced in companies. These formulas allow personalisation of reconciliation with positive consequences on people's quality of life inside and outside the workplace, and, in the long run, companies can see reduced absenteeism rates for family reasons. To promote this kind of contributions, there must be adequate communication of their use in the company and a reliable territorial network for their activation and dissemination. Besides, real family-work services could be set up in the workplace to be offered to staff, such as specialist advice, guidance, and information provision.

The Impact of Paternity Leave Compared to Unemployment on Child Care and Housework Distribution in Spain

Gerardo Meil[1], Jesús Rogero-García[1], Pedro Romero-Balsas[1], Vicente Díaz-Gandasegui[2], Daphne Muntañola-Saura[3]

[1]Universidad Autónoma de Madrid, Spain; [2]Universidad Carlos III, Spain; [3]Universidad Autónoma de Barcelona, Spain

There is growing evidence that paternity leave has a socializing effect on childcare. However, it is has not been identified yet its impact in forthcoming stages and neither if other situations, such as unemployment, have a similar influence in paternal involvement in childcare. Based on the Fertility Survey 2018, this paper aims to (1) analyze the relationship between the duration of paternity leave and father's involvement in care and domestic activities in the short, medium and long term; and (2) examine the association between unemployment and paternal involvement in these activities. The results show that prolonged leaves are related to a greater dedication of time to care activities and housework, although only in the former the effect is maintained in the long term. Regarding unemployed fathers, these individuals show more involvement in childcare during the first year, but the effect disappears later and there is no significant relationship with housework. In this sense, time availability motivated by unemployment does not

seem to transform gender roles in the same way as it is produced by the use of paternity leave.

On The Treadmil of Pandemic Everyday Life:Work-Life Boundary Dynamics In Three Types of Organizations in Poland

Dorota Mroczkowska, Monika Frackowiak-Sochanska, Malgorzata Kubacka

Adam Mickiewicz University, Poznan, Poland

Our presentations aims to examine the subject of boundary work and management in the pandemic, taking into account the employment mode and family status of the researched participants. We present (1) changes the coronavirus pandemic has caused in lives of men and women as well as (2) responses and adjustments to these changes, including undertaken institutional and non-institutional alleviating measures, through the lens of the linkages between work and non-work aspects of their lives.

We will discuss implemented border management strategies undertaken during the pandemic by researched participants: the strategy of rational regulation of work-life interface as well as various strategies of contesting and blurring work-life boundaries.

Our presentation is based on research project (etnographic interpretive paradigm) during which 12 people (6 women and 6 men) were examined. The respondents were selected on the basis of quota sampling with the type of organisation (family micro-businesses, non-governmental organisations which work on project base mode, and corporations) and their family situations (families with dependent relatives and without them). Participants were asked (1) to keep a diary for one week, (2) to provide a story completion, (3) to take part in the In-Depth Interview.

Working from Home and Work-family Conflict: Longitudinal Evidence from Australia

Inga Laß[1], Mark Wooden[2]

[1]Federal Institute for Population Research (BiB), Germany; [2]University of Melbourne

About one in four Australians regularly worked from home in 2018, and this share has since further increased due to the Covid-19 pandemic. Yet, despite numerous studies, there is no agreement in the literature on whether working from home (WFH) produces good or bad work-life outcomes. On the one hand, home workers are saving on commuting time and often have increased schedule flexibility. On the other hand, WFH blurs the boundaries between working time and leisure, increasing the risk of overtime hours and negative mood spillover from work to family.

Against this background, this paper investigates the effects of WFH on work-family conflict (WFC) among Australian parents, using longitudinal data from the Household, Income and Labour Dynamics in Australia (HILDA) Survey (covering 2001 to 2019). We measure WFC by a four-item scale reflecting how much workers' job demands interfere with their parenting and family role. An example is: "Because of the requirements of my job, I miss out on home or family activities that I would prefer to participate in". Our study goes beyond previous research through its specific focus on parents, use of longitudinal methods, and an investigation of the mediators linking WFH to WFC.

Preliminary results show that regular WFH is associated with reduced WFC for women, whereas there is no general effect for men. Further, WFC decreases with the share of total working hours worked from home. Mediator analysis suggest the work-family benefits of WFH are mainly due to increased schedule control.

Sickness as a Family Transition Challenging the Interplay Between Family and Work

Sara Mazzucchelli, Maria Letizia Bosoni, Letizia Medina

Catholic University of Milan, Italy

Today family transitions become increasingly challenging and, even if often invisible, they inevitably impact on professional life.

This topic was dealt within a broader quanti-qualitative research project - "Ageless Talents" (2017-2018) funded by Valore D - carried out in Italy on workers aged between 50 and 69: 73% of interviewed reports an event that significantly changed one's life, in particular divorce, loss of a loved one and illness.

Through focus group we focused on a challenging transition - managing illness in the workplace - aimed at understanding and deepening personal experiences and motivations of different categories of workers: manager, executive, office worker, manual worker.

First of all, the importance of narrating and reconstructing the continuity of one's life story emerges. Companies are faced with very different situations (such as tumors, neurodegenerative and autoimmune diseases ...) that can directly touch the worker or one of his family members. In both cases we can distinguish two temporalities or phases: an emergency phase- close to the illness event and requiring immediate coping and a detachment from work - and a chronicity phase- at a distance from the event, with more dilated and blurred temporal boundaries where the worker can resume work even with some precautions and modulations. Work allows continuity, despite the disease, although specific measures are needed to allow people to rebalance their personal life spheres.

Thus, the research project gave us back the urgency and importance of giving voice to topics that usually struggle to find a suitable time, space and interlocutor.

562

Life Course Generational Placements in the Family System and Individuals' Well-Being and Health in Later Life

Bettina Hünteler, Karsten Hank

University of Cologne, Germany

Previous research has demonstrated that intergenerational family transitions, like entering (grand-) parenthood and losing a parent, are closely related to short-term fluctuations but also long-term consequences for subjective well-being and health. Following the family life course perspective and understanding the family as a system, this paper uses generational placement trajectories, i.e., sets of (multiple) family transitions and their timing across individual life courses, to predict well-being and health in later life. We assume that the interplay of different transitions influences later-life outcomes holistically.

Based on individuals aged 60-75 from the German Study of Ageing, sequence and cluster analysis identified six typical patterns of generational placement trajectories ranging from patterns with multiple transitions early in life to more stable clusters with fewer transitions later. Subsequently, regression models revealed that – irrespective of the timing of filial bereavement – individuals experiencing clusters without children were least and with earlier (grand-)parenthood most satisfied with life. Overall, earlier parental death was associated with lower functional and physical health. However, (later) parenthood weakened the relationship to functional health. Members of the most common pattern, the 3-generation-family with later transitions, exhibited best functional health. Childless individuals who lost their parents late reported best physical health while childless with early filial bereavement reported the worst. Depressive symptoms were not related to the trajectories.

The current analysis highlights the importance of considering the interplay of multiple family transitions across the life course to better understand how the family as a system affects overall well-being and health far into later life.

Multiple Social Roles In Early Adulthood And Later Mental Health: Gender Differences In Different Labour Market Contexts

Miriam Engels[1], Morten Wahrendorf[1], Christian Deindl[2]

[1]Heinrich-Heine-University Düsseldorf, Germany; [2]TU Dortmund, Germany

Work and family roles entail divergent responsibilities, which can be a source of conflict, especially in young adulthood – the so-called "rush-hour" of life. Combining multiple social roles can result in stress or strain but it can also function as a resource for later mental health across the life course. The aim of this study is to investigate combined employment, parenthood and partnership trajectories of men and women during early adulthood and to examine the relationship of these trajectories with depressive symptoms at older age.

We used harmonised data from the Survey of Health, Ageing and Retirement in Europe (SHARE) and the English Longitudinal Study of Ageing (ELSA) with retrospective information on employment, partnerships and parenthood histories between age 25 and 40 for men and women from 22 European countries (n=42,340). We applied sequence analysis and Ward's linkage clustering to group trajectories into clusters. We then used multilevel models to analyse the links between combined employment and family roles and later mental health in different historical labour market contexts.

Men and women with fewer social roles (e.g. partnered workers without children) reported higher levels of depression than those who combined work, partnership and parenthood between age 25 and 40. Results for women differ between countries, depending on the female employment rates around the time of labour market entry.

563

Disability and Gender in the Formation of Couples. Revisiting Some Classic Sociological Processes.

Célia Bouchet

OSC (Sciences Po-CNRS), LIEPP (Sciences Po), France

While the sociodemographic determinants of couple formation have been well established, the way in which disability enters into these mechanisms has been little explored, and even less in a gender-sensitive way. Yet, for people with childhood-onset impairments, difficulties in accessing conjugal life (intimate cohabiting relationships) have been documented. Based on 37 interviews conducted between December 2019 and June 2020 in France with people who have grown up with a visual impairment (20, including 12 women, 8 men) or with specific learning difficulties (17, including 8 women, 7 men, 2 non-binary individuals), we find that, just like social class or age, disability shapes the attitudes towards couple life, the nature of physical and digital venues where partners meet, and the matching process. Moreover, within the disabled population itself, some variations in the schemes are to be noticed, depending on the visibility of the condition, the nature of the limitations, and the familiary with institutions in the disability sector. Furthermore, although the heterosexual respondents seem to align themselves with certain classic male and female standards of conjugality (restrictions on partnering induced by pre-existing informal help work among women, masculine and masculine norms of self-presentation, injunction to male paid work), two dimensions suggest more complex interrelationships between disability and gender: exposure to violence is framed either from a gender or a disability perspective, but never cumulatively, as multiple affiliations make each other invisible ; and stakes of financial and human dependence are framed by respondents of all genders as a mere disability issue.

RN13_T10_01 | Multi-local, Multicultural, and Transnational Families III

Migration Decisions, Gender Roles, and Comparative Advantages – A Cross National Analysis

Veronika V. Eberharter

University of Innsbruck, Austria

Economically motivated family location moves are key ways to accumulate human capital and provide opportunities to reduce gender earnings differentials, but may asymmetrically favoring career profiles of either women or men (Cooke 2013). The paper aims to contribute to a more accentuated explanation of economically motivated family migration. Based on representative longitudinal data (CNEF 1980-2018) the paper focuses on long distant moves of dual-earner couples in two observation periods in countries with different welfare state regimes. Theoretically, the paper balances human capital approach (Sandell 1977), relative resource theory (Blood and Wolfe 1960), and gender role explanations of family migration (Bielby and Bielby 1992). We test the hypotheses that gender asymmetries of migration decisions, and net returns to residental moves are explained by human capital investments, family role models, comparative advantages, and intra-household earnings distribution. Methodologically, we fit random effect dynamic probit models, and conditional difference-in-differences models. The paper is structured in five sections: (1) discusses the relevant literature, (2) describes the database, (3) presents methodological issues, (4) presents empirical results, and (5) concludes

564

Negotiating Gender Roles at the Shared Space of the Intercultural Home

Kristel Edelman

Tallinn University, Estonia

Being engaged intimately with a partner from another culture is a profound change for both of the partners with a shift in power relations what, according to Beck & Beck-Gernsheim, needs to be renegotiated and "a new equilibrium established" otherwise "relationship will be put under severe strain" (2014, p. 28). The current paper is particularly concerned how the gender roles are (re)negotiated and established during the process of homemaking in intercultural context. The biographical study draws on narratives of intimate partners of Estonian and Northern or Southern Europe origin, residing in Estonia or North or South of Europe.

As power is a crucial aspect for reconciliation of distinct expectations (Clapham, 2005) of the intimate partners, the paper draws on the theoretical works of Bourdieu (1972/1999, 1984), what enables to see home as a field (see also Paadam, 2003), with its power relations and Massey's (2005) understanding of space in light of negotiations of power and identity, along with the theories of material culture (e.g. Miller 2005, 2008/2010). The analysis of biographical experiences suggests that gender roles appear as implicit, not openly negotiated in homemaking. The negotiations appear within couples when their taken-for-granted understandings of the division of practices are contested by the other partner and/or by the partner's significant others, supported by the gender ideologies characteristic of the local community and a society at large.

Keywords: gender, identity, space, home, intercultural couples

Mutual Life and Coping Strategies of Jewish Women in Intercultural Jewish-Arab Families in Israel

Shlomit Oryan1, Tal Meler2

1Oranim Academic College, Israel; 2zefat Academic College, Israel

The number of mixed couples has increased in recent years in Israel, with several thousands of them being Jewish-Muslim mixed couples. Studies which examined how Jewish women and Muslim men in mixed families cope with their mutual life, found that the Jewish women display both at the interpersonal aspect and in the raising children aspect full assimilation into Arab culture (Abadi, 1991; Abu-Raiya, 2000; Asadi, 1984).

Following these findings, the present study examines, through in-depth interviews with 12 Jewish Israeli middle-class women married to Muslim Israeli men, the coping strategies used by the women regarding their daily mutual life and their children's education.

The findings differ from previous studies, show that the interviewees have a wide range of coping strategies: on the one end, there are few women who display full assimilation into Muslim culture. On the other end, there are families in which a complete assimilation of Jewish culture is done by the husband. In between, there are families in which mutual acculturation of both spouses occurs either through daily confrontations or through respectful, democratic negotiations based on acceptance and tolerance towards the other culture.

These findings imply that the existence of these intercultural families, and the ongoing negotiations that occur within them, reveal cracks in the rigid ethno-national-religious boundaries which prevail among the social groups in Israel. In addition, the negotiations that take place in these families regarding children education present a rising of multicultural discourse that encourages ethno-national-religious tolerance and mutual respect in the Israeli society.

565

Culture or Structure? A Longitudinal Study of 122 National-origin Groups' Marital Assimilation in Denmark, 1986-2016

Hans-Peter Y. Qvist, Jeevitha Yogachandiran Qvist

Aalborg University, Denmark

The marital assimilation of immigrants from non-Western countries in the Western countries in the late 20th and early 21st century occurs at widely different speeds depending on the immigrants' national origin groups but it is not clear why. One theory is that the distance between a national origin groups' culture and that of the receiving country is inversely related to its members' likelihood of intermarriage with the native stock because people generally prefer partners who resemble themselves. However, opportunity structure theory emphasizes that immigrants' and descendants' opportunities for finding a partner from their own country of origin is shaped by demographic constraints in local marriage markets. This study uses discrete-time multilevel event history analysis to investigate to what extent cultural and structural factors explain differences in the likelihood of intermarriage with the native stock between national-origin groups when compositional factors are controlled for. Drawing on administrative register data from Denmark, our study follows 71,123 immigrants and descendants from 122 different national-origin groups residing in 97 local marriage markets. Controlling for compositional factors, our results suggest that cultural and structural factors alike explain differences in the likelihood of intermarriage with the native stock between the national-origin groups.

RN13_T10_02 | Work-Family Balance, Work-Family Conflicts, Parental Leave VII

Parental Self-Efficacy and Work-to-Family Conflicts

Ayhan Adams, Katrin Golsch

Osnabrueck University, Germany

Parental self-efficacy describes the belief in the own ability to implement effective parental behaviour and to meet the requirements of a parent. Findings indicate that parental self-efficacy is an important factor regarding parental and child wellbeing, positive parent-child interactions, and child outcomes such as behavioural problems (Albanese et al., 2019). For many employees, the work demands decide how much energy and time can be spent on family life, which impacts if parents meet their own standards of a good parent. This dependency may result in conflicts between the work and family role. These work-to-family conflicts were found to influence children's well-being (Hess & Pollman-Schult, 2020) – similarly to parental self-efficacy.

Our study, therefore, investigates how work-to-family affect parental self-efficacy in Germany over time. We extend previous research based on cross-sectional data by conducting multilevel panel regression models using dyadic longitudinal data from The German Family Panel (waves 6, 8, 10; n = 2,116 employed individual parents). Leant on the assumption of different role expectations between mothers and fathers and the work-care culture perspective, we additionally investigate gender-specific effects and possible differences between parents from Eastern and Western Germany to account for the influence of the normative imprint.

Results, in line with our expectations, show a significantly negative impact of work-to-family conflicts on parental self-efficacy. The models, however, do not report any significant interaction effects of gender or region, which indicates that work-to-family conflicts reduce parental self-efficacy, for mothers and fathers in Eastern and Western Germany to the same amount.

566

Role Of The Family In The Processes Of Women Entrepreneurship

Julija Mazuoliene

Lithuanian Centre for Social Sciences, Lithuania

Entrepreneurship has become an engine of progress and the core of economic development. Women are getting involved into entrepreneurial activities in all spheres of life and this factor has positive social impact on women and their social surroundings. In this paper I present findings of a study on women family relationships as one of the key factors that influence women's success in work-life balance and a career as an entrepreneur.

Despite the significance of the subject, there is limited number of studies on entrepreneurship with a particular focus on women. My ongoing research aims at evaluating major factors that can determine the decision of women to start a business. This paper presents first results of qualitative analysis of 30 narrative interviews that took place between April 2020 and February 2021 in Lithuania. The main research question is: what role does family play in women's business development processes, and what influences do family relationships and family commitments have on woman's decision to create her own business? The analysis also included Covid-19 pandemic challenges and barriers for women entrepreneurship.

The analysis has shown that the most important reasons or motives for women to develop own business is the need for self-realization, control in decision-making, and the opportunity to balance work and family. Sharing childcare and household responsibilities with a partner is crucial for women with children to start her own business, especially during the Covid-19 time when schools closed and women are juggling primary care-giving and homemaking while trying to save their businesses.

The Impact of Women's Meaningful or Vocational Work on Relationship/marital Conflict and Divorce

Dana Andreea Costache Tudose

University of Bucharest, Romania

This paper provides a deeper understanding of how women are more affected by the conflict between their work, their dedication and involvement in their career and their multiple social roles and, especially the roles of taking care of the family.

The theoretical foundations for the conflict perspective on work and family can be traced to the scarcity hypothesis (Goode 1960), which proposes that time and energy are limited, finite resources, and to Robert Merton's role conflict hypothesis, which proposes that people sometimes face conflict among their multiple social roles (Merton 1949). These models were applied to work-family studies in the 1970s, in important early work (Kanter 1977, Pleck 1977, Rapoport & Rapoport 1971) acknowledging the existence of dual-career families and the overlap and conflict between work and family roles. Overall, early research on work and family presented a bleak picture. For instance, conflict theory (Greenhaus & Beutell 1985) proposed that work and family were incompatible domains due to their competing responsibilities. Early research on work and family almost exclusively examined negative outcomes of attempts to combine them, particularly

for women and their families. Perspectives that allowed for the possibility of role enhancement would come later.

My focus in this paper lies at the intersection of gender hierarchy, vocation, marital life and marital conflict.

I try to show that women who focus on their work for which they have a strong calling are more likely to show more resilience and clarity during separation and divorce and are less likely to compromise the values which allow them to continue doing their work in order to preserve the "role" as "wife".

How to Manage Life and Sex Work? Strategies of Indoor Female Sex Workers in Poland

Izabela Ślęzak

University of Lodz, Poland

Work–life research focuses almost exclusively on the work–life management practices of white, heterosexual, dual-career couples (Blithe & Wolfe, 2016, p. 2; see also Gill, 2006). Little is known, therefore, of the practices of marginalized populations and people in non-normative work situations.

The purpose of the speech is to analyze the strategies deployed by female sex workers in Poland when navigating the areas of work and life. I approach the provision of sexual services (as the participants of the study do) as stigma-burdened, non-regulated work that may offer an opportunity to establish a work–life balance. In practice, this enterprise is jeopardized by a number of factors within the legal, social, and organizational frames of sex work.

I discern several work-life management strategies depending on what realm, work or life, is prioritized by sex workers as well as whether they choose to segment or integrate these realms. Much as establishing strong boundaries between the domains of work and life is the predominant strategy, some sex workers strive to make these boundaries permeable or remove them altogether. The strategies practiced are also informed by the sex workers' life and occupational conditions as well as the experience or anticipation of social stigma.

The speech draws on unstructured interviews, analyzed using the procedures of grounded theory methodology.
